And, you know, I'm delighted to see them repurchasing shares. We own — let's say we own 250 million or so shares. They have, I think, 4 billion, 923 million or something like that. And mentally, you can say we own 5 percent of it.

But I figure with, you know, with the passage of a little time we may own 6 or 7 percent simply because they repurchase shares. And it —

I find that if you've got an extraordinary product, and ecosystem, and there's lots to be done, I love the idea of having our 5 percent, or whatever it may be, grow to 6 or 7 percent without us laying out a dime. I mean, it's worked for us in many other situations.

But you have to have some very, very, very special product, and — which has an enormous wide — enormously widespread ecosystem, and the product's extremely sticky, and all of that sort of thing.

And they're not going to find 50 or a hundred billion dollar acquisitions that they can make at remotely a sensible price that really become additive to that.

And they may find it, who knows? But there certainly, as I look around the horizon, I don't see anything that would make a lot of sense for them in terms of what they'd have to pay and what they would get.

Whereas I do see a business that they know everything about, and where they may or may not be able to buy it at an attractive price when they repurchase their shares. That remains to be seen.

Incidentally, that's one thing that I always enjoy. People say, "Well, you're talking your book," or something if you talk —

From our standpoint, we would love to see Apple go down in price. They're going to — well, just put it this way. If Andrew and Charlie and I were partners in a business that was worth \$3 million so each of us had a million dollar interest in it, if Andrew offered to sell out his one-third interest at 800,000 and we had the money around, we'd jump at the chance to buy him out. I mean, it's so simple.

But people get all lost — and if he'd wanted a million-two for it, we wouldn't pay it to him.
(Laughs)

It's very simple math, but it gets lost in all these discussions. And of course, like I say, Tim Cook could do simple math. And he could probably do very complicated math, too. So, we very much approve of them repurchasing shares.

Charlie?

CHARLIE MUNGER: I think, generally speaking in America, when companies go out hell-bent to buy other companies, they do — they're worth less after the transaction is made than they were before.

So I don't think you have a general way to wealth for American corporations to go out and buy other corporations. Averaged out, it's a way down, not up.

And I think that a great many places have nothing better to do than to buy in their own stock, and nothing as advantageous to do as they can — as buying in their own stock.

So, I think we know pretty damn well what's going to happen to Apple. They'd be very lucky to — if there was something available at a low price that they could buy. It's —

I don't think the world's that easy. I think that the reason these companies are buying their stock is that they're smart enough to know that it's better for them than anything else.

WARREN BUFFETT: And that does not mean we approve of every buyback, at all, though. I mean, we've seen —

CHARLIE MUNGER: No, no, no. I think some people just buy it to keep the stock up. And that, of course, is insane. And immoral. But apart from that, it's fine. (Laughter)

7. “I like very much our holdings of American Express”

WARREN BUFFETT: OK, Gregg?

GREGG WARREN: Warren, if we look at the performance of your equity investment portfolio the last three to five years, some of the strongest performances come from Visa and MasterCard, which put up returns that are three to four times greater than American Express.

Unfortunately, your holdings of the two names, which we assume were held by Todd [Combs] or Ted [Wechsler], have accounted for less than one percent of stock holdings on a combined basis the past five years, while American Express has tended to be a top-five holding, accounting for 10 percent of the portfolio, on average, and closer to 8 percent of late.

Given that all three firms benefit from powerful network effects along with valuable brands, were there any particular reasons Berkshire did not ramp up its stakes in Visa and MasterCard to more meaningful levels, especially during those years when American Express was struggling?

After all, you've shown a willingness to own several stocks from the same industry, holding shares in several competing banks, and buying stakes in all four domestic airlines in fairly equal amounts when you picked them up in late 2016.

WARREN BUFFETT: Yeah. When Ted and Todd, or either one of them — I won't get into which specifically — which one of them specifically — bought, or for that matter they could both have bought — Visa and MasterCard — they were significant portions of their portfolio.

And there was no embargo or anything on them owning those stocks because we had a big investment in American Express. And I could have bought them as well. And, looking back, I should have.

On the other hand, I think American Express has done a fabulous job, and now we own 17 and a large fraction percent of a company that not that long ago we may have owned 12 percent.

We've done it without spending a dime and without — you know, it's a company that has really done a fantastic job in a very competitive field where lots of people would love to take their customers away from them. But they have more customers than ever, and they're spending more money than ever. The customers are.

And the international growth has accelerated. The small business penetration is terrific. It's really quite a business. And, you know, we love the fact we own it.

Like I say, it didn't preclude me from, in any way, from buying MasterCard or Visa. And if I had been as smart as Ted or Todd, I would have. (Laughs)

Charlie?

CHARLIE MUNGER: Well, we would have been a little — a lot better with all of our stock picking if we could do it in retrospect.

But — (laughter) — at the time, we have a big position in American Express, and there is one tiny cloud on the horizon of the payments processors and that is the system of WeChat in China.

And so it isn't as though there isn't a little cloud somewhere off in the — and I don't have the faintest idea how important that cloud is, and I don't think Warren does either.

WARREN BUFFETT: No. No. Payments are a huge deal worldwide. And you've got all kinds of smart people working at various ways to change the payment arrangements. And —

CHARLIE MUNGER: To destroy what we have now.

WARREN BUFFETT: Sure, sure. And you've got some very smart people that, you know, I am — the — but there — building a company.

And American Express made a decision a few years ago not to bid as low as somebody else did to retain the Costco business. And I think — Charlie and I disagree on this — but I think it was a smart decision. He doesn't think it was a smart decision. But one of us will be right. And — (laughter) — and one of us will remind you that they were right. (Laughter)

The — but if you look at American Express, it is — it's a remarkable company. I mean, you know, they came after them with Sapphire last year. People want that business. And payments are changing.

And you can see in different countries different ways things are going on in that. And there are a lot of people that will play the game of gaming the system, and switch from one to another based on the rewards on this card or that, and all of that sort of thing.

But there also is a — I think there's a very substantial group for which American Express does something very special, and they keep capitalizing on that premier position with that group.

And they're doing it successfully around the country. And you'll see in the first quarter — you've seen in the first quarter — you know, where in Britain, in Mexico, in Japan, you're seeing gains of 15 percent or better in local currencies.

And the base is not tiny, but it's not huge, so there's a lot of room left to go in that. And the small business penetration is good. The loan portfolio has behaved sensationally compared to, really, just about anybody.

So, I like very much our holdings of American Express.

The first half, because of the accounting changes, they had to suspend their repurchase program for six months. But I — they've announced that they expect to renew it.

And someday we'll even, you know, we'll own a greater percentage of American Express and it will be a bigger company, in my opinion. And I think we'll do very well.

But as Charlie says, nobody knows how payments is — for sure — comes out. And nobody knows how autos for sure come out. And there — that is true of a great many businesses we're in, and we've faced it before.

We used to buy things that were certain failures, like textiles and second-rate department stores and trading stamps in California. Now we just face things that face real difficulty. So we're actually moving up the ladder. (Laughter)

8. Capital-intensive businesses are “good enough”

WARREN BUFFETT: OK, Station 1.

AUDIENCE MEMBER: Mr. Buffett, my name is Daphne Collier Starr (PH). I'm eight years old and live in New York City. I've been a shareholder for two years and this is my second annual shareholders meeting.

Berkshire Hathaway's best investments on which the company built its reputation have been in very capital-efficient businesses — (laughter) — such as Coke, See's Candy, American Express, and GEICO.

But recently, Berkshire has made really big investments in a few businesses that require huge capital investments to maintain and that offer only a regulated low rate of return such as — (laughter) — Burlington Northern Railroad.

My question to you, Mr. Buffett, is could you please explain why Berkshire's largest recent investments have been departed from your old capital-efficient philosophy?

And why specifically have you invested Burlington Northern instead of buying a capital-efficient company like American Express? (Applause)

WARREN BUFFETT: You're killing me, Daphne. (Laughter) Yeah.

CHARLIE MUNGER: I'm certainly glad she's not nine years old.

WARREN BUFEFTT: Yeah. (Laughter)

I'm just sitting here thinking which of the six panelists we're going to bump next year and put you in. (Laughter)

Well, I thought I was doing well when I bought that City Service at 11. (Laughs)

The answer is that we have — we'd love — we always prefer the businesses that earn terrific returns on capital, like a See's Candy when we bought it or a good many of the businesses.

And, we've — and, you know, American Express, you know, earns a terrific return on equity, and has for a very long time.

The fact that we buy a Burlington — BNSF, Burlington Northern — means that, essentially, we can't get more money deployed in capital-light businesses at prices that make sense to us. And so we have gone into more capital-intensive businesses that are good businesses.

But wouldn't it be wonderful if we could run the railroad without trains, and track, and tunnels, and bridges, and a few things?

We get a decent return on the capital-intensive businesses. We bought most of them at very decent prices, and they've been run very well since we bought them.

We still love a business that takes very little capital and earns high returns, and continues to grow, and requires very little incremental capital.

We can't deploy as much money as we have in doing that. And so as the second-best choice, still a good choice, the answer is yes. It's not as good as the best choice.

Charlie?

CHARLIE MUNGER: Yes, I like the aspiration of that young lady. She basically wants her royalty on the other fellow's sales. And of course that's a very good model, and if everybody could do that, why, nobody would do anything else.

The reason we're satisfied with our utility returns and our railroad returns is they're quite satisfactory. And we — and the — quite satisfactory. I wish we had two more just like them. Don't you, Warren?

WARREN BUFFETT: Yeah.

CHARLIE MUNGER: So —

WARREN BUFFETT: Definitely.

CHARLIE MUNGER: So the answer is they're good enough, and you're asking us to get perfection if you would want us to have all our money in Coke at, say five percent of what it's now selling for.

WARREN BUFFETT: Yeah. And a business like Apple really doesn't take much capital.

But — so, you've got to spend a lot of money to buy businesses like that. Very few are for sale.

And the answer is we have not foregone any opportunity to buy businesses that earn high returns — very high returns — on equity capital, when we could buy them at a sensible price, to buy these other businesses.

So they haven't shoved anything else off the table. But you are — you definitely have a job in our capital allocation department. (Laughter)

9. Buffett "surprised" rate of decline for newspapers hasn't moderated

WARREN BUFFETT: OK, Carol.

CAROL LOOMIS: This question is from Max Taylor (PH) of Chicago, and it concerns the newspapers that Berkshire owns.

In your 2012 letter to shareholders, Mr. Buffett, you had a section devoted to Berkshire's buying 28 newspapers during the year just past. Since then, you have not come back to the newspaper subject.

But this year, at the end of the annual report, you published a list of the newspapers Berkshire owns today, along with their circulation. I compared that list with the one you published five years ago at the end of 2012.

As you no doubt know better than anyone, the circulation of the 26 newspapers that Berkshire still owns, of the 28 originally bought, fell sharply. In many cases, by big amounts like 30 percent to almost 50 percent.

I know that five years ago, you acknowledged the risk in owning newspapers, but you still said, 'Charlie and I believe that papers delivering comprehensive and reliable information to tightly-bound communities, and having a sensible internet strategy, will remain viable for a long time.'

Skip to today, and imagine that you are writing about Berkshire's experience with newspapers. What would you be saying?"

WARREN BUFFETT: Yeah. I would say that — I forget the modifying word on internet strategy — but I could say (Inaudible).

The problem has been — about 1,300 daily newspapers in the United States — there were 1,700 not that long ago — is that no one except The Wall Street Journal, The New York Times, and now probably The Washington Post has come up with a digital product that, really in any really significant way, will replace the revenue that is being lost as print newspapers lose both circulation and advertising.

And if you look at the communities in which we operate, or the communities in which, you name it — other newspapers operate, the community could be prospering. We're in a prosperous economy presently. And all are losing daily circulation, they're losing Sunday circulation, they're losing street — all street sales, they're losing home-delivered.

And it is — I've been surprised that the rate of decline has not moderated in the last five years.

We bought all the papers at reasonable prices, so it is not of great economic consequence to Berkshire. But I would like to see daily newspapers, actually, you know, be economically viable, because of the importance to society.

But I would say that the trends which — I put those circulation figures in there because I think the shareholder's entitled to look, year-to-year, at what is happening. And it's not only —

It's happening to 1,300 newspapers throughout the United States. And it happens in small towns, where you would think that the alternative sources of information would not be that good. It happens every place.

And The Journal, The Times, and probably The Post, have a viable economic model in the digital world, and probably will continue to shrink — I'm almost certain will continue to shrink — in the print world.

But the digital world will be big enough that — and they'll be successful enough — so that they have, in my view, a sustainable business model.

But it is very difficult to see, with the lack of success, in terms of important dollars arising from digital, it's difficult to see how the print product survives over time. And that's — I'm afraid that's true of 1,300 papers in this country.

And we'll keep looking to see if there is a way to do it. But you'd have to look at our experience, and look at the experience of everyone else's.

McClatchy newspapers came out the other day, you know, and I think that newspaper — which is very good — fine cities that they operate in — and advertising revenue is down something like 17 or 18 percent, and circulation. But it isn't just them, it's everybody in the business. And I wish I had a better answer for you, but I don't.

I would say that the economic significance to Berkshire is almost negligible, but the significance to society, I think, actually is enormous.

And, you know, I hope that we find something. I hope others find something because we'll copy it. But so far, we have not succeeded in that.

Charlie?

CHARLIE MUNGER: Well, the decline was faster than we thought it was going to be. So it was not our finest bit of economic prediction. And I think it's even worse.

I think, to the extent we miscalculated, we may have done it because we both love newspapers and are — and have considered them so important in our country.

These little local newspaper monopolies tended to be owned by people who behaved well and tended to control the politicians. And we're going to miss these newspapers if they disappear. We're going to miss them terribly. And —

WARREN BUFFETT: I think you may continue —

CHARLIE MUNGER: — I hope to God it doesn't happen, but the figures are not good, Warren.

WARREN BUFFETT: No. No, they aren't. And it isn't just — you know, it isn't some town that has a particular problem with unemployment or anything of the sort. And it isn't due to general economic conditions.

It's due to the fact that a newspaper, if you wanted to know the baseball results from the present day, and the box scores, and everything else, they told you the following morning and it was still news to you.

And the financial material that I read from there, and in terms of looking at the stock prices and everything, they were news to you the following morning. And the —

What was developing in the Pacific in terms of the war was news to you when you read about it in the morning in The New York Times. And it's — news is what you don't know that you want to know. And the —

And those Help Wanted ads, you know, segregated as they may have been, still were the place to go to look to find a job. And you can go up and down the line and one element after another where the daily print newspaper was primary, they're no longer primary.

And the business has changed in a very material way, and we haven't been able to figure out any solutions to that, and we'll keep trying.

Like I say, it's not of economic consequence, but I think it is societal consequence. And we haven't been able to solve it.

10. TTI has "improved dramatically in the past year"

WARREN BUFFETT: OK, Jonathan?

JONATHAN BRANDT: TTI has been a nice growth story since Berkshire acquired it 11 years ago, more than doubling its pre-tax earnings to about \$400 million due to fine organic growth and at least two successful bolt-on acquisitions. Business momentum appeared to accelerate in the first quarter.

Can you please talk about the competitive landscape in the electronic components distribution industry and what TTI's advantages are? Is it just a great industry to be in or is TTI's business model and/or management team special?

WARREN BUFFETT: Well —

JONATHAN BRANDT: Do you expect it to continue to be one of Berkshire's faster growing non-insurance subsidiaries?

WARREN BUFFETT: TTI is run by a fellow named Paul Andrews who's done an absolutely sensational job with us. He's a wonderful man. He's a wonderful manager.

And in the last — he's quadrupled the business, basically, but in the last year and accelerating right to this point.

They distribute little electronic components. They actually — their average — they're a many-billion dollar business — and their average item is less than a nickel that they sell. So it's kind of like being in the jellybean business or something like that. Except these things go into all kinds of fancy machines that I don't understand.

And we have a worldwide operation based in the Dallas, Fort Worth area. And built by one man who left a division of General Dynamics 45 or 50 years ago. And step-by-step built up this business — like we just bought within the last two months, we bought an operation in South Korea that will be another substantial addition. We do business worldwide. And electronic components that have absolutely taken off in the last year.

And they use something called, you know, well, it's essentially a measure of backlog. And book-to-build is the ratio they call it. But it's just kind of a special term.

The — but, it's grown — I mean, it's just improved dramatically in the last year. And it continues month after month. So something is going on out there because nobody buys these things to store them in their basement or anything of the sort. I mean, these get used, these electronic components.

Some of them are on allocation. We have a great relationship with suppliers. We have a very good relationship with our customers because we carry more inventory than most of our competitors. So particularly when the business is tight we can deliver and do a very first-class job doing it.

So I give credit to Paul. He increased his physical facility, started on that a few years ago. And it's a godsend that he did it because with the business going through there now we wouldn't have been able to handle it.

But it's a competitive business. I mean, if you look at Arrow Electronics, you know, on the New York Stock Exchange — we've got competitors. I think Paul is doing a better job, by a considerable margin, than they are. And I'm delighted as a part of the Berkshire family.

There will be times when that business slows down because their customers, you know, will have their own cycles. And what it does will go down. But over time that business is going to grow.

Charlie?

CHARLIE MUNGER: Yeah, it's a wonderful business because it's so difficult to do that competitors don't want try it. When I lived in Omaha there was a man who lived in great prosperity and almost no work. And his business was gathering up and rendering dead horses. And he never had any competitors. (Laughter)

He used to come up to the Omaha Club and start drinking about 11 in the morning. It was not a difficult business. But nobody ever crowded him with new competition.

And very few people want to distribute zillions of electronic parts that are worth a nickel each. It's very complicated.

And of course that business is terribly good at it. And it keeps getting more and more of the same. So you're right. It's a huge growth business which is sort of the electronic equivalent of gathering up and rendering dead horses. (Laughter)

WARREN BUFFETT: Imagine keeping track of close to a million different items, you know, with very small values attached to them and getting them out to your customer fast because they

want them fast, all over the world. You know, and those things are not easy to manage. I mean, yeah.

CHARLIE MUNGER: And staying in stock on so many items. It's very complicated. And that business is very good at it.

WARREN BUFFETT: Yeah, we're luck —

CHARLIE MUNGER: And of course it'll grow. The horses went away but these parts aren't going to go away. (Laughter)

WARREN BUFFETT: Charlie made a profession of studying businesses where the owners could sit around and drink all day and have — (laughter) — he thought that was where we ought to be competing but — or buying.

CHARLIE MUNGER: My theory, Warren, is if it can't stand a little mismanagement, it's no business. (Laughter)

WARREN BUFFETT: Yeah and we're testing that sometimes. (Laughter)

11. Phillips 66 and staying below 10 percent ownership

WARREN BUFFETT: OK, Station 2.

AUDIENCE MEMBER: Hi, Ben Sherber (PH), Topeka, Kansas. Just want to say, Warren and Charlie, thank you again for hosting us all. This is a great event.

WARREN BUFFETT: Thank you.

AUDIENCE MEMBER: My question is about the recent decision to sell shares back of Phillips 66. Not to put you on the hot seat. But right after that, share prices jumped up about \$22 a share.

You mentioned at the time that there's some regulatory requirements if you own over 10 percent of a company. Could you talk about the factors that go into how you decide whether to retain more than that or get under that threshold? And then what are your thoughts long-term on Phillips 66, like, their business mid-stream refining?

WARREN BUFFETT: Yeah, well, it was the City Service preferred of last year. (Laughter)

We sold the stock at around 93 or '4. And it's probably 115 now. But we own just under 10 percent of the company. And the more Ted [Weschler] and Todd [Combs] and I think about various problems connected with regulatory problems and trading problems and so on, overwhelmingly we will stick below 10 percent on marketable security holdings.

We've done it with the airlines. Now that does not mean we're going to reduce our holdings in American Express or anything of the sort.

But — and Greg Garland has done a great job at Phillips 66. We've had very good relations with the company. They're very — he's a very, very, very experienced and sensible manager.

But I did decide that I wanted to be below 10 percent in that holding. And we, like I say, we'll stay just slightly under 10 percent of Wells Fargo.

We've actually sold a few shares just to stay below 10 percent in the case, I think, of both American Airlines and United Continental.

Unless there's something unusual we're going to stay under ten. But we have nine and a significant fraction percent of Phillips. And I think they've been good at operations. I think they've been good at capital allocation.

We traded them a business — we traded them stock for a business some years ago, which has been a very nice business that we've retained in operation.

So we've got a lot of money still in Phillips. And I wish I'd made the deal at a higher price. But we made money on what we sold and we accomplished an objective.

Charlie?

CHARLIE MUNGER: Well, we like the subsidiary we traded the stock for. (Laughter)

WARREN BUFFETT: I missed that —

CHARLIE MUNGER: We traded the stock for a subsidiary.

WARREN BUFFETT: Yeah, well, yeah.

CHARLIE MUNGER: We like the subsidiary.

WARREN BUFFETT: Oh yeah. Well, it improved —

CHARLIE MUNGER: It isn't like the stock went away for nothing.

WARREN BUFFETT: Yeah. Yeah, actually we've done pretty well with Phillips.

12. Cryptocurrency craze will “come to a bad ending”

WARREN BUFFETT: Becky?

BECKY QUICK: This question comes from Vlad Koptev (PH) in Ukraine. He says, “Capitalization of cryptocurrency has approached that of Berkshire and Apple last year. And clearly the idea behind crypto will affect conventional banking groups where Berkshire is a shareholder. You always say you didn’t go into too much detail to obtain an understanding on cryptocurrencies. So what factors caused you to say that it’s a bubble?”

WARREN BUFFETT: Well, generally non-productive assets remain not only — if you’d bought gold at the time of Christ and you figured the compound rate on it, you know, it may be a couple tenths of 1 percent.

It essentially is not going to deliver anything other than supposed scarcity, you know, because they’ll only — you can only mine so many. But so what? I mean, what does it produce itself?

You know, the check is a wonderful idea. Just imagine how the world would be without being able to write checks or have wire transfer of funds. But it doesn’t make the check intrinsically itself worth a lot of money.

And if you said you can’t use something called “check” with a little piece of paper you’d do something else to transfer money.

I think that anytime you buy a nonproductive asset you are counting on somebody else later on to buy a nonproductive asset because they think they can sell it to somebody for more money.

And it’s been tried with tulips and it’s been tried. It’s been tried with various things over time. And it does come to a bad ending.

I mean, having — you have a hard time. You can think of raw land. I mean, the Louisiana Purchase was, say, \$15 million for 800,000 or so square miles of land. In fact, you’re sitting on land that came with the Louisiana Purchase.

And so what’d we pay? We paid 20 bucks a square mile. And, you know, 640 acres in a square mile. And you’re down to three cents or something. So that was a pretty good purchase of what was then a nonproductive property. But it’d depend — but it’s very hard. You can buy stamps. Bill Gross got, you know, collected a wonderful stamp collection. It sold for more money in the end.

But it’s dependent on somebody else wanting to buy, hoping they will sell it for more money and so on.

And in the end you make your money on productive assets. If you buy a farm, you try to estimate what the crops, what amount per acre of soybeans or corn or whatever may be raised, and how much you have to pay the farmer that farms it for you, and what your taxes will be, and various things. And you make a conclusion based on what the asset itself will produce over time. And that’s an investment.

When you buy something because you're hoping tomorrow morning you're going to wake up, you know, and the price will be higher, the only reason, you know, you need more people coming into it than are leaving.

And you can get that. And it will feed on itself for a while, and sometimes for a long while, and sometimes to extraordinary numbers. But in the end — but they come to bad endings. And cryptocurrencies will come to bad endings.

And along with the fact that there's nothing being produced in the way of value from the asset that you also have the problem that it draws in a lot of charlatans and that sort of thing who are trying to create various sorts of exchanges or whatever it may be.

You know, it's something where people who are of less than stellar character see an opportunity to clip people who are trying to get rich because their neighbor's getting rich buying this stuff that neither one of them understands. It will come to a bad ending.

Charlie?

CHARLIE MUNGER: Well, I like cryptocurrencies a lot less than you do. (Laughter)

And so to me it's just dementia. And I think the people who are professional traders that go into trading cryptocurrencies, it's just disgusting. It's like somebody else is trading turds and you decide, "I can't be left out." (Laughter and applause)

WARREN BUFFETT: To the extent that this — we are being webcast around the world, I hope some of our stuff doesn't translate very well, actually. (Laughter)

13. Shareholders will get a lot of the corporate tax cut benefit

WARREN BUFFETT: OK, Gary.

GARY RANSOM: Yes, I had a question on the corporate tax rate. And we have a debate in my investment world about where the benefits of that cut fall. And I'd say the consensus is going to the consumer as it gets competed away over time. But perhaps some of it sticks to shareholders.

And my question is, do you think, over the long run, some of the benefits sticks to shareholders? And maybe it's even beyond auto insurance? Maybe it's other businesses you have as well.

WARREN BUFFETT: Well, what people do generally with that is they take what they want to be the answer for them and then they hire — or they just attach themselves to some economist that gives them a more complicated way of saying it's all going to be wonderful because it's happened.

But the answer is that in the case of our regulated public utilities, the benefits are all supposed to go, and will go, to the utility customer, because we're entitled to a return on equity if we perform well. And we're not entitled to get excess returns because our tax rates changed. And similarly, if tax rates would go back up, we would expect to get compensated for that. So in that area — and that was 5 or \$6 billion for us.

But in that area, absolutely, it goes to the user, the consumer. And it should.

Then the question is, with the remainder, does it get competed away or not? And the answer is sometimes it does, sometimes it gets competed very quickly and substantially. Sometimes it may be slow. And other times it probably won't.

The one thing to know is that the change in the corporate tax law was good for shareholders, generally, and Berkshire shareholders. I mean — and that's what Congress passed. And the intent had to be that if you were going to cut taxes that shareholders would get a particularly large portion this time. And some of you will agree with that politically and some of you won't agree with it politically. But you'll all benefit equally. (Laughs)

And I think it's human nature if you're getting a break to say it's going to work wonderfully for everybody else. And we'll find out whether it will or not.

It's very, very, very difficult in economics to measure the impact of single variables. You cannot just do one thing in economics. People kind of learn that in physics and talk about butterflies in China and all that sort of thing. But the — every question you get in economics the next, any statement, you should say "and then what?"

And when you get into the "and then whats" you get start favoring people who give an answer to that in political life that happens to usually help you in some way or another, including your pocketbook. And we've see that with this. And it's helped the shareholders at Berkshire Hathaway.

I would say that some will be competed away. Some (inaudible) utilities and some will benefit Berkshire shareholders. Charlie?

CHARLIE MUNGER: I have nothing to add.

14. Utilizing multicultural backgrounds to improve international economies, and the benefits of multiculturality

WARREN BUFFETT: OK. Station 3.

AUDIENCE MEMBER: Hi, Mr. Buffett and Mr. Munger. My name's Kevin and I'm from Shenzhen, China, currently studying finance and philosophy at Boston College.

I have a rather broad question. In this more and more globalized world, what do you think our younger generation can do to best leverage our background and experience of both China and U.S. to create values and for the benefit two countries' economy and relationship? And what do you see valuable in a person with a multicultural background? Thank you.

WARREN BUFFETT: Well, I think in answer to the last question, I think it's terrific to have a multicultural background. And I never was any good at languages. But if I were in college today, in either country, I'd be learning the language of the other country, because I think it would be a great advantage over time.

The first part of the question, I'd like to have that stated again to me. I want to make sure I'm answering your specific aspect there on the — I think it's going to be good for your future. But can we have the microphone on up there again?

AUDIENCE MEMBER: So the first part of the question is, like, what do you think our younger generation can do to best leverage our background and experience of both China and U.S.?

WARREN BUFFETT: Well, I'd start with being multilingual, I mean, certainly, in terms of, you know, I mean, obviously you want to be able to express yourself in both. And the better you can understand, obviously, the culture of another society, obviously, that's a benefit.

But I think the market system, modified as it may be, both in China and in the United States, in a way, it really does — there will be an invisible hand, to some extent, that does work to improve the lot of future generations by the fact that both China and the United States, and the rest of the world, is improving. I mean, it is much better, in my view, particularly in a nuclear world. But it's much better to have people prospering throughout the world, partly through their own efforts but partly through their interactions with the rest of the world.

And we've made a lot of progress in that respect particularly since World War II. I mean, it was a terrific idea to have the Marshall Plan, you know, instead of behaving like we did after World War I and getting the result that we got. I think we behaved much more intelligently after World War II.

So I'm bullish on the future of United States. But I'm bullish on the future of China, and to a significant extent, you know, the rest of the world.

People are going to be living better 10, 20, 50 years from now. And I don't think that's something that can be stopped even. Charlie? Absent weapons of mass destruction.

CHARLIE MUNGER: Yeah, well, the multicultural stuff, it wouldn't do you much good to be fluent in both English and Chinese if you were, say, a proctologist in China or a proctologist in Nebraska. (Laughter)

So if you're going to use your multicultural background, you've got to work at some interface between the United States and China.

And you can raise money in the United States and invest it in China like Li Lu does or you can be some kind of an importer or a trade specialist. But you've got to get near that interface to benefit from being bilingual and so on.

WARREN BUFFETT: But you would bet that the interface will be substantially greater.

CHARLIE MUNGER: Huge.

WARREN BUFFETT: Yeah.

CHARLIE MUNGER: Huge.

WARREN BUFFETT: And that's what you want to prepare for.

CHARLIE MUNGER: Yes. And I think that, generally speaking, that we get multicultural you can also be multidisciplinary. But generally I think people make more money if they're very narrowly specialized, like the proctologist. (Laughter)

And it's much harder to make a lot of money for most people if you try to imitate Warren and me.

WARREN BUFFETT: I'm glad I didn't meet him earlier. I mean — (Laughter)

15. Subsidiaries encouraged to offer low-cost 401(k) options

WARREN BUFFETT: OK, Andrew.

ANDREW ROSS SORKIN: OK, this question comes from someone who says, "I am a Berkshire employee and shareholder."

WARREN BUFFETT: Uh huh.

ANDREW ROSS SORKIN: "I read an investigative article from ProPublica and The Washington Post that many of Berkshire's various units only offer 401(k) plans with high fees that are actively managed rather than the low-cost indexes you have advocated as the best path for savings for retirement.

"The article's author said he contacted the company and nobody would comment.

“Will you do something to improve our 401(k) offerings to match your investment philosophy? And from an operational perspective, how did this happen, given your strong views on the topic?”

WARREN BUFFETT: Well, I’ve absolutely said what — many, many times through annual reports — and our managers know what I think about the attractiveness of having an index fund option. But they all have different plans, different histories. And they run their businesses.

And who knows, you know, which particular — if you go back to the older businesses, they have defined benefit pension plans, generally. Nobody puts them in anymore. And then the question is, you know, do you transition to something else.

In the end, we overwhelmingly thought our managers make those kind of decisions and others. And my guess is that a very high significant percentage of people who have — who work at a company that has a 401(k) plan will have an index fund option, but they may not, in some cases.

The only thing we — I think we have asked the companies to have a limit on the percentage, I think, that they might put in Berkshire’s stock through the 401(k). We don’t want people to lose jobs who are tied to Berkshire.

We certainly don’t want to be in the position of encouraging to put 100 percent or something of their savings in Berkshire itself. I don’t want to be in that position.

But I don’t think even there we’ve insisted on any company doing that. I think we’ve probably made that, when we’ve been asked about it once or twice, I think we’ve given that suggestion.

But the managers will run the companies. The employees, if they feel — and some of our companies have human relations departments — if they feel that they’d like different options or something like that, you know, they should make those views known to the managers. And in some cases the managers, I think, will pay attention to them and in others they probably won’t.

We’ve got a wide variety of managers that run our businesses. And we’re not going to start trying to run them from Omaha.

Charlie?

CHARLIE MUNGER: Well, you’re right. That has happened. That business of the high-fee choices, because we’ve delegated the whole subject to the managers of the subsidiaries. And so no attention at all is being given to the employee choices at headquarters.

And what you're pointing out is that a lot of the employees in the subsidiaries would do better if they indexed instead of choosing what they did choose. My guess is you're absolutely right about that. You know.

WARREN BUFFETT: Yeah.

CHARLIE MUNGER: And if there are any people, managers, in the business today, I hope we'll do a little better at encouraging better choices.

WARREN BUFFETT: Yeah, although we don't want them to interfere too much in —

CHARLIE MUNGER: No.

WARREN BUFFETT: — directing what they, you know, we can take over human relations.

CHARLIE MUNGER: No, it's up to the managers. But we wouldn't object to a little different viewpoint.

WARREN BUFFETT: And we have made it very clear what we think. I mean, some of them don't listen to us. (Laughter)

16. Berkshire's culture will continue because "it works"

WARREN BUFFETT: OK, Gregg.

GREGG WARREN: Warren, you've noted time and again that there is a strong common culture shared across Berkshire subsidiaries built on a commitment to honesty and integrity, a focus on the long-term, and an emphasis on customer care. And it's also critical to find cultures that mesh well with Berkshire's when acquiring operating companies.

In most cases, the managers that are currently running these subsidiaries are the same individuals who are members of the families that originally sold their firms to Berkshire, leaving them with a vested interest in the businesses they are running and a strong connection to the culture they tend to share in common with Berkshire.

It seems to me that the greater challenge is in ensuring that the large publicly-traded firms that have been acquired and account for a meaningful and growing amount of Berkshire's overall value, stay the course. Could you comment on whether or not this is the case and what the greatest challenge is for you and Charlie when it comes to not only maintaining Berkshire's culture but in finding firms that would fit in well with what you've built?

WARREN BUFFETT: Yeah, I think the culture is very, very strong. And I think it gets reinforced — frankly, I think it gets reinforced by the shareholders we have. I mean, we have a different body

of shareholders and we look at those shareholders, I think, in a somewhat different way than a good many other companies do.

I mean, I think there are a fair number of public companies that wish they didn't have, you know, public shareholders. We're happy to have public shareholders. And we like having individual shareholders. And we don't favor institutions. And we're not going to, you know, give guidance and talk especially to them on investor calls and all that sort of thing. We want our — we want it to be directly with — we want shareholders who are partners, basically.

And it begins with that. It goes to the directors. We have directors who are not — well, I've been on 19 boards, and I've never seen another board like ours. And I think it's terrific that we've got the people who represent, in many cases, lots of shares themselves. They didn't get special deals. It's a group of owner-oriented, Berkshire-conscious, business-savvy owners.

And we don't have anybody on the board because they're a leading, you know, educator or whatever it may be. We want people who, basically, think about how to run a business well for themselves and for their partners. And we've got managers who fit into that culture, who have chosen that culture in coming with us.

And sometimes we have the second or the third or fourth generation, say at the Nebraska Furniture Mart, that share that. Is it perfect? No, it's far from perfect. I mean, you don't get everybody thinking the same way. We have people — we have people that are very independently minded running a lot of businesses. And some of them have different political beliefs, they have different — they see through different lenses than we do, to some degree.

But in terms of having a common, strong, positive culture, I don't think there's any big public company that has it any better than Berkshire. And I think that will continue because people opt into it to a great deal. Cultures get passed along. You do things that are consistent with the culture, so you do — what you talk about is what you do.

And you don't find people saying, you know, "We're a wonderful partnership," and then voting themselves, you know, huge options. And then a whole bunch of other people will say options beneath them because they can't look like they're taking it all for themselves, and arranging — I read about some deal where it could pay off with many, many, many billions of dollars, the other day. We won't name names.

But we've got as good a culture as you can get. And I would say, net, it grows stronger. We have a few people all of the time that really don't buy into it entirely. I mean, it is not 100 percent. But it's as close to it.

And I think it gets closer all the time as we go along. And we will keep — we will try to keep behaving in a way that reinforces it and doesn't dilute it. And I think that will not only work for Charlie and me but it will work for our successors very well. It won't be perfect.

Charlie?

CHARLIE MUNGER: Every time I come to one of these meetings and sit in the manager's luncheon, I feel more strongly at the end of the luncheon that the culture and values of Berkshire Hathaway will go on and on for a long time after the present management is gone.

In fact, I think it'll go on after all of the present managers are gone. I think we've started something here that will work well enough that it will last. And one of the reasons it will last is it's not that damned easy to duplicate.

So the one that is present is likely to just keep going and going. Think of how little direct copying of the Berkshire system there's been.

WARREN BUFFETT: But it won't produce the returns it's produced in the past even.

CHARLIE MUNGER: No, I think it's going to last a long time for a very simple reason. It's going to —

WARREN BUFFETT: It works.

CHARLIE MUNGER: — deserve to last a long time.

WARREN BUFFETT: It works.

CHARLIE MUNGER: And it's going to work.

17. Cash needed to support Berkshire insurance operations

WARREN BUFFETT: OK. (Applause) Station 4.

CHRISTIAN MAX: My name is Christian Max (PH). I'm a proud shareholder from Cologne, Germany. It is my pleasure to be here.

My question relates to the Berkshire insurance operations. When I look at the quarterly billing sheets of the last two decades, I noticed a pattern that I kindly ask you to discuss.

The sum of cash plus fixed income always hovers around 100 percent of the amount of insurance float. Therefore, my question is, is it fair to say that from the 128 billion of consolidated cash plus fixed income as of March, 116 billion are actually needed to support the insurance operations?

WARREN BUFFETT: No, I appreciate —

CHARLIE MUNGER: The answer is no. Yes.

WARREN BUFFETT: The answer is no. But he deserves an explanation of how this — maybe I haven't looked at it the way he's looked at it.

We would much rather have a number closer to 20 than to have 116. And we do not correlate or, in effect, measure the float and then decide how much to put or leave in cash, in fixed income.

The fact —our float keeps growing. And lately our — which is by design and has been terrific for us — and our cash and cash equivalents have has grown because the competition for acquisitions has become much stronger as — both as money has piled up with the buyers of businesses and because debt has been so cheap and a variety of factors.

But I don't think those are necessarily permanent. In fact, it would be reasonably true they aren't permanent. It's just a question of when they change.

We are not tying, as Charlie said, we're not tying the cash and cash equivalents at all to float. The float is (inaudible).

The float went up \$2 billion in the first quarter. And there is no way that that that float can shrink a lot in any short period. It just structurally has been set up in such a way that it will not — it cannot shrink. And actually, I think it'll grow a little bit for a while.

I mean, I've always been amazed by how much it has grown. We've got so much more float than any property-causality company in the world. And it's pretty amazing that it all came from that little building that Jack Ringwalt built and picked the location because it was near the tennis courts. (Laughs)

OK, Carol.

Oh, and Charlie.

CHARLIE MUNGER: There are encouraging recent developments. Some of the cash has gone out recently for securities we vastly prefer over the cash. And we have a lot of cash that could be — remaining — that could be deployed in securities we might like a lot better than Treasury notes. So stay tuned.

WARREN BUFFETT: Yeah, to make it very simple, in the first quarter we earned five and — from operations we earned a little over \$5 billion. Now, we only spent about our depreciation. Normally we would spend somewhat more than that. But that's 5-and-a-fraction billion. Two billion came, in net, from float. So that's \$7 billion that — basically in the first quarter — that would have been added to our cash if we hadn't done something with it. And instead our cash and equivalents went down, because we, net, invested more in equities by some margin than the seven that came in.

But we do have this position where, even absent a change in float, about 400 million comes into Berkshire every week, which is very comfortable. (Laughs)

And we will — we want to get it so that more than 400 million is going out into productive assets. And we succeeded in doing that in the first quarter. And, net, net we improved our position in the first quarter.

18. “Amazing” earnings in the new “asset-light economy”

WARREN BUFFETT: Carol?

CAROL LOOMIS: In your 1999 article in Fortune magazine, you stated your belief that after-tax corporate profits were unlikely to hold much above 6 percent for any sustained period, due not only to competition but also to public policy.

You stated in the article, “If corporate investors, in aggregate, are going to eat an ever-growing portion of the economic pie, some other group will have to settle for a smaller portion. That would justifiably raise political problems.”

Since 2008, after-tax corporate profits have been 8 to 10 percent of GDP. Do you believe that is a permanent shift in the U.S. economy? And of course, we have to think about the latest tax bill. Or will corporate profits revert back to the 4 percent to 6 percent of GDP range that was normal in the 20th century?

WARREN BUFFETT: Well, it’s been an interesting development during that period. It goes back a little bit before that period. But you now have the four largest companies, by market value, in the United States — a \$30 trillion market — you have four companies that essentially don’t need any net tangible assets.

And if you go back many years, I mean, if you looked to the largest companies — Carol used to put out the Fortune 500 list. And you know, it would be AT&T and General Motors, and it was companies that — Exxon Mobil — it was companies that just required lots of capital in order to produce earnings.

So American industry has gotten incredibly more profitable, in aggregate, in the last 20 or 30 years. You look at the return on the S&P 500, the earnings as a percent of net tangible assets, and the rest is just, you know, if you buy a company that has a million dollars’ worth of net worth and you pay a billion for it, it still only had the million dollars’ of net worth. I mean you just paid more for it. So the basic profitability of the company is huge, even though your investment may be at a significantly higher price.

So that what has happened is that, I think if you look at the earnings on tangible net worth of the S&P 500 and compare it to 20 years ago, it is amazing. And that is really due to the fact that this has become somewhat, you could call it an asset-light economy.

And you know, those four companies that earn 10 percent of the — they comprise close to 10 percent of the market value of the entire publicly-traded corporate America, they don't — and they don't take any money, basically. And that is a changing world. And they will earn even more money with the tax rate going down.

And I don't think people have quite processed all that information in terms of what has gone on in the market.

You don't — you know, [Andrew] Carnegie built a steel mill, and then he paid it off. Or he borrowed a little money, and then he built another steel mill, and all of that sort of thing. But it was enormously capital-intensive.

And one industry after another. AT&T was enormously capital-intensive. And now the money is in the asset-light — I mean, huge money is in the — not only asset-light business — but the negative asset.

You know, IBM even, you know, had — it has no tangible — it has a net — minus tangible net worth. There's nothing wrong with that. It's terrific. But it is not the world we lived in 30 years ago.

And in that sense, I didn't see that coming in 1999 when I wrote whatever I wrote there. It hasn't changed the profitability of the asset-heavy companies particularly. I mean, it isn't like oil.

If you take the five most capital-intensive industries in the '90s, I don't think you'll find that their earnings on tangible asset have increased a lot. But you will find that this group has moved in that really doesn't — they don't need any net tangible assets at all, or they need very minor amounts.

Charlie?

CHARLIE MUNGER: There's also a lot of financial engineering that's raised leverage, even in the capital-intense businesses. And you know, while Warren may have predicted a little wrong when he wrote that very scholarly article, he didn't invest wrong. And so it just shows that it's hard to make these economic predictions.

WARREN BUFFETT: OK, Jon —

CHARLIE MUNGER: We weren't very right on that one, Warren.

WARREN BUFFETT: Yeah, actually, the performance of the stock market since then has been pretty accurate. (Laughs)

CHARLIE MUNGER: Yes. That's true.

WARREN BUFFETT: Yeah. Being right for the wrong reason or something. (Laughs) Or wrong for the right reasons.

19. “We still feel OK” about AIG’s \$10.2 retroactive premium

WARREN BUFFETT: Anyway, Jonathan? (Laughs)

JONATHAN BRANDT: Berkshire received a 10.2 billion retroactive premium from AIG early last year. If the upwardly revised estimate of 18.2 billion of ultimate claims proves to be correct, will the cost of float, adjusted for favorable tax attributes, likely be lower or higher than what Berkshire would have paid to borrow 10 billion for a similar duration?

WARREN BUFFETT: Well, we certainly go in with the idea that it will be — the cost will be lower. And it’s an interesting situation.

We — essentially, AIG, which is one of the largest property-casualty, particularly commercial property-casualty companies in the world, said, “We want to give you all of the losses that we incurred in a very big percentage of our domestic business before December 31st of 2015, and we will pay the first 25 billion. And then after we pay 25 billion and AIG pays \$25 billion, then you pay 80 percent of the next 25 billion.” And they gave us \$10 billion for doing that. And that’s —

If we are correct about our estimates of how much money will be paid and when it will be paid, we should come out being better off than if we had borrowed a similar amount.

We have a history of doing 10 or so — maybe 12 — big deals like that. We hold the record. We did it for Lloyd’s of London 10 or more years ago, and we did it now with AIG.

And sometimes we’ve been on the low side in our estimate, and sometimes we’ve been on the high side so far.

AIG just said that they — I think they paid 15-and-a-fraction billion on these pre-12/31/2015 losses. They paid 15-and-a-fraction billion. But the payments tend to trickle down over years as you get further away from when the losses occurred.

So I would say that we still feel OK about it, and we’ll be wrong one way or the other. Everybody is when you estimate losses that may not get settled for 20 or 30 years. But so far, on the group as a whole of these deals we’ve done, we’ve been OK. And I think on the AIG thing, we think we’ll be OK. And I think AIG thinks we’ll be OK. I mean, they entered into it for good reasons of their own. So it looks OK.

Sorry to get into this technical stuff, but Jonathan always asks me questions like that, so I have to be ready to — I want to answer them.

20. “We really want products where people feel like kissing you”

WARREN BUFFETT: OK. Station 5.

AUDIENCE MEMBER: Good afternoon. My name’s Adam Bergman with Sterling Capital in Virginia Beach, Virginia. I’m here with my daughter Michelle from Cape Henry Collegiate in Virginia Beach.

AUDIENCE MEMNBER: Hi Warren, hi Charlie.

AUDIENCE MEMBER: Our question for you is how you go about attempting to forecast the degree of future success of one specific product in a good business versus another, such that you invest in American Express and Coca-Cola rather than Diners Club or RC Cola, for example. Thanks.

WARREN BUFFETT: Well, with American Express — (laughs) — it was an interesting situation, because Diners Club got there first. I think American Express, in a certain sense — I mean, they did it for a lot of reasons — but they went into the credit card business because they were worried about what was going to happen to traveler’s checks. And — although traveler’s checks are — still exist in a significant way.

But the interesting thing when American Express went into competition with Diners Club, and with Carte Blanche, as I remember that — which also existed at the time — was that instead of charging less than Diners Club and going in figuring they were going against the established guy and they’d come in at a lower price, they went in it at a higher price, as I remember.

And the American Express centurion was on that card. I’ve got one that I got in 1964, but they were in it before that. It had more value in time. I mean, it got better representation. And frankly, if you were a salesperson out with somebody, and you could pull out that American Express card with that centurion, you looked you were JP Morgan. And if you pulled out the Diners Club, it had a whole bunch of flashy symbols, you looked like a guy that was kiting his checks from one month to the next, and — (Laughter)

A fellow named Ralph Schneider — Ralph Schneider and Al Bloomingdale developed the Diners Club. And they were very smart about getting there first, but they weren’t smart about how they merchandised it subsequently.

RC Cola, you know, it did — there are all kinds of colas that came after Coke. I mean, you know, you go back to 1886 and come up with something at Jacobs’ Pharmacy that’s incredibly successful, you know, fairly soon you’re going to get lots of imitators. But Coke really is the real thing. And you know, you offer me RC Cola and say, “I’ll give it to you at half the price of Coca-Cola,” in terms of drinking it,

I mean, just, this is a product that's 6 1/2 ounces, sold for a nickel in 1900, you know. And now if you buy it on the weekend and buy it in large quantities and everything, you're not paying that much more. This newspaper was three cents in 1942, you know. I mean, the amount of enjoyment per real — in terms of the real — of what you pay for this, has gone dramatically down in inflation-adjusted money. So it is a bargain product.

You know, you have to look at — See's Candy, you know, if you live in California and you were a teenage boy, and you went to your girlfriend's house and you gave the box of candy to her or to her mother or father and she kissed you, you know, you lose price sensitivity at that point. (Laughter)

So we really want products where people feel like kissing you, you know — (laughs) — rather than slapping you.

It's an interesting thing. I mean, you know, in effect we're betting on the ecosystem of Apple products, but — led by the iPhone. And I see characteristics in that that make me think that it's extraordinary. But I may be wrong.

And you know, so far we've been — I would say we've been right on American Express and Coca-Cola.

American Express had this huge salad oil scandal in 1960 happen — in '63, November, right around the time [President John] Kennedy was shot. And there was really worry about whether the company would survive.

But nobody quit using the card. Nobody quit using the traveler's checks. And they charged a premium price for their traveler's checks. So there are things you can see around consumer products that sometimes can give you a pretty good insight into the future. And then sometimes we make mistakes.

Charlie?

CHARLIE MUNGER: I've got nothing to add, except that if we'd been offered a chance to go into Coca-Cola right after it was invented, we probably would have said no.

WARREN BUFFETT: We'd have turned it down. Yeah.

CHARLIE MUNGER: It would've looked kind of silly to us.

WARREN BUFFETT: Well, unless we drank it, now, Charlie, listen. (Laughs)

No, he's right. I mean, we don't foresee things that we haven't got a lot of evidence in on. And —

CHARLIE MUNGER: No.

WARREN BUFFETT: We want to see a lot of — if we're talking about a consumer product — we want to see how a consumer product behaves under a lot of different circumstances, and then we want to use something — actually, there was a book by Phil Fisher written around 1960 called "Common Stocks and Uncommon Profits." It's one of the great books on investing.

And it talks about the "scuttlebutt method" of investing, which was quite a ways from what Ben Graham taught me in terms of figures. But it's a very, very good book. And you can learn a lot, you know, just by going out and using some shoe leather.

Now they call them channel checks now or something like that. But it's — you can get a feel for some products, and then there are others you can't. And then sometimes you're wrong. But it is a good technique. It's an important investing technique, I would say that. And Ted [Weschler] and Todd [Combs] do a lot of that. And they have people — some people that help them out on doing it, too.

Charlie's done it with Costco. I mean, he's — (Laughs)

I mean, all the time he is finding new virtues in Costco, you know, and then it — and he's right, incidentally. I mean, Costco has an enormous appeal to its constituency. They delight — they surprise and delight their customers. And there is nothing like that in business. You have delighted customers, you're a long way home.

21. Hostile bids aren't "evil" but Berkshire doesn't do them

WARREN BUFFETT: OK, Becky.

BECKY QUICK: This comes from John Hegarty (PH) at Brightstar Capital Partners, who writes, "Warren, you're stepping down from the Kraft Heinz board at a time when the company's looking to do a large acquisition: Unilever, for example. Do you fundamentally disagree with the combative nature of hostile bids, activist investing, and competitive proxy contests?"

WARREN BUFFETT: Well, we will not make hostile tenders ourselves. I do not believe that there's anything fundamentally wrong with the idea. I mean, if you take the Fortune 500 companies, I'm sure that all 500 are not managed by the best, or in some cases even the friendliest to investor managements in the world.

So I don't think it's evil or anything to conduct a hostile offer for a company. It's just we won't do it, and we don't want to get into that. We like being liked by the managements that we join, because we're counting on them to run the company, and we're not bringing in a whole bunch of people that know how to change businesses.

We seldom take a position opposite the management — very seldom — on anything involving a proxy, but — contest of sorts. But we don't rule it out. We don't think every management is entitled to be — you know, they don't have a lifetime hold on their business. But it's not our style at all to — well, we won't do it in terms of initiating it ourselves, and we'd be very, very, very unlikely to support a contest.

But we have voted against a couple of propositions over 50 years that managements have had — made — in relation to stocks options. We withheld a vote at Coca-Cola a few years ago to express our opinion.

But we don't think it's evil for the shareholders, in some cases, to have different opinions about who should run the company, or whether compensation's appropriate, or matters of that sort. The stockholders still own the company.

Charlie?

CHARLIE MUNGER: I've got nothing to add to that. I don't envy these people that are in these unfriendly uproars all the time. Imagine doing that after you're already rich. It's insane.
(Laughter)

WARREN BUFFETT: Yeah. Yeah, we are definitely not looking for it. We don't —

There are certainly companies that deserve challenge. And they propose things that deserve challenge occasionally. But again, it's not our main activity.

And incidentally, this has — the question was asked in reference to Kraft Heinz.

The people at 3G are great, great managers. They've been wonderful partners. I had made a determination, before we got involved there, I was going to be on no more public boards. I'd been on 19 of them, and it takes a lot of time. And they asked me if I'd go on for a while, and I did.

But it really is, like, seven-and-a-half days or something. And if you're on a bank board, it may be quite a bit more than that. I mean, there just —

Being on a public board usually means quarterly meetings plus maybe an extra one. And, you know, at 87, I think I've now learned what happens, and it's fine, but I don't want to spend seven-and-a-half days a year when I — maybe I can call up people that I trust and admire who are on the board in five minutes, you know, and find out what's going on or whatever it may be, any questions that come up.

And so we are their partners, and delighted to be their partners. And now we have two people on the board of Kraft Heinz, and they can do the traveling and I can stay home.

Charlie, how many public — you're on Costco, of course, over the — your lifetime, how many public boards?

CHARLIE MUNGER: Oh, I — Costco — except for something —

WARREN BUFFETT: Kansas City Power.

CHARLIE MUNGER: — like The Daily Journal where I own part of it, Costco's the only public board —

WARREN BUFFETT: You were on Kansas City Power.

CHARLIE MUNGER: — if it wasn't Berkshire or something I owned personally.

WARREN BUFFETT: Yeah.

CHARLIE MUNGER: I was on Kansas City Power and Light. Boy, that goes way back. But basically it hasn't happened. I don't envy people who float around to a lot of different board meetings.

WARREN BUFFETT: No, generally speaking you have very little influence and spend a lot of time. And the trouble is, if you're going to a board meeting, particularly if you get to the international, and sometimes they feel they have to have one that's international, you know, they feel they have to take up a fair amount of your time or it wouldn't have been worth coming, you know, thousands of miles for.

So you get a lot of the show and tell stuff and — that — I find my mind drifting. OK. (Laughter)

22. Berkshire still not on radar screen of international business sellers

WARREN BUFFETT: Gary.

GARY RANSOM: Yes, you've said that you are looking for non-insurance large acquisitions to put that cash to work. And when you've said that, I've usually thought of the United States, because you're a big fan of the U.S. business.

And I just was wondering whether you're seeing more opportunities as the rest of the world opens up, grows, whether there's opportunities for some of those mega-transactions in other parts of the world, say Asia or Europe.

WARREN BUFFETT: Yeah, Gary, I would say that I've been disappointed in that, because we do see some outside the United States, and thank heavens we saw the one we saw in Israel some years ago [ISCAR] when Eitan [Wertheimer] wrote me a letter. But — and you know, we bought a business which is a very important part of Berkshire now.

But we are still not — they're certainly aware of Berkshire Hathaway outside the United States. But they don't sort of pick up the phone automatically.

In the United States, I think any large — particularly private — company that thinks — is thinking about doing something, they at least think about Berkshire. But that — in Europe or Asia, that — we are not embedded in the minds the same way.

They know about us, they know we've got a lot of money and they know we like to buy things. But we really, we're on the radar screen big-time in the United States, and we're not as — we don't — the immediate desire to be sure that they've thought about the Berkshire option does not occur the same way outside the United States. And we've tried to encourage it a few ways. But I would say that the results have not been great at all.

But I hope tomorrow, you know, I get a call from Germany or Britain or Italy or you name it, and Australia, wherever it may be. And I hope I get a call and we get an opportunity to do it.

There's a good many countries we'd be quite happy to put substantial money into it. And like I say, our experience in Israel has been just terrific.

Charlie?

CHARLIE MUNGER: Yeah, but the corporate acquisition game now is so driven by the leveraged buyout and the so-called, whatever they call them, strategic, yes, strategic. I usually translate that into barnyard language. (Buffett laughs)

And we're so — there's so much craziness in price from our viewpoint. Of course, it's very hard for us to do it.

The people in the leveraged buyout game, who love massive leverage and don't mind high prices, even they are getting nosebleeds. It's hard. And it's not an environment that means that — that allows Berkshire just to go out and buy a whole lot of companies.

WARREN BUFFETT: Have you ever made a strategic deal that you —

CHARLIE MUNGER: We have to wait.

WARREN BUFFETT: We've made a strategic deal that you can remember?

CHARLIE MUNGER: Hmm?

WARREN BUFFETT: Have we ever made a deal that we would have regarded as strategic?

CHARLIE MUNGER: We've never had a strategic plan unless you've hidden it from me.
(Laughter)

WARREN BUFFETT: OK. That answers that.

23. Investing “doesn’t require advanced learning”

WARREN BUFFETT: Station 6.

AUDIENCE MEMBER: Hi, I’m Brady Ritchie (PH) from St. Louis, Missouri. Shareholder since 1996.

WARREN BUFFETT: Terrific.

AUDIENCE MEMBER: Warren, you and Charlie have been critical of business schools in the past and what they teach. With respect to value investing, in “Superinvestors of Graham-and-Doddsville,” you featured the returns of many great investors with different backgrounds’ work in education, with the lesson being, “Following the philosophy is the key.”

To be successful today, does it still just fall back to chapter eight of “The Intelligent Investor?” And what do you think of programs and designations such as CFA, CFP, et cetera, which purport high standards yet root it heavily into academia? And I’d like to challenge you to a round of bridge tomorrow. (Laughter)

WARREN BUFFETT: And what was the last part?

CHARLIE MUNGER: Well, he was talk — what do we think about —

WARREN BUFFETT: Yeah, business schools and all that.

CHARLIE MUNGER: — business schools and all that.

WARREN BUFFETT: I didn’t catch the last —

CHARLIE MUNGER: They’re better —

WARREN BUFFETT: Oh, he’s challenged me to a round of bridge. OK. The — (Laughter)

I went to three business schools, and at each I found a teacher or two. I went to one specifically to get a given teacher. But at each one of them I found a teacher or two that I really got a lot out of. The — so we’re not anti-business school here at all.

We do think that the priesthood, say, 30 years ago, for example, in terms of — or 40 years ago — in terms of efficient market theory and everything. They strayed pretty far, in our view, from the reality of investing. And I would rather have a person — if I could hire somebody among the top five graduates of number one, two or three of the business schools, and my choice was somebody that had — was bright — but had chapter eight of “The Intelligent Investor”

absolutely — it just was natural to them — they had it in their bones, basically — I'd take the person from chapter eight.

This is not — what we do is not a complicated business. It's got to be a disciplined business, but it is — it does not require a super IQ or anything of the sort. And there are a few fundamentals that are incredibly important, and you do have to understand accounting. And it helps to get out and talk to consumers and start thinking like a consumer in many ways in certain — and all of that.

But it just doesn't require advanced learning. And — I — I certainly — you know, I didn't want to go to college, so I don't know whether I would have done better or worse if I'd just quit after high school, you know, and read the books I read and all of that.

I think that if you run into a few great teachers, and they really change the way you see the world to some degree, you know, you're lucky. And you can find them in — you can find them in academia and you can find them in ordinary life.

And I've been extraordinarily lucky in having great teachers, including Charlie. I mean, Charlie's been a wonderful teacher. And, you know —

Anyplace you can find somebody that gives you insights into things you didn't understand before, maybe makes you a better person than you would have been before, you know, you get — that's very lucky, and you want to make the most of it. If you can find it in academia, make the most of it. And if you can find it in the rest of your life, make the most of it.

Charlie?

CHARLIE MUNGER: Well, when you found Ben Graham he was unconventional, and he was very smart. And of course, that was very attractive to you. And then when you found out it worked and you could make a lot of money while you're sitting on your ass — (laughter) — of course you were an instant convert. And so —

WARREN BUFFETT: It still appeals to me, actually. I mean — (Laughter)

CHARLIE MUNGER: But the world changed. Before he died, Bill Graham — I mean, Ben Graham — recognized that the exact way he sought undervalued companies wouldn't necessarily work for all times under all conditions. And that's certainly the way it worked for us.

We gradually morphed into trying to buy the better companies when they were underpriced, instead of the lousy companies when they were underpriced. And of course, that worked pretty well for us.

And Ben Graham, he outlived the game that he played personally most of the time. He lived to see most of it fade away. I mean, just to find some company that's selling for one third of its

working capital, and figure out it could easily be liquidated and distribute \$3 for every dollar of market price. Lots of luck if you can find those in the present market. And if you can find them, they're so small that Berkshire wouldn't find them of any use anyway.

So we've had to learn a different game. And that's a lesson for all the young people in the room. If you're going to live a long time, you have to keep learning.

WARREN BUFFETT: Yeah.

CHARLIE MUNGER: What you formerly knew is never enough. So if you don't learn to constantly revise your earlier conclusions and get better (inaudible), you are — I always use the same metaphor. You're like a one-legged man in an ass-kicking contest. (Laughter)

WARREN BUFFETT: If anybody has suggestions for another metaphor, send them to me. (Laughter)

Graham, incidentally, one point, important point. Graham was not scalable. I mean, you could not do with really big money. And when I worked for Graham-Newman Corp, here he was, the dean of all analysts. And you know, he was an intellect above all others around that time.

But our — the investment fund was \$6 million, and the partnership that worked in tandem with the investment company also had about \$6 million in it. So we had 12 million bucks we were working with. Now, you can make adjustments for inflation and everything. But it was just a tiny amount. It wasn't really scalable.

And the truth is that Graham didn't care, because he really wasn't interested in making a lot of money for himself. So he had no reason to want to find something that could go on and on, become larger and larger.

And so the utility of chapter eight, in terms of looking at stocks as a business, is of enormous value. The utility of chapter 20 about a margin of safety is of enormous value. But that's not complicated stuff.

CHARLIE MUNGER: I finally figured out why the teachers of corporate finance often teach a lot of stuff that's wrong. When I had some eye troubles very early in life, I consulted a very famous eye doctor. And I realized that his place of business was doing a totally obsolete cataract operation. They were still cutting with a knife after better procedures had been invented.

I said, "Why are you in a great medical school performing absolute obsolete operations?" And he said, "Charlie, it's such a wonderful operation to teach." (Laughter)

Well, that's what happens in corporate finance. They get these formulas, and it's a fine teaching experience. (Laughter)

You give them a formula, you present the problem, they use the formula. You get a real feeling of worthwhile activity. (Laughter)

There's only one there. It's all balderdash.

WARREN BUFFETT: Yeah, whenever you hear a theory described as elegant, watch out, you know. (Laughter)

CHARLIE MUNGER: Right.

24. Buffett “bullish on human race” as women enter the workforce”

WARREN BUFFETT: OK, Andrew.

ANDREW ROSS SORKIN: This question — we got a couple like this one — comes from Lauren Taylor Wolfe. She's a managing partner at Impactive Capital.

“Warren, you've recently said that one of the things that makes you optimistic about America is women entering the workforce and the quote ‘doubling of the talent that's effectively employed in that workforce.’ When it comes to positions of leadership, however, women make up less than 21 percent of boards of S&P 500 companies, and an even smaller 5 percent of the CEOs.

“What can Berkshire do, and what is Berkshire specifically doing, as a major investor in many of these large companies, to advance gender equality, both at the board level and among senior leadership?”

WARREN BUFFETT: Yeah. Well, again — (applause) — you know, as I've pointed out in the past, one of my sisters is here. And I have two sisters that are absolutely as smart as I am. And they have better personalities, as anybody that knows both of us — or all of us — can attest. And they didn't remotely have the same opportunities I had.

And you have this 1942, or — New York Times — and you know, women could be nurses or teachers or retail clerks or stenographers. And that actually worked enormously to my advantage when I was a kid in Omaha in the '30s, because I had way better teachers, because they were — that was a job open to women, I didn't have a single male teacher in grammar school, and Charlie didn't when he went to Dundee, I don't think, either.

And we had this huge talent pool that was being funneled into very few opportunities, and therefore we got better than we deserved in terms of a market system producing it. The —

Again, our managers run their companies. But I've probably named — before we made this management change — I probably named only six or seven CEOs in the last five or six years. We

don't change that much. But I would say that half of them that I've named have been women, which is about what you would — what should turn out to be the case in terms of ability.

Now, there is a certain pipeline problem, but that gets cured with time, and you can't use that forever as an excuse.

And you know, I feel very good about the decisions we made for CEOs. I prefer all our CEOs to live forever. And one woman almost did that, that we hired. Mrs. B. [Nebraska Furniture Mart founder Rose Blumkin] lived to be 104. She retired at 103. And that's a lesson to our other managers, that if you retire prematurely, you know — (laughter) — no telling what'll happen.

But it is absolutely true. It does make me bullish. It makes me bullish on the human race. But it's certainly on our country. Because if you look at what happened, you know, before the 19th Amendment, and then after the 19th Amendment for a long time, and continuing to this day, but it's — that — there's been significant improvement.

And I do feel more optimistic about the future, because I think there will be more selection by merit, rather than, you know, by gender or by race or by inheritance.

I think that if you had a system where all businesses got passed on to the eldest son or something, I think it — I think that society would make a lot less progress than one that's merit-based.

Charlie?

CHARLIE MUNGER: Well, we did live in a different age. There's an old saying that the past is a very strange country. People behave quite differently there. And it was just totally different. And it was ridiculous that — I cannot remember — I had one or two male teachers in my high school. But almost none. And the world has really changed.

And within Berkshire, I've never seen any overt discrimination anywhere on the grounds of gender.

WARREN BUFFETT: There probably has been some, though. I mean —

CHARLIE MUNGER: No, no, I'm sure that we have our —

WARREN BUFFETT: Oh, there has —

CHARLIE MUNGER: —share of all the peculiarities of human nature.

WARREN BUFFETT: Sure.

CHARLIE MUNGER: But it's generally, it's — everything has always improved, wouldn't you agree with that?

WARREN BUFFETT: Yeah.

CHARLIE MUNGER: And I think it'll keep improving.

25. Berkshire buybacks not limited by state insurance rules

WARREN BUFFETT: OK. Gregg?

GREGG WARREN: Warren, in this year's annual report it was noted, much as it is every year, that payments of dividends by the company's insurance subsidiaries are restricted by insurance statutes and other regulations, with Berkshire's insurance operations currently allowed to declare up to 16 billion as ordinary dividends during 2018.

My question here is, should we view this annual regulatory threshold for dividends as a benchmark for allowable share repurchases as well? And in the event that Berkshire wanted to buy back more stock than that, or pay out even more as dividends, would there be an issue with you using capital from operations that aren't held by the insurance operations to return additional capital?

With the side question here being, would the annual cash distribution from BNSF, which is held on National Indemnity's books, be excluded?

WARREN BUFFETT: Yeah. The — we will obviously follow the rules of the states in which we're domiciled, and all the rules, of course. But basically it's the state of domestication in the insurance companies, and they do restrict the amount of dividends in any given year. Although you could, if you wanted to, request some additional amount. But we don't ever consider that.

But repurchases — if repurchases were really attractive, we would do it in a very big way. And, you know, I wouldn't rule — there's all kinds of ways that we could arrange things to do either a very large acquisition, which is what I would prefer, or a very large repurchase, would I don't think is probably in the cards just because the way our stock trades, not because we wouldn't like it at a large discount.

So Charlie and I, we've got the appetite. And we would have — we've got a lot of cash — but we could have a lot more cash. We can make any deal of — even one of a very large size. We can make anything that came along — we could work out how to get it done.

We would — we would have — we're not going to be doing this, but we would have partners who would come in and give us a preferential part of a partnership. That's not going to happen, in all probability. But there's a lot of things that we could do. So don't rule out anything based on statutory limitations of distributions from insurance companies —

CHARLIE MUNGER: And that — we could get special permissions to —

WARREN BUFFETT: Oh, we can get —

CHARLIE MUNGER: — declare bigger dividends. We are not — you should not assume that we're constrained by the laws of nature to the amount that we can take out under the statutes now.

26. Munger: "I don't think the world is going to be changed that much by machine intelligence"

WARREN BUFFETT: OK, station 7.

AUDIENCE MEMBER: Hi, Warren and Charlie. Thank you for everything. I'm David (inaudible), an investment manager in Shanghai. I've been here for eight years.

If investment is a sport in the Olympics, you are our champion team. So my question is, facing the fast-growing machine challenges, how do you see the new competition impact the capital allocation productivity in the future?

For Charlie, what is the first principle of capital allocation from a general economic interest point of view? Thank you.

CHARLIE MUNGER: Well, two questions. Machine intelligence. I'm afraid the only intelligence I have is — is being provided by something that's not a machine. And I don't think I'm going to learn machine intelligence. Yeah. If you ask me how to beat the game of Go with my own intelligence, I couldn't do it. And I think it's too old for me to learn computer science.

Generally I'm — I think that the machine intelligence has worked. After all, a machine now can beat the best human player of Go. But I think there's more hype in that field than there is probable achievement.

So I don't think the world is going to be changed that much by machine intelligence. Some, but not hugely.

And what was the other question?

WARREN BUFFETT: Well —

CHARLIE MUNGER: One of them was machine intelligence.

WARREN BUFFETT: I think he was getting at capital allocation —

CHARLIE MUNGER: Oh yeah. That's such a general question. Generally speaking, we're always trying to get the best — to get something that's worth buying.

And the human mind rejects that if you're in academia, because you could come in and make one declaratory sentence at the opening of the semester and you wouldn't have anything to do for the rest of the — of your time. So people want to find some formula. It's what I call "physics envy." These people want the world to be like physics.

But the world isn't like physics, outside of physics. And that false precision just does nothing but get you in trouble.

So I would say you've got to master the general ideas, and you've got to work to improve your judgment slowly, the way all the rest of us had. And I don't think most individuals have much hope of individual gain from machine intelligence.

WARREN BUFFETT: No, I don't — I don't think that — I'm impressed when machines beat Go or something of the sort, or even win at chess or whatever it may be.

I don't really think they bring much to the table in terms of capital allocation or investing. And then I may be missing something entirely, you know, maybe I'm just blind to what's out there.

CHARLIE MUNGER: You're missing a lot of very remunerative, fee-earning twaddle. (Laughter)

WARREN BUFFETT: Yeah, well. Well, that takes care of that. So we'll go on to station 8. (Laughter)

27. Munger: "American investors are missing China"

AUDIENCE MEMBER: Dear Mr. Buffett and Mr. Munger, thank you very much for hosting the meeting. It's truly been remarkable. Thank you.

My name is Yen (PH), and I'm a partner at Tiger Brokers, a leading electronic brokerage firm from China.

Let me rephrase that. So, I and my colleagues flew half a way from the globe with (inaudible) to be here, and it is honor, just like everyone else in the stadium, we're honored to be here.

My question is, you mentioned earlier that investors don't really have to be struggling in picking the right stocks. They would do well in picking, probably, the right market and the right country.

China is the second-largest economy, and probably has the biggest growth potential. Just by passively weighting a portfolio — by passively valuating a portfolio — U.S. investors are significantly underweighting China. So in your opinion, what are stopping the investors from investing in China? Thank you.

CHARLIE MUNGER: Well, I think the answer is that you're absolutely right. That we are — American investors are missing China. And they're missing it because it's a long way away, it looks different, they're not used to it, it's complicated, the headlines confuse them.

In other words, it just looks too hard, sitting in Omaha, to outsmart the Chinese market. But I think you're absolutely right. It's where they should be looking.

WARREN BUFFETT: OK. (Laughter)

We've actually had a couple investments in China. We've done pretty well. But there were — well, if you go back a number of years, (inaudible).

In terms of getting a lot of money into something, you know, many billions, and we have to get billions into things in — to move any kind of a needle, that can be tougher in markets that you've got — you're unfamiliar working in. And it's difficult under any circumstances.

But accumulating a 6 or 8 or \$10 billion position in investments outside the United States can be very difficult. For example, in U.K. and much of Europe we have to report when we own 3 percent of a company. In fact, we can be asked to report if we even have less than 3 percent. That really gets very tough when we get a bunch of followers and a lot of publicity that probably isn't deserved in terms of what we're doing in the markets and everything.

Some of the problems are, just by the nature of our size. It would be lot — it'd be a lot easier if we were running a smaller fund.

PetroChina, we managed to get a very big position. But the government owned 90 percent of it. So we bought 14 percent of what the government didn't own, but it was still only 1.4 percent of the company.

But Charlie, Charlie actually keeps pushing me to do more in China. And we've tried a couple of times, actually. And there was one operation that we got involved in —

CHARLIE MUNGER: Well, you did so poorly the first time, you put in 200,000 and got about 2 billion, so.

WARREN BUFFETT: Yeah. Yeah. Well.

CHARLIE MUNGER: Wasn't encouraging enough. (LAUGHTER)

28. "What Jeff Bezos has done is something close to a miracle"

WARREN BUFFETT: OK. Station 9.

AUDIENCE MEMBER: My name is Dr. Sherman Silber. I'm an infertility doctor from St. Louis. And I've been a shareholder and coming to this meeting for 23 years, and I want to thank you very much for making my grandchildren very rich. (Laughter and applause)

And they sometimes compare me in the medical world — infertility world — as the Berkshire Hathaway of infertility, because I'm so old and I come from a relatively small community.

But I'm wondering about your interests in not just Apple, but all of the tech stocks, like Amazon and Google. Because you've avoided them, you've stated in the past, because they're complicated, you should stick with something you understand.

On the other hand, Amazon and Google have what you call a very durable competitive advantage. They really hardly have any competitor. And that's true in China, too, of Alibaba and Tencent.

So it seems like it's a conflict, and I'm wondering if you're going to be turning the corner and going into these tech companies that seem to have no serious competition.

WARREN BUFFETT: Well, we certainly looked at them. And we don't think of whether we should be in tech companies or not, or that sort of thing. We are looking for things when we do get into the durability of the competitive advantage, and whether we think that our opinion might be better than other people's opinion in assessing the probability of the durability, so to speak.

But the truth is that I've watched Amazon from the start, and I think what Jeff Bezos has done is something close to a miracle. And the problem is, if I think something will be a miracle, I tend not to bet on it. (Laughs)

It would have been better — far better, obviously — if we — if I had some insights into certain businesses.

But you know, in fact, Bill told me early on — Bill Gates told me early on — you know, that I think I was on AltaVista and he suggested I turn to Google.

But the trouble is I saw that Google was skipping past AltaVista, and then I wondered if anybody could skip past Google. And I saw at GEICO that we were paying a lot of money for something that cost them nothing incrementally.

We've looked at it, and you know, I made a mistake in not being able to come to a conclusion where I really felt that at the present prices that the prospects were far better than the prices indicated.

And I didn't go into Apple because it was a tech stock in the least. I mean, I went into Apple because I made certain — came to certain conclusions about both the intelligence with which

the capital would be employed, but more important, about the value of an ecosystem and how permanent that ecosystem could be, and what the threats were to it, and a whole bunch of things.

And that didn't — I don't think that required me to, you know, take apart an iPhone or something and figure out what all the components were or anything. It's much more the nature of consumer behavior. And some things strike me as having a lot more permanence than others.

But the answer is, we'll miss a lot of things that — or I'll miss a lot of things — that I don't feel I understand well enough.

And there is no penalty in investing if you don't swing at a ball that's in the strike zone, as long as you swing at something at some point, then you know, eventually that you find the pitches you like. And that's the way we'll continue to do it. We'll try to stay within our circle of competence.

And Charlie and I generally agree on sort of where that circle ends, and what kind of situations where we might have some kind of an edge in our reasoning or our experience or something that — where we might evaluate something differently than other people.

But the answer is, we're going to miss a lot of things.

Charlie?

CHARLIE MUNGER: Yeah, we have a wonderful system. If one of us is stupid in some area, so is the other. (Laughter)

And of course, we were not ideally located to be high-tech wizards. How many people of our age quickly mastered Google? I've been to Google headquarters. They look to me like they're — it looks like a kindergarten. (Laughter)

WARREN BUFFETT: A very rich kindergarten.

CHARLIE MUNGER: Yes. (Laughter)

WARREN BUFFETT: No, it's extraordinarily impressive, what they've done. And like I say, at GEICO we were paying them a lot of money at the time they went public. And all three of the main characters — Eric [Schmidt] and Larry [Page] and Sergey [Brin] — they actually came and saw me. But they were more interested in talking about going public and the mechanics of it and various things along that line.

But it wasn't like what they were doing was a mystery to me. The mystery was how much competition would come along, and how effective they would be, and whether it would be a

game where four or five people were slugging it out without making as much money as they could if one company dominated.

Those are tough decisions to make. You can have industries where there's only two people in it, and they still don't (inaudible) very good because they beat each other's brains out. And that's one of the questions in the airline business. It's a better business now than it used to be, but it used to be suicide, so — (Laughs)

And you know that the competitive factors are extraordinary in airlines, and how much better business is it with four people operating at 85 percent capacity than it was at — with seven or eight operating in the mid-70s, and with more planes run. Those are tough decisions.

But I made the wrong decision on Google. And Amazon, I just — I really consider that a miracle, that you could be doing Amazon web services and changing retail at the same time, with — you know, without enormous amounts of capital, and with the speed and effectiveness of what Amazon has done.

I just — I underestimated — I had a very, very, very high opinion of Jeff's ability when I first met him. And I underestimated him. (Laughs)

Charlie?

CHARLIE MUNGER: Well, my comment would be that the shareholders have one thing to be thankful for.

Some of the age-related stupidity at headquarters has been ameliorated by Ted and Todd joining us. We are looking at the world with the aid of some younger eyes now. And they've had a contribution —

WARREN BUFFETT: Significant.

CHARLIE MUNGER: — beyond their own investments. And so you're very lucky to have them be shareholders. Because there's a lot of ignorance in the older generation that needs removal. (Applause)

29. "We already have a family office. It's sitting right here"

WARREN BUFFETT: OK, station 10.

AUDIENCE MEMBER: Hi, good afternoon. Good afternoon, Warren. Good afternoon, Charlie. And my name is Ujean (PH). I come from China, and I work for (foreign language) family office. And we are serving high-worth individual clients in China. And you two would be my dream customer.

I know your shareholder Bill Gates has a family office, which, helping his wealth. So my question is, do you have a family office, and what — can we know what they do, some — anything for you? And if not, are you planning to have a family office in the future?

CHARLIE MUNGER: We already have a family office. It's sitting right here. (Laughter)

WARREN BUFFETT: Yeah, we would be the last guys in the world to have a family office, actually. (Laughter)

There are a lot of them around, and — but it's not something that fits the Munger family or the Buffett family. (Laughs)

Charlie, you have anything?

CHARLIE MUNGER: No.

WARREN BUFFETT: OK.

30. No “precise formulas” on Berkshire’s incentive plans

WARREN BUFFETT: Let's — we'll do one more. Station 11.

AUDIENCE MEMBER: Hi Warren, Charlie. My name is Adam Mead, Mead Capital Management from Derry, New Hampshire.

In the past you have touched on certain compensation arrangements with key executives. Could you please provide some specific examples of compensation arrangements within Berkshire that speak to incentivizing good behavior while not penalizing the manager for size or the relative ease or difficulty of the business or industry? Thank you.

WARREN BUFFETT: Well, that is a very, very good question, and a very, very tough question. Because some of our —

CHARLIE MUNGER: He really doesn't want to answer.

WARREN BUFFETT: Well, some of our managers — (Laughter)

No, some of our managers are in businesses that are just much easier. I mean, we bought into a variety of businesses. People are obviously influenced by what pay arrangements are elsewhere. They wouldn't be human if they weren't.

And trying to come to the right answer when you have different degrees of capital intensity, different degree — very different degrees — of basic profitability, and how much you scale up based on size, because there is an incentive to grow businesses. Usually if businesses get much

larger, everybody from the CEO down expects to earn more money for something that — where they really bring the same amount of intensity and work and (inaudible) to it.

It is really a tough question. I think that if you engage compensation consultants at public companies, which they all do, they're going to recommend things that cause them to have CEOs recommend them to other companies. (Laughs)

It's just, you're working against human nature when you have an arrangement like that.

I would say that we have obviously kept a very, very, very high percentage of the managers that we hoped to have stay with us. In fact, just about a hundred percent. It's —

And I think people do like — they do like to make their own decisions. They do like recognition. You know, they — most people respond — they like doing a good job, and they like the fact that we understand it. And compensation's part of that. But it's not the whole thing.

And I wish I could give you some precise formulas, but there aren't any —

CHARLIE MUNGER: No, you really don't, Warren.

WARREN BUFFETT: What?

CHARLIE MUNGER: It's an advantage at Berkshire to keep our individual deals private. There would be no advantage to just publishing them all.

WARREN BUFFETT: No, we're not going to do that.

CHARLIE MUNGER: No, of course not. So what we're saying, he makes all those decisions personally. He's got every formula in the book. And he keeps them all private. That's our system. (Laughter)

WARREN BUFFETT: Well, we do — (Laughter)

We publish what the directors are paid.

CHARLIE MUNGER: We publish what we have to, yes.

WARREN BUFFETT: OK. It's 3:30 now. We're going to reconvene at 3:45.

Charlie and I, we love the fact that our partners basically turn out for this. So we thank you for coming. I hope you've had a good time, both at the meeting and in Omaha. And we look forward to seeing you again next year. Thanks. (Applause)

31. Formal business meeting

WARREN BUFFETT: We're going to move it right along, with a little (inaudible) copy here.

If you'll please take your seat, thank you.

This is the formal meeting, so the meeting will now come to order.

I'm Warren Buffett, chairman of the board of directors of the company, and I welcome you to this 2018 annual meeting of shareholders.

This morning, I introduced the Berkshire Hathaway directors that are present and also with today are partners in the firm of Deloitte & Touche, our auditors.

Jennifer Tselentis is the assistant secretary of Berkshire Hathaway. She will make a written record of the proceedings.

Becki Amick has been appointed inspector of elections at this meeting, and she will certify to the count of votes cast in the election for directors and the motions to be voted upon at the meeting.

The named proxy holders for this meeting are Walter Scott and Marc Hamburg. Does the assistant secretary have a report of the number of Berkshire shares outstanding entitled to vote and represented at the meeting?

VOICE: This is the important part.

VOICE: You sit there.

WARREN BUFFETT: We're building the suspense here. (Laughs)

JENNIFER TSELENTIS: Yes, I do. As indicated in the proxy statement that accompanied the notice of this meeting that was sent to all shareholders of record on March 7th, 2018, the record date for this meeting, there were 748,347 shares of Class A Berkshire Hathaway common stock outstanding with each share entitled to one vote on motions considered at the meeting, and 1,344,969,701 shares of Class B Berkshire Hathaway common stock outstanding with each share entitled to 1/10,000th of one vote on motions considered at the meeting.

Of that number, 537,524 Class A shares and 823,145,874 Class B shares are represented at this meeting by proxies returned through Thursday evening May 3rd.

WARREN BUFFETT: Thank you. That number represents a quorum. And we will therefore directly proceed with the meeting.

First order of business will be a reading of the minutes of the last meeting of shareholders. I recognize Mr. Walter Scott who will place a motion before the meeting.

WALTER SCOTT: I move that the reading of the minutes of the last meeting of shareholders be dispensed with and the minutes be approved.

WARREN BUFFETT: Do I hear a second?

RON OLSON: I second the motion.

WARREN BUFFETT: Motion has been moved and seconded. We will vote on this motion by voice vote. All those in favor say aye.

VOICES: Aye.

WARREN BUFFETT: Opposed. The motion is carried.

The next item of business is to elect directors. If a shareholder is present who did not send in a proxy or wishes to withdraw a proxy previously sent in, you may vote in person on the election of directors and other matters to be considered at this meeting. Please identify yourself to one of the meeting officials in the aisles so that you can receive a ballot.

I recognize Mr. Walter Scott to place a motion before the meeting with respect to the election of directors.

WALTER SCOTT: I move that Warren Buffett, Charles Munger, Greg Abel, Howard Buffett, Stephen Burke, Susan Decker, William Gates, David Gottesman, Charlotte Guyman, Ajit Jain, Thomas Murphy, Ron Olson, Walter Scott, and Meryl Witmer be elected as directors.

WARREN BUFFETT: Is there a second?

RON OLSON: I second the motion.

WARREN BUFFETT: It has been moved and seconded that Warren Buffett, Charles Munger, Gregory Abel, Howard Buffett, Stephen Burke, Susan Decker, William Gates, David Gottesman, Charlotte Guyman, Ajit Jain, Thomas Murphy, Ronald Olson, Walter Scott, and Meryl Witmer be elected as directors. Are there any other nominations or any discussion?

The nominations are ready to be acted upon. If there are any shareholders voting in person, they should now mark their ballots on the election of directors and deliver their ballots to one of the meeting officials in the aisles. Miss Amick, when you are ready you may give your report.

BECKI AMICK: My report is ready. The ballot of the proxy holders in response to proxies that were received through last Thursday evening cast not less than 605,906 votes for each nominee. That number exceeds a majority of the number of the total votes of all Class A and Class B shares outstanding. The certification required by Delaware law of the precise count of the votes will be given to the secretary to be placed with the minutes of this meeting.

WARREN BUFFETT: Thank you, Miss Amick. Warren Buffett, Charles Munger, Gregory Abel, Howard Buffett, Steve Burke, Susan Decker, William Gates, David Gottesman, Charlotte Guyman, Ajit Jain, Thomas Murphy, Ron Olson, Walter Scott, and Meryl Witmer have been elected as directors.

32. Shareholder motion on methane emissions

WARREN BUFFETT: The next item of business is a motion put forth by Freeda Cathcart on behalf of shareholder Marcia Sage. The motion is set forth in the proxy statement. The motion requests that the company provide a report revealing the company's policies, actions, plans, and reduction targets related to methane emissions from all operations.

The directors have recommended that the shareholders vote against the proposal.

I will now recognize Miss Cathcart to present the motion. To allow all interested shareholders their views, I ask that the representative of the Baldwin Brothers limit the presentation of the motion to five minutes.

FREEDA CATHCART: Good morning Chairman Buffett, Mr. Munger, members of the board and fellow shareholders. I am presenting this proposal on behalf of Baldwin Brothers on the issue of methane asset risk. This is the second year for this methane-focused proposal. Last year 10 percent of shareholders approved of it.

Methane asset risk is a serious financial safety and environmental issue across the entire natural gas supply chain. The failure of a gas injection well at Southern California Gas Aliso Canyon Storage facility in Los Angeles revealed major vulnerabilities in the maintenance and safety of natural gas facilities.

In that situation, cleanup and containment costs have soared to close to \$1 billion. Governor Jerry Brown of California has threatened to shut down the facility.

Berkshire Hathaway owns the largest interstate natural gas pipeline system in the United States. It has natural gas storage distribution and transportation facilities that may face similar safety risks through the Northern Natural Gas Company, Kern River Gas, and Mid-American Energy Corporations.

On an environmental front, research indicates methane leaks could erase the climate benefits of reducing coal use to meet internationally agreed upon climate change targets. Methane emissions have an impact on global temperature of roughly 84 times that of CO₂ over a 20-year period.

Berkshire is a voluntary member of the EPA's Methane Challenge and ONE Future Emissions Intensity Commitment Framework and should be applauded for reducing its leakage rates to below the 1 percent target along its value chain.

Since this framework is a cost-effective versus prescriptive approach, shareholders would like to understand if this cost-effective approach employed at Berkshire is sufficient — maintenance and enhanced disclosure should help mitigate the potential for these financial and regulatory risks.

In closing, we think it prudent that Berkshire Hathaway issue a report revealing and disclosing the company's specific best practices, policies, and safety standards for methane assets and required upgrade costs to facilities to mitigate potential business risks.

The report would make it easier for investors, customers, and regulators to understand Berkshire's overall approach to managing methane emissions and risks. Thank you for your consideration.

WARREN BUFFETT: Miss Cathcart, could you help me out? Are there some other people that are there to speak? I can't quite see from here.

VOICE: No, there are no other shareholders who wish to speak on this issue.

FREEDA CATHCART: There's nobody behind me to speak.

WARREN BUFFETT: Did you get that, Charlie?

CHARLIE MUNGER: No.

WARREN BUFFETT: Greg — could we put up slide one and then if somebody will give Greg a microphone, that'd be helpful. He could elaborate some on this chart and knows what we're doing.

GREG ABEL: OK. Thanks, Warren and appreciate the comments there. What we've prepared here is in response to the proposal. It demonstrates the ONE Future Initiative goal as it was highlighted. They'd like to see our pipelines operating by 2025 at a 1 percent throughput — or a loss of throughput at 1 percent.

I'm happy to report, as this slide shows, that in 2017 our throughput loss was 0.046 percent, 20 times better than the request in 2025. (Applause)

Thank you. It's a great compliment to our operating team, obviously. They take the issue that has been highlighted very seriously. I would also add, as it was noted, we're part of the EPA program where we report on a voluntary basis. Our practices are disclosed and reviewed by the EPA and additionally added on our website.

Accordingly, I strongly feel we're getting the results and disclosing the appropriate information. Thank you.

WARREN BUFFETT: Yeah, and thanks Greg. And Miss Cathcart, we are on the same side you are on this basically. We just are not looking for ways to conduct more studies and prepare reports that may cost us money and generate more reports and all that. But I can tell you two things.

This is something that is reported to the board of directors of Berkshire Hathaway Energy quarterly. And I'm on that board. And we believe in achieving the same (inaudible) and we think Berkshire Hathaway Energy is both sensitive and effective — sensitive to and effective — in reducing methane emissions.

So if — I think we're now ready. The motion is now ready to be acted upon. If there are any shareholders voting in person, they should now mark their ballots on the motion and deliver their ballot to one of the meeting officials in the aisles. Miss Amick, when you're ready, you may give your report.

BECKI AMICK: My report is ready. The ballot of the proxy holders in response to proxies that were received through last Thursday evening cast 48,040 votes for the motion and 558,640 votes against the motion.

As the number of votes against the motion exceeds a majority of the number of votes of all Class A and Class B shares properly cast on the matter, as well as all votes outstanding, the motion has failed. The certification required by Delaware law of the precise count of the votes will be given to the secretary to be placed with the minutes of this meeting.

WARREN BUFFETT: Thank you, Miss Amick. The proposal fails.

33. Shareholder proposal on sustainability reports

WARREN BUFFETT: The next item of business is a motion put forth by shareholder Freeda Cathcart. The motion is set forth in the proxy statement. The motion requests that Berkshire adopt a policy to encourage more Berkshire subsidiary companies to issue annual sustainability reports.

I will now recognize Freeda Cathcart to present the motion, and to all interested shareholders to present their views I ask her to limit her remarks to five minutes. You have the floor, Miss Cathcart.

FREEDA CATHCART: Thank you so much. It is a privilege to be here and a privilege I can give thanks to my grandfather James Cathcart, who started out in the mailroom of Gen Re and worked himself up through the company to become the chair of Gen Re. During that time he accumulated a lot of Gen Re stock, which he bestowed generously upon his family.

And when he did so, he encouraged the members of his family to do good and to pay it forward, to do something that would make a difference in the world and in our communities. For my father, he did so by being philanthropic with educational institutions with the theory

that if you give a person a fish you feed them for a day, but if you teach them to fish, you feed them for a lifetime.

My focus has been on the environment with the thought that when people fish, it would be nice if they were able to eat the fish.

I want to take this opportunity to clarify my proposal about the sustainability reports and put the emphasis on the word encourage. It is evident that Berkshire Hathaway's management of allowing the subsidiaries to work without getting guidance — well, mandates from you is being very successful.

And I wouldn't recommend changing it. You're doing a great job. Please keep it up.

But I do think that there's something to be said to encourage them and support them, and in many ways you already are.

There is a high level of interest from investors and the public in corporate social responsibility. One-fifth of investments are based on socially responsible investment strategies. And back in 2012, I found an article by Planet Earth Herald where they wrote, "When Warren Buffett talks, people listen. He is now talking about the environment. He believes that companies need to have a triple bottom line. And respecting the environment is absolutely critical to a company's economic performance."

In times — and this is a direct quote from you, Mr. Buffett, "In times such as these a company must invest in the key ingredients of profitability: its people, communities, and the environment."

One-third of Berkshire Hathaway's subsidiaries already have a sustainability presence on the web. And one of them is Berkshire Energy that has the acronym respect, R-E-S-P-E-C-T, which stands for Responsibility, Efficiency, Stewardship, Performance, Communication, and Training.

And Berkshire Hathaway provides an annual sustainability summit to help bring the subsidiaries together so they can learn how to be more sustainable, how to share tips, and how to be profitable. And that's excellent.

But when I try to find a web presence about the sustainability summit, I wasn't able to find it. And that's where I think that we can do a better job in Berkshire Hathaway when it comes to communication with our shareholders and with the outside world about the good work that we're doing.

A simple solution to that would just be to create a link on the Berkshire Hathaway website to sustainability that people could click on and go and find out about initiatives like the sustainability summit. And from there, perhaps, they could click on to go to the subsidiaries that have a web presence about sustainability to see what they're doing.

In doing so, we give a window to the world where they can see what we're doing to make a difference that might inspire other corporations to follow the example. Or perhaps a college student working on a paper would read about it and think that that is a good business model, that that's something that he wants to bring forward when he goes into his career.

There is a Facebook page called "Berkshire Hathaway's Sustainability" that will be available for shareholders and the outside world to look at to see research and to encourage each other to learn how we can support sustainability practices. And that is available now.

I greatly appreciate this opportunity to speak with you today and to clarify what my proposal is. And I do greatly applaud and appreciate all the work that you're doing on behalf of our corporation and the world. Thank you so much.

WARREN BUFFETT: And thank you. (Applause)

Many of the managers — a great many of the managers — of Berkshire are here and are listening to you. And I suspect that a very high percentage of them agree with what you're saying. Whether they — what they do in terms of web pages and so on, in our view, is basically up to them.

But I can tell you that one leading proponent, as you mentioned, was Greg Abel, who until recently was running Berkshire Hathaway Energy and now is vice chairman. And Greg may want to say a few words on this, too. But I can assure you that the managers are listening to you.

GREG ABEL: Thanks, Warren. Yeah, we do everything that was touched on. I'll just maybe add a few points for our shareholders. Obviously, sustainability is a priority for Berkshire and each of our operating subsidiaries. It was highlighted that a number of them have sustainability reports. But I would go beyond that. If you go to our various companies' websites, you'll see specific actions they're taking relative to sustainability. So it may not be summarized in a specific report, but that type of information is available.

I can also add that when you think of the Berkshire Hathaway Energy Corporation, we're trying to lead by example with support from Warren, Charlie, Walter Scott. I'm happy to report, if you look at where our energy production is right now at the end of 2017, 50 percent of our energy that is produced and consumed by our customers comes from renewable energy.

That's something we're strongly communicating across the U.S. and globally as an example of what can be done in our industry. And I'm happy to report by the end of 2021, 100 percent of the energy utilized by our customers can be met through renewable energy in Iowa.

So I understand the concept of sustainability. We're working across our organizations to share best practices. But as Warren highlighted, it really resides in each of our companies. But it will be encouraged and you'll continue to see great results. Thank you.

WARREN BUFFETT: Thank you. (Applause)

The motion is now ready to be acted upon. If there are any shareholders voting in person they should now mark their ballot on the motion and deliver their ballot to one of the meeting officials in the aisles.

Miss Amick, when you're ready you may give your report.

BECKI AMICK: My report is ready. The ballot of the proxy holders in response to proxies that were received through last Thursday evening cast 67,282 votes for the motion and 544,256 votes against the motion.

As the number of votes against the motion exceeds a majority of the number of votes of all Class A and Class B shares properly cast on the matter, as well as all votes outstanding, the motion has failed. The certification required by Delaware law of the precise count of the votes will be given to the secretary to be placed with the minutes of this meeting.

WARREN BUFFETT: Thank you, Miss Amick. And I would say Miss Cathcart, our managers heard you. I mean, you have had an impact and I appreciate what you have done.

Walter, I guess we're now ready for a motion?

WALTER SCOTT: I move that this meeting be adjourned.

WARREN BUFFETT: Is there a second?

RON OLSON: I second the motion.

Berkshire's Performance vs. the S&P 500

Year	Annual Percentage Change		
	in Per-Share Book Value of Berkshire	in Per-Share Market Value of Berkshire	in S&P 500 with Dividends Included
1965	23.8	49.5	10.0
1966	20.3	(3.4)	(11.7)
1967	11.0	13.3	30.9

1986	26.1	14.2	18.6
1987	19.5	4.6	5.1
1988	20.1	59.3	16.6
1989	44.4	84.6	31.7
1990	7.4	(23.1)	(3.1)
1991	39.6	35.6	30.5
1992	20.3	29.8	7.6
1993	14.3	38.9	10.1
1994	13.9	25.0	1.3
1995	43.1	57.4	37.6
1996	31.8	6.2	23.0
1997	34.1	34.9	33.4
1998	48.3	52.2	28.6
1999	0.5	(19.9)	21.0
2000	6.5	26.6	(9.1)
2001	(6.2)	6.5	(11.9)
2002	10.0	(3.8)	(22.1)
2003	21.0	15.8	28.7
2004	10.5	4.3	10.9
2005	6.4	0.8	4.9
2006	18.4	24.1	15.8
2007	11.0	28.7	5.5
2008	(9.6)	(31.8)	(37.0)
2009	19.8	2.7	26.5
2010	13.0	21.4	15.1
2011	4.6	(4.7)	2.1
2012	14.4	16.8	16.0
2013	18.2	32.7	32.4
2014	8.3	27.0	13.7
2015	6.4	(12.5)	1.4
2016	10.7	23.4	12.0
2017	23.0	21.9	21.8
2018	0.4	2.8	(4.4)
Compounded Annual Gain – 1965-2018	18.7%	20.5%	9.7%
Overall Gain – 1964-2018	1,091,899%	2,472,627%	15,019%

Note: Data are for calendar years with these exceptions: 1965 and 1966, year ended 9/30; 1967, 15 months ended 12/31. Starting in 1979, accounting rules required insurance companies to value the equity securities they hold at market rather than at the lower of cost or market, which was previously the requirement. In this table, Berkshire's results through 1978 have been restated to conform to the changed rules. In all other respects, the results are calculated using the numbers originally reported. The S&P 500 numbers are **pre-tax** whereas the Berkshire numbers are **after-tax**. If a corporation such as Berkshire were simply to have owned the S&P 500 and accrued the appropriate taxes, its results would have lagged the S&P 500 in years when that index showed a positive return, but would have exceeded the S&P 500 in years when the index showed a negative return. Over the years, the tax costs would have caused the aggregate lag to be substantial.

BERKSHIRE HATHAWAY INC.

To the Shareholders of Berkshire Hathaway Inc.:

Berkshire earned \$4.0 billion in 2018 utilizing generally accepted accounting principles (commonly called “GAAP”). The components of that figure are \$24.8 billion in operating earnings, a \$3.0 billion non-cash loss from an impairment of intangible assets (arising almost entirely from our equity interest in Kraft Heinz), \$2.8 billion in realized capital gains from the sale of investment securities and a \$20.6 billion *loss* from a reduction in the amount of unrealized capital gains that existed in our investment holdings.

A new GAAP rule requires us to include that last item in earnings. As I emphasized in the 2017 annual report, neither Berkshire’s Vice Chairman, Charlie Munger, nor I believe that rule to be sensible. Rather, both of us have consistently thought that at Berkshire this mark-to-market change would produce what I described as “wild and capricious swings in our bottom line.”

The accuracy of that prediction can be suggested by our quarterly results during 2018. In the first and fourth quarters, we reported GAAP *losses* of \$1.1 billion and \$25.4 billion respectively. In the second and third quarters, we reported *profits* of \$12 billion and \$18.5 billion. In complete contrast to these gyrations, the many businesses that Berkshire owns delivered consistent and satisfactory operating earnings in *all* quarters. For the year, those earnings exceeded their 2016 high of \$17.6 billion by 41%.

Wide swings in our quarterly GAAP earnings will inevitably continue. That’s because our huge equity portfolio – valued at nearly \$173 billion at the end of 2018 – will often experience one-day price fluctuations of \$2 billion or more, all of which the new rule says must be dropped immediately to our bottom line. Indeed, in the fourth quarter, a period of high volatility in stock prices, we experienced several days with a “profit” or “loss” of more than \$4 billion.

Our advice? Focus on operating earnings, paying little attention to gains or losses of any variety. My saying that in no way diminishes the importance of our investments to Berkshire. Over time, Charlie and I expect them to deliver substantial gains, albeit with highly irregular timing.

* * * * *

Long-time readers of our annual reports will have spotted the different way in which I opened this letter. For nearly three decades, the initial paragraph featured the percentage change in Berkshire’s per-share book value. It’s now time to abandon that practice.

The fact is that the annual change in Berkshire’s book value – which makes its farewell appearance on page 2 – is a metric that has lost the relevance it once had. Three circumstances have made that so. First, Berkshire has gradually morphed from a company whose assets are concentrated in marketable stocks into one whose major value resides in operating businesses. Charlie and I expect that reshaping to continue in an irregular manner. Second, while our *equity holdings* are valued at market prices, accounting rules require our collection of *operating companies* to be included in book value at an amount far below their current value, a mismatch that has grown in recent years. Third, it is likely that – over time – Berkshire will be a significant repurchaser of its shares, transactions that will take place at prices above book value but below our estimate of intrinsic value. The math of such purchases is simple: Each transaction makes per-share intrinsic value go up, while per-share book value goes down. That combination causes the book-value scorecard to become increasingly out of touch with economic reality.

In future tabulations of our financial results, we expect to focus on Berkshire's market price. Markets can be extremely capricious: Just look at the 54-year history laid out on page 2. Over time, however, Berkshire's stock price will provide the best measure of business performance.

* * * * *

Before moving on, I want to give you some good news – *really* good news – that is not reflected in our financial statements. It concerns the management changes we made in early 2018, when Ajit Jain was put in charge of all insurance activities and Greg Abel was given authority over all other operations. These moves were overdue. Berkshire is now far better managed than when I alone was supervising operations. Ajit and Greg have rare talents, and Berkshire blood flows through their veins.

Now let's take a look at what you own.

Focus on the Forest – Forget the Trees

Investors who evaluate Berkshire sometimes obsess on the details of our many and diverse businesses – our economic “trees,” so to speak. Analysis of that type can be mind-numbing, given that we own a vast array of specimens, ranging from twigs to redwoods. A few of our trees are diseased and unlikely to be around a decade from now. Many others, though, are destined to grow in size and beauty.

Fortunately, it's not necessary to evaluate each tree individually to make a rough estimate of Berkshire's intrinsic business value. That's because our forest contains five “groves” of major importance, each of which can be appraised, with reasonable accuracy, in its entirety. Four of those groves are differentiated clusters of businesses and financial assets that are easy to understand. The fifth – our huge and diverse insurance operation – delivers great value to Berkshire in a less obvious manner, one I will explain later in this letter.

Before we look more closely at the first four groves, let me remind you of our prime goal in the deployment of your capital: to buy ably-managed businesses, *in whole or part*, that possess favorable and durable economic characteristics. We also need to make these purchases at sensible prices.

Sometimes we can buy control of companies that meet our tests. Far more often, we find the attributes we seek in publicly-traded businesses, in which we normally acquire a 5% to 10% interest. Our two-pronged approach to huge-scale capital allocation is rare in corporate America and, at times, gives us an important advantage.

In recent years, the sensible course for us to follow has been clear: Many stocks have offered far more for our money than we could obtain by purchasing businesses in their entirety. That disparity led us to buy about \$43 billion of marketable equities last year, while selling only \$19 billion. Charlie and I believe the companies in which we invested offered excellent value, far exceeding that available in takeover transactions.

Despite our recent additions to marketable equities, the most valuable grove in Berkshire's forest remains the many dozens of non-insurance businesses that Berkshire controls (usually with 100% ownership and never with less than 80%). Those subsidiaries earned \$16.8 billion last year. When we say “earned,” moreover, we are describing what remains after *all* income taxes, interest payments, managerial compensation (whether cash or stock-based), restructuring expenses, depreciation, amortization and home-office overhead.

That brand of earnings is a far cry from that frequently touted by Wall Street bankers and corporate CEOs. Too often, their presentations feature “adjusted EBITDA,” a measure that redefines “earnings” to exclude a variety of all-too-real costs.

For example, managements sometimes assert that their company’s stock-based compensation shouldn’t be counted as an expense. (What else could it be – a *gift* from shareholders?) And restructuring expenses? Well, maybe last year’s exact rearrangement won’t recur. But restructurings of one sort or another are common in business – Berkshire has gone down that road dozens of times, and our shareholders have always borne the costs of doing so.

Abraham Lincoln once posed the question: “If you call a dog’s tail a leg, how many legs does it have?” and then answered his own query: “Four, because calling a tail a leg doesn’t make it one.” Abe would have felt lonely on Wall Street.

Charlie and I do contend that our acquisition-related amortization expenses of \$1.4 billion (detailed on page K-84) are not a true economic cost. We add back such amortization “costs” to GAAP earnings when we are evaluating both private businesses and marketable stocks.

In contrast, Berkshire’s \$8.4 billion depreciation charge understates our true economic cost. In fact, we need to spend *more* than this sum annually to simply remain competitive in our many operations. Beyond those “maintenance” capital expenditures, we spend large sums in pursuit of growth. Overall, Berkshire invested a record \$14.5 billion last year in plant, equipment and other fixed assets, with 89% of that spent in America.

Berkshire’s runner-up grove by value is its collection of equities, typically involving a 5% to 10% ownership position in a very large company. As noted earlier, our equity investments were worth nearly \$173 billion at yearend, an amount far above their cost. If the portfolio had been sold at its yearend valuation, federal income tax of about \$14.7 billion would have been payable on the gain. In all likelihood, we will hold most of these stocks for a long time. Eventually, however, gains generate taxes at whatever rate prevails at the time of sale.

Our investees paid us dividends of \$3.8 billion last year, a sum that will increase in 2019. Far more important than the dividends, though, are the huge earnings that are annually retained by these companies. Consider, as an indicator, these figures that cover only our five largest holdings.

<u>Company</u>	<u>Yearend Ownership</u>	<u>Berkshire’s Share in \$ millions of</u>	
		<u>Dividends(1)</u>	<u>Retained Earnings(2)</u>
American Express	17.9%	\$ 237	\$ 997
Apple	5.4%	745	2,502
Bank of America	9.5%	551	2,096
Coca-Cola	9.4%	624	(21)
Wells Fargo	9.8%	809	1,263
Total		<u>\$2,966</u>	<u>\$6,837</u>

(1) Based on current annual rate.

(2) Based on 2018 earnings minus common and preferred dividends paid.

GAAP – which dictates the earnings we report – does not allow us to include the retained earnings of investees in our financial accounts. But those earnings are of enormous value to us: Over the years, earnings retained by our investees (viewed as a group) have eventually delivered capital gains to Berkshire that totaled more than one dollar for each dollar these companies reinvested for us.

All of our major holdings enjoy excellent economics, and most use a portion of their retained earnings to repurchase their shares. We very much like that: If Charlie and I think an investee’s stock is underpriced, we rejoice when management employs some of its earnings to increase Berkshire’s ownership percentage.

Here's one example drawn from the table above: Berkshire's holdings of American Express have remained unchanged over the past eight years. Meanwhile, our ownership increased from 12.6% to 17.9% because of repurchases made by the company. Last year, Berkshire's portion of the \$6.9 billion earned by American Express was \$1.2 billion, about 96% of the \$1.3 billion we paid for our stake in the company. When earnings increase and shares outstanding decrease, owners – over time – usually do well.

A third category of Berkshire's business ownership is a quartet of companies in which we share control with other parties. Our portion of the after-tax operating earnings of these businesses – 26.7% of Kraft Heinz, 50% of Berkadia and Electric Transmission Texas, and 38.6% of Pilot Flying J – totaled about \$1.3 billion in 2018.

In our fourth grove, Berkshire held \$112 billion at yearend in U.S. Treasury bills and other cash equivalents, and another \$20 billion in miscellaneous fixed-income instruments. We consider a portion of that stash to be untouchable, having pledged to always hold at least \$20 billion in cash equivalents to guard against external calamities. We have also promised to avoid *any* activities that could threaten our maintaining that buffer.

Berkshire will forever remain a financial fortress. In managing, I will make expensive mistakes of commission and will also miss many opportunities, some of which should have been obvious to me. At times, our stock will tumble as investors flee from equities. But I will never risk getting caught short of cash.

In the years ahead, we hope to move much of our excess liquidity into businesses that Berkshire will permanently own. The immediate prospects for that, however, are not good: Prices are sky-high for businesses possessing decent long-term prospects.

That disappointing reality means that 2019 will likely see us again expanding our holdings of marketable equities. We continue, nevertheless, to hope for an elephant-sized acquisition. Even at our ages of 88 and 95 – *I'm the young one* – that prospect is what causes my heart and Charlie's to beat faster. (Just writing about the possibility of a huge purchase has caused my pulse rate to soar.)

My expectation of more stock purchases is *not* a market call. Charlie and I have no idea as to how stocks will behave next week or next year. Predictions of that sort have *never* been a part of our activities. Our thinking, rather, is focused on calculating whether a portion of an attractive business is worth more than its market price.

I believe Berkshire's intrinsic value can be *approximated* by summing the values of our four asset-laden groves and then subtracting an appropriate amount for taxes eventually payable on the sale of marketable securities.

You may ask whether an allowance should not also be made for the major tax costs Berkshire would incur if we were to sell certain of our wholly-owned businesses. Forget that thought: It would be foolish for us to sell any of our wonderful companies even if *no* tax would be payable on its sale. Truly good businesses are exceptionally hard to find. Selling any you are lucky enough to own makes no sense at all.

The interest cost on *all* of our debt has been deducted as an expense in calculating the earnings at Berkshire's non-insurance businesses. Beyond that, much of our ownership of the first four groves is financed by funds generated from Berkshire's fifth grove – a collection of exceptional insurance companies. We call those funds "float," a source of financing that we expect to be cost-free – or maybe even better than that – over time. We will explain the characteristics of float later in this letter.

Finally, a point of key and lasting importance: Berkshire's value is maximized by our having assembled the five groves into a single entity. This arrangement allows us to seamlessly and objectively allocate major amounts of capital, eliminate enterprise risk, avoid insularity, fund assets at exceptionally low cost, occasionally take advantage of tax efficiencies, and minimize overhead.

At Berkshire, the whole is greater – considerably greater – than the sum of the parts.

Repurchases and Reporting

Earlier I mentioned that Berkshire will from time to time be repurchasing its own stock. Assuming that we buy at a discount to Berkshire's intrinsic value – which certainly will be our intention – repurchases will benefit both those shareholders leaving the company and those who stay.

True, the upside from repurchases is very slight for those who are leaving. That's because careful buying by us will minimize any impact on Berkshire's stock price. Nevertheless, there is *some* benefit to sellers in having an extra buyer in the market.

For continuing shareholders, the advantage is obvious: If the market prices a departing partner's interest at, say, 90¢ on the dollar, continuing shareholders reap an increase in per-share intrinsic value with every repurchase by the company. Obviously, repurchases should be price-sensitive: Blindly buying an overpriced stock is value-destructive, a fact lost on many promotional or ever-optimistic CEOs.

When a company says that it contemplates repurchases, it's vital that all shareholder-partners be given the information they need to make an intelligent estimate of value. Providing that information is what Charlie and I try to do in this report. We do not want a partner to sell shares back to the company because he or she has been misled or inadequately informed.

Some sellers, however, may disagree with our calculation of value and others may have found investments that they consider more attractive than Berkshire shares. Some of that second group will be right: There are unquestionably many stocks that will deliver far greater gains than ours.

In addition, certain shareholders will simply decide it's time for them or their families to become net consumers rather than continuing to build capital. Charlie and I have no current interest in joining that group. Perhaps we will become big spenders in our old age.

For 54 years our managerial decisions at Berkshire have been made from the viewpoint of the shareholders who are staying, not those who are leaving. Consequently, Charlie and I have *never* focused on current-quarter results.

Berkshire, in fact, may be the only company in the Fortune 500 that does not prepare monthly earnings reports or balance sheets. I, of course, regularly view the monthly financial reports of most subsidiaries. But Charlie and I learn of Berkshire's overall earnings and financial position only on a quarterly basis.

Furthermore, Berkshire has no company-wide budget (though many of our subsidiaries find one useful). Our lack of such an instrument means that the parent company has *never* had a quarterly "number" to hit. Shunning the use of this bogey sends an important message to our many managers, reinforcing the culture we prize.

Over the years, Charlie and I have seen all sorts of bad corporate behavior, both accounting and operational, induced by the desire of management to meet Wall Street expectations. What starts as an "innocent" fudge in order to not disappoint "the Street" – say, trade-loading at quarter-end, turning a blind eye to rising insurance losses, or drawing down a "cookie-jar" reserve – can become the first step toward full-fledged fraud. Playing with the numbers "just this once" may well be the CEO's intent; it's seldom the end result. And if it's okay for the boss to cheat a little, it's easy for subordinates to rationalize similar behavior.

At Berkshire, our audience is neither analysts nor commentators: Charlie and I are working for our shareholder-partners. The numbers that flow up to us will be the ones we send on to you.

Non-Insurance Operations – From Lollipops to Locomotives

Let's now look further at Berkshire's most valuable grove – our collection of non-insurance businesses – keeping in mind that we do not wish to unnecessarily hand our competitors information that might be useful to them. Additional details about individual operations can be found on pages K-5 – K-22 and pages K-40 – K-51.

Viewed as a group, these businesses earned pre-tax income in 2018 of \$20.8 billion, a 24% increase over 2017. Acquisitions we made in 2018 delivered only a trivial amount of that gain.

I will stick with pre-tax figures in this discussion. But our after-tax gain in 2018 from these businesses was *far* greater – 47% – thanks in large part to the cut in the corporate tax rate that became effective at the beginning of that year. Let's look at why the impact was so dramatic.

Begin with an economic reality: Like it or not, the U.S. Government “owns” an interest in Berkshire's earnings of a size determined by Congress. In effect, our country's Treasury Department holds a special class of our stock – call this holding the AA shares – that receives large “dividends” (that is, tax payments) from Berkshire. In 2017, as in many years before, the corporate tax rate was 35%, which meant that the Treasury was doing very well with its AA shares. Indeed, the Treasury's “stock,” which was paying nothing when we took over in 1965, had evolved into a holding that delivered billions of dollars annually to the federal government.

Last year, however, 40% of the government's “ownership” (14/35^{ths}) was returned to Berkshire – free of charge – when the corporate tax rate was reduced to 21%. Consequently, our “A” and “B” shareholders received a major boost in the earnings attributable to *their* shares.

This happening materially increased the intrinsic value of the Berkshire shares you and I own. The same dynamic, moreover, enhanced the intrinsic value of almost all of the stocks Berkshire holds.

Those are the headlines. But there are other factors to consider that tempered our gain. For example, the tax benefits garnered by our large utility operation get passed along to its customers. Meanwhile, the tax rate applicable to the substantial dividends we receive from domestic corporations is little changed at about 13%. (This lower rate has long been logical because our investees have already paid tax on the earnings that they pay to us.) Overall, however, the new law made our businesses and the stocks we own *considerably* more valuable.

Which suggests that we return to the performance of our non-insurance businesses. Our two towering redwoods in this grove are BNSF and Berkshire Hathaway Energy (90.9% owned). Combined, they earned \$9.3 billion before tax last year, up 6% from 2017. You can read more about these businesses on pages K-5 – K-10 and pages K-40 – K-45.

Our next five non-insurance subsidiaries, as ranked by earnings (but presented here alphabetically), Clayton Homes, International Metalworking, Lubrizol, Marmon and Precision Castparts, had aggregate pre-tax income in 2018 of \$6.4 billion, up from the \$5.5 billion these companies earned in 2017.

The next five, similarly ranked and listed (Forest River, Johns Manville, MiTek, Shaw and TTI) earned \$2.4 billion pre-tax last year, up from \$2.1 billion in 2017.

The remaining non-insurance businesses that Berkshire owns – and there are many – had pre-tax income of \$3.6 billion in 2018 vs. \$3.3 billion in 2017.

Insurance, “Float,” and the Funding of Berkshire

Our property/casualty (“P/C”) insurance business – our fifth grove – has been the engine propelling Berkshire’s growth since 1967, the year we acquired National Indemnity and its sister company, National Fire & Marine, for \$8.6 million. Today, National Indemnity is the largest property/casualty company in the world as measured by net worth.

One reason we were attracted to the P/C business was the industry’s business model: P/C insurers receive premiums upfront and pay claims later. In extreme cases, such as claims arising from exposure to asbestos, or severe workplace accidents, payments can stretch over many decades.

This collect-now, pay-later model leaves P/C companies holding large sums – money we call “float” – that will eventually go to others. Meanwhile, insurers get to invest this float for their own benefit. Though individual policies and claims come and go, the amount of float an insurer holds usually remains fairly stable in relation to premium volume. Consequently, as our business grows, so does our float. And *how* it has grown, as the following table shows:

<u>Year</u>	<u>Float (in millions)*</u>
1970	\$ 39
1980	237
1990	1,632
2000	27,871
2010	65,832
2018	122,732

* Includes float arising from life, annuity and health insurance businesses.

We may in time experience a decline in float. If so, the decline will be *very* gradual – at the outside no more than 3% in any year. The nature of our insurance contracts is such that we can *never* be subject to immediate or near-term demands for sums that are of significance to our cash resources. That structure is by design and is a key component in the unequalled financial strength of our insurance companies. That strength will *never* be compromised.

If our premiums exceed the total of our expenses and eventual losses, our insurance operation registers an underwriting profit that adds to the investment income the float produces. When such a profit is earned, we enjoy the use of free money – and, better yet, get *paid* for holding it.

Unfortunately, the wish of all insurers to achieve this happy result creates intense competition, so vigorous indeed that it sometimes causes the P/C industry as a whole to operate at a significant underwriting *loss*. That loss, in effect, is what the industry pays to hold its float. Competitive dynamics almost guarantee that the insurance industry, despite the float income all its companies enjoy, will continue its dismal record of earning subnormal returns on tangible net worth as compared to other American businesses.

Nevertheless, I like our own prospects. Berkshire’s unrivaled financial strength allows us far more flexibility in investing our float than that generally available to P/C companies. The many alternatives available to us are always an advantage and occasionally offer major opportunities. When other insurers are constrained, our choices expand.

Moreover, our P/C companies have an excellent underwriting record. Berkshire has now operated at an underwriting profit for 15 of the past 16 years, the exception being 2017, when our pre-tax loss was \$3.2 billion. For the entire 16-year span, our pre-tax gain totaled \$27 billion, of which \$2 billion was recorded in 2018.

That record is no accident: Disciplined risk evaluation is the daily focus of our insurance managers, who know that the benefits of float can be drowned by poor underwriting results. All insurers give that message lip service. At Berkshire it is a religion, Old Testament style.

* * * * *

In most cases, the funding of a business comes from two sources – debt and equity. At Berkshire, we have two additional arrows in the quiver to talk about, but let’s first address the conventional components.

We use debt sparingly. Many managers, it should be noted, will disagree with this policy, arguing that significant debt juices the returns for equity owners. And these more venturesome CEOs will be right *most* of the time.

At rare and unpredictable intervals, however, credit vanishes and debt becomes financially fatal. A Russian-roulette equation – usually win, occasionally die – may make financial sense for someone who gets a piece of a company’s upside but does not share in its downside. But that strategy would be madness for Berkshire. Rational people don’t risk what they have and need for what they don’t have and don’t need.

Most of the debt you see on our consolidated balance sheet – see page K-65 – resides at our railroad and energy subsidiaries, both of them asset-heavy companies. During recessions, the cash generation of these businesses remains bountiful. The debt they use is both appropriate for their operations and *not* guaranteed by Berkshire.

Our level of equity capital is a different story: Berkshire’s \$349 billion is unmatched in corporate America. By retaining all earnings for a very long time, and allowing compound interest to work its magic, we have amassed funds that have enabled us to purchase and develop the valuable groves earlier described. Had we instead followed a 100% payout policy, we would still be working with the \$22 *million* with which we began fiscal 1965.

Beyond using debt and equity, Berkshire has benefitted in a major way from two less-common sources of corporate funding. The larger is the float I have described. So far, those funds, though they are recorded as a huge net *liability* on our balance sheet, have been of more utility to us than an equivalent amount of equity. That’s because they have usually been accompanied by underwriting earnings. In effect, we have been *paid* in most years for holding and using other people’s money.

As I have often done before, I will emphasize that this happy outcome is far from a sure thing: Mistakes in assessing insurance risks can be huge and can take many years to surface. (Think asbestos.) A major catastrophe that will dwarf hurricanes Katrina and Michael *will* occur – perhaps tomorrow, perhaps many decades from now. “The Big One” may come from a traditional source, such as a hurricane or earthquake, or it may be a total surprise involving, say, a cyber attack having disastrous consequences beyond anything insurers now contemplate. When such a mega-catastrophe strikes, we will get our share of the losses and they will be big – *very* big. Unlike many other insurers, however, we will be looking to add business the next day.

The final funding source – which again Berkshire possesses to an unusual degree – is deferred income taxes. These are liabilities that we will eventually pay but that are meanwhile interest-free.

As I indicated earlier, about \$14.7 billion of our \$50.5 billion of deferred taxes arises from the unrealized gains in our equity holdings. These liabilities are accrued in our financial statements at the current 21% corporate tax rate but will be paid at the rates prevailing when our investments are sold. Between now and then, we in effect have an interest-free “loan” that allows us to have more money working for us in equities than would otherwise be the case.

A further \$28.3 billion of deferred tax results from our being able to accelerate the depreciation of assets such as plant and equipment in calculating the tax we must currently pay. The front-ended savings in taxes that we record gradually reverse in future years. We regularly purchase additional assets, however. As long as the present tax law prevails, this source of funding should trend upward.

Over time, Berkshire's funding base – that's the right-hand side of our balance sheet – should grow, primarily through the earnings we retain. Our job is to put the money retained to good use on the left-hand side, by adding attractive assets.

GEICO and Tony Nicely

That title says it all: The company and the man are inseparable.

Tony joined GEICO in 1961 at the age of 18; I met him in the mid-1970s. At that time, GEICO, after a four-decade record of both rapid growth and outstanding underwriting results, suddenly found itself near bankruptcy. A recently-installed management had grossly underestimated GEICO's loss costs and consequently underpriced its product. It would take many months until those loss-generating policies on GEICO's books – there were no less than 2.3 million of them – would expire and could then be repriced. The company's net worth in the meantime was rapidly approaching zero.

In 1976, Jack Byrne was brought in as CEO to rescue GEICO. Soon after his arrival, I met him, concluded that he was the perfect man for the job, and began to aggressively buy GEICO shares. Within a few months, Berkshire bought about $\frac{1}{3}$ of the company, a portion that later grew to roughly $\frac{1}{2}$ without our spending a dime. That stunning accretion occurred because GEICO, after recovering its health, consistently repurchased its shares. All told, this half-interest in GEICO cost Berkshire \$47 million, about what you might pay today for a trophy apartment in New York.

Let's now fast-forward 17 years to 1993, when Tony Nicely was promoted to CEO. At that point, GEICO's reputation and profitability had been restored – but not its growth. Indeed, at yearend 1992 the company had only 1.9 million auto policies on its books, far less than its pre-crisis high. In sales volume among U.S. auto insurers, GEICO then ranked an undistinguished seventh.

Late in 1995, after Tony had re-energized GEICO, Berkshire made an offer to buy the remaining 50% of the company for \$2.3 billion, about 50 times what we had paid for the first half (and people say I never pay up!). Our offer was successful and brought Berkshire a wonderful, but underdeveloped, company and an equally wonderful CEO, who would move GEICO forward beyond my dreams.

GEICO is now America's Number Two auto insurer, with sales 1,200% greater than it recorded in 1995. Underwriting profits have totaled \$15.5 billion (pre-tax) since our purchase, and float available for investment has grown from \$2.5 billion to \$22.1 billion.

By my estimate, Tony's management of GEICO has increased Berkshire's intrinsic value by more than \$50 billion. On top of that, he is a model for everything a manager should be, helping his 40,000 associates to identify and polish abilities they didn't realize they possessed.

Last year, Tony decided to retire as CEO, and on June 30th he turned that position over to Bill Roberts, his long-time partner. I've known and watched Bill operate for several decades, and once again Tony made the right move. Tony remains Chairman and will be helpful to GEICO for the rest of his life. He's incapable of doing less.

All Berkshire shareholders owe Tony their thanks. I head the list.

Investments

Below we list our fifteen common stock investments that at yearend had the largest market value. We exclude our Kraft Heinz holding – 325,442,152 shares – because Berkshire is part of a control group and therefore must account for this investment on the “equity” method. On its balance sheet, Berkshire carries its Kraft Heinz holding at a GAAP figure of \$13.8 billion, an amount reduced by our share of the large write-off of intangible assets taken by Kraft Heinz in 2018. At yearend, our Kraft Heinz holding had a market value of \$14 billion and a cost basis of \$9.8 billion.

<u>Shares*</u>	<u>Company</u>	<u>Percentage of Company Owned</u>	12/31/18	
			<u>Cost**</u>	<u>Market</u>
			<i>(in millions)</i>	
151,610,700	American Express Company	17.9	\$ 1,287	\$ 14,452

	Total Common Stocks Carried at Market		<u>\$ 102,867</u>	<u>\$ 172,757</u>

* Excludes shares held by pension funds of Berkshire subsidiaries.

** This is our actual purchase price and also our tax basis.

Charlie and I do *not* view the \$172.8 billion detailed above as a collection of ticker symbols – a financial dalliance to be terminated because of downgrades by “the Street,” expected Federal Reserve actions, possible political developments, forecasts by economists or whatever else might be the subject *du jour*.

What we see in our holdings, rather, is an assembly of companies that we partly own and that, on a weighted basis, are earning about 20% on the net tangible equity capital required to run their businesses. These companies, also, earn their profits without employing excessive levels of debt.

Returns of that order by large, established and understandable businesses are remarkable under any circumstances. They are truly mind-blowing when compared against the return that many investors have accepted on bonds over the last decade – 3% or less on 30-year U.S. Treasury bonds, for example.

On occasion, a ridiculously-high purchase price for a given stock will cause a splendid business to become a poor investment – if not permanently, at least for a painfully long period. Over time, however, investment performance converges with business performance. And, as I will next spell out, the record of American business has been extraordinary.

The American Tailwind

On March 11th, it will be 77 years since I first invested in an American business. The year was 1942, I was 11, and I went all in, investing \$114.75 I had begun accumulating at age six. What I bought was three shares of Cities Service preferred stock. I had become a capitalist, and it felt good.

Let's now travel back through the two 77-year periods that preceded my purchase. That leaves us starting in 1788, a year prior to George Washington's installation as our first president. Could anyone then have imagined what their new country would accomplish in only three 77-year lifetimes?

During the two 77-year periods prior to 1942, the United States had grown from four million people – about 1/2 of 1% of the world's population – into the most powerful country on earth. In that spring of 1942, though, it faced a crisis: The U.S. and its allies were suffering heavy losses in a war that we had entered only three months earlier. Bad news arrived daily.

Despite the alarming headlines, almost all Americans believed on that March 11th that the war would be won. Nor was their optimism limited to that victory. Leaving aside congenital pessimists, Americans believed that their children and generations beyond would live far better lives than they themselves had led.

The nation's citizens understood, of course, that the road ahead would not be a smooth ride. It never had been. Early in its history our country was tested by a Civil War that killed 4% of all American males and led President Lincoln to openly ponder whether "a nation so conceived and so dedicated could long endure." In the 1930s, America suffered through the Great Depression, a punishing period of massive unemployment.

Nevertheless, in 1942, when I made my purchase, the nation expected post-war growth, a belief that proved to be well-founded. In fact, the nation's achievements can best be described as breathtaking.

Let's put numbers to that claim: If my \$114.75 had been invested in a no-fee S&P 500 index fund, and all dividends had been reinvested, my stake would have grown to be worth (pre-taxes) \$606,811 on January 31, 2019 (the latest data available before the printing of this letter). That is a gain of *5,288 for 1*. Meanwhile, a \$1 million investment by a tax-free institution of that time – say, a pension fund or college endowment – would have grown to about \$5.3 billion.

Let me add one additional calculation that I believe will shock you: If that hypothetical institution had paid only 1% of assets annually to various "helpers," such as investment managers and consultants, its gain would have been *cut in half*, to \$2.65 billion. That's what happens over 77 years when the 11.8% annual return actually achieved by the S&P 500 is recalculated at a 10.8% rate.

Those who regularly preach doom because of government budget deficits (as I regularly did myself for many years) might note that our country's national debt has increased roughly 400-fold during the last of my 77-year periods. That's 40,000%! Suppose you had foreseen this increase and panicked at the prospect of runaway deficits and a worthless currency. To "protect" yourself, you might have eschewed stocks and opted instead to buy 3 ¼ ounces of gold with your \$114.75.

And what would that supposed protection have delivered? You would now have an asset worth about \$4,200, *less than 1% of what* would have been realized from a simple unmanaged investment in American business. The magical metal was no match for the American mettle.

Our country's almost unbelievable prosperity has been gained in a bipartisan manner. Since 1942, we have had seven Republican presidents and seven Democrats. In the years they served, the country contended at various times with a long period of viral inflation, a 21% prime rate, several controversial and costly wars, the resignation of a president, a pervasive collapse in home values, a paralyzing financial panic and a host of other problems. All engendered scary headlines; all are now history.

Christopher Wren, architect of St. Paul's Cathedral, lies buried within that London church. Near his tomb are posted these words of description (translated from Latin): "If you would seek my monument, look around you." Those skeptical of America's economic playbook should heed his message.

In 1788 – to go back to our starting point – there really wasn't much here *except* for a small band of ambitious people and an embryonic governing framework aimed at turning their dreams into reality. Today, the Federal Reserve estimates our household wealth at \$108 *trillion*, an amount almost impossible to comprehend.

Remember, earlier in this letter, how I described retained earnings as having been the key to Berkshire's prosperity? So it has been with America. In the nation's accounting, the comparable item is labeled "savings." And save we have. If our forefathers had instead consumed all they produced, there would have been no investment, no productivity gains and no leap in living standards.

* * * * *

Charlie and I happily acknowledge that much of Berkshire's success has simply been a product of what I think should be called *The American Tailwind*. It is beyond arrogance for American businesses or individuals to boast that they have "done it alone." The tidy rows of simple white crosses at Normandy should shame those who make such claims.

There are also many other countries around the world that have bright futures. About that, we should rejoice: Americans will be both more prosperous and safer if *all* nations thrive. At Berkshire, we hope to invest significant sums across borders.

Over the next 77 years, however, the major source of our gains will almost certainly be provided by The American Tailwind. We are lucky – gloriously lucky – to have that force at our back.

The Annual Meeting

Berkshire's 2019 annual meeting will take place on Saturday, May 4th. If you are thinking about attending – and Charlie and I hope you come – check out the details on pages A-2 – A-3. They describe the same schedule we've followed for some years.

If you can't join us in Omaha, attend via Yahoo's webcast. Andy Serwer and his Yahoo associates do an outstanding job, both in covering the entire meeting and interviewing many Berkshire managers, celebrities, financial experts and shareholders from the U.S. and abroad. The world's knowledge of what goes on in Omaha the first Saturday of every May has grown dramatically since Yahoo came on board. Its coverage begins at 8:45 a.m. CDT and provides Mandarin translation.

* * * * *

For 54 years, Charlie and I have loved our jobs. Daily, we do what we find interesting, working with people we like and trust. And now our new management structure has made our lives even more enjoyable.

With the whole ensemble – that is, with Ajit and Greg running operations, a great collection of businesses, a Niagara of cash-generation, a cadre of talented managers and a rock-solid culture – your company is in good shape for whatever the future brings.

February 23, 2019

Warren E. Buffett
Chairman of the Board

Morning Session - 2019 Meeting

1. Welcome and Munger's insurgency campaign

WARREN BUFFETT: Thank you.

Good morning and welcome to Berkshire Hathaway.

And for those of you who have come from out of state, welcome to Omaha. The city is delighted to have you here at this event.

And for those of you who came from outside of the country, welcome to the United States.

So, we've got people here from all over the world. We've got some overflow rooms that are taking care of people. And we will just have a few preliminaries and then we will move right into the Q&A period.

We'll break about noon for about an hour. We'll come back and do more Q&A until about 3:30. Then we'll adjourn for a few minutes, and then we'll conduct the meeting.

I understand that in the room adjacent, that Charlie has been conducting a little insurgency campaign.

I don't know whether you've seen these, but these are the buttons that are available for those of you — you keep asking questions about succession. And Charlie wants to answer that question by getting your vote today. So, it says — this one says, "Maturity, experience, why accept second best? Vote for Charlie." (Laughter)

I, however, have appointed the monitors who have — collect the votes, so I feel very secure. (Laughter)

2. Berkshire directors introduced

WARREN BUFFETT: The first thing I'd like to do — Charlie is my partner of 60 years, a director and vice chairman, and we make the big decisions jointly. It's just that we haven't had any big decisions. So, (laughter) we haven't — we're keeping him available for the next big one.

But now at the formal meeting today, we'll elect 14 directors, and you're looking at two of them. And I'd like to introduce the 12 that will be on the ballot at 3:45.

And I'm going to proceed alphabetically. And if they'll stand. If you'll withhold your applause because some of them get sensitive if certain people get more applause than others, and (Laughter) they'll — and if you'll withhold it till I'm finished, then you can applaud or not, as you see fit, having looked at these directors. (Laughter)

So, we'll start on my left. Greg Abel, who's both a chairman and a director. Greg? Yeah, oh, there we are. Right, OK. And going along alphabetically, Howard Buffett, Steve Burke, Sue Decker, Bill Gates, Sandy Gottesman— (applause) — Charlotte Guyman, Ajit Jain, who is also a vice chairman, Tom Murphy, Ron Olson, Walter Scott, and Meryl Witmer. Now you can applaud. (Applause)

3. Berkshire's Q1: Pay attention to operating earnings

WARREN BUFFETT: Now, this morning we posted on our website the quarterly, the 10Q that's required to be filed with the SEC. We published it at 7 o'clock Central Time. And we also published an accompanying press release.

And if we'll put slide one up — these figures as usual require some explanation. As we've mentioned in the annual report, the new GAAP rule of Generally Accepted Accounting Principles require that we mark our securities to market and then report any unrealized gains in our earnings.

And you can see, I've warned you about the distortions from this sort of thing. And, you know, the first quarter of 2019 actually was much like the first quarter of 2018, and I hope very much that newspapers do not read headlines saying that we made \$21.6 billion in the first quarter this year against a loss of last year.

These — the bottom line figures are going to be totally capricious, and what I worry about is that not everybody studied accounting in school, or they can be very smart people but that doesn't mean that they've spent any real time on accounting.

And I really regard these bottom line figures, particularly if they're emphasized in the press, as doing — as potentially being harmful to our shareholders, and really not being helpful. So, I encourage you now, and I encourage all the press that's here, focus on what we call our operating earnings, which were up a bit. And forget about the capital gains or losses in any given period.

Now, they're enormously important over time. We've had substantial capital gains in the future; we have substantial unrealized capital gains at the present time; we expect to have more capital gains in the future.

They are an important part of Berkshire, but they have absolutely no predictive value or analytical value on a quarterly basis or an annual basis. And I just hope that nobody gets misled in some quarter when stocks are down and people say, "Berkshire loses money," or something of the sorts. It's really a shame that the rules got changed in that way, but we will report.

But we will also explain, and we will do our best to have the press understand the importance of focusing on operating earnings, and that we do not attract shareholders who think that there's some enormous gain because in the first quarter the stock market was up.

There's one other footnote to these figures that I should point out. It's already been picked up by the wires from our 7 o'clock filing.

We report on Kraft Heinz, of which we own about 27 percent or so. We report on what they call the equity method. Now, most stocks, when you get dividends, that goes into our earnings account, and their undistributed earnings don't affect us. They affect us in a real way, but they don't affect us in an accounting way.

We are part of a control group at Kraft Heinz, so instead of reporting dividends, we report what they call equity earnings.

Kraft Heinz has not filed their 10K for the 2018 year with the SEC. And therefore, they have not released the first quarter of 2019 earnings. Now, normally, we would include our percentage share of those earnings, and we've done that every quarter up till this quarter. But because we do not have those figures, we've just — we've not included anything.

We received 40 cents times — \$130 million of dividends in the first quarter from our shares, but that reduces our carrying basis and it is not reflected in the earnings. So, that's an unusual item which we have mentioned, specifically pointed out in our press release as well as included in our own.

But there is nothing in here, plus or minus, for Kraft earnings, Kraft Heinz earnings this year, whereas there was last year. And when we have the figures, obviously we will report them. Let's see what beyond that I want to tell you.

4. Berkshire signs 20-year lease for its Omaha headquarters

WARREN BUFFETT: I think — oh yes, I'd wanted to mention to you, the Kiewit Company, which has been our landlord since 1962 — 57 years — has owned the building in which Berkshire is headquartered.

Kiewit Company is moving their headquarters and, in the process, will be doing something with the building. And they very generously, as they always have been, they came and said, "What kind of a lease would you like? Since we're leaving, and we've always sort of worked these things out as we've gone along." And so Bruce Grewcock, who runs Kiewit, said, "You just sort of — you name your terms and what you'd like. So, you — no matter with happens with the building, you're all set."

So, I was about to sign a ten-year lease for the present space, but Charlie said, "Ten years might be long enough for me but," he said he would like me to sign one for 20 years, considering.

And — so we are entering a 20-year lease, and I confess to you that we now occupy one full floor, as we have for decades, and the new lease provides for two floors. So, I just want you to know that your management is loosening up just a little bit. (Laughter)

And whether or not we fill them is another question. But we will have that, and I would like to say to Omaha that I think the fact that Berkshire has signed up for 20 years is very good news for the city over time. It — (Applause) OK.

5. Berkshire employees pitch in for annual meeting

WARREN BUFFETT: And now I would like to tell you something about the people that make all of this possible. This is totally a — this is a homegrown operation.

We started with a few people, meeting in the lunchroom at National Indemnity many years ago. And I think we will probably set another record for attendance today. Yesterday afternoon, 16,200 people came in five hours, and that broke the previous record by a couple thousand.

On Tuesday, the Nebraska Furniture Mart did \$9.3 million worth of business. And if any of you are in the retail business, you'll know that that's the yearly volume for some furniture stores, and here in Omaha, the 50th or so largest market in the country, maybe even a little less, \$9.3 billion (million) I think probably exceeds anything any home furnishing store's ever done in one day.

And we have people pitching, and we have all the people, virtually all of the people from the home office, some of them, you know, are — they'll take on any task. We have a bunch of people from National Indemnity, for example, that come over, and they've been some of the monitors around.

And in terms of the exhibit hall, more than 600 people from our various subsidiaries give up a weekend to come to Omaha, work very hard, and tomorrow, 4:00 or 4:30, or I should say today at 4:00 or 4:30, they will start packing up things and heading back home. And they come in, and I saw them all yesterday, and they were a bunch of very, very happy, smiling faces. And, you know, they work hard all year, and then they come in and help us out on this meeting.

And then, finally, if we could get a spotlight, I think Melissa Shapiro is someplace here — she runs the whole show. I mean, we — Melissa, where are you? (Applause)

Melissa's name was Melissa Shapiro before she got married, then she married a guy named Shapiro, so now she's Melissa Shapiro Shapiro. So — (Laughter) but she can handle that sort of thing. She handles everything, and never — totally unflappable. Totally organized. Everything gets done. Everybody likes her when they get through. So, I — it's marvelous to get a chance to work with people like this.

I think it's a special quality that — at Berkshire. I think other people would hire some group to put on the meeting and all be very professional and all of that. But I don't think you can get — I don't think you can buy the enthusiasm and energy and help-the-next-guy feeling that you've seen out on that exhibition floor, and you'll see as you meet people here at the hall, and as you meet the people around Omaha. They're very, very happy that you're here.

6. Q&A Begins

WARREN BUFFETT: And with that, I would like to start on the questions. We'll do it just as we've done it in recent years. We'll start with the press group. They've received emails from a great many people — perhaps they can tell you how many — and selected the questions they think would be most useful to the Berkshire shareholders.

Yahoo is webcasting this as they've done for several years now, they've done a terrific job for us.

So, this meeting is going out, both in English and in Mandarin, and I hope our results translate well, or our — (laughs) our comments translate well. Sometimes we have trouble with English. But we're going to — we'll start in with Carol Loomis, my friend of 50 years, but you'll never know it by the questions she's going to ask me. (Laughter)

CAROL LOOMIS: I'm going to start, very briefly — this is for the benefit of people who send us questions next year. There are kind of two things that you get wrong a lot of the time. You can't send two-part questions or three-part, et cetera. We need a one-part question. And the other thing is the questions all need to have some relevance to Berkshire, because Warren said when he started it that his hope was that shareholders would come out of the questions with a further education about the company. So, keep those in mind for next year.

7. Munger: "I predict we'll get a little more liberal in repurchasing shares"

CAROL LOOMIS (RETIRED FORTUNE MAGAZINE EDITOR): Many people — a number of people — wrote me about repurchases of stock. And, hence, the question I picked for my first one.

The question, this particular question comes from Ward Cookie (PH), who lives in Belgium and who was still emailing me this morning in reference to the first quarter report.

And he asked, "My question concerns your repurchase of Berkshire shares. In the third quarter of last year, you spent almost 1 billion buying Berkshire B stock at an average price of \$207.

"But then you got to a period between December 26th and April 11th when the stock languished for almost four months under 207. And yet, you purchased what I think of as a very limited amount of stock, even as you were sitting on an enormous pile of 112 billion.

"My question is why you did not repurchase a lot more stock? Unless, of course, there was for a time an acquisition of, say, 80 billion to 90 billion on your radar."

WARREN BUFFETT: Yeah, the question — whether we had 100 billion or 200 billion would not make a difference — or 50 billion — would not make a difference in our approach to repurchase of shares.

We repurchase shares — we used to have a policy of tying it to book value. But that became — really became obsolete. It did not —

The real thing is to buy stock — repurchase shares — only when you think you're doing it at a price where the remaining shareholders have had — are worth more the moment after you repurchased it than they were the moment before.

It's very much like if you were running a partnership and you had three partners in it and the business was worth 3 million, and one of the partners came and said, "I'd like you to buy back my share of the partnership for a billion" — I started out with millions, so I'll stay with millions — "for \$1.1 million?" And we said, "Forget it." And if he said, "1 million?" we'd probably say, "Forget it," unless — and if he said, "900,000," we'd take it because, at that point, the remaining business would be worth 2-million-1, and we'd have two owners, and our interest in value would have gone from a million to a million and fifty-thousand.

So, it's very simple arithmetic. Most companies adopt repurchase programs and they just say, "We're going to spend so much." That's like saying, you know, "We're going to buy XYZ stock, and we're going to spend so much here." "We're going to buy a company." "We're going to spend whatever it takes."

We will buy stock when we think it is selling below a conservative estimate of its intrinsic value. Now, the intrinsic value is not a specific point, it's probably a range in my mind that might have a band maybe of 10 percent. Charlie would have a band in his mind, and it would probably be 10 percent. And ours would not be identical, but they'd be very close. And sometimes he might figure a bit higher than I do, a bit lower.

But we want to be sure, when we repurchase shares, that those people who have not sold shares are better off than they were before we repurchased them. And it's very simple.

And in the first quarter of the year, they'll find we bought something over a billion worth of stock, and that's nothing like my ambitions. But it — what that means is that we feel that we're OK buying it, but we don't salivate over buying it.

We think that the shares we repurchased in the first quarter leave the shareholders better off than if we hadn't — the remaining shareholders — better off than if we hadn't bought it. But we don't think the difference is dramatic.

And you will — you could easily see periods where we would spend very substantial sums if we thought the stock was selling at, say, 25 or 30 percent less than it was worth, and we didn't have something else that was even better.

But we have no ambition in any given quarter to spend a dime unless we think you're going to be better off for us having done so. Charlie?

CHARLIE MUNGER: Well, I predict that we'll get a little more liberal in repurchasing shares.
(Laughter)

WARREN BUFFETT: I was going to give you equal time, but then — (Laughter)

8. BNSF may adopt “precision-scheduled railroading”

WARREN BUFFETT: OK, Jon Brandt.

JONATHAN BRANDT (RESEARCH ANALYST, RUANE, CUNNIFF & GOLDFARB): Hi, Warren and Charlie. Thanks for having me, as always.

Every major North American railroad other than Burlington Northern has adopted at least some aspects of precision-scheduled railroading, generally to good effect to their bottom line.

Some believe that point-to-point schedule service and minimal in-transit switching is good for both returns on capital and customer service.

Others believe precision railroading has done little for on-time performance, and its rigidity has jeopardized the compact that railroads have had with both regulators and customers.

Do you and current BNSF management believe that it's now a good idea for BNSF to adopt precision railroading playbook? Or do you agree with its critics?

WARREN BUFFETT: Yeah, precision railroading, as it's labeled, was probably invented by a fellow named Hunter Harrison. I think maybe he was at the Illinois Central Railroad at the time; there's a book that came out about Hunter, who died maybe a year ago or thereabouts. And it describes the — his procedure toward railroading. It's an interesting read if you're interested in railroading.

And he took that to Canadian National, CN. There are six big railroads in North America, and he took that to CN, and he was very successful.

And actually, Bill Gates is probably the largest holder of CN, and I think he's done very well with that stock.

And then later, Canadian Pacific was the subject of an activist, and when they — as they proceeded, they got Hunter to join them and brought in an associate, Keith Creel, who — and they instituted a somewhat similar program. Now the same thing has happened at CSX.

And all of those companies dramatically improved their profit margins, and they had varying degrees of difficulty with customer service in the implementing of it.

But I would say that we watch very carefully — Union Pacific is doing a somewhat modified version. But the — we are not above copying anything that is successful. And I think that there's been a good deal that's been learned by watching these four railroads, and we will — if we think we can serve our customers well and get more efficient in the process, we will adopt whatever we observe.

But we don't have to do it today or tomorrow, but we do have to find something that gets at least equal, and hopefully better, customer satisfaction and that makes our railroad more efficient. And there's been growing evidence that — from the actions of these other four railroads — there's been growing evidence that we can learn something from what they do. Charlie?

CHARLIE MUNGER: Well, I doubt that anybody is very interested in un-precision in railroading. (Laughter)

WARREN BUFFETT: Well, Jonny, has Charlie answered your question? (Laughter)

JONATHAN BRANDT: Yes, thank you.

9. BNSF trying to improve energy efficiency

WARREN BUFFETT: OK. Station number 1, from the shareholder group up on my far right.

AUDIENCE MEMBER: Good morning. My name is Bill Moyer and I'm from Vashon Island, Washington. And I'm part of a team called "The Solutionary Rail Project."

Interestingly, only 3.5 percent of the value of freight in the U.S. moves on trains. Berkshire Hathaway is incredibly well positioned with its investments in the northern and southern transcon through BNSF to grab far more of that freight traffic off of the roads and get diesel out of our communities, as well as harness transmission corridors for your Berkshire renewable energy assets, for which you're obviously very proud.

Would you consider meeting with us to look at a proposal for utilizing your assets and leveraging a public/private partnership to electrify your railroads and open those corridors for a renewable energy future?

WARREN BUFFETT: No, I — we've examined a lot of things in terms of LNG. I mean, they're — obviously, we want to become more energy efficient, as well as just generally efficient.

And I'm not sure about the value of freight. You mentioned 3 1/2 percent. I believe — I mean, I'm not sure what figure you're using as the denominator there.

Because if you look at movement of traffic by ton miles, rails are around 40 percent of the U.S. — we're not talking local deliveries or all kinds of things like that — but they're 40 percent, roughly, by rail.

And BNSF moves more ton miles than any other entity. We move 15 percent-plus of all the ton miles moved in the United States.

But if you take trucking, for example, on intermodal freight, we're extremely competitive on the longer hauls, but the shorter the haul, the more likely it is that the flexibility of freight, where a truck can go anyplace and we have rails. So, the equation changes depending on distance hauled and other factors, but distance hauled is a huge factor.

We can move a ton mile 500 — we can move 500-plus ton miles of freight for one gallon of diesel. And that is far more efficient than trucks.

So, the long-haul traffic, and the heavy traffic, is going to go to the rails, and we try to improve our part of the equation on that all the time.

But if you're going to transport something ten or 20 or 30 miles between a shipper and a receiver, and they're — you're not going to move that by rail.

So, we look at things all the time, I can assure you.

Carl Ice is in — well, he's probably here now, and he'll be in the other room — and he's running the railroad. You're free to talk to him, but I don't see any breakthrough like you're talking about. I do see us getting more efficient year-by-year-by-year.

And obviously, if driverless trucks become part of the equation, that moves things toward trucking. But on long-haul, heavy stuff, and there's a lot of it, you're looking at the railroad that carries more than any other mode of transportation. And BNSF is the leader. Charlie?

CHARLIE MUNGER: Well, over the long term, our questioner is on the side of the angels. Sooner or later, we'll have it more electrified. I think Greg (Abel) will decide when it happens.

WARREN BUFFETT: Yeah. But we're all working on the technology but —

And we're considerably more efficient than ten, 20, 30 years ago, if you look at the numbers. But it —

One interesting figure, I think right after World War II, when the country probably had about 140 million people against our 330 million now, so we had 40 percent of the population. We had over a million-and-a-half people employed in the railroad industry. Now there's less than 200,000 and we're carrying a whole lot more freight.

Now, obviously there's some change in passengers. But the efficiency of the railroads compared to — and the safety — compared to what it was even immediately after World War II has improved dramatically. Charlie, anything more?

CHARLIE MUNGER: No.

10. Bank CEOs who make bad mistakes should lose all their net worth

WARREN BUFFETT: OK, Becky?

BECKY QUICK (CNBC): This is a question that comes from Mike Hebel. He says, "The Star Performers Investment Club has 30 partners, all of whom are active or retired San Francisco police officers. Several of our members have worked in the fraud detail, and have often commented after the years-long fraudulent behavior of Wells Fargo employees, should have warranted jail sentences for several dozen, yet Wells just pays civil penalties and changes management.

"As proud shareholders of Berkshire, we cannot understand Mr. Buffett's relative silence compared to his vigorous public pronouncement many years ago on Salomon's misbehavior. Why so quiet?"

WARREN BUFFETT: Yeah, I would say this. The — (applause) — problem, well, as I see it — although, you know, I have read no reports internally or anything like that — but it looks like to me like Wells made some big mistakes in what they incentivized. And as Charlie says, there's nothing like incentives, but they can incentivize the wrong behavior. And I've seen that a lot of places. And that clearly existed at Wells.

The interesting thing is, to the extent that they set up fake accounts, a couple million of them, that had no balance in them, that could not possibly have been profitable to Wells. So, you can incentivize some crazy things.

The problem is — I'm sure is that — and I don't really have any inside information on it at all — but when you find a problem, you have to do something about it. And I think that's where they probably made a mistake at Wells Fargo.

They made it at Salomon. I mean, John Gutfreund would never have played around with the government. He was the CEO of Salomon in 1991. He never would have done what the bond trader did that played around with the rules that the federal government had about government bond bidding.

But when he heard about it, he didn't immediately notify the Federal Reserve. And he heard about it in late April, and May 15th, the government bond auction came along. And Paul Mozer did the same thing he'd done before, and gamed the auction.

And at this point, John Gutfreund — you know, the destiny of Salomon was straight downhill from that point forward. Because, essentially, he heard about a pyromaniac, and he let him keep the box of matches.

And at Wells, my understanding, there was an article in The Los Angeles Times maybe a couple years before the whole thing was exposed, and, you know, somebody ignored that article.

And Charlie has beaten me over the head all the years at Berkshire because we have 390,000 employees, and I will guarantee you that some of them are doing things that are wrong right now. There's no way to have a city of 390,000 people and not need a policeman or a court system. And some people don't follow the rules. And you can incentivize the wrong behavior. You've got to do something about it when it happens.

Wells has become, you know, exhibit one in recent years. But if you go back a few years, you know, you can almost go down — there's quite a list of banks where people behaved badly. And where they — I would not say — I don't know the specifics at Wells — but I've actually written in the annual report that they talk about moral hazard if they pay a lot of people.

The shareholders of Wells have paid a price. The shareholders of Citicorp paid a price. The shareholders of Goldman Sachs, the shareholders of Bank of America, they paid billions and billions of dollars, and they didn't commit the acts. And of course, nobody did go — there were no jail sentences. And that is infuriating.

But the lesson that was taught was not that the government bailed you out because the government got its money back, but the shareholders of the various banks paid many, many billions of dollars.

And I don't have any advice for anybody running a business except, when you find out something is leading to bad results or bad behavior, you know, you — if you're in the top job, you've got to take action fast.

And that's why we have hotlines. That's why we get — when we get certain anonymous letters, we turn them over to the audit committee or to outside investigators.

And we will have — I will guarantee you that we will have some people who do things that are wrong at Berkshire in the next year or five years, ten years, and 50 years. It's — you cannot have 390,000 people — and it's the one thing that always worries me about my job, but — because I've got to hear about those things, and I've got to do something about them when I do hear about them. Charlie?

CHARLIE MUNGER: Well, I don't think people ought to go to jail for honest errors of judgment. It's bad enough to lose your job. And I don't think that any of those top officers was deliberately malevolent in any way. I just — we're talking about honest errors in judgment.

And I don't think (former Wells Fargo CEO) Tim Sloan even committed honest errors of his judgment, I just think he was an accidental casualty that deserve the trouble. I wish Tim Sloan was still there.

WARREN BUFFETT: Yeah, there's no evidence that he did a thing. But he stepped up to take a job that — where he was going to be a piñata, basically, for all kinds of investigations.

And rightfully, Wells should be checked out on everything they do. All banks should. I mean, they get a government guarantee and they receive trillions of dollars in deposits. And they do that basically because of the FDIC. And if they abuse that, they should pay a price.

If anybody does anything like a Paul Mozier did, for example, with Salomon, they ought to go to jail. Paul Mozier only went to jail for four months. But if you're breaking laws, you should be prosecuted on it.

If you do a lot of dumb things, I wish they wouldn't go away — the CEOs wouldn't go away — so rich under those circumstances. But people will do dumb things. (Applause)

I actually proposed — think it may have been in one of the annual reports even. I proposed that, if a bank gets to where it needs government assistance, that basically the responsible CEO should lose his net worth and his spouse's net worth. If he doesn't want the job under those circumstances, you know (Applause)

And I think that the directors — I think they should come after the directors for the last five years — I think I proposed — of everything they'd received.

But it's the shareholders who pay. I mean, if we own 9 percent of Wells, whatever this has cost, 9 percent of it is being borne by us. And it's very hard to tie it directly.

One thing you should know, incidentally though, is that the FDIC, which was started — I think it was started January 1st, 1934 — but it was a New Deal proposal.

And the FDIC has not cost the United States government a penny. It now has about \$100 billion in it. And that money has all been put in there by the banks. And that's covered all the losses of the hundreds and hundreds and hundreds of financial institutions.

And I think the impression is that the government guarantee saved the banks, but the government money did not save the banks. The banks' money, as an industry, not only has paid every loss, but they've accumulated an extra \$100 billion, and that's the reason the FDIC assessments now are going back down. They had them at a high level. And they had a higher level for the very big banks.

When you hear all the talk about — the political talk — about the banks, they had not cost the federal government a penny. There were a lot of actions that took place that should not have

taken place. And there's a lot fewer now, I think, than there were in the period leading up to 2008 and '09. But some banks will make big mistakes in the future. Charlie?

CHARLIE MUNGER: I've got nothing to add to that.

11. "We will spend a lot of money" on buybacks if price is right

WARREN BUFFETT: OK. Jay Gelb from Barclays. Barclays just had a proxy contest of sorts, didn't it?

JAY GELB (INSURANCE ANALYST, BARCLAYS): That's right, Warren. (Laughs)

I also have a question on Berkshire Hathaway — I'm sorry — on share buybacks.

Warren, in a recent Financial Times article, you were quoted as saying that the time may come when the company buys back as much as \$100 billion of its shares, which equates to around 20 percent of Berkshire's current market cap. How did you arrive at that \$100 billion figure? And over what time frame would you expect this to occur?

WARREN BUFFETT: Yeah. I probably arrived at that \$100 billion figure in about three seconds when I got asked the question. (Laughter)

It was a nice round figure and we could do it. And we would like to do it if the stock was — we've got the money to buy in \$100 billion worth of stock.

And bear in mind, if we're buying in \$100 billion stock, it probably would be that the company wasn't selling at 500 billion. So, it might buy well over 20 percent.

We will spend a lot of money. We've been involved in companies where the number of shares has been reduced 70 or 80 percent over time. And we like the idea of buying shares at a discount.

We do feel, if shareholders — if we're going to be repurchasing shares from shareholders who are partners, and we think it's cheap, we ought to be very sure that they have the facts available to evaluate what they own.

I mean, just as if we had a partnership, it would not be good if there were three partners and two of them decided that they would sort of freeze out the third, maybe in terms of giving him material information that they knew that that third party didn't know.

So, it's very important that our disclosure be the same sort of disclosure that I would give to my sisters who are the imaginary — they're not imaginary — but they're the shareholders to whom I address the annual report every year.

Because I do feel that you, if you're going to sell your stock, should have the same information that's important, that's available to me and to Charlie.

But we will — if our stock gets cheap, relative to intrinsic value, we would not hesitate.

We wouldn't be able to buy that much in a very short period of time, in all likelihood. But we would certainly be willing to spend \$100 billion. Charlie?

CHARLIE MUNGER: I think when it gets really obvious, we'll be very good at it. (Laughter)

WARREN BUFFETT: Let me get that straight. What'd you say, exactly?

CHARLIE MUNGER: When it gets really obvious, we'll be very good at it.

WARREN BUFFETT: Oh, yeah. I was hoping that's what you said. (Laughter)

Yeah, we will be good at it. We don't have any trouble being decisive. We don't say yes very often. But if it's something obvious — I mean, Jay, if you and I are partners, you know, and our business is worth a million dollars and you say you'll sell your half to me for 300,000, you'll have your 300,000 very quickly.

12. Buying one share in an oil-rich duck hunting club

WARREN BUFFETT: OK, station two.

AUDIENCE MEMBER: Good morning. My name is Patrick Donahue from Eden Prairie, Minnesota, and I'm with my ten-year-old daughter, Brooke Donahue.

AUDIENCE MEMBER: Hi, Warren. Hi, Charlie.

WARREN BUFFETT: Hi. It's Brooke, is it?

AUDIENCE MEMBER: It is.

WARREN BUFFETT: Yeah.

AUDIENCE MEMBER: First, I'm a proud graduate of Creighton University. And I need to say a personal thank you for coming over the years to share your insights. And it's been a tradition since I graduated in 1999 to come to the annual meeting, and thank you for a lifetime of memories.

WARREN BUFFETT: Thank you. (Applause)

AUDIENCE MEMBER: Brooke is a proud Berkshire shareholder and read the letter and had some questions regarding investments that have been made in the past. And she had made some interesting comments about what she thought was a lot of fun.

So, our question for both of you is: outside of Berkshire Hathaway, what is the most interesting or fun personal investment you have ever made? (Laughter)

WARREN BUFFETT: Well, they're always more fun when you make a lot of money off of them. (Laughter)

Well, one time, I bought one share of stock in the Atled Corp. That's spelled A-T-L-E-D. And Atled had 98 shares outstanding and I bought one. And not what you call a liquid security. (Laughter)

And Atled happened to be the word "delta" spelled backwards. And a hundred guys in St. Louis had each chipped in 50 or \$100 or something to form a duck club in Louisiana and they bought some land down there.

Two guys didn't come up with their — there were a hundred of them — two of them defaulted on their obligation to come up with a hundred dollars — so there were 98 shares out. And they went down to Louisiana and they shot some ducks.

But apparently somebody shot — fired a few shots into the ground and oil spurted out. And — (laughter) — those Delta duck club shares — and I think the Delta duck club field is still producing. I bought stock in it 40 years ago for \$29,200 a share.

And it had that amount in cash and it was producing a lot, and they sold it. If they kept it, that stock might've been worth 2 or \$3 million a share, but they sold out to another oil company.

That was certainly — that was the most interesting —

Actually, I didn't have any cash at the time. And I went down and borrowed the money. I bought it for my wife. And I borrowed the money. And the loan officer said, "Would you like to borrow some money to buy a shotgun as well?" (Laughter)

Charlie, tell them about the one you missed. (Laughter)

CHARLIE MUNGER: Well, I got two investments that come to mind. When I was young and poor, I spent a thousand dollars once buying an oil royalty that paid me 100,000 a year for a great many years. But I only did that once in a lifetime.

On a later occasion, I bought a few shares of Belridge Oil, which went up 30 times rather quickly. But I turned down five times as much as I bought. It was the dumbest decision of my

whole life. So, if any of you have made any dumb decisions, look up here and feel good about yourselves. (Laughter)

WARREN BUFFETT: I could add a few, but — Andrew?

13. Buffett speaks for himself on politics, not for Berkshire

ANDREW ROSS SORKIN (NEW YORK TIMES/CNBC): Warren and Charlie, this is a question — actually, we got a handful of questions on this topic. This is probably the best formulation of it.

Warren, you have been a long-time, outspoken Democrat. With all the talk about socialism versus capitalism taking place among Democratic presidential candidates, do you anticipate an impact on Berkshire in the form of more regulations, higher corporate taxes, or even calls for breakups among the many companies we own if they were to win?

And how do you think about your own politics as a fiduciary of our company, and at the same time, as someone who has said that simply being a business leader doesn't mean you've put your citizenship in a blind trust?

WARREN BUFFETT: Yeah. I have said that you do not put your citizenship in a blind trust. But you also don't speak on behalf of your company. You do speak as a citizen if you speak. And therefore, you have to be careful about when you do speak, because it's going to be assumed you're speaking on behalf of your company.

Berkshire Hathaway certainly, in 54 years, has never — and will never — made a contribution to a presidential candidate. I don't think we've made a contribution to any political candidate. But I don't want to say, for 54 years, that — (Applause)

We don't do it now. We operate in several regulated industries. And our railroad and our utility, as a practical matter, they have to have a presence in Washington or in the state legislatures in which they operate.

So, we have some — a few — I don't know how many — political action committees which existed when we bought it — when we bought the companies at subsidiaries.

And I think, unquestionably, they make some contributions simply to achieve the same access as their competitors. I mean, if the trucking industry is going to lobby, I'm sure the railroad industry's going to lobby.

But — the general — well, the rule is, I mean, that people do not pursue their own political interests with your money here.

We've had one or two managers over the years, for example, that would do some fundraising where they were fundraising from people who were suppliers of them or something of the sort. And if I ever find out about it, that ends promptly.

My position, at Berkshire, is not to be used to further my own political beliefs. But my own political beliefs can be expressed as a person, not as a representative of Berkshire, when a campaign is important.

I try to minimize it. But it's no secret that in the last election, for example, I raised money.

I won't give money to PACs. I accidentally did it one time. I didn't know it was a PAC. But I don't do it.

But I've raised substantial sums. I don't like the way money is used in politics. I've written op-ed pieces for the New York Times in the past on the influence of money in politics.

I spent some time with John McCain many years ago before McCain-Feingold, on ways to try to limit it. But the world has developed in a different way.

14. Buffett: "I'm a card-carrying capitalist" but some regulations are needed

WARREN BUFFETT: On your question about the — I will just say I'm a card-carrying capitalist. (Applause)

But I — and I believe we wouldn't be sitting here except for the market system and the rule of law and some things that are embodied in this country. So, you don't have to worry about me changing in that manner.

But I also think that capitalism does involve regulation. It involves taking care of people who are left behind, particularly when the country gets enormously prosperous. But beyond that, I have no Berkshire podium for pushing anything. Charlie?

CHARLIE MUNGER: Well, I think we're all in favor of some kind of a government social safety net in a country as prosperous as ours.

What a lot of us don't like is the vast stupidity with which parts of that social safety net are managed by the government. It'd be much better if — (applause) — we could do it more wisely. But I think it also might be better if we did it more liberally.

WARREN BUFFETT: Yeah, one of the reasons we're involved in this effort along with J.P. Morgan and Amazon — with (J.P. Morgan CEO) Jamie Dimon and (Amazon CEO) Jeff Bezos — on the medical question, is we do have as much money going — 3.3 or 3.4 trillion — we have as much money going to medical care as we have funding the federal government.

And it's gone from 5 to 17 percent — or 18 percent — while actually the amount going to the federal government has stayed about the same at 17 percent.

So, we hope there's some major improvements from the private sector because I generally think the private sector does a better job than the public sector in most things.

But I also think that if the private sector doesn't do something, you'll get a different sort of answer. And I'd like to think that the private sector can come up with a better answer than the public sector in that respect.

I will probably — it depends who's nominated — but I voted for plenty of Republicans over the years. I even ran for delegate to the Republican National Convention in 1960. But — we are not —

I don't think the country will go into socialism in 2020 or in 2040 or 2060.

15. We don't try to push Berkshire stock higher or lower

WARREN BUFFETT: OK, Gregg Warren.

GREGG WARREN (FINANCIAL SERVICES ANALYST, MORNINGSTAR RESEARCH SERVICES): Warren, my first question, not surprisingly, is on share repurchases.

Stock buybacks in the open market are a function of both willing buyers and sellers. With Berkshire having two shares of classes, you should have more flexibility when buying back stock. But given the liquidity difference that exists between the two share classes — with an average of 313 Class A shares exchanging hands daily the past five years, equivalent to around \$77 million a day, and an average of 3.7 million Class B shares doing the same, equivalent to around 622 million — Berkshire's likely to have more opportunities to buy back Class B shares than Class A, which is exactly what we saw during the back half of last year and the first quarter of 2019.

While it might be more ideal for Berkshire to buy back Class A shares, allowing you to retire shares with far greater voting rights, given that there's relatively little arbitrage between the two share classes and the number of Class B shares increase every year as you gift your Class A shares to the Bill and Melinda Gates Foundation and your children's foundations, can we assume that you're likely to be a far greater repurchaser of Class B shares, going forward, especially given your recent comments to the Financial Times about preferring to have loyal individuals on your shareholder list, which a price tag of \$328,000 of Class A shares seems to engender?

WARREN BUFFETT: Yeah, we will - when we're repurchasing shares, if we're purchasing substantial amounts, we're going to spend a lot more on the Class B than the Class A, just because the trading volume is considerably higher.

We may, from time to time — well, we got offered a couple blocks in history, going back in history from the Yoshi (PH) estate and when we had a transaction exchanging our Washington Post stock for both a television station and shares held — A shares — held by the Washington Post.

So, we may see some blocks of A. We may see some blocks of B. But there's no question. If we are able to spend 25, 50, or a hundred billion dollars in repurchasing shares, more of the money is almost certainly going to be spent on the B than the A.

There's no master plan on that other than to buy aggressively when we like the price. And as I say, the trading volume in the B is just a lot higher than the A in dollar amounts. Charlie?

CHARLIE MUNGER: I don't think we care much which class we buy.

WARREN BUFFETT: Yeah. (Laughter)

We would like — we really want the stock — ideally, if we could do it if we were small — once a year we'd have a price and, you know, we'd do it like a private company. And it would be a fair price and people who want to get out could get out. And if other people wanted to buy their interest, fine. And if they didn't, and we thought the price was fair, we'd have the company repurchase it.

We can't do that. But that's — we don't want the stock to be either significantly underpriced or significantly overpriced. And we're probably unique on the overpriced part of it. But we don't want it.

I do not want the stock selling at twice what's it worth because I'm going to disappoint people, you know. I mean, we can't make it — there's no magic formula to make a stock worth what it's selling for, if it sells for way too much.

From a commercial standpoint, if it's selling very cheap, we have to like it when we repurchase it.

But ideally, we would hope the stock would sell in a range that more or less is its intrinsic business value. We have no desire to hype it in any way. And we have no desire to depress it so we can repurchase it cheap. But the nature of markets is that things get overpriced and they get underpriced. And we will — if it's underpriced, we'll take advantage of it.

16. We welcome change, but we won't always adapt to it

WARREN BUFFETT: OK, station 3.

AUDIENCE MEMBER: Hello Charlie Munger and Warren Buffett, (unintelligible). I am Terry (PH) from Shanghai (unintelligible), which aims to catch the best investment opportunities in that era.

So, my question is, as we all know, 5G is coming. It is said that the mode of all industry will be challenged in 5G era. So, what is the core competence that we should master, if (unintelligible) wants to catch the best investment opportunities in this era? Thank you.

WARREN BUFFETT: Well, there's no core competence at the very top of Berkshire. (Laughter)

The subsidiaries that will be involved in developments relating to 5G, or any one of all kinds of things that are going to happen in this world, you know, the utility of LNG in the railroad, or all those kinds of questions, we have people in those businesses that know a lot more about them than we do.

And we count on our managers to anticipate what is coming in their business. And sometimes they talk to us about it. But we do not run that on a centralized basis.

And Charlie, do you want to have anything to add to that?

Do you know anything about 5G I don't know? Well, you probably know a lot about 5G.

CHARLIE MUNGER: No, I know very little about 5G.

But I do know a little about China. And we have bought things in China. And my guess is we'll buy more. (Laughter)

WARREN BUFFETT: Yeah. But I mean, we basically want to have a group of managers, and we do have a group of managers, who are on top of their businesses.

I mean, you saw something that showed BNSF and Berkshire Hathaway Energy and Lubrizol all aware of that. Those people know their businesses. They know what changes are likely to be had.

Sometimes, they find things that they can cooperate on between their businesses. But we don't try to run those from headquarters.

And that may mean — that may have certain weaknesses at certain times. I think, net, it's been a terrific benefit for Berkshire.

Our managers, to a great degree, own their businesses. And we want them to feel a sense of ownership. We don't want them to be lost in some massive conglomerate, where they get directions from this group, which is a subgroup of that group.

And I could tell you a few horror stories from companies we bought, when they tell us about their experience under such an operation.

The world is going to change in dramatic ways. Just think how much it's changed in the 54 years that we've had Berkshire. And some of those changes hurt us.

They hurt us in textiles. They hurt us in shoes. They hurt us in the department store business. Hurt us in the trading stamp business. These were the founding businesses of this operation. But we do adjust. And we've got a group, overall, of very good businesses.

We've got some that will be, actually, destroyed by what happens in this world. But that's — I still am the card-carrying capitalist. And I believe that that's a good thing, but you have to make changes.

We had 80 percent of the people working on farms in 1800. And if there hadn't been a lot of changes, and you needed 80 percent of the people in the country producing the food and cotton we needed, we would have a whole different society.

So, we welcome change. And we certainly want to have managers that can anticipate and adapt to it. But sometimes, we'll be wrong. And those businesses will wither and die. And we'd better use the money someplace else. Charlie? OK, Carol.

Charlie, you haven't had any peanut brittle lately, you know. (Laughs)

17. Kraft Heinz is a good business, but we paid too much

CAROL LOOMIS: This question comes from Vincent James of Munich, Germany. "There has been a lot written about the recent impairment charge at Kraft Heinz. You were quoted as stating that you recognize that Berkshire overpaid for Kraft Heinz. Clearly, major retail chains are being more aggressive in developing house brands.

"In addition, Amazon has announced intentions to launch grocery outlets, being that, as Mr. Bezos has often stated, 'Your margin is my opportunity.' The more-fundamental question related to Kraft Heinz may be whether the advantages of the large brands and zero-based budgeting that 3G has applied are appropriate and defensible at all in consumer foods.

"In other words, will traditional consumer good brands, in general, and Kraft Heinz, in particular, have any moat in their future? My question is, to what extent do the changing dynamics in the consumer food market change your view on the long-term potential for Kraft Heinz?"

WARREN BUFFETT: Yeah, actually, what I said was, we paid too much for Heinz — I mean Kraft — I'm sorry — the Heinz part of the transaction, when we originally owned about half of Heinz,

we paid an appropriate price there. And we actually did well. We had some preferred redeemed and so on.

We paid too much money for Kraft. To some extent, our own actions had driven up the prices.

Now, Kraft Heinz, the profits of that business, 6 billion — we'll say very, very, very roughly, I'm not making forecasts — but 6 billion pretax on 7 billion of tangible assets, is a wonderful business. But you can pay too much for a wonderful business.

We bought See's Candy. And we made a great purchase, as it turned out. And we could've paid more. But there's some price at which we could've bought even See's Candy, and it wouldn't have worked. So, the business does not know how much you paid for it.

I mean, it's going to earn based on its fundamentals. And we paid too much for the Kraft side of Kraft Heinz.

Additionally, the profitability has basically been improved in those operations over the way they were operating before.

But you're quite correct that Amazon itself has become a brand. Kirkland, at Costco, is a \$39 billion brand. All of Kraft Heinz is \$26 billion. And it's been around for — on the Heinz side — it's been around for 150 years. And it's been advertised — billions and billions and billions of dollars, in terms of their products. And they go through tens of thousands of outlets.

And here's somebody like Costco, establishes a brand called Kirkland. And it's doing 39 billion, more than virtually any food company. And that brand moves from product to product, which is terrific, if a brand travels. I mean, Coca Cola moves it from Coke to Cherry Coke and Coke Zero and so on.

But to have a brand that can really move — and Kirkland does more business than Coca Cola does. And Kirkland operates through 775 or so stores. They call them warehouses at Costco. And Coca Cola is through millions of distribution outlets.

So, brands — the retailer and the brands have always struggled as to who gets the upper hand in moving a product to the consumers.

And there's no question, in my mind, that the position of the retailer, relative to the brands, which varies enormously around the world. In different countries, you've had 35 percent, even, maybe 40 percent, be private-label brands in soft drinks. And it's never gotten anywhere close to that in the United States. So, it varies a lot.

But basically, retailers — certain retailers — the retail system — has gained some power. And particularly in the case of Amazon and Walmart and their reaction to it, and Costco — and Aldi and some others I can name — has gained in power relative to brands.

Kraft Heinz is still doing very well, operationally. But we paid too much. If we paid 50 billion, you know, it would've been a different business. It'd still be earning the same amount.

You can turn any investment into a bad deal by paying too much. What you can't do is turn any investment into a good deal by paying little, which is sort of how I started out in this world.

But the idea of buying the cigar butts that are declining or poor businesses for a bargain price is not something that we try to do anymore. We try to buy good businesses at a decent price. And we made a mistake on the Kraft part of Kraft Heinz. Charlie?

CHARLIE MUNGER: Well, it's not a tragedy that, out of two transactions, one worked wonderfully, and the other didn't work so well. That happens.

WARREN BUFFETT: The reduction of costs, you know — there can always be mistakes made, when you've got places, and you're reorganizing them to do more business with the same number of people.

And we like buying businesses that are efficient to start with. But the management — the operations — of Kraft Heinz have been improved over the present management overall. But we paid a very high price, in terms of the Kraft part. We paid an appropriate price, in terms of Heinz.

18. Internet competition for Berkshire's furniture retailers

WARREN BUFFETT: Jonathan?

JONATHAN BRANDT: Internet-based furniture retailers, like Wayfair, appear willing to stomach large current losses acquiring customers in the hope of converting them to loyal online shoppers.

I've been wondering what this disruptive competition might do to our earnings from home-furnishing retail operations like Nebraska Furniture Mart.

If we have to transition to more of an online model, might we have to spend more heavily to keep shoppers without a corresponding increase in sales? The sharp decline in first-quarter earnings from home furnishings suggest, perhaps, some widening impact from intensifying competition.

Do you believe Wayfair's customers first, profits later model is unsustainable? Or do you think our furniture earnings will likely be permanently lower than they were in the past?

WARREN BUFFETT: I think furnishings — the jury's still out on that, whether the operations which have grown very rapidly in size but still are incurring losses, how they will do over time.

It is true that in the present market, partly because of some successes, like, most dramatically, Amazon, in the past, that investors are willing to look at losses as long as sales are increasing, and hope that there will be better days ahead.

We do a quite significant percentage of our sales online in the furniture operation. That might surprise you. We do the highest percentage in Omaha.

And what's interesting is that we — I won't give you the exact numbers, but it's large — we do a significant dollar volume, but a very significant portion of that volume, people come to the store to pick up, so that they will order something from us online, but they don't seem to mind at all — and they don't have to do it — but they get a pick up at the store.

So, you know, you learn what customers like, just like people learned in fast food, you know, that people would buy a lot of food by going through a drive-in, that they don't want to stop and go into the place. We learn about customer behavior as it unfolds.

But we did do, now — on Tuesday, we did 9.2 million of — or 9.3 million of profitable volume at the Nebraska Furniture Mart. And I think that company had paid-in capital of \$2,500. And I don't think anything's been added since. So, it's working so far.

The first quarter — It's interesting — the first quarter was weak at all four of our furniture operations.

But there are certain other parts of the economy — well, just home building, generally — it's considerably below what you would've expected, considering the recovery we have had from the 2008-9 period. I mean, if you look at single-family home construction, the model has shifted more to people living in apartment rentals.

I think it's gone from 69-and-a-fraction percent. It got down to 63 percent. It's bounced up a little bit. But people are just not building — or moving to houses as rapidly as I would have guessed they would have, based on figures prior to 2008 and '09, and considering the recovery we've had, and considering the fact that money is so cheap. And that has some effect on our furniture stores.

But I think we've got a very good furniture operation, not only with the Nebraska Furniture Mart, but at other furniture operations. And we will see whether the models work over the long run.

But I think, you know, they have a reasonable chance. Some things people — we're learning that people will buy some things that they've always gone to the mall or to a retail outlet to buy, that they will do it online. And others don't work so well. Charlie?

CHARLIE MUNGER: I think that we'll do better than most furniture retailers.

WARREN BUFFETT: I think that's a certainty overall, overall. But we've got some good operations there.

But we don't want to become a showroom for the online operations and have people come and look around the place and then order someplace else. So, we have to have the right prices. And we're good at that at the Furniture Mart.

19. Pension funds should avoid "alternative" investments

WARREN BUFFETT: Station 4.

AUDIENCE MEMBER: Warren and Charlie, my name is Brent Muio. I'm from Winnipeg, Canada.

First, thank you for devoting so much time and energy to education. I'm a better investor because of your efforts. But more important, I'm a better partner, friend, son, brother, and soon-to-be first-time father.

There's nothing more important than these relationships. And my life is better, because you're willing to pass on your experience and wisdom.

My path into finance was unconventional. I worked as an engineer for 12 years, while two years ago, I began a career in finance, working for the Civil Service Superannuation Board, a \$7 billion public pension fund in Winnipeg.

I work on alternative investments, which include infrastructure, private equity, and private credit. I go to work every day knowing that I'm there to benefit the hardworking current and future beneficiaries of the fund.

Like most asset classes, alternative purchase multiples have increased. More of these assets are funded with borrowed money. And the terms and covenants on this debt are essentially nonexistent.

With this in mind and knowing the constraints of illiquid, closed-end funds, please give me your thoughts on private, alternative investments, the relevancy in public pension funds, and your view on long-term return expectations.

WARREN BUFFETT: Yeah, if you leveraged up investments in just common stocks, and you'd figured a way so that you would have staying power, if there were any market dip, I mean, you'd obviously retain extraordinary returns.

I pointed out, in my investing lifetime, you know, if an index fund would do 11 percent, well, imagine how well you would've done if you'd leveraged that up 50 percent whatever the prevailing rates were over time.

So, a leveraged investment in a business is going to beat an unleveraged investment in a good business a good bit of the time. But as you point out, the covenants to protect debtholders have really deteriorated in the business. And of course, you've been in an upmarket for businesses. And you've got a period of low interest rates. So, it's been a very good time for it.

My personal opinion is, if you take unleveraged returns against unleveraged common stocks, I do not think what is being purchased today and marketed today would work well.

But if you can borrow money, if you can buy assets that will yield 7 or 8 percent, you can borrow enough money at 4 percent or 5 percent, and you don't have any covenants to meet, you're going to have some bankruptcies. But you're going to also have better results in many cases.

It's not something that interests us at all. We are not going to leverage up Berkshire. If we'd leveraged up Berkshire, we'd have made a whole lot more money, obviously, over the years.

But both Charlie and I, probably, have seen some more high-IQ people — really extraordinarily high-IQ people — destroyed by leverage. We saw Long-Term Capital Management, where we had people who could do in their sleep math that we couldn't do, at least I couldn't do, you know, working full time at it during the day and, I mean, really, really smart people working with their own money and with years and years of experience of what they were doing.

And you know, it all turned to pumpkins and mice in 1998. And actually, it was a source of national concern, just a few hundred people. And then we saw some of those same people, after that happened to them once, go on and do the same thing again.

So, I would not get excited about so-called alternative investments. You can get all kinds of different figures. But there may be — there's probably at least a trillion dollars committed to buying, in effect, buying businesses. And if you figure they're going to leverage them, you know, two for one on that, you may have 3 trillion of buying power trying to buy businesses in — well, the U.S. market may be something over 30 trillion now — but there's all kinds of businesses that aren't for sale and that thing.

So, the supply-demand situation for buying businesses privately and leveraging them up has changed dramatically from what it was ten or 20 years ago.

And I'm sure it doesn't happen with your Winnipeg operation, but we have seen a number of proposals from private equity funds, where the returns are really not calculated in a manner than — well, they're not calculated in a manner that I would regard as honest.

And so I — it's not something — if I were running a pension fund, I would be very careful about what was being offered to me.

If you have a choice in Wall Street between being a great analyst or being a great salesperson, salesperson is the way to make it.

If you can raise \$10 billion in a fund, and you get a 1 1/2 percent fee, and you lock people up for ten years, you know, you and your children and your grandchildren will never have to do a thing, if you are the dumbest investor in the world. But —

Charlie?

CHARLIE MUNGER: Well, I think what we're doing will work more safely than what he's doing. And — but I wish him well.

WARREN BUFFETT: Yeah, Brent, you sound — actually, you sound like a guy that I would hope would be working for a public pension fund. Because frankly, most of the institutional funds, you know — well, we had this terrible — right here in Omaha — you can get a story of what happened with our Omaha Public Schools' retirement fund. And they were doing fine until the manager started going in a different direction. And the trustees here — perfectly decent people — and the manager had done OK to that point, and —

CHARLIE MUNGER: Yeah, but they are smarter in Winnipeg than they are here.

WARREN BUFFETT: Yeah. Well — (Laughter)

CHARLIE MUNGER: That was pretty bad here.

WARREN BUFFETT: It's not a fair fight, actually, usually, when a bunch of public officials are listening to people who are motivated to really just get paid for raising the money. Everything else is gravy after that.

But if you run a fund, and you get even 1 percent of a billion, you're getting \$10 million a year coming in. And if you've got the money locked up for a long time, it's a very one-sided deal.

And you know, I've told the story of asking the guy one time, in the past, "How in the world can you — why in the world can you ask for 2-and-20 when you really haven't got any kind of evidence that you are going to do better with the money than you do in an index fund?" And he said, "Well, that's because I can't get 3-and-30," you know. (Laughter)

CHARLIE MUNGER: What I don't like about a lot of the pension fund investments is I think they like it because they don't have to mark it down as much as it should be in the middle of the panics. I think that's a silly reason to buy something. Because you're given leniency in marking it down.

WARREN BUFFETT: Yeah. And when you commit the money — in the case of private equity often — you — they don't take the money, but you pay a fee on the money that you've committed.

And of course, you really have to have that money to come up with at any time. And of course, it makes their return look better, if you sit there for a long time in Treasury bills, which you have to hold, because they can call you up and demand the money, and they don't count that.

They count it in terms of getting a fee on it. But they don't count it in terms of what the so-called internal rate of return is. It's not as good as it looks. And I really do think that when you have a group sitting as a state pension fund —

CHARLIE MUNGER: Warren, all they're doing is lying a little bit to make the money come in.

WARREN BUFFETT: Yeah. Yeah, well, that sums it up. (Laughter)

20. Amazon buy doesn't mean portfolio managers aren't "value" investors

WARREN BUFFETT: Becky?

BECKY QUICK: This question is from Ken Skarbeck in Indianapolis. He says, "With the full understanding that Warren had no input on the Amazon purchase, and that, relative to Berkshire, it's likely a small stake, the investment still caught me off guard.

"I'm wondering if I should begin to think differently about Berkshire looking out, say, 20 years. Might we be seeing a shift in investment philosophy away from value-investing principles that the current management has practiced for 70 years?"

"Amazon is a great company. Yet, it would seem its heady shares ten years into a bull market appear to conflict with being fearful when others are greedy. Considering this and other recent investments, like StoneCo, should we be preparing for change in the price-versus-value decisions that built Berkshire?"

WARREN BUFFETT: Yeah. It's interesting that the term "value investing" came up. Because I can assure you that both managers who — and one of them bought some Amazon stock in the last quarter, which will get reported in another week or ten days — he is a value investor.

The idea that value is somehow connected to book value or low price/earnings ratios or anything — as Charlie has said, all investing is value investing. I mean, you're putting out some money now to get more later on. And you're making a calculation as to the probabilities of getting that money and when you'll get it and what interest rates will be in between.

And all the same calculation goes into it, whether you're buying some bank at 70 percent of book value, or you're buying Amazon at some very high multiple of reported earnings.

Amazon — the people making the decision on Amazon are absolutely as much value investors as I was when I was looking around for all these things selling below working capital, years ago. So, that has not changed.

The two people — one of whom made the investment in Amazon — they are looking at many hundreds of securities. And they can look at more than I can, because they're managing less money. And their universe — possible universes — is greater.

But they are looking for things that they feel they understand what will be developed by that business between now and Judgement Day, in cash.

And it's not — current sales can make some difference. Current profit margins can make some difference. Tangible assets, excess cash, excess debt, all of those things go into making a calculation as to whether they should buy A versus B versus C.

And they are absolutely following value principles. They don't necessarily agree with each other or agree with me. But they are very smart. They are totally committed to Berkshire. And they're very good human beings, on top of it.

So, I don't second guess them on anything. Charlie doesn't second guess me. In 60 years, he's never second guessed me on an investment.

And the considerations are identical when you buy Amazon versus some, say, bank stock that looks cheap, statistically, against book value or earnings or something of the sort.

In the end, it all goes back to Aesop, who, in 600 B.C., said, you know, that a bird in the hand is worth two in the bush.

And when we buy Amazon, we try and figure out whether the — the fellow that bought it — tries to figure out whether there's three or four or five in the bush and how long it'll take to get to the bush, how certain he is that he's going to get to the bush, you know, and then who else is going to come and try and take the bush away and all of that sort of thing. And we do the same thing.

And it really, despite a lot of equations you learn in business school, the basic equation is that of Aesop. And your success in investing depends on how well you were able to figure out how certain that bush is, how far away it is, and what the worst case is, instead of two birds being there, and only one being there, and the possibilities of four or five or ten or 20 being there.

And that will guide me. That will guide my successors in investment management at Berkshire. And I think they'll be right more often than they're wrong. Charlie?

CHARLIE MUNGER: Well I — Warren and I are a little older than some people, and —

WARREN BUFFETT: Damn near everybody. (Laughs)

CHARLIE MUNGER: And we're not the most flexible, probably, in the whole world. And of course, if something as extreme as this internet development happens, and you don't catch it, why, other people are going to blow by you.

And I don't mind not having caught Amazon early. The guy is kind of a miracle worker. It's very peculiar. I give myself a pass on that.

But I feel like a horse's ass for not identifying Google better. I think Warren feels the same way.

WARREN BUFFETT: Yeah.

CHARLIE MUNGER: We screwed up.

WARREN BUFFETT: He's saying we blew it. (Laughter)

And we did have some insights into that, because we were using them at GEICO, and we were seeing the results produced. And we saw that we were paying \$10 a click, or whatever it might've been, for something that had a marginal cost to them of exactly zero. And we saw it was working for us. So —

CHARLIE MUNGER: We could see in our own operations how well that Google advertising was working. And we just sat there sucking our thumbs. (Laughter)

So, we're ashamed. We're trying to atone. (Laughter)

Maybe Apple was atonement. (Laughter)

WARREN BUFFETT: When he says, "Sucking our thumbs," I'm just glad he didn't use some other example. (Laughter)

21. Buffett: Berkshire insurance businesses are worth more than you think

WARREN BUFFETT: OK, Jay?

JAY GELB: This question is on Berkshire's intrinsic value. Warren, in your most-recent annual letter, you discussed a methodology to estimate Berkshire's intrinsic value. However, a major component of Berkshire's value that many investors find challenging to estimate is that of the company's vast and unique insurance business.

Could you discuss how you value the company's insurance unit, based on information Berkshire provides, especially since GAAP book value is not disclosed, of the insurance unit?

WARREN BUFFETT: Well, our insurance business gives us a float that's other people's money, which we're temporarily holding, but which gets regenerated all the time, so as a practical matter, it has a very, very long life. And it's probably a little more likely to grow than shrink.

So, we have \$124 billion that people have given us. And that's somewhat like having a bank that just consists of one guy. And people come in and deposit \$124 billion and promise not to withdraw it forever.

And we've got a very good insurance business. It's taken a very long time to develop it, very long time. In fact, I think we probably have the best property-casualty operation, all things considered, in the world, that I know of, of any size. So, it's worth a lot of money.

It's probably — we think it's worth more to us, and we particularly think it's worth more while lodged inside Berkshire. We'd have a very, very high value on that. I don't want to give you an exact number, because I don't know the exact number. And any number I would have given you in the past would've turned out to be wrong, on the low side.

We have managed to earn money on money that was given to us for nothing and have (inaudible) earnings from underwriting and then have these large earnings from investing. And it's an integral part of Berkshire.

There's a certain irony to insurance that most people don't think about. But if you really are prepared, and you have a diversified property-casualty insurance business — a lot of property business in it — if you're really prepared to pay your claims under any circumstances that come along in the next hundred years, you have to have so much capital in the business that it's not a very good business.

And if you really think about a worst-case situation, the reinsurance — that's insurance you buy from other people, as an insurance company, to protect you against the extreme losses, among other things — that reinsurance probably — could likely be — not good at all.

So, even though you'd think you're laying off part of the risk, if you really take the worst-case examples, you may well not be laying off the risk. And if you keep the capital required to protect against that worst-case example, you'll have so much capital in the business that it isn't worthwhile.

Berkshire is really the ideal form for writing the business. Because we have this massive amount of assets that, in many cases, are largely uncorrelated with natural disasters. And we can — we don't need to buy reinsurance from anybody else. And we can use the money in a more efficient way than most insurance companies.

It's interesting. The three — In the last 30 years, the three largest reinsurance companies — and I'm counting Lloyd's as one company — although it isn't — it's a group of brokers assembled in — underwriters assembled at a given location. But people think of Lloyd's as a

massive reinsurance market, which it is, not technically one entity. But if you take the three largest companies — and they're all in fine shape now, they're first-class operations — but all three of them came close to extinction sometime in the last 30 years, or reasonably close.

And we didn't really have any truly extraordinary natural catastrophes. The worst we had was Katrina in, whatever it was, 2006 or thereabouts, 2005. But we didn't have any worst-case situation. And all three of those companies, which everybody looks at as totally good on the asset side, if you show a recoverable from them, two of the three actually made some deals with us to help them in some way. And they're all in fine shape now.

But it's really not a good business if you keep your — as a standalone insurer — if you keep enough capital to really be sure you can pay anything that comes along, under any kind of conditions.

And Berkshire can do that. And it can use the money in ways that it likes to use.

So, it's a very valuable asset. I don't want to give you a figure on it. But we would not sell it. We certainly wouldn't want to sell it for its float value. And that float is shown on the balance sheet as a liability. So, it's extraordinary.

And it's taken a long time to build. It'd be very, very, very hard for anybody to — I don't think they could build anything like it. It just takes so long.

And we continue to plow new ground. If you went in the next room, you would've seen something called "THREE," which is our movement toward small and medium business owners for commercial insurance. And there's an online operation.

And it will take all kind — we'll do all kinds of mid-course adjusting and that sort of thing — and we've only just started up in four states.

But we'll, you know — ten or 20 years from now, that will be a significant asset of Berkshire, just like Geico has grown from two and a fraction billion of premium to, you know, who knows, but well into the mid-30 billion, just with Tony Nicely. And when I said, in the annual report, that Tony Nicely, who's here today —

CHARLIE MUNGER: Warren, is there anybody in the world who has a big casualty insurance business that you'd trade our business for theirs?

WARREN BUFFETT: Yeah, oh, no, it's taken a long time. And it's taken some tremendous people. And Tony Nicely has created more than 50 billion — with his associates, and he's got 39,000 of them, probably more now, because he's growing this year — he's created more than \$50 billion at GEICO — of value — for Berkshire. (Applause)

CHARLIE MUNGER: It's pretty much what you'd expect. It's such an easy business, taking in money now in cash and just keeping the books and giving a little of it back.

There's a lot of stupidity that gets into it. And if you're not way better than average at it, you're going to lose money in the end. It's a mediocre business for most people. And it's good at Berkshire only because we're a lot better at it. And if we ever stop being a lot better at it, it wouldn't be safe for us, either.

WARREN BUFFETT: And Ajit Jain has done a similar thing. He's done it in a variety of ways within the insurance business. But I would not want to undo — somebody would have to give me more than \$50 billion to undo everything he has produced for Berkshire.

And he walked into my office on a Saturday in the mid-1980s. He'd never been in the insurance business before. And I don't think there's anybody in the insurance world that doesn't wish that he'd walked into their office instead of ours, at Berkshire. It's been extraordinary. It's truly been extraordinary.

But we have Tom Nerney. We have Tim Kenesey at MedPro. We have Tom Nerney at U.S. Liability.

We have — at GUARD Insurance — we only bought that a few years ago, and that's a terrific operation. It's based in Wilkes-Barre, Pennsylvania. Who would expect to find a great insurance operation in Wilkes-Barre?

But we've got a great insurance — really great — insurance operation right here in Omaha, about two miles from here. And it was bought by us in 1967. And you know, it changed Berkshire. We built on that base.

We've got a — we really got a great insurance business. And I won't give you a number, but it's probably a bigger number than you've got in your head for — and it's worth more within Berkshire than it would be worth as an independent operation.

Somebody can say, "Well, this little gem, if it was put out there, would sell at a higher multiple," or something of the sort. It works much better as being part of a whole, where we have had two tiny operations — two tiny insurance operations — many, many years ago. And they both went broke. The underwriting was bad. But we paid all the claims. We did not walk away. We paid every dime of claims.

And nobody worries about doing any kind of financial transaction with Berkshire. And you know that today — on Saturday — about 9 in the morning, I got a phone call. And we made a deal the next day committing Berkshire to pay out \$10 billion, come hell or high water, no outs for, you know, material adverse change or anything like that. And people know we'll be there with \$10 billion.

And they know, in the insurance business, when we write a policy that may come — be payable during the worst catastrophe in history, or may be payable 50 years from now, they know Berkshire will pay. And that's why we've got \$124 billion of float.

22. “Don't go overboard on delayed gratification”

WARREN BUFFETT: OK, station 5.

AUDIENCE MEMBER: Hey, Warren and Charlie. I'm Neil Nerrono (PH). I'm 13 years old and from San Francisco.

I feel like I see you in our living room a lot. My dad is constantly playing these videos of you at these meetings. And he teaches me a lot of lessons about you guys. But many of them require the delayed gratification skill. (Laughter)

I want to know, is there any way that kids can develop the delayed gratification skill? (Laughter and applause)

CHARLIE MUNGER: I'll take it, if you want me to, Warren.

WARREN BUFFETT: Go to it.

CHARLIE MUNGER: I'll take that, because I'm a specialist in delayed gratification. I've had a lot of time to delay it. (Laughter)

And my answer is that they sort of come out of the womb with the delayed gratification thing, or they come out of the womb where they have to have everything right now. And I've never been able to change them at all. So, we identify it. We don't train it in.

WARREN BUFFETT: Charlie's had eight children, so he's become more and more of a believer in nature versus nurture. (Laughter)

CHARLIE MUNGER: You'll probably see some nice, old woman of about 95 out there, in threadbare clothing. And she's delaying gratification right to the end and probably has 4,000 A shares. (Laughter)

It's just these second- and third-generation types that are buying all the jewelry.

WARREN BUFFETT: It's interesting. If you think about — we'll take it to a broader point. But if you think of a 30-year government bond paying 3 percent, and you allow for, as an individual, paying some taxes on the 3 percent you'll receive, and you'll have the Federal Reserve Board saying that their objective is to have 2 percent inflation, you'll really see that delayed gratification, if you own a long government bond, is that, you know, you get to go to Disneyland and ride the same number of rides 30 years from now that you would if you did it now.

The low interest rates, for people who invest in fixed-dollar investments, really mean that you really aren't going to eat steak later on if you eat hamburgers now, which is what I used to preach to my wife and children and anybody else that would listen, many years ago. (Laughs)

So, it's — I don't necessarily think that, for all families, in all circumstances, that saving money is necessarily the best thing to do in life. I mean, you know, if you really tell your kids they can — whatever it may be — they never go to the movies, or we'll never go to Disneyland or something of the sort, because if I save this money, 30 years from now, you know, well, we'll be able to stay a week instead of two days.

I think there's a lot to be said for doing things that bring you and your family enjoyment, rather than trying to save every dime.

So, I — delayed gratification is not necessarily an unqualified course of action under all circumstances. I always believed in spending two or three cents out of every dollar I earn and saving the rest. (Laughter)

But I've always had everything I wanted. I mean, one thing you should understand, if you aren't happy having \$50,000 or a hundred-thousand dollars, you're not going to be happy if you have 50 million or a hundred million.

I mean, a certain amount of money does make you feel — and those around you — feel better, just in terms of being more secure, in some cases.

But loads and loads of money — I probably know as many rich people as just about anybody. And I do not — I don't think they're happier because they get super rich. I think they are happier when they don't have to worry about money.

But you don't see a correlation between happiness and money, beyond a certain place. So, don't go overboard on delayed gratification. (Applause)

23. Munger on succession: "You're just going to have to endure us"

WARREN BUFFETT: Andrew?

ANDREW ROSS SORKIN: This question comes from a shareholder of yours for more than 20 years, who asked to remain anonymous, but wanted me to start by saying, "Warren and Charlie, I want to preface this question by saying it comes from a place of love for both of you and the beautiful painting you've drawn for us in the form of Berkshire."

WARREN BUFFETT: But. (Laughter)

ANDREW ROSS SORKIN: "Now, please update us on succession planning. And as you think about succession, would you ever consider having Greg (Abel) and Ajit (Jain) join you onstage at future

annual meetings and allow us to ask questions of them and Ted and Todd, as well, so we can get a better sense of their thinking?”

WARREN BUFFETT: That’s probably a pretty good idea. And we’ve talked about it. (Applause)

We have Greg and Ajit here. And any questions that anybody wants to direct to them, it’s very easy to move them over.

So, we thought about having four of us up here. And this format is not set in stone at all.

Because you — I can tell you that, actually, the truth is, Charlie and I are afraid of looking bad. Those guys are better than we are. (Laughs)

You could not have two better operating managers than Greg and Ajit. I mean, they are — it is just fantastic, what they accomplished.

They know the businesses better. They work harder, by far. And you are absolutely invited to ask questions to be directed over to them at this meeting. I don’t think —

Yeah, this format will not be around forever. And if it’s better to get them up on the stage, we’ll be happy to do it.

Ted (Weschler) and Todd (Combs), they’re basically not going to answer investment questions. We regard investment decisions as proprietary, basically. They belong to Berkshire. And we are not an investment advisory organization. So, that is counter to the interests of Berkshire for them to be talking about securities they own. It’s counter to the interests of Berkshire for Charlie or me to be doing it.

We’ve done better because we don’t publish every day what we’re buying and selling. I mean, if somebody’s working on a new product at Apple, or somebody’s working on a new drug or they’re assembling property or something of the sort, they do not go out and tell everybody in the world exactly what they’re doing every day.

And we’re trying to generate ideas in investment. And we do not believe in telling the world what we’re doing every day, except to the extent that we’re legally required. But it’s a good idea. Charlie?

CHARLIE MUNGER: Well, one of the reasons we have trouble with these questions is because Berkshire is so very peculiar. There’s only one thing like it.

We have a different kind of unbureaucratic way of making decisions. There aren’t any people in headquarters. We don’t have endless committees deliberating forever and making bad decisions. We just — we’re radically different. And it’s awkward being so different. But I don’t

want to be like everybody else, because this has worked better. So, I think you're just going to have to endure us. (Laughter and applause)

WARREN BUFFETT: We do think that it's a huge corporate asset, which may only surface very occasionally and depending very much on how the world is around us. But to be the one place, I think, in the world, almost, where somebody can call on a Saturday morning and meet on Sunday morning and have a \$10 billion commitment.

And nobody in the world doubts whether that commitment will be upheld. And it's not subject to any kind of welching on the part of the company that's doing it. It's got nothing involved over than Berkshire's word. And that's an asset that, every now and then, will be worth a lot of money to Berkshire. And I don't really think it will be subject to competition.

So — and Ted and Todd, in particular, are an additional pipeline, and have proven to be an additional pipeline, in terms of facilitating the exercise of that ability. I mean they — things come in through them that, for one reason or another, I might not hear about otherwise.

So, they have expanded our universe. In the markets we've had in recent years, that hasn't been important. I can see periods where they would be enormously valuable. Just take the question that was raised by the fellow from Winnipeg about weak covenants and bonds.

I mean, we could have a situation — who knows when, who knows where, or who knows whether — but we could have a situation where there could be massive defaults in the junk-bond-type market. We've had those a couple times. And we made a fair amount of money off of them.

But Ted and Todd would multiply our effectiveness in a big way, if such a period comes along, or some other types of periods come along. They are very, very, very useful to Berkshire.

The call happened to come in on Friday from Brian Moynihan, CEO of Bank of America. And he's done an incredible job. But we have a better chance of getting more calls and having them properly filtered and everything — appropriately filtered — the next time conditions get chaotic than we did last time. And that's important.

Charlie?

CHARLIE MUNGER: Well, I do think it's true that if the world goes to hell in a hand basket, that you people will be in the right company. We've got a lot of cash and we know how to behave well in a panic. And if the world doesn't go to hell, are things so bad now?

24. Munger invited to happy hour by the bitcoin people

CHARLIE MUNGER: And I also want to report that your vice chairman is getting new social distinction.

I've been invited during this gathering to go to a happy hour put on by the bitcoin people. (Laughter)

And I've tried to figure out what the bitcoin people do in their happy hour, and I finally figured it out. They celebrate the life and work of Judas Iscariot. (Laughter)

CHARLIE MUNGER: Is your invitation still good? (Laughter)

WARREN BUFFETT: Bitcoin — actually — on my honeymoon in 1952, my bride, 19, and I, 21 — stopped in Las Vegas. We just got in — my aunt Alice gave me the car and said, "Have a good time," and we went west.

So, we stopped in the Flamingo, and I looked around, and I saw all of these well-dressed — they dressed better in those days — well-dressed people who had come, in some cases, from thousands of miles away. And this was before jets, so transportation wasn't as good.

And they came to do something that every damn one of them knew was mathematically dumb. And I told Susie, I said, "We are going to make a lot of money." (Laughter)

I mean, imagine people going to stick money on some roulette number with a zero and a double-zero there and knowing the percent. They all could do it, and they — they just do it. And I have to say, bitcoin has rejuvenated that feeling in me. (Laughter)

25. Berkshire will probably increase stakes above 10% if regulations are eased

WARREN BUFFETT: OK, Gregg?

GREGG WARREN: Warren and Charlie. While I understand Berkshire's need to trim its stake in Wells Fargo and any other banks you hold, each year, in order to bring Berkshire's ownership stake below the 10 percent threshold required by the Federal Reserve for bank holdings, given the ongoing share repurchase activity that's taking place in the industry.

I was kind of surprised, though, to see you move to trim all of your holdings, where possible, on a regular basis to eliminate the regulatory requirements that come with ownership levels above 10 percent, which in my view limits the investment universe that Berkshire, or at least Warren, can meaningfully invest in longer term, given that Warren manages a large chunk of Berkshire's \$200 billion equity portfolio.

Could you elaborate more on the regulatory impact for Berkshire of holding more than 10 percent of any company's stock, as well as how you feel about the Fed's recent proposal to allow investors like Berkshire to own up to 25 percent shares of a bank without triggering more restrictive rules and oversight?

Basically, if that proposal were to come to fruition, would you be willing to forego that 10 percent threshold self-imposed that you've done, and put money to work in names that you're already fairly comfortable with?

WARREN BUFFETT: Yeah, the 10 percent, there's a couple reasons —

CHARLIE MUNGER: That's the right answer. Yeah. (Laughter)

WARREN BUFFETT: We will — there's two factors beyond in the case of banks. There's the Federal Reserve requirement there. But many people probably don't even — might not know about this, but if you own over 10 percent of a security — common stock — and you sell it within six months at a profit, you give the money over to the company, the short-swing profit that you give them.

And you match your — any sale against your lowest purchase. And I think if you sell it and then buy it within six months — I'm not as positive about that, because I haven't reread the rule for a lot of years. But I think if you sell and then buy within six months, and the purchase is below the price at which you made the sale, you owe the money to the company.

There used to be lawyers that would scan that monthly SEC report that I used to get 30 or 40 years ago. They would scan it to find people that inadvertently had broken that rule, and they would get paid a fee for recovering it for the company.

So, it restricts enormous — it restricts significantly your ability to reverse a position or change your mind or something of the sort.

Secondly, I think you have to report within two or three business days every purchase you make once you're in that over 10 percent factor. So, you're advertising to the world, but the world tends to follow us some, so it really — it has a huge execution cost attached to it.

Nevertheless — and those are both significant minuses, and they're both things that people generally don't think about.

We did go over recently, for example, in Delta Airlines, that was actually an accident, but I don't mind the fact at all that we did.

And if the Federal Reserve changes its approach, we won't have to trim down below that. We don't want to become a bank holding company and we don't want to —

We went in many years ago and got permission with Wells, but then our permission expired, and we went in again a few — a couple years ago. And we spent a year or so, and there were just a million questions that Wells got asked about us and so on.

So, it's been a deterrent. It'll be less of a deterrent in the future, but it does have those two —

The short-swing thing is less onerous to us than it would be to most people who buy and sell stocks, because we don't really think in terms of doing much.

CHARLIE MUNGER: But if we didn't have all these damn rules, we would cheerfully buy more, wouldn't we?

WARREN BUFFETT: Sure, sure. Well, any time we buy we do it cheerfully, but —

Yeah. And we will — you'll probably see us at more than 10 percent in more things. And if the Fed should change its rules, there will be companies where we drift up over 10 percent simply because they're repurchasing their shares. That's been the case with Wells, and it's been the case with an airline or two in the last year or so.

So, if we like 9.5 percent of a company, we'd like 15 percent better, and you may see us behave a little differently on that in the future.

CHARLIE MUNGER: Well, one more awkward disadvantage of being extremely rich.

WARREN BUFFETT: Yeah. (Laughter)

And it really is. Yeah, and people following you. I mean, the followers problem can be a real problem.

26. Money managers need to set expectations for their investors

WARREN BUFFETT: OK, station 6.

AUDIENCE MEMBER: Hi. I'm Jeff Malloy (PH) from San Francisco. And this is my first shareholders meeting.

Mr. Buffett and Mr. Munger, I'm 27 years old and aspire to be a great money manager like you two one day.

I'm considering starting my own investment fund, but I also recognize that I am young and have a lot to learn. My question to both of you is, how did you know you were ready to manage other people's money? And what general advice would you give to someone in my shoes? Thank you.

WARREN BUFFETT: Well, that's a very interesting question, because I've faced that. And I sold securities for a while, but in May of 1956, I had a number of members of my family — I'd come back from New York, and they wanted me to help them out with stocks as I had earlier before I'd taken a job in New York. And I said, I did not want to get in the stock sales business, but I wanted to — I enjoyed investing. I was glad to figure out a way to do it, which I did through a partnership form.

But I would not have done that, if I thought there was any chance, really, that I would lose the money.

And what I was worried about was not how I would behave, but how they would behave, because I needed people who were in sync with me. So, when we sat down for dinner in May of 1956 with seven people who either were related to me, or one was a roommate in college and his mother.

And I showed them the partnership agreement, and I said, “You don’t need to read this.” You know, there’s no way that I’m doing anything in the agreement that is any way that — you know, you don’t need a lawyer to read it or anything of the sort.

But I said, “Here are the ground rules as to what I think I can do and how I want to be judged, and if you’re in sync with me, I want to manage your money, because I won’t worry about the fact that you will panic if the market goes down or somebody tells you to do something different. So, we have to be on the same page.”

“And if we’re on the same page, then I’m not worried about managing your money. And if we aren’t on the same page, I don’t want to manage your money, because you may be disappointed when I think that things are even better to be investing and so on.”

So, I don’t you want to manage other people’s money until you have a vehicle and can reach the kind of people that will be in sync with you. I think you ought to have your own ground rules as to what your expectations are, when they should you roses and when they should throw bricks at you.

And you want to be on the same — and that’s one reason I never — we didn’t have a single institution in the partnership, because institutions meant committees, and committees meant that —

CHARLIE MUNGER: You had some aunts that trusted you.

WARREN BUFFETT: What’s that?

CHARLIE MUNGER: You had some aunts who trusted you.

WARREN BUFFETT: Yeah, well, and a father-in-law who gave me everything he had in the world, you know. And I didn’t mind taking everything he had in the world, as long as he would stick with me and wouldn’t get panicked by headlines and that sort of thing.

And so, it’s enormously important that you don’t take people that have expectations of you that you can’t meet. And that means you turn down a lot of people. It means you probably start very small, and you get an audited record.

And when you've got the confidence, where if your own parents came to you and they were going to give you all their money, and you were going to invest for them, I think that's the kind of confidence that you'll say, "I may not get the best record, but I'll be sure that you get a decent record over time," that's when you're ready to go on the —

CHARLIE MUNGER: Let me tell you story that I tell young lawyers who frequently come to me and say, "How can I quit practicing law and become a billionaire instead?" (Laughter)

So, I say, well, it reminds me of a story they tell about Mozart. A young man came to him, and he said, "I want to compose symphonies. I want to talk to you about that."

And Mozart said, "How old are you?" And the man said, "Twenty-two." And Mozart said, "You're too young to do symphonies." And the guy says, "But you were writing symphonies when you were ten years old." He says, "Yes, but I wasn't running around asking other people how to do it." (Laughter)

WARREN BUFFETT: Carol?

We wish you well. (Laughter)

And we, and actually, we really do, because the fact you asked that sort of a question is to some extent indicative of the fact you got the right attitude going in.

CHARLIE MUNGER: It isn't that easy to be a great investor. I don't think we'd have made it.

27. Berkshire doesn't have to disclose most foreign stock holdings, so it doesn't

CAROL LOOMIS: This question is from Franz Traumburger (PH) of Austria and his son, Leon, who are both Berkshire shareholders. And it's interesting to me that in the years we've been doing this, nobody has ever asked this question, as far as I know.

Their question is, "Mr. Buffett, I believe it is correct that in its SEC filings — that is the Securities and Exchange Commission — Berkshire does not have to give information about foreign stocks it holds.

"Assuming we hold foreign stocks, could you please tell us what our five largest positions are?"

WARREN BUFFETT: No, the fellow wants investment information. We really aren't in the investment information business. We disclose what we have to disclose, but we could set up an investment advisory firm and probably take in a lot of money, but we haven't done it. And we aren't giving away what belongs to our shareholders for nothing.

But he's correct that — I'm 99 percent sure he's correct, and Marc Hamburg can correct me from our office — but we do not have to report foreign stocks.

And we do have — in certain important countries, there's lower thresholds at which we have to report our holdings, as a percentage of the company stock outstanding — there's lower thresholds than there are in the United States.

So, in a sense — in certain stocks. I think when we bought Munich Re stock or bought Tesco stock, or there are certain stocks we've had to report at — before we would have had to report in the United States.

But we will never unnecessarily advise if we plan to buy some land some place, if we plan to develop a business — we are not about giving business information that's proprietary to Berkshire. We don't give it unless we're required by law.

And he is correct that, I'm virtually certain that we do not have to report our foreign stocks on the SEC filings. And he'll have to find his own holdings in Austria.

But I think this Mozart story may have encouraged that particular question from Austria, what stocks we're going to own in Austria. OK, Charlie, do you have any comments on that?

CHARLIE MUNGER: No.

WARREN BUFFETT: No, I didn't think you would. (Laughs)

28. Buffett expects Precision Castparts earnings will “improve fairly significantly”

WARREN BUFFETT: Jonny?

JONATHAN BRANDT: Precision Castparts' pre-tax profit margins, while perfectly fine relative to American industry as a whole, continue to be almost 10 percentage points below where they were in the years preceding the acquisition. And I'm guessing they're lower than contemplated when the purchase price was determined.

The annual report hints that unplanned shutdowns, the learning curve on new plane models, and a shift of oil and gas capacity to aerospace, might all be temporarily depressing margins. But it's unclear what a reasonable, long-term margin expectation is for this unit.

Now, I know you won't want to issue a specific margin target or forecast, but I do have a question that I hope you can answer.

Is the downward trend in earning since 2015 mostly due to these transitory items, or have the competitive structure of the industry and Precision's relationship with its customers changed to the point that meaningful increases from current margin levels are probably unlikely?

WARREN BUFFETT: Yeah. Your prelude is quite correct. I mean, they are below what we projected a few years ago. And my expectation — but I would have told you this a year ago — and they have improved somewhat.

My expectation is, based on the contracts we have and the fact that the initial years in anything in the aircraft industry, for example, tend to be less profitable as you go further down the learning curve and the volume curve, tend to be lower in the near-term. My expectation is that the earnings of Precision will improve fairly significantly.

And I think I mentioned maybe to you last year, in those earnings, there is about \$400 million a year of purchase amortization, which are economic earnings in my viewpoint.

So — but even including that 400 million a year, which they would be reporting if they were independent, and we don't report, because we bought them and there's a purchase amortization charge. Even without that, they are below what I would anticipate by a fair margin within a year or two. That's the present expectation on my part. Charlie?

CHARLIE MUNGER: No, I don't have anything.

WARREN BUFFETT: You'll have that question for me next year, and I think I'll be giving you a different answer.

29. The older you get, the better you understand human behavior

WARREN BUFFETT: OK, station 7.

AUDIENCE MEMBER: Good morning Mr. Buffett, Mr. Munger. My name is JC. (PH) I am 11 years old, and I came from China. This is my second year at the meeting.

Mr. Munger, it's great to see you again after the Daily Journal meeting in February.

Mr. Buffett, you mentioned that the older you get, the more you understood about human nature. Could you elaborate more about what you've learned, and how can the differences of human nature help you make a better investment? I would also like Mr. Munger to comment on that, please. Thank you very much. (Applause)

WARREN BUFFETT: You should wait for Charlie's answer, because he's even older. (Laughter)

He can tell you more about being old than I can even.

It's absolutely true that virtually any yardstick you use, I'm going downhill. And, you know, if I would take an SAT test now, and you could compare it to a score of what I was in my early 20s, I think it'd be quite embarrassing. (Laughs)

And Charlie and I can give you a lot of examples, and there's others we won't tell you about how things decline as you get older.

But I would say this. It's absolutely true in my view that you can and should understand human behavior better as you do get older. You just have more experience with it. And I don't think you can read — Charlie and I read every book we could on every subject we were interested in, you know, when we were very young. And we learned an enormous amount just from studying the lives of other people.

And — but I don't think you can get to be an expert on human behavior at all by reading books, no matter what your I.Q. is, no matter who the teacher is. And I think that you really do learn a lot about human behavior. Sometimes you have to learn it by having multiple experiences.

I actually think I, despite all the other shortcomings — and I can't do mental arithmetic as fast as I used to, and I can't read as fast as I used to.

But I do think that I know a lot more about human behavior than I did when I was 25 or 30 —

CHARLIE MUNGER: I'll give you — do you want one mantra? It comes from a Chinese gentleman who just died, Lee Kuan Yew, who was the greatest nation builder probably that ever lived in the history of the world.

And he said one thing over and over and over again all his life. "Figure out what works, and do it." If you just go at life with that simple philosophy from your own national group, you will find it works wonderfully well. Figure out what works, and do it.

WARREN BUFFETT: And figuring out what works means figuring out how other people —

CHARLIE MUNGER: Of course.

WARREN BUFFETT: — behave.

CHARLIE MUNGER: Of course.

WARREN BUFFETT: And Charlie and I have seen the extremes in human behavior, in so many unexpected ways.

CHARLIE MUNGER: Now we get it every night, extremes in human behavior. All you got to do is turn on the television.

WARREN BUFFETT: Yeah. I'm glad he used that example. (Laughter)

30. Ajit Jain on pricing unconventional insurance contracts

WARREN BUFFETT: OK, Becky?

BECKY QUICK: Warren, you mentioned, in response to an earlier question, that Ajit (Jain) and Greg (Abel) are both here to answer questions, and so I thought I'd ask this question that comes from Will in Seattle. He says, his question is for Mr. Ajit Jain and Mr. Warren Buffett.

"You have said that you communicate regularly about unconventional insurance contracts that expose the company to extremely unlikely but highly costly events. I'm curious about how you think about and safely price these unconventional insurance contracts. What analyses and mental checks do you run through your head, to make sure that Berkshire Hathaway will profit without being unduly exposed to catastrophic risk?"

"Furthermore, Mr. Buffett, would you want a future CEO to continue a similarly close collaboration with the chief underwriter?"

WARREN BUFFETT: We will get a microphone to Ajit and a spotlight in just a second. And there he is.

Ajit, why don't you answer first, if you'd like to?

AJIT JAIN: Hi. Obviously, the starting point, I mean, these situations where there's not enough data to hang your hat on, it's more of an art than a science.

We start off with as much science as we can use, looking at historical data that relates to the risk in particular, or something that comes close to relating to the risk that we're looking at.

And then beyond that, if there's not enough historical data we can look at, then clearly, we have to make a judgment in terms of, what are the odds of something like that happening?

We try — we absolutely, in situations like that, we absolutely make sure we cap our exposure. So, that if something bad happens or we've got something wrong, we absolutely know that how much money we can lose and whether we can absorb that loss without much pain to the income statement or the balance sheet.

In terms of art, it's a difficult situation. More often than not, it's impossible to have a point of view, and we end up passing on it.

But every now and then, we think we can get a price where the subjective odds we have of something like that happening has a significant margin of safety in it. So, we feel it's a risk that's worth taking.

Then finally, the absolute acid test is, I pick up the phone and call Warren. "Warren, here's a deal. What do you think?" (Laughter) OK. Your turn, Warren.

WARREN BUFFETT: OK. (Applause)

CHARLIE MUNGER: It's not easy, and you wouldn't want just anybody doing it for you.

WARREN BUFFETT: No, no. In fact, the only one I would want doing it for us on the kind of things we have sometimes received is Ajit. I mean, it's that simple. There isn't anybody like him.

And as Ajit said, we'll look at a worst case, but we are willing, if we like the odds, and like you say, there's no way to look these up.

We can tell you how many 6.0 or greater earthquakes have happened in the last hundred years in Alaska or California or so on. And there's a lot of things you can look up figures on. Sometimes those are useful, and sometimes they aren't. But there's a lot where you can get a lot of data.

And then there's others that — well, after 9/11, you know, was that going to be the first of several other attacks that were going to happen very quickly? There were planes flying that couldn't — well they couldn't land in Hong Kong, as I remember. I think it was Cathay Pacific couldn't land in Hong Kong the following Monday unless they had a big liability coverage placed with somebody.

I mean, the world had to go on. The people that held mortgages on the Sears Tower all of a sudden wanted coverage. — I think that actually was one — but they were just pouring in, of people that hadn't been worried about something a week earlier, and now they were worried about things involving huge sums.

And there were really only a couple people in the world that would even listen and had the capacity to take on a lot of the deals we were proposed. And there's no book to look up. So, you do — there's a big element of judgment.

Ajit and I — I mean, Ajit's a hundred times better at this than I am, but we do tend to think alike on this sort of thing. You don't want to think too much alike, but we think alike. I've got a willingness to lose a lot of money.

And most, well, virtually every insurance company if they get up to higher limits, they've got treaties in place, and they can only take this much. So, the world was paralyzed on that.

We don't get those, but now obviously. But we do occasionally get inquiries about doing things that really nobody else in the world can do. It's a little like our investment situation, only transferred over to insurance. We don't build a business around it, but we are ready when the time comes.

And Ajit is an asset that no other company in the world has. And we work him. And we actually enjoy a lot talking to each other about these kind of risks, because he'll ask me to think about

what the price should be. And he'll think about — we don't tell each other ahead of time. And then I'll name it, and then he'll say, "Have you lost your mind, Warren?" (Laughs)

And then he'll point something out to me that I've overlooked. And it's a lot of fun, and it's made us a lot of money.

And the shareholders of Berkshire Hathaway are extraordinarily lucky. You can't hire people like Ajit. I mean, you get them once in a lifetime. Charlie?

CHARLIE MUNGER: I don't think we helped him very much. It's really difficult.

WARREN BUFFETT: There will be a time when — I mean, I probably won't be around then — but there will be a time occasionally, just like in financial markets, when things are happening in the insurance world, and basically, Berkshire will be the only one — virtually the only one — people turn to.

CHARLIE MUNGER: But in the past, Ajit, talking to you, has added more than \$50 billion to the balance sheet at Berkshire, by making these oddball calls.

WARREN BUFFETT: And if he hadn't talked to me, it'd be probably 49.9 billion, you know? (Laughs)

But you don't want to try — don't try this at home.

CHARLIE MUNGER: Yeah, that doesn't mean it's easy.

WARREN BUFFETT: No. And it's not very teachable.

CHARLIE MUNGER: No, it isn't very teachable, you're right.

WARREN BUFFETT: No, it is not something that Berkshire has some secret formula someplace for it. It basically is a very unusual talent with Ajit, and —

CHARLIE MUNGER: We're not holding anything back. It's hard.

31. Despite Kraft Heinz problems, Berkshire could partner with 3G again

WARREN BUFFETT: OK, Jay? (Applause)

JAY GELB: This question is on Berkshire's relationship with 3G Capital. Kraft Heinz's recent challenges have raised questions about whether Berkshire's partnership with 3G has become a weakness for Berkshire.

Warren, what are your thoughts on this? And would Berkshire be open to partnering again with 3G in a major acquisition?

WARREN BUFFETT: Yeah, they are our partners, and we joined them. We had a one-page agreement, which I haven't even actually ever reread. I mean, Jorge Paulo, I mean, is a good friend of mine. I think he's a marvelous human being. And I'm pleased that we are partners. It's conceivable that something would come up.

They have more of a taste for leverage than we do, and they probably have more of a taste for paying up, but they also are, in certain types of situations, they'd be way better operators than we would.

I mean, they go into situations that need improvement, and they have improved them. But I think both they and we, I know we did underestimate, not what the consumer is doing so much, but what the retailer is.

And at See's Candy, we sell directly to the consumer, but at Kraft Heinz, they're intermediaries. And those intermediaries are trying to make money. We're trying to make money.

And the brand is our protection against the intermediaries making all the money.

Costco tried to drop Coca-Cola back in, I think 2008, and you can't drop Coca-Cola, you know, and not disappoint a lot of customers.

Snickers bars are the number one candy that Mars makes. And they've been number one for 30 or 40 years. And if you walk into a drugstore, and the guy says, "The Snickers are 75 cents or whatever it might be, and I've got this special little bar my wife and I make in the back of the store, and it's only 50 cents, and it's just as good," you don't buy it, you know. When you're at some other place the next time, you buy the Snickers bar.

So, brands can be enormously valuable, but many of the brands are dependent, most of them — Geico is not, Geico goes directly to the consumer. If we save the consumer money on insurance, they're going to buy it from us.

And our brand, you know — and we'll spend well over a billion and a half on advertising this year, and you think, my God, we started this in 1936, and we were saying the same thing then about saving 15 percent in 15 minutes or something of the sort — not exactly the same — but that brand is huge, and we have to come through on the promise we give, which is to save people significant money on insurance — a great many people. That brand is huge, and we're dealing directly with the consumer.

And when you're selling Kool-Aid or ketchup or, you know, Heinz 57 sauce or something, you are going through a channel, and they would — the phrase was used earlier today. You know,

our gross margin is their opportunity, and we think that the ultimate consumer is going to force them to have our product, and that we will get the gross margin.

And that fight, that tension, has increased in the last five years and I think is likely to increase the next five or ten years. And Charlie is a director of a company that has caused me to think a lot about that subject. Charlie?

CHARLIE MUNGER: Well. What I think is interesting about the 3G situation, it was a long series of transactions that worked very well, and finally there was one transaction at the end that didn't work so well.

That is a very normal outcome of success in a big place with a lot of young men who want to get rich quick. And it just happens again and again. And you do want to be careful.

It's so much easier to take the good ideas and push them to wretched excess.

WARREN BUFFETT: Yeah, that is — no idea is good at any price, and the price settlement is probably something that we worry more about generally than our partners, but we are their partners in Kraft Heinz. And it's not at all inconceivable that we could be partners in some other transaction in the future.

32. Buffett's not worried about strength of Kraft Heinz's brands

WARREN BUFFETT: OK. Station 8.

AUDIENCE MEMBER: Hello Warren and Charlie. Consumer tastes are changing. I think if we asked how many people here in the arena have eaten Velveeta cheese in the last year or so, there'd be only a small handful, maybe more for Jell-O.

3G's playbook of cutting R&D looks to have stifled new product development amidst changing preferences.

So, here's my question. Why continue to hold when the moat appears to be dry? Or do you think it is filling back up?

CHARLIE MUNGER: Well, I don't think the problem was that they cut research or something. I think the problem was, they paid a little too much for the last acquisition.

WARREN BUFFETT: That Jell-O — I can't give you the exact figures. There are certain brands that may be declining 2 percent a year or 3 percent a year in unit sales, and there's others that are growing 1 or 2 percent. There's not dramatic changes taking place at all. I mean, Kraft Heinz is earning more money than Kraft and Heinz were earning six or seven years ago.

I mean, and the products are being used in a huge way. Now it's true that certain — that there are always trends going to some degree, but they have not fallen apart, remotely. And they have widened the margin somewhat.

But it is tougher, in terms of the margin and the price negotiations, probably to go through to the actual consumer. It's become a somewhat tougher passageway for all food companies, than it was ten years ago. It's still a terrific business.

I mean, you know, you mentioned Jell-O or Velveeta. Charlie worked at my grandfather's grocery store in 1940, I worked there in '41. And they were buying those products then, and they buy the products now. The margins are still very good. They earn terrific returns on invested capital. But we paid too much in the case of Kraft.

You can pay too much for a growing brand. I mean, you can pay way too much for a growing brand, probably be easier to be sucked into that. So, I basically don't worry about the brands.

A certain number are very strong, and a certain number are declining a bit. But that was the case 10 years ago. It'll be the case 10 years from now. There's nothing dramatic happening in that.

33. Buffett's biggest problem with Apple is the stock keeps going up

WARREN BUFFETT: OK, we'll take one more, and then we'll break for lunch. Andrew.

ANDREW ROSS SORKIN: Thank you, Warren. Question on technology and the company's biggest holding now.

"Given that Apple is now our largest holding, tell us more about your thinking. What do you think about the regulatory challenges the company faces, for example? Spotify has filed a complaint against Apple in Europe on antitrust grounds. Elizabeth Warren has proposed ending Apple's control over the App Store, which would impact the company's strategy to increase its services businesses. Are these criticisms fair?"

WARREN BUFFETT: Well, again, I will tell you that all of the points you've made I'm aware of, and I like our Apple holdings very much. I mean, it is our largest holdings.

And actually, what hurts, in the case of Apple, is that the stock has gone up. You know, we'd much rather have the stock — and I'm not proposing anything be done about it — but we'd much rather have the stock at a lower price so we could buy more stock.

And importantly, if Apple — I mean, they authorized another 75 billion the other day — but let's say they're going to spend a hundred billion dollars in buying in their stock in the next three years. You know, it's very simple. If they buy it at 200, they're going to get 500 million

shares. They've got 4 billion, 600 million out now. And so they'll end up with 4.1 billion under that circumstance.

If they're buying at 150, they buy in 667 million shares. And instead of owning what we would own in the first case, we'd now — the divisor would be less than 4 billion, and we'd own a greater percentage of it.

So, in effect, a major portion of earnings — at least possibly, it's at least been authorized — will be spent in terms of increasing our ownership without us paying out a dime, which I love for a wonderful business.

And the recent development, when the stock has moved up substantially, actually hurts Berkshire over time. We'll still do — In my opinion, we'll do fine, but we're not going to dissect our expectations about Apple, you know, for people who may be buying it against us tomorrow or something of the sort. We don't give away investment advice on that for nothing.

But we have — all the things you've mentioned, obviously we know about, and we've got a whole bunch of other variables that we crank into it. And we like the fact that it's our largest holding. Charlie?

CHARLIE MUNGER: Well, in my family, the people who have Apple phones, it's the last thing they'll give up. (Laughter)

Afternoon Session - 2019 Meeting

1. Union Pacific has higher profit margins than BNSF

WARREN BUFFETT: OK. If you'll take your seats, we'll proceed in a minute.

And it looks like we're ready for Gregg.

GREGG WARREN: Good morning, Charlie. I have a follow up on the railroad business.

By nearly all measures, BNSF had a solid year in 2018, full-year revenue growth of 11 1/2 percent was better than the 7 1/2 percent topline growth at Union Pacific — which is BNSF's largest direct competitor — came up with, with Burlington Northern seeing both larger increases in average revenue per car unit and total volumes than its closest peer.

Even so, Burlington Northern once again fell short of Union Pacific when it came to profitability, with its operating ratio declining 130 basis points to 66.9 percent, while Union Pacific's ratio fell only 120 basis points to 62.7, further cementing the spread that exists between the two companies' margins, at more than 400 basis points.

Can you explain what is driving the difference in profitability between Burlington Northern and Union Pacific, as theoretically we should not see that wide of a spread between two similar-sized companies that are basically competing for the same business, with the same customers in the western half of the United States?

And while you noted that Burlington Northern is in a wait and see mode with regards to precision-schedule railroading, we've kind of heard the same line historically with regards to GEICO's approach to telematics.

And what worries me here is that the potential now exists for a much wider gap to emerge between profitability levels at Burlington Northern and Union Pacific, which has recently adopted a version of PSR some of which Union Pacific could eventually use to get more price competitive.

CHARLIE MUNGER: Well, Warren knows the answer to that a lot better than I do. My guess is that they work a little harder than we do at billing the rates. But Warren, you answer that one.

WARREN BUFFETT: Yeah. Well, it's true that we receive the lowest ton mile revenue of any of the six big railroads in North America, and there's some explanation for that — obviously, a significant explanation — in the particular types of hauls we have and that sort of thing. We have longer hauls, generally.

But the answer — Union Pacific's profit margin, they talk about operating ratios, but that goes back to the Interstate Commerce Commission. It's really profit margin, pre-tax, pre-interest profit margin. And Union Pacific, at one time, probably 15 or maybe a little more years ago,

they really went off the tracks, so to speak. But they've done a very good job of getting — well, they got a lot of underpriced coal contracts that worked out, as did we.

But they've also — they've done a very good job on expenses. And there's no fundamental reason why the BNSF franchise — I always like the western railroads better than the eastern — not by a dramatic margin — but I think the west will do better in terms of ton miles over time than the eastern roads.

And we've got some great routes, some of which were underwater in March for a while.
(Laughs)

We pay a lot of attention to what's going on at the Union Pacific, as we should.

And the future, it's not like we're losing business to anybody. But they have been operating more efficiently, in effect, than we have during the last few years. And like I said, we take notice of it.

They've cut a lot of people, right here in Omaha. And we'll see what that does in terms of passengers — or in terms of shipper satisfaction.

But we are measuring ourselves very carefully against what they do. And if changes are needed, we'll do that.

We've got a wonderful asset in that business. And when I bought it, I said it's for a hundred years. It's for a lot more than a hundred years. It is a very, very fundamental business. And we've got a wonderful franchise, and we should have margins comparable to other railroads. Charlie?

CHARLIE MUNGER: I don't know much about it.

WARREN BUFFETT: You don't? (Laughter)

2. Buffett: I'm lucky that I can "control my own time"

WARREN BUFFETT: Station 9.

AUDIENCE MEMBER: Hi, Warren and Charlie. My name is Rob Lee (PH) from Vancouver, Canada. Could you please share with us what you value the most in life now? Thank you.

WARREN BUFFETT: Well —

CHARLIE MUNGER: I'd like to have a little more of it. (Laughter and applause)

WARREN BUFFETT: It's the two things you can't buy, time and love. And that, I value those for a long time. And I've been very, very, very lucky in life, in being able to control my own time to an extreme degree. Charlie's always valued that, too.

That's why we really wanted to have money, was so we could do what we damn pleased, basically — (laughs) — in our life. It wasn't six houses or boats or anything. Well, Charlie's got a boat. But it doesn't do us that much good.

But time is valuable. And we are very, very lucky to be in jobs where physical ability doesn't make any difference.

And, you know, we've got the perfect job for a couple of guys with aging bodies. And we get to do what we love to do every day.

I mean, I literally could do anything that money could buy, pretty much. And I'm having more fun doing what I do than doing anything else, and Charlie is designing dormitories. And I mean, he's got an interesting life, and he brings a lot to it.

He still reads, you know, more books in a week than I get done in a month, and he remembers what he reads. So, we've got it very good, but we don't have unlimited time. And whatever we do to free up the time to do what we like to do — and we both maximize that in our lives — we do.

CHARLIE MUNGER: Anybody's lucky if he so that what he spends his time at, he really likes doing. That's a blessing.

WARREN BUFFETT: Yeah, we've had so much good luck in life. It sort of blows your mind. Starting with being born in the United States. And Canada would be fine too, incidentally. I don't want to offend anybody. (Laughter)

3. "We're not in the business of explaining why we own a stock"

WARREN BUFFETT: OK, Carol?

CAROL LOOMIS: This question is from Brian Neal (PH), who writes from the Mayo Clinic Education Site.

"Berkshire owns approximately 200 billion in publicly traded stocks. I appreciate the disclosure of Berkshire's holdings, but I am disappointed by the lack of specific performance information.

"Since investing in publicly owned stocks is so much a part of Berkshire's business, why do you not tell us every year how our portfolio performed?"

WARREN BUFFETT: Well, obviously it could be calculated fairly easily, and it's about 40 percent of Berkshire's value. But 60 percent is the businesses. And if you look at the top ten stocks I would guess, you know, you're down to where beyond those ten stocks you're talking about less than — probably less than 10 percent of Berkshire's value.

So, I — again — we're not in the business of explaining why we own a stock. We're not looking for people to compete to buy it. We have a portfolio of companies where I would say that, of that 200 billion or so, at least 150 billion of them are buying in their stock and increasing our interest every year.

And why in the world should we want to tell a whole bunch of people to go out and buy those stocks so that we end up paying — or the company on our behalf — ends up paying more money for them?

I mean, people get very happy when their stocks go up. But if we're going to own whatever, whether it's Bank of America, whether it's Apple, whether it's any of the big holdings, we will do considerably better in the next ten years if their stocks do terribly during certain periods and that they buy lots of stock in.

It's just exactly like buying it ourselves, except we're using their — they're using our money. But it's so elementary.

And why in the world would we want to go out and tell the world that these stocks should go up so that maybe they can sell or something when it costs us money? And we're not going to be able to move in and out of the stocks to our advantage.

So, our holdings are filed quarterly — our domestic holdings, as it was pointed out earlier — filed quarterly.

But we would rather not tell the world what we own, any more than we'd like to tell them what our strategy is at NetJets or what we're going to do with Lubrizol and what we're working on in the way of better advances in additives or whatever it may be, or where we plan to build a new store for the Furniture Mart or something.

That's proprietary information. And we have to disclose a certain amount, but we're certainly not going to be touting the stocks to other people.

In terms of calculating our performance, you can take the top ten or 12 stocks, and anybody could make the calculation. I mean, at the end of the year the Wall Street Journal runs — all the papers run something — where it says a year-to-date performance or something of the sort. So that's a simple calculation. Charlie?

CHARLIE MUNGER: I've got nothing to add to that.

4. FlightSafety probably won't get more demand for its simulators after Boeing MAX 737 crashes

WARREN BUFFETT: OK. Jonathan.

JONATHAN BRANDT: No one's ever asked a question about FlightSafety, but perhaps this year it's somewhat topical given the 737 MAX controversy. The New York Times spoke to engineers who said that Boeing explicitly designed the MAX in a manner that allowed airline customers to avoid paying for simulators to train their pilots.

Do you expect the worldwide regulatory and commercial response to the MAX's problems to result in increased demand for FlightSafety simulators? And could you please more generally discuss FlightSafety's competitive position and growth prospects?

WARREN BUFFETT: Yeah, well, FlightSafety is — their specialty would be with corporate pilots. They train our NetJets pilots, for example. They have a major facility with simulators for that.

I don't think what's happened with the 737 MAX will have any particular effect. I mean, we have — I don't know how many of the Fortune 100 companies that we do business with, but it's a very significant percentage.

And they train their pilots with FlightSafety because we've got the talent and the simulators like nobody else has for that business. And Charlie, didn't you have that friend of yours that was trying to get Al Ueltschi to pass him when he shouldn't?

CHARLIE MUNGER: What?

WARREN BUFFETT: You remember that story of your friend that wanted to have FlightSafety —

CHARLIE MUNGER: Oh yes.

WARREN BUFFETT: Yeah, why don't you tell them? I mean, Al Ueltschi, who started FlightSafety with a few thousand dollars and a little visual simulator, or whatever it may have been at, LaGuardia, I mean, he really cared about saving lives. And he made a lot of money in the process, but he was dedicated throughout his lifetime to truly train better pilots and reduce the chance of accidents dramatically.

It was a mission with him. And that spirit still continues.

And as I say we've got a — I can't tell you the percentages, I don't know, but I know it's very high — of certainly the corporate business. We have government business, we have some airline businesses and all of that.

But I don't expect any great change in the flight training business. But tell them about your friend, Charlie.

CHARLIE MUNGER: Well, of course, people pass those tests with flying colors, and then some of them just barely pass. And one of my friends just barely passed and they called me and told me. It's (inaudible) of the business.

WARREN BUFFETT: FlightSafety would not —

CHARLIE MUNGER: They care about everything.

WARREN BUFFETT: They care.

CHARLIE MUNGER: They watch the details.

WARREN BUFFETT: They care. And those simulators can cost over \$10 million, I mean, just — and they're dedicated, obviously, to a given model of plane.

You might find it interesting, at NetJets our pilots only fly one model. I mean — most charters and all those, I'm sure they — and incidentally, I think they could fly other models and all that, but we just want them to be flying one model. And we give them the maximum amount of training annually.

And it's — when I bought the company for Berkshire in, I think it was 1998 or thereabouts, you know, the thought obviously bothered me that I would have a significant percentage of people who would be friends of mine that were using it, and you know, you'd hate to have anything happen.

I use it, my family uses it, our managers use it. And there's nobody that cares more about safety. But I don't see — other than at NetJets — it's a first-class operation.

CHARLIE MUNGER: They've never killed a passenger. They had one pilot who hit a glider at 16,000 feet, and it was kind of a difficult landing.

WARREN BUFFETT: It was more than difficult landing —

CHARLIE MUNGER: They've never killed a — it was a woman pilot, yeah.

WARREN BUFFETT: And she was flying the next day. The copilot was kind of taken out of operation for a while. But this woman ended up almost with the control panel in her lap because this guy turned off his battery and hit one of our Hawkers. And she had one shot at the runway and she brought it in.

And we've had some remarkable training and pilots there. You should ask for her if you're flying on NetJets. (Laughter)

5. Buffett on tech investing: "We won't go into something because somebody else tells us it's a good thing to do"

WARREN BUFFETT: Station 10.

AUDIENCE MEMBER: Mr. Buffett and Mr. Munger, hi. My name is Daphne. I'm from New York and I'm nine years old. And I'm excited to be at the Berkshire meeting, and this is my third year.

WARREN BUFFETT: Wow. (Applause)

You should be rich by now. (Laughter)

AUDIENCE MEMBER: You have often said that investors are well-served by identifying businesses with a wide moat, where the castle behind the moat is run by a king or queen who can be trusted to make good decisions.

In the past, you have applied this advice by investing in businesses with world class strong brands, such as Coke, American Express, and See's, as well as media companies that has helped these brands protect and widen their moats, such as Cap Cities, ABC, and the Washington Post.

In the past, you have also generally avoided investing in technology companies, pointing out how quickly technology changes and how hard it is to build a circle of competence in it.

Today, we seem to be in a world where some of the most dominant companies in the world are technology companies. And we have built powerful platforms, such as Amazon, Google, Facebook, and Microsoft in America, and Alibaba and Tencent in China.

These companies all have wide moats, strong brands, and are led by brilliant — entrepreneurs.

WARREN BUFFETT: That's good. (Laughter)

AUDIENCE MEMBER: My question to you is this: if Berkshire is to honor its tradition of investing in wide moats and strong brands, and especially in companies that are also capital efficient, do you think that Berkshire needs to expand its investing lens to include more of these leading technology platforms?

In other words, do you believe that you need to adapt your model of wide moats and strong brands to embrace, not avoid, technology? (Applause)

CHARLIE MUNGER: I think the answer is maybe. (Laughter)

WARREN BUFFETT: I think the answer is to put her on the board and it'll bring down the average age enormously. We won't get criticized as much.

You're exactly right, in that we do like moats, and we used to be able to identify them in a newspaper that was the only newspaper in town, or in TV stations where we felt the dominant position, we felt the product was underpriced in terms of advertising. We saw it in brands, sometimes.

And it is true that in the tech world, if you can build a moat, it can be incredibly valuable. I've not felt the confidence that I was the best one to judge that in many cases.

It wasn't hard to figure out who was winning at any given time or what their business was about, but there were a huge number of people that knew more about the game than I did. And we don't want to try and win at a game we don't understand. We may hire people, such as Ted (Weschler) and Todd (Combs), that are better at understanding certain areas of investing than I am, or maybe even Charlie is.

But the principles haven't changed. You're right that some of the old ones have lost their moat and you're right that there are going to be companies in the future that have them that will be enormously valuable.

And we hope we can identify one every now and then. But we won't — we'll still stay within where we think we know what we're doing. And obviously, we'll make mistakes even within that area.

But we won't go into something because somebody else tells us it's a good thing to do. I mean, we are not going to subcontract your money to somebody else's judgment. You can take your money and follow somebody else's judgment, but we're not in the business of thinking that if we hire ten people with specialties in this area or that, that it will lead to superior investment results. And we do worry that we could blow a lot of money that way.

So, we'll do our best to enlarge the circle of competence of the people at Berkshire so that we don't miss so many. But we'll miss a lot in the future. We missed a lot in the past.

The main thing to do is to find things where our batting average is going to be high. And if we miss the biggest ones, that really doesn't bother us, as long as the things we do with money work out OK. Charlie?

CHARLIE MUNGER: Well, I think we've still got an awful lot of companies with big moats, and a lot of them are very — and some are industrial brands that are just incredibly strong in the niches we're in.

So, Berkshire shareholders don't need to worry about we're just one big morass of unprofitability or anything like that. But we have not covered ourselves with glory in the new fields.

WARREN BUFFETT: Yeah. We won't end up all in buggy whips, though, or anything. But it's a very good question, and it's what we focus on all the time. And I hope —

CHARLIE MUNGER: We're trying to improve.

WARREN BUFFETT: And we hope we see you back here for your fourth next year.

6. "In the end, Berkshire should prove itself over time"

WARREN BUFFETT: Becky? (Applause)

BECKY QUICK: This question comes from Stuart Boyd (PH), who's a chemical engineer from Australia.

He says, "Currently Berkshire would be incredibly difficult for an activist investor to target, because number one, Warren, your ownership stake is large. Number two, shareholders appreciate the business is more valuable operating under the Berkshire umbrella rather than being sold off in pieces.

"And number three, the sheer size or market capitalization of Berkshire is an entry barrier for most activist investors.

"Warren and Charlie, after your ownership has been completely distributed, will Berkshire be more vulnerable to activist investors? I'm guessing this isn't something that keeps you up at night, but thought it was worth asking."

CHARLIE MUNGER: No, it's going to happen quite a few decades after my death.

WARREN BUFFETT: Yeah. It —

CHARLIE MUNGER: I don't think I'll be bothered much by it. (Laughter)

WARREN BUFFETT: No, anything could happen. It's a low probability. It can't happen for a lot of years, in terms of the way my stock gets distributed and in terms of the way other stock is held.

But in the end, Berkshire should prove itself over time. I mean, there are no perpetuities. And it deserves to be continued in its present form. It has a lot of attributes that are maximized by being in one entity, which people don't fully understand.

I think if you spin off something that would command a high PE that therefore value has been unlocked, which is totally nonsense. I mean, it's already built in.

One day out, you know, you might have an extra 3 percent or 5 percent in price, but over the years, we want to keep the wonderful businesses.

But eventually I think the culture will remain one of a kind. I think that we will be able to do things other people can't do.

I think that the advantages of having them in one spot will likely be significant over time. And if that happens, then no activist is going to take it over.

And if the model doesn't work for some reason over a long period of time, then something else should happen. Charlie?

CHARLIE MUNGER: Nothing more.

WARREN BUFFETT: OK.

7. GEICO trying to improve its loss ratio as it competes with Progressive

WARREN BUFFETT: Jay.

JAY GELB: This question is on GEICO. Progressive is gaining the most market share among the major auto insurers, based on its presence in the direct and independent agency channels, as well as now bundling its auto and homeowners insurance coverage.

How does GEICO plan on responding to competitive threats so that it can retain its place as the second-largest auto insurer? I was hoping we could also hear on this topic from Ajit (Jain) or GEICO's management. Thank you.

WARREN BUFFETT: OK. Progressive is a very well-run business. GEICO is a very well-run business. And I think they will, for a long time, be the two companies that the rest of the auto insurance industry has trouble not losing share to. But there's, you know, I think — I've always thought for a long, long time, Progressive has been very well run.

They have an appetite for growth. Sometimes they copy us a little, sometimes we copy them a little. And I think that'll be true five years from now and 10 years from now.

And we sell substantial amounts of homeowners insurance. We have an agency arrangement with that. We were in the business of writing it ourselves, until Hurricane Andrew, when a decision was made — we didn't control it then — but the decision was made that the homeowners, essentially, you could lose as much in one year as you made in the previous 25 years. And the float isn't as large.

So, we became a company that placed our customers' desire for homeowners with several other large and solid organizations.

The big thing is auto insurance. And we grew in the first quarter about 340,000 policies, net, which will look quite good compared to anybody but Progressive.

And that was quite a bit more than last year, but not as good as two years ago. And the profit margin was in the nine-point area. So, I feel extremely good about GEICO, I mean, what has been built there by Tony (Nicely) and his people is perfect, but I would feel fine —

We don't own any Progressive, but I think that Progressive is an excellent company, and we will watch what they do, and they will watch what we do. And we will see, five years from now or 10 years from now, which one of us passes State Farm first. Charlie? Oh, and Ajit, would you like?

AJIT JAIN: Well, the underwriting profit is really a function of two major variables. One is the expense ratio and the other is the loss ratio, without getting too technical.

GEICO has a significant advantage over Progressive when it comes to the expense ratio, to the extent of about seven points or so.

On the loss ratio side, Progressive does a much better job than GEICO does. They have, I think, about a 12-point advantage over GEICO. So, net-net, Progressive is ahead by about five points.

GEICO is very aware of this disadvantage on the loss ratio that they are suffering, and they're very focused on trying to bridge that gap as quickly as they can. They have a few projects in place, and, you know, sometimes GEICO is ahead of Progressive. Right now, Progressive is ahead of GEICO. But I'm hopeful they'll catch up on the loss ratio side and maintain the expense ratio advantage as well. Thank you.

WARREN BUFFETT: GEICO has gained market share, essentially — I'd have to look at the figures for sure — but virtually every year since Tony took over. And I would bet significant money that GEICO increases its market share in the next five years. And I think it will, for sure, this year.

So, it is a terrific business. And — but Progressive is a terrific business. And we'll — as Ajit says, we've got the advantage in expenses, and we will have an advantage in expenses. And then the question is, are we —

They have a very sophisticated way of pricing business. And the question is whether we give some of that five points back — or six points back — in terms of loss ratio. We are working very hard at that, but I'm sure they're working very hard too to improve their system.

So, it's a — to some extent it's a two-horse race, and we've got a very good horse.

CHARLIE MUNGER: But Warren, in the nature of things, every once in a while, somebody's a little better at something than we are.

WARREN BUFFETT: Ha. You've noticed. (Laughter)

CHARLIE MUNGER: Yeah. I noticed.

WARREN BUFFETT: Yeah. I'd settle for second place in a lot of the businesses.

8. Try to have a big circle of competence but be realistic about its perimeter

WARREN BUFFETT: OK, station 11.

AUDIENCE MEMBER: Mr. Buffett and Mr. Munger, thank you for taking my question. My name is Feroz Qayyum and I'm from Mississauga in Canada, and now live in New York.

My question is how to best emulate your success in building your circle of competence. Given the environment today in investing is a lot more competitive than when you started out, what would you do differently, if anything at all, when building your circle?

Would you still build a very broad, generalist framework? Or would you build a much deeper but narrower focus, say on industries, markets, or even a country? And if so, which ones would interest you? Thank you.

WARREN BUFFETT: Yeah, well, you're right. It's much more competitive now than when I started. And you would — when I started, I literally could take the Moody's industrial manual and the Moody's banks and financial manual and I could go through page by page, at least run my eyes over every company and think about which ones I might think more about.

It's — it's important — I would just do a whole lot of reading. I'd try and learn as much as I could about as many businesses, and I would try to figure out which ones I really had some important knowledge and understanding that was probably different than, overwhelmingly, most of my competitors.

And I would also try and figure out which ones I didn't understand, and I would focus on having as big a circle as I could have, and also focus on being as realistic as I could about where the perimeters of my circle of competence were.

I knew when I met (GEICO executive) Lorimer Davidson in January of 1951, I could get insurance. I mean, what he said made so much sense to me in the three or four hours I spent with him on that Saturday.

So, I dug into it and I could understand it. My mind worked well in that respect.

I didn't think I could understand retailing. All I'd done is work for the same grocery store that Charlie had, and neither one of us learned that much about retailing, except it was harder work than we liked.

And you've got to do the same thing, and you've got way more competition now. But if you get to know even about a relatively small area more than the other people do, and you don't feel the compulsion to act too often, you just wait till the odds are strongly in your favor. It's still a very interesting game. It's harder than it used to be. Charlie?

CHARLIE MUNGER: Well, I think the great strategy, for the great mass of humanity, is to specialize. Nobody wants to go to a doctor that half-proctologist and half-dentist, you know? (Laughter)

And so, the ordinary way to succeed is to narrowly specialize. Warren and I really didn't do that. And that — and we didn't because we prefer the other type of activity. But I don't think we could recommend it to other people.

WARREN BUFFETT: Yeah, a little more treasure hunting in our day, and it was easy to spot the treasures —

CHARLIE MUNGER: We made it work, but it was kind of a lucky thing.

WARREN BUFFETT: Yeah.

CHARLIE MUNGER: It's not the standard way to go.

WARREN BUFFETT: The business, at least I best understood, actually was insurance. I mean — and I had very little competition. You know, I went to the insurance department in Harrisburg, Pennsylvania. I remember one time I drove there just to check on some Pennsylvania company. And this is when you couldn't get all this information on the internet.

And I went in and I asked about some company, and the guy said, "You're the first one that's ever asked about that company." And there wasn't a lot.

I went over to the Standard and Poor's library on Houston — Houston — Street, I guess they call it. And I would go up there and ask for all this obscure information. And there wasn't anybody sitting around there. They had a whole bunch of tables that you could set and examine things through. So, there was less competition.

But if you know even one thing very well, it'll give you an edge at some point. You know, it's what Tom Watson Sr. said at IBM, you know. "I'm no genius, but I'm smart in spots and I stay around those spots." And that's basically what Charlie and I try and do. And I think that's probably what you can do. But you'll find those spots in —

CHARLIE MUNGER: Yeah, we did it in several fields. That's hard.

WARREN BUFFETT: And we got our head handed to us a few times, too.

9. Berkshire is strong on the environment but won't do expensive reports to prove it

WARREN BUFFETT: OK, Andrew?

ANDREW ROSS SORKIN: Thanks, Warren. Governance question from a shareholder.

Larry Fink of BlackRock has predicted that in the near future, all investors will be using ESG — environmental, social, governance — metrics to help determine the value of a company. I'm worried we don't score well on everything from climate to diversity to inclusion. How well do you think Berkshire measures up on those metrics, and are they valuable metrics?

WARREN BUFFETT: I think in reality we measure up well, but we don't participate in preparing reports for anybody that asks about it.

And we have this idea that even though all shareholders are equal, we sort of — we prefer individual shareholders. We actually prefer people we know as co-owners.

And we don't want to be preparing a lot of reports and asking 60 subsidiaries each to do something, where they'll set up a team, and they'll mail things to headquarters, and then we'll supply them to somebody who, if our stock goes up some, is probably going to sell it anyway.

We want our managers to do the right things. We give them enormous latitude to do that. And I think that our batting average really is quite good.

You saw that in the movie, we talked about having a hundred percent of the electricity we sell in Iowa come from, essentially, wind generation. Now that doesn't mean that we get to do it 24 hours a day. We sell some and we buy it. But essentially, we will be creating as much wind energy as all of our customers use in electricity.

There's one competitive — there's one other utility — electric utility — that's about our size — roughly our size — in Iowa, and they have practically no wind resources. And the wind blows where they exist, too. But we have — we will have that hundred percent — and as a matter of fact, it's a moving target, because we do so well — partly — we do so well on wind generation that a number of the high-tech companies want to locate in Iowa and get clean energy from us at very low prices. And therefore, the moving target becomes our growth in customers in that area.

But we are not going to put out a — we're not going to spend the time of the people at Berkshire Hathaway Energy responding to questionnaires or trying to score better with somebody that is working on that.

It's just, we trust our managers and I think the performance is at least decent. And we keep expenses and needless reporting down to a minimum at Berkshire.

We do not get — and I mentioned this in the annual report — I can't imagine another company like it — but here we are, with 500 billion of market capitalization — we do not have a consolidated P&L monthly. We don't need it.

Now I can't imagine any other organization doing that, but we don't need it. And we're not going to tie up resources — people resources — doing things we don't need to do just because it's the sort of standard procedure in corporate America.

And corporate America is very worried about, in general, they're very worried about whether somebody's going to upset their apple cart, you know, with activists and everything.

So, they want to be very sure that every shareholder is happy on issues like that. And in the end, fortunately, we don't have to worry about that. So, we don't have to run up a lot of expenses doing things that don't actually let us run the business better. Charlie?

CHARLIE MUNGER: Well, I think at Berkshire the environmental stuff is done one level down from us. And I think Greg Abel is just terrific at it. And so, I think we score very well.

When it gets to so-called best corporate practices, I think the people that talk about them don't really know what the best practices are. They just know what they think are the best practices. And they determine that based on what will sell, not what will work.

And so, I like our way of doing things better than theirs, and I hope to God we never follow their best practices. (Applause)

10. "Independent" board members aren't really independent

WARREN BUFFETT: I'd like to point out one thing on independent directors. I mean, I have been on 20 public company corporate boards, not counting any Berkshire subsidiaries. So, I've seen a lot of corporate boards operate. And the independent directors, in many cases, are the least independent.

I mean, if the income you receive as a corporate director — which typically may be around \$250,000 a year — now, if that's an important part of your income, and you hope that some other corporation calls the CEO and says, "How's so-and-so as a director?" and the current CEO — your CEO — says, "Oh, he's fine and never raises any problems," and then you get on another board at 250,000 and that's an important part, how in the world is that independent? I mean, I really, just an observation. (Applause)

I can't recall, particularly, any independent director — where their income from the board was important to them — I can't recall them ever doing anything in board meetings or committee

meetings that actually was counter to the interest — you know, they put them on the comp committee.

They're just not going to upset the apple cart, because what they're — and I'd probably behave the same way in the same position. I mean, if \$250,000 a year is important to you, why in the hell would you behave in a way that's going to cause your CEO to say to the next CEO, "This guy acts up a little bit too much. You really better get somebody else." It's the way it works. But they've —

CHARLIE MUNGER: I think it works a little worse than Warren's telling you. (Laughter)

WARREN BUFFETT: Yeah, Charlie and I —

CHARLIE MUNGER: It's really awful.

WARREN BUFFETT: It's awful. I mean, we —

CHARLIE MUNGER: And not only that, Warren and I are — we occupy the niche for pomposity very well ourselves. We don't need any more of it. (Laughter)

WARREN BUFFETT: Charlie and I were on one board. Well, I was on one board, actually, a long time ago where we owned a very significant percentage of the company. And the rest of the board was almost exclusively customers of the company. But not owners. They had absolutely token holdings. And at one point we were looking at something where a tax decision was being made in terms of the distribution of some securities.

And it was a lot of money that was involved. And one of the other directors said, "Well, let's just swallow the tax." Well, his swallowing amounted to about \$15 or something — (Laughs)

I said, "Let's parse this sentence out. Let's swallow the tax. That's let us swallow the tax. So, who wants to swallow an equal amount, you know, to me?"

It's — you know, it's — you don't get invited to be on boards if you belch too often at the dinner table —

CHARLIE MUNGER: Well, at Blue Chip Stamps we had a director who said, "I don't see why you guys get to be so important just because you own all the shares."

WARREN BUFFETT: Yeah. (Laughter)

Charlie and I used to have to cool off after the Blue Chip Stamps meetings, because we and Rick Garrett owned what percent, probably?

CHARLIE MUNGER: Oh, 50 percent.

WARREN BUFFETT: Yeah, 50 percent, and they'd appointed all these —

CHARLIE MUNGER: They were all members of the Rotary Club.

WARREN BUFFETT: It came out of a government settlement or something. And it was not an ideal form of decision making. And they just had a different calculus in their mind than we did. And I can understand it, but I'm not going to replicate it. (Laughs)

11. "We will put a lot of money into energy" with capital spending at utilities

WARREN BUFFETT: OK, Gregg.

GREGG WARREN: Warren and Charlie, U.S. electricity demand has flatlined during the past decade, but could potentially pick up over the next decade with three emerging sources of demand — electric vehicle charging, datacenters, and cannabis cultivation — expected to account for more than 5 percent of total U.S. electricity demand.

Utilities will have to work hard to benefit from this new demand, though, much of which is likely to accrue to states in the South Atlantic, Central, West, and Mountain regions, with the greatest benefit going to firms that invest in grid expansion, smart networks, reliability, and renewable energy.

While Berkshire Energy has been aggressive with its capital investments, and already has some of the lowest electricity rates in the areas where it competes, it seems like the firm is winding down its annual spending at a time when more might actually be required.

With annual spending expected to fall from around 6 billion, on average, annually to around 4 billion in 2021, with two-thirds of that spending being more maintenance driven than growth.

Is there any one area where you feel Berkshire Energy might need to commit more capital over the next decade to ensure that it captures this future expected demand growth, much as it already has with wind power in western Iowa, which is now populated with a lot of data centers, and for territories where demand growth is expected to be the strongest but where Berkshire does not have a presence, are there any avenues aside from acquisitions for the company to put capital to work?

WARREN BUFFETT: I'm going to throw that over to Ajit in just a second. But I will tell you that we have three owners of Berkshire Hathaway Energy. We are the 91 percent owner. And there are no three owners that are more interested in pouring money into sensible deals within the utility industry or are better situated in terms of the people we have to maximize any opportunities. We have never had a penny of dividends in — whatever it is — close to 20 years of owning MidAmerican Energy.

And other utility companies pay high dividends. They really — they just don't have the capital appetite, essentially, that we do. So, it's just a question of finding sensible projects.

And I would say that there's no group that is as smart about it, as motivated about it as our group. And with that I'll turn it over to Greg.

CHARLIE MUNGER: In short, we're about as good as you can get, and you should worry about something else.

WARREN BUFFETT: Yeah. (Laughter)

But Greg, could you stand up and talk about —? We really hope to spend a lot of money in energy.

GREG ABEL: Yeah, yeah. Afternoon. Yeah, Gregg, you touched on it. A couple critical areas we go forward is to look realistically in the '21, 2022 timeframe. Because as you touched on, we've got a great portfolio as we finish out 2019, 2020. And it's really been focused on building new renewable energy projects in Iowa, expanding the grid.

But equally, we do have those opportunities in our other utilities. The footprint in Iowa, realistically, is getting pretty full. As we hit a hundred percent renewables — Warren touched on it — every time we get a new data center, that means we can build another 300 megawatts of renewables. We'll continue to do that.

But when you look at PacifiCorp, where we serve six states in the Northwest, we've really just embarked on an expansion program there.

The first part was to build significant transmission, so expand the grid, and then start to build renewables. But just to give you some perspective of the regulation that exists in place, we started that project in 2008. And we're realistically building the first third of it. But we do have the planning in place for the second phase and the third phase, and that's what you'll see coming into place in 2021 and in '23.

And the reality is we'll continue to do that at NV Energy, with really, again, the focus being on both grid expansion, so we can move the resources, and then supplementing it with renewables. So, it's exactly what you've touched on.

And we haven't identified the specific projects yet, so we never put them in our capital forecast that we disclose to folks. But as they firm up and we know that they will go forward, clearly you'll see some incremental capital. And that's capital we clearly earn on behalf of the Berkshire shareholders as we deploy it. Thank you.

WARREN BUFFETT: We will put a lot of money into energy. (Laughs)

CHARLIE MUNGER: Yeah, we're really in marvelous shape in this department.

WARREN BUFFETT: Incidentally, you know, Walter Scott, I mean, he gets excited looking at all these projects, and goes out and visits them. He knows way more about the business — and he's forgotten more about it than I'll ever know.

But we've got a great partnership. We've got unlimited capital. We'll continue to have it. And there's needs for huge capital in the industry.

So, I think 10 years from now or 20 years from now, our record will be looked at and there'll be nothing like it in the energy business.

CHARLIE MUNGER: Well, Greg, is there anybody ahead of where we are in Iowa in terms of energy?

GREG ABEL: Charlie, there's realistically no one ahead of us in the U.S., let alone in Iowa. When you look at the amount of energy we produce relative to what our customers consume, we really do lead the nation and Iowa.

CHARLIE MUNGER: And aren't our rates about half that of our leading competitor in Iowa to boot?

WARREN BUFFETT: About half. Close.

GREG ABEL: Exactly. We're right in that range.

CHARLIE MUNGER: If this isn't good enough for you, we can't help you. (Laughter)

WARREN BUFFETT: Incidentally, I mean, we sell electricity five miles from here. Greg, is that correct?

GREG ABEL: Right across the river.

WARREN BUFFETT: Yeah, right across the river. And, you know, the wind blows the same and all that sort of thing. And the public power district here, in Nebraska, going back to George Norris, has always been a public power state. There's no — capitalism doesn't exist in the electric utility field in Nebraska.

So, they have had the advantage of selling tax-exempt bonds. We have to sell taxable bonds, which raises cost to some degree. They have a big surplus, which they don't have to pay dividends on or anything else. And our rates are cheaper than theirs, you know, basically.

I mean, we're very proud of our utility operation.

12. Why Berkshire doesn't put its unspent cash into a stock index fund

WARREN BUFFETT: Carol?

CAROL LOOMIS: "Warren, you are a big advocate of index investing, and of not trying to time the market. But by your having Berkshire hold such a large amount of cash in T-bills, it seems to me you don't practice what you preach.

"I'm thinking that a good alternative would be for you to invest most of Berkshire's excess cash in a well-diversified index fund until you find an attractive acquisition or buy back stocks.

"Had you done that over the past 15 years, all the time keeping the \$20 billion cash cushion you want, I estimate that at the end of 2018, the company's 112 billion balance in cash, cash equivalents, in short-term investments and T-bills, would've instead been worth about 155 billion.

The difference between the two figures is an opportunity cost equal to more than 12 percent of Berkshire's current book value. What is your response to what I say?" And I forgot to say the question is from Mike Elzahr, who is with the Colony Group, located in Boca Raton, Florida.

WARREN BUFFETT: That's a perfectly decent question, and I wouldn't quarrel with the numbers. And I would say that that is an alternative, for example, that my successor may wish to employ. Because, on balance, I would rather own an index fund than carry Treasury bills.

I would say that if we'd instituted that policy in 2007 or '08, we might have been in a different position in terms of our ability to move late in 2008 or 2009.

So, it has certain — it has certain execution problems with hundreds of billions of dollars than it does if you were having a similar policy with a billion or 2 billion or something of the sort.

But it's a perfectly rational observation. And certainly, looking back on ten years of a bull market, it really jumps out at you.

But I would argue that if you were working with smaller numbers, it would make a lot of sense. And if you're working with large numbers, it might well make sense in the future at Berkshire to operate that way.

You know, we committed 10 billion a week ago. And there are conditions under which — and they're not remote, they're not likely in any given week or month or year — but there are conditions under which we could spend a hundred billion dollars very, very quickly.

And if we did — if those conditions existed — it would be capital very well deployed, and much better than in an index fund.

So, we've been — we're operating on the basis that we will get chances to deploy capital. They will come in clumps in all likelihood. And they will come when other people don't want to allocate capital.

Charlie, what do you think about it?

CHARLIE MUNGER: Well, I plead guilty to being a little more conservative with the cash than other people. But I think that's all right.

We could have put all the money into a lot of securities that would've done better than the S&P with 20/20 hindsight. Remember, we had all that extra cash all that period, if something had come along in the way of opportunities and so on.

I don't think it's a sin to be a little strong on cash when you're as big a company as we are. We don't have to —

I watched Harvard use the last ounce of their cash, including all their prepaid tuition from the parents, and plunge it into the market at exactly the wrong moment and make a lot of forward commitments to private equity. And they suffered, like, two or three years of absolute agony. We don't want to be like Harvard.

WARREN BUFFETT: Plus timber and a whole bunch of —

CHARLIE MUNGER: What?

WARREN BUFFETT: Plus timber. And I mean —

CHARLIE MUNGER: Yeah, yeah. We're not going to change. (Laughter and applause)

WARREN BUFFETT: We do like having a lot of money to be able to operate very fast and very big. And we know — and maybe we won't — we know we won't get those opportunities frequently.

I don't think — certainly, you know, in the next 20 or 30 years there'll be two or three times when it'll be raining gold and all you have to do is go outside. But we don't know when they will happen. And we have a lot of money to commit.

And I would say that if you told me I had to either carry short-term Treasury bills or have index funds and just let that money be invested in America generally, I would take the index funds.

But we still have hopes. And the one thing you should very definitely understand about Berkshire is that we run the business in a way that we think is consistent with serving shareholders who have virtually all of their net worth in Berkshire. I happen to be in that position myself, but I would do it that way under any circumstances.

We have a lot of people who trust us, who really have disproportionate amounts of Berkshire compared to their net worth, if you were to follow standard investment procedures.

And we want to make money for everybody, but we want to make very, very sure that we don't lose permanently money for anybody that buys our stock somewhere around intrinsic business value to begin with.

We just have an aversion to having a million-plus shareholders, maybe as many as two million, and having a lot of them ever really lose money, if they're willing to stay with us for a while.

And we know how people behave when the world, generally, is upset. And they want to be with something — I think they want to be with something they feel is like the Rock of Gibraltar. And we have a real disposition toward that group.

13. Fannie Mae and Freddie Mac should do more loans for manufactured housing, even if it hurts Clayton's profits

WARREN BUFFETT: Jonathan?

JONATHAN BRANDT: Freddie Mac and Fannie Mae have new financing programs for manufactured home loans that I'm guessing could finally put purchasers of those homes who need mortgages on a somewhat more level playing field with those buying site-built homes.

How positive an effect do you expect these new programs to have on manufactured home demand? And how might the programs affect Clayton's sizable profits from lending? Will Clayton sell more loans to Freddie and Fannie, and does that help profits even if spreads compress?

WARREN BUFFETT: Well, it may not help profits, but it would — it definitely is good if the Freddie and Fannie are authorized to do more lending against manufactured homes.

Manufactured homes are a very reasonable for people to get decent housing and have a home. And they are hard to finance to some degree. The local banks frequently do it, but the big lenders haven't wanted to do it. They are —

There is the possibility, or the likelihood, that Freddie and Fannie are going to expand. We already sell — I don't know whether it's 10 million a month of loans or something like that — to Freddie and Fannie.

But it would be very good for America, in my view, if Freddie and Fannie did more in that area. Obviously, we would sell some more homes, but we would lose financing, and we might come out behind, we might come out ahead. But I think it would a good thing to do. Charlie?

CHARLIE MUNGER: Well, I think Freddie and Fannie will finance more and more homes, and I think they'll do it more and more of it through Clayton. And they'll do it because Clayton is very trustworthy, and will do a very good job at making good housing at cheap prices for people.

And I think Clayton will get bigger and bigger and bigger as far ahead as you can see. And the guy's young, he doesn't look like Warren and me. Not at all.

WARREN BUFFETT: We've got a perfect managerial group at Clayton, and we're expanding our site-built homes. We just closed on a builder a couple — a few days ago. And we now have nine different — I believe — nine different site-built home operations, and we didn't have any a few years ago.

And we think extraordinarily well of Kevin Clayton and his group. Our directors met last year in Knoxville and viewed the Clayton operation for the second time. So, we like the idea of Clayton expanding, and we like the idea of more people having very affordable housing.

During the 2008 and '09 recession, our borrowers — who had very low FICO scores on average, I mean compared to typical home buyers, and they — if they kept their jobs, they made the payments. I mean, they wanted that home, and the home was an enormously important item to them. And we had various programs that helped them as well.

But our loan experience was far better than people anticipated under the stress that existed then. But it was because a home really means something to people. And absent losing jobs or sickness — and, like I say, we have some programs to help people — they make the payments, and they have very decent living.

But they would get that even cheaper if Freddie and Fannie expanded their programs. And, like I say, I hope they do.

14. "Ingenious" capitalism will replace jobs lost to automation

WARREN BUFFETT: OK, station 2.

AUDIENCE MEMBER: Hi. Hi Warren, hi Charlie. My name is Carrie and this is my daughter, Chloe. She's 11 weeks. It's her very first Berkshire meeting. (Laughter)

We're from San Francisco, and we have a question on employment for you. As both a major employer and a producer of consumer goods, what do you make of the uncertain outlook for good full-time jobs with the rise of automation and temporary employment?

WARREN BUFFETT: Well, if we'd asked that question 200 years ago, and somebody said, "With the outlook for development of farm machinery and tractors and combines and so on —" meaning that 90 percent of the people on farms were going to be — lose their job — it would look terrible, wouldn't it?

But our economy and our people, our system, has been remarkably ingenious in achieving whatever we have now — 160 million jobs — when throughout the period ever since 1776, we've been figuring out ways to get rid of jobs. That's what capitalism does, and it produces more and more goods per person.

And we never know exactly where they're going to come from. I mean, it — I don't know if you were whatever occupation — well, if you were in the passenger train business, I mean, you know, you were going to — that was going to change.

But we find ways, in this economy, to employ more and more people. And we've got now more people employed than ever in the history of the country, even though company after company in heavy industry and that sort of thing, has been trying to figure out, naturally, how to get more productive all the time, which means turning out the same number of goods with fewer people, or turning out more goods with the same number.

That is capitalism. I don't think you need to worry about American ingenuity running out. I mean, if you look at people in all kind of businesses, and they like to make money, but they really like to be inventive, you know. They like to do things.

And this economy, it works. It will continue to work. And it will be very — it's very tough in certain industries, and there will be dislocations. You know, we won't be making as many horseshoes and that sort of thing when cars come along and all that.

But we do find ways now to employ whatever we're employing — 155, whatever it is — million people, and supporting a population of 330 million people when we started with 4 million people, with 80 percent of the labor being employed on farms.

So, the system works and it will continue to work. And I don't know what the next big thing will be. I do know there will be a next big thing. Charlie?

CHARLIE MUNGER: Well, we want to shift the scut work to the robots to the extent we can. That's what we were doing, as Warren said, for 200 years.

Nobody wants to go back to being a blacksmith, or scooping along the street, picking up the horse manure, or whatever the hell people used to do. We're glad to have that work eliminated.

And a lot of this worry about the future comes from leftists who worry terribly that the people at the bottom of the economic pyramid have had a little stretch when the people at the top got ahead faster.

That happened by accident because we were in so much trouble that we had to flood the world with money and drive interest rates down to zero. And, of course, that drove asset prices up and helped the rich.

Nobody did that because they suddenly loved the rich, it was just an accident, and it will soon pass.

We want to have all this productivity improvement, and we shouldn't worry a little about the fact that one class or another is a little ahead at one stretch.

WARREN BUFFETT: Charlie and I — (applause) — we worked in a grocery store. And when people ordered a can of peas, we had ladders that we climbed up to reach the can of peas, and then we placed it in a folding box, and then we put it on a truck. And if you looked at the amount of food actually transferred between the producer and the person who consumed it, and the number of people involved in the transaction, you know, it was — I don't know whether it was one-third or one-quarter or one-fifth as efficient as the best way now to get food delivered to you. And —

CHARLIE MUNGER: And the food was worse.

WARREN BUFFETT: (Laughs) And my grandfather, you know, was distressed about the fact that this particular credit and delivery kind of store would be eliminated. And it was eliminated, but society —

CHARLIE MUNGER: It's coming back.

WARREN BUFFETT: —addressed the — pardon?

CHARLIE MUNGER: It's coming back.

WARREN BUFFETT: It's coming back, but more efficiently. (Laughter)

Anyway, we've seen a little creative destruction. And frankly, we're glad that it freed us up to go into the investment business. Worked out better for us.

15. Regulations can be “irritating,” but they're needed for banks and insurance

WARREN BUFFETT: Becky?

BECKY QUICK: This question comes from Brian Gust of Grafton, Wisconsin. He's talking about regulators and politicians. It says, “The Berkshire Hathaway investment portfolio holds several large financial institutions that are heavily regulated and are politically charged.

“Do you feel that, in some cases, the regulators and/or politicians are running the big banks instead of the CEO and the board of directors?”

CHARLIE MUNGER: Sure. (Laughter) But not too much.

WARREN BUFFETT: No, insurance has been regulated — it happens to be regulated primarily on a state basis — but insurance has been regulated ever since we went into it, and it hasn't — you know, when I looked at GEICO, it was doing 7 million of business. And, you know, it will do 30-odd billion of — billion — of business now. And it's been regulated the whole time.

And regulation can be a pain in the neck, generally, but on the other hand, we don't want a bunch of charlatans operating in the insurance business. And insurance actually lends itself to charlatans because you get handed money and you give the other guy a promise.

And I like the fact that there is regulation in the insurance business, or the banking business. It doesn't mean it can't drive you crazy sometimes or anything of the sort, but those businesses should be regulated. It — they're too important.

And anytime you can take other people's money, and they go home with a promise and you go home with the money, I don't mind a certain amount of regulation in those businesses. Charlie?

CHARLIE MUNGER: Yeah. You're using the government's credit because you have deposit insurance, there's an implicit bargain. You can't be too crazy with what you do with the money. That's a perfectly reasonable —

And I absolutely believe that we should have a regulation system that involves supervision of risk-taking by banks.

It got particularly bad in the investment banks at the peak of the real estate crisis, and the behavior was — there's only word for the behavior — it was disgusting. And it was pretty much everybody.

Warren, you — it's hard to think of anybody who stayed sane in that boom. They felt the other guy's doing dumb things, I've got to do it, too, or I'll be left out. What a crazy way to behave.

And so, sure, there's some intervention, but there probably has to be.

WARREN BUFFETT: You want a Food and Drug Administration. Yeah. You'll be unhappy with how they do it, if you're in the business and all that, but — and, you know, I find any kind of regulation irritating. But nevertheless, it's good for the system.

And actually, a number of regulators, you know, I would say that they've really been quite sensible about regulation. But you don't feel that way when you're being told how to run your business.

But as Charlie says, you wouldn't want to be a bank that ran in an unregulated system where anybody could come in and do all kinds of things that would actually have consequences that drew you into the problems that they created themselves.

We had the Wild West in banking long ago, and it produced a lot of problems in the 19th century.

16. Shareholders don't want or need very detailed information on the subsidiaries

WARREN BUFFETT: Jay?

JAY GELB: For the past several years, in Berkshire's annual shareholder letter, there's been increasingly less detail provided on its operating businesses and financial performance.

For example, the company is no longer providing details on the finance and financial product segment, or a balance sheet for the manufacturing, service, and retail segment, or a breakdown of float by unit in the insurance business.

For a company as large and diversified as Berkshire, why are investors being provided less information than previously?

WARREN BUFFETT: Well, I don't think we actually provide less information. We may present it in a somewhat different form from year to year, just — and then this year, for example, you know, I started my letter, as usual, in my mind as saying, "Dear Doris and Birdie," my sisters, to tell them what I would tell anybody that had a very significant proportion of their net worth in Berkshire, who is intelligent, did not know all the lingo of our various businesses, that would read a lot of words, because they did have a large investment. So, if I explained anything, and did a decent job, that they would understand what I was talking about.

And I tell them that in the language that I think will be understandable to a significant percentage of a million-plus people who have all kinds of different understanding of accounting and all that sort of thing. I tell them the information I would want to hear on the other side.

Now, if I was a competitor, and I wanted to know what one of our furniture stores was earning or something of the sort, you know, I might love it, but it doesn't really make any difference.

If you're talking about a \$500 billion organization, if you understand our insurance business, in terms of giving you the picture, I think, in three or four or five pages — you know, actually we've got a whole bunch of stuff required by the SEC about loss reserve development.

I think you can write a 300-page report that gives a whole lot less information than a 50-page report. And you lose people.

So, I try to tell them — like I say, in my mind, it's my sisters — I try to tell them what I would tell them if we had a private business and they owned a third of it each, and I owned a third, and once a year, they like to get filled in. And they don't know what a combined ratio means because it's a dumb term that everybody uses. And the important thing is to call it a profit margin.

They don't know what the operating ratio is in the railroad business, and it's an obsolete term. It'd be better to call that a profit margin. But the lingo — we're not writing it for analysts. We're writing it for shareholders, and we're trying to tell them something so they can make a — they can not only get the picture as to what we own now, but how we think about the operation, what we're trying to do over time. And we try to do the best job we can every year.

And I don't think it — I think if somebody is terribly interested in the details, they really are missing the whole picture. Because you could have known every detail of our textile business in 1965, and we could give you the information as to how much we made from linings and how much we made from handkerchiefs, and you'd be in a different world. I mean, the important thing was how we looked at running money and what we would do about things over time.

And it just — you could have gotten very misled — if you'd read it in 1980 or '85 and you looked for great detail on how See's candy was doing because they moved eastward, you know, we'll tell you that overall that failed, in terms of moving out the territory.

But going into a whole lot of detail that might be very interesting to an analyst, but really for the shareholder, they've got to make a decision as to who's running their money, and how they're running it, and what they've done over time, and what they hope to do in the future, and how to measure that. And again, we're writing it for the individual. Charlie?

CHARLIE MUNGER: Well, I suppose I should be watching every tiny little business down to the last nickel, but I don't. And I don't want that much detail. And I think our competitors would like it, and it wouldn't do our shareholders any good. So, we'll probably just keep reporting the way we do.

WARREN BUFFETT: You can see how flexible we are here. (Laughter)

17. Munger: "Climate getting better" for U.S. investments in China

WARREN BUFFETT: Station 3.

AUDIENCE MEMBER: Hello, Mr. Buffett and Mr. Munger. I'm Sasha Xixi (PH) from China International Capital Corporation Limited.

Last week, China announced 12 new measures further opening up the financial industry. All these measures will allow more invested institutions to enter into Chinese financial market, and to insure the policies of foreign investment to be consistent with those of domestic investment.

What do you think about these new measures? Do you believe the foreign financial institutions will have more pricing power over the Chinese stock markets in the future? Do you have any plans to set up a company in China? If so, what time? Thank you.

CHARLIE MUNGER: Well, we've got one now. Dairy Queen is all over China. (Laughter)

And it's working fine. And we didn't wait for new laws. We did it under the old laws. But we're not that big, net, in China, right, Warren?

WARREN BUFFETT: We're not that big what?

CHARLIE MUNGER: In China.

WARREN BUFFETT: No, but we had something, you know, that could have happened that would have been quite sizable.

But China, it's a big market, and we like big markets. I mean, we really can only deploy capital in a major way maybe in 15 or so countries just because of the size.

CHARLIE MUNGER: But generally, I think the climate is getting better. It really makes sense for the two countries to get along. Think of how stupid it would be if China and the United States didn't get along. Stupid on both sides, I might add.

WARREN BUFFETT: Yeah. We've done well in China. We haven't done enough, but —
(Applause)

18. Buffett has “feeling” Brexit vote was a mistake, but he’s still anxious for a U.K. deal

WARREN BUFFETT: Andrew?

ANDREW ROSS SORKIN: Warren, this is a question from a member of the House of Lords in Westminster, who happens to be here today, who also is a shareholder of the company.

This is Lord (Jitesh) Gadhia who says, “You've written, ‘We hope to invest significant sums across borders. So, what's your appetite to invest in the U.K. and Europe, and how will Brexit impact that? And while we're at it, what's your advice for solving U.K.'s Brexit dilemma?’”
(Laughter)

CHARLIE MUNGER: That's yours, Warren. (Laughter)

WARREN BUFFETT: Well, I can — I will tell you this. I mean, I gave an interview to The Financial Times, and I don't do that very often.

But one of the considerations I have is that I would like to see Berkshire Hathaway better known in both the U.K. and Europe. And the FT audience was an audience that I hoped would think of Berkshire more often in terms of when businesses are for sale.

Our name is familiar, I think, pretty much around the world in, at least, financial circles. But there is no question if anybody's going to sell a large business in the United States, they're

going to think of Berkshire. They may decide, for other reasons, they'd rather do it differently. But they will think of Berkshire.

And I don't think — I mean, obviously that is not as true around the world. We've had some very good luck with a few people that have thought of Berkshire, I mean, such as at ISCAR. And actually, Berkshire Hathaway Energy had one of its base holdings from way back was in the U.K.

But I was looking, in doing that interview, I was willing to spend three hours with the FT reporters in the hope that when they write about — when they write the story — that somebody, someplace thinks of Berkshire that wouldn't otherwise think of it.

And we'd love to put more money into the U.K. I mean, if I get a call tomorrow and somebody says, you know, "I've got an X-billion-dollar — pound — company that I think might make sense for you to own," and that I would like to actually have as part of Berkshire, you know, I'll get on the plane and be over there.

But they'll have to name — they'll have to tell me what their price ideas are, and what its earnings — I'm not interested in going over and talking about it and pricing it for them and not making a deal. We like to make deals when we actually get into action. And we're hoping for it.

And we're hoping for a deal in the U.K., and/or in Europe, no matter how Brexit comes out.

I think it — I don't — I'm not an Englishman, but I have the feeling it was a mistake to vote to leave. But I don't think it's — I don't think it — it doesn't destroy my appetite in the least for making a very large acquisition in the U.K. Charlie?

CHARLIE MUNGER: Well, all my ancestors came from northern Europe so I'm very partial to the place. On the other hand, if you asked me how I would vote on Brexit if I lived in Britain, I don't even know. It just strikes me as a horrible problem. And I'm glad it's theirs, not mine. (Laughter)

WARREN BUFFETT: But if I called you tomorrow and said we had a deal in U.K., you'd tell me —

CHARLIE MUNGER: Oh, I would go in, in a minute.

WARREN BUFFETT: Yeah.

CHARLIE MUNGER: Those are my kind of people. I understand them.

WARREN BUFFETT: Yeah. (Laughter)

19. We don't need "boots on the ground" to find foreign acquisitions, we need lower prices

WARREN BUFFETT: OK, Gregg. (Laughter)

GREGG WARREN: Yeah, Warren, just wanted to kind of maybe follow up on those past two questions, because there is sort of a theme there.

It seems to me that there's definitely more of a home country bias when we look at the acquisitions and investments that Berkshire's done historically.

And while there's definitely value in sticking with what you know and feel the most comfortable with, it seems like you've gone from a model that was originally focused on putting boots on the ground to find investment and acquisition opportunities to one where you're seemingly more content to have sellers or their representatives call you or drop by the office, basically more of a pull model than a push model.

There's nothing wrong with this, but I just wonder, if the opportunity cost that comes with this type of model is that Berkshire misses out on a lot of overseas business where owners are unaware of your willingness to step up and buy them outright and allow them to run their companies under the Berkshire umbrella, and missing stock investment opportunities because Berkshire is not necessarily familiar enough with the local market.

At this point, do you think Berkshire would benefit from putting more boots on the ground in these overseas markets?

WARREN BUFFETT: Yeah, we — actually, it must have been after we bought ISCAR, Eitan Wertheimer convinced me that we should get more exposure in Europe. And he helped out in doing that.

I went over, he arranged various meetings. We've had a lot of contact. It isn't that they're not aware, and we do hear about some.

But we do have the problem they've got to be sizable. I mean, if we do a billion-dollar acquisition, and it makes \$100 million, or thereabouts, pretax, \$80 million after tax, you know, it's — if we really know the business and we're sure we're not going to have a problem with the people running it being motivated in the future, and doing a similar job as to when they had their money in and everything, it's nice to add 80 million to 25 billion.

But you can't afford to spend lots of time doing that. And we gain something by having Todd (Combs) and Ted (Weschler) do some looking at things, screening them and that sort of thing.

But in the end, you want somebody that — you want some family that's held their business in Europe or in the U.K. for 50 or 100 years that can make a deal, and that wants to do it with Berkshire.

I mean, if they're looking to get the most money, if they want to have an auction, we're not going to win and we're not going to participate because we're not going to waste our time on it.

If we form an acquisition crew, they'll acquire something. I mean, I've watched so many institutions in operation that, you know, if your job every day is to go to work and screen a bunch of things with the idea that you're the strategic department or acquisition department, you're going to want to do something. I want to do something, but I don't want to do something unless — (laughs) — Berkshire benefits by it — truly benefits by it — and generally it's of a size.

CHARLIE MUNGER: Warren, our problem is not a lack of boots on the ground, our problem is the people on the ground are paying prices that we don't want to pay.

WARREN BUFFETT: Yeah.

CHARLIE MUNGER: That's our problem. And that problem is not going to be cured by boots.

WARREN BUFFETT: We can spend \$100 billion in the next year. That is not a problem.

CHARLIE MUNGER: No.

WARREN BUFFETT: Spending it intelligently is a huge problem. And the —

CHARLIE MUNGER: Our competitors are buying with somebody else's money, and they get part of the upside and take none of the downside.

WARREN BUFFETT: And a lot of them —

CHARLIE MUNGER: It is hard to compete with people like that.

WARREN BUFFETT: Yeah. They'll leverage it up, they'll make a lot of money if it fails, and they'll make even more money if it succeeds. And that's not our equation.

CHARLIE MUNGER: No.

WARREN BUFFETT: And that isn't always that way, but it's certainly that way now. It's probably —

CHARLIE MUNGER: And it's not in the shareholders' interest that we get to be like everybody else.

WARREN BUFFETT: Yeah. (Applause)

20. We feel good about Berkshire as a long-term “compounding machine”

WARREN BUFFETT: OK, station 4.

AUDIENCE MEMBER: Mr. Buffett and Mr. Munger, thank you so much for the wisdom you've shared with us over the years. This is Steven Wood from New York. And, Mr. Buffett, thank you very much for your feedback, your very generous feedback, last August on the book that I'm writing.

I just had one follow-up, if I may. In studying the most significant value creators of all time, it is very evident that the major compounding effect happened later — at the later stages of the careers. Or, in (Cornelius) Vanderbilt's case, even beyond his own career.

So, your recent investments have suggested to me that you are designing Berkshire to be a steady compounding machine that should continue to create value for a very long time.

Would you both please elaborate on this compounding machine? And the machine's ability to continue to adapt to keep this value creation durable. And then is this legacy one of your sort of primary motivations when you wake up every day?

WARREN BUFFETT: I would say it is the primary motivation, but it's been that for a very, very, very long time.

No matter what was going right in my life, if things were going badly at Berkshire, I would not feel good, you know. I don't need to be spending my time working on something — (laughs) — that makes me feel bad about the results when we get through.

And it's something that's doable. I mean, the culture is stronger now than it was 10 years ago, and it was stronger then than 10 years previously. It moves slowly, but it goes in the right direction.

And when we get chances to deploy the capital, we've always tried to make any entity, whether it was the partnership originally, or Berkshire now, or Blue Chip Stamps when we owned it, or even Diversified (inaudible), we wanted them all to be compounding, in effect, be compounding machines.

That's why people gave us capital. That's why we put our own capital in. And if we failed at it, we really felt like we'd failed. It didn't make any difference how much money we made from fees or anything like that, we knew what our yardstick was.

And so that will continue. I think Berkshire is better situated than it's ever been, except for the fact that size is a drag on performance, and I probably wrote that 40 years — well, I wrote it, actually, when I closed the partnership to new money when we had like \$40 million in it.

I just said, really, that new — that additional capital would drag down returns from a \$40 million base. So, you can imagine how I feel with a \$368 billion — (laughs) — base of capital in Berkshire now.

But this culture is special. It can work. It won't be the highest compounder, by a long shot, against many other businesses. I think it will be one of the safest ways to make decent money over time. But that will depend on the people that follow us. Charlie?

CHARLIE MUNGER: Well, we came a long way from very small beginnings. And the fact that it slows down a little when it becomes monstrous is not my idea of a huge tragedy. And I think we will continue to do very well in the future.

We had nothing like the energy operation, you know, 20 years ago, and it's a powerhouse. We had nothing like Kevin's (Clayton) operation in home building 30 years ago, and it will soon be the biggest — well, even now, it's bigger than anybody else in the country, you know, both of types of housing. Isn't it — houses? I think so.

And we have a lot going for us, and I'm satisfied. I think it's going to continue reasonably.

WARREN BUFFETT: And it would ruin our life if we did terribly. (Laughs)

So, that's what we wake up thinking about in the morning. But I wouldn't want to be in a business where I was going to let down other people, and I think it would be crazy to do something like that, even if you weren't rich and 88. (Laughs)

But we are motivated to have something that is regarded as something different than others, and we're actually — in a world where so much money is institutionalized, you know, I like the idea of having something that's actually owned by individuals in very significant part, who basically trust us and, you know, don't worry about what the next quarter's earnings are going to be. I think it's different than much of capitalism, and I think it's something that Charlie and I feel good about. Isn't it, Charlie?

CHARLIE MUNGER: Yeah, absolutely. (Applause)

21. Berkshire vs the S&P, with taxes thrown in

WARREN BUFFETT: Carol?

CAROL LOOMIS: This question comes from Stephen De Bode of Danville, California, and it raises a question I've certainly never heard before.

"Mr. Buffett, in the past, you have recommended low-cost S&P — and again today — the S&P 500 Index funds as reliable, long-term investment vehicles. These funds have certain inherent structural advantages such as low costs, and automatic reshuffling of their holding.

"But Berkshire also has certain structural advantages, such as financial leverage from the float, and diverse capital allocation opportunities. I think of Berkshire as being ahead in this game.

“For example, it seems to me that if Berkshire’s overall operating business and investment performance were to exactly match the total return of the S&P Index over a 10-year period, Berkshire’s growth in intrinsic value would outperform the S&P 500.

“If you agree, could you estimate by how many percentage points?”

WARREN BUFFETT: (Laughs) Well, the answer is, I won’t estimate anything. But the — if we just owned stocks, and we owned the S&P, our performance would be significantly worse than the S&P because we would be incurring a corporate tax, which would now be 21 percent on capital gains, plus possibly some state income taxes. And effectively, our tax rate on dividends is — depends where they’re held — but somewhere between 10 1/2 or 11 and 13 percent.

So, Berkshire is a mistake — or it’s at a corporate disadvantage simply by the way the tax law runs, compared to owning an index fund, which has no tax at the corporate level, but just passes through to shareholders.

So, I wouldn’t — I don’t know whether we’ll outperform the S&P 500 or not. I know that we’ll behave with our shareholders’ money exactly as we would behave with our own money.

And we will have — we’ll basically tie our fortunes in life to this business, and we will be very cognizant of doing anything that can destroy value in any significant way. But we will probably —

If there were to be a very strong bull market from this point forward, we would probably underperform during that period. If the market five years from now or 10 years from now is at this level or below, we will probably overperform.

But I don’t think that I want to — I don’t quite understand the question in terms of when it said the total return of the S&P over a 10-year period and Berkshire’s growth in intrinsic value would outperform. I don’t know whether that will happen or not. Charlie?

CHARLIE MUNGER: Well, there would be one big advantage for the shareholders that pay taxes, and that is that the Berkshire shareholders, even if we just matched the S&P, we’d be way ahead after taxes. We all have a pretty decent role in life and a pretty good position. We shouldn’t be too disappointed.

WARREN BUFFETT: No. If we — we could have structured — going back to partnership days — we could have structured things so that actually, over a period of time, doing the same things we did, would have actually come out somewhat more favorably for shareholders if we had kept it to the original partnership group.

But the present form hasn’t worked badly, although we have had periods when our corporate capital gains tax, as opposed to the individual, I think it got up to 39 percent a couple of years

or one year, and certainly was 35 percent for a long time. And then, on top of that, we had the state income taxes in some cases.

And they exceeded — well, I mean, if you owned a pass-through fund, you did not have that level of possible double taxation. Now, if you hold your stock forever, you don't pay it. But if you actually sell your stock, you've had a double tax effect.

We're not complaining in any way, shape, or form. This country has treated us incredibly well, and we've added this huge tailwind, which I wrote about in the annual report. And it wouldn't have happened in any other country.

So, we've been very lucky that we've been operating in this country at this time. Charlie, anything?

CHARLIE MUNGER: No.

22. How NV Energy is working to recover from casino defections

WARREN BUFFETT: Jonathan?

JONATHAN BRANDT: In Nevada, several casinos have cut the cord with our NV Energy subsidiary and are seeking their electricity needs elsewhere, even though they had to pay huge exit fees. I have three questions about this phenomenon.

One: do you believe that these are rational choices, or were they made for non-economic reasons?

Two: what can NVD do, if anything, to stem the tide of defections?

And, three: is this something that could happen in other states where you operate regulated utilities? Or is the situation in Nevada somehow unique because of super-sized customers that have more leverage in the power market than smaller industrial customers in other states?

And I don't know whether that's a question for you or Greg, but I'd be happy to hear from either of you.

WARREN BUFFETT: It's a question for Greg. (Laughter)

GREG ABEL: Thanks, Jonathan. So just for everybody, I think they heard the question from Jonathan, but we've owned the utility there for approximately five years.

When we inherited the utility, we knew it had some fundamental issues around its customers. The relationships were really strained from day one because they'd had a history of continuing

to increase rates, and they really weren't delivering renewable energy or meeting the customers' needs or expectations. So, we knew we had some challenges there.

As we sit here today, we've had five customers leave our system. Those customers still use our distribution services. So, the only thing we do not provide them is the power. So, we have lost an opportunity to sell them power, and we've lost the associated margin on that. And we are disappointed with that. We do recover, you know, substantial fees, as you noted.

How the commission looked at it was, "Well, you lose this customer; we'll give you effectively six years of profit on that. And by then, you should have grown back into your normal load." And actually, it's a fair outcome. Our load is higher than it was relative to when those customers have left. So, we've grown through that, and it's consistent with their belief.

The fundamental issue, and you've touched on it, why are they leaving? There are economic reasons for them leaving. And the fundamental reason is, in year seven, they no longer bear sort of the societal costs that are being imposed by the state. They don't have to bear the costs of renewable energy. They don't bear the costs of energy efficiency. And they viewed it as sort of the time to exit out of that model.

We do have a variety of legislation that's going to levelize the playing field. We've had a number of customers that announced they were leaving now who've entered into long-term agreements with NV Energy. And I really do believe our team has the right model, which is we're much more focused on delivering a great value proposition to our customers. So, it has to include price.

But equally, we're building substantial renewable energy there now. And long term, our team will deliver a great proposition to them, and I think NV Energy will prosper in the long term. We're going to be happy with it as a long-term investment. Thank you.

WARREN BUFFETT: Greg, could you give them, give the audience a rough approximation of what, say, in the 10 years or whatever it may be before we bought Nevada Power, what had happened with rates; what had happened with rates under us; and what has happened with coal generation under us?

GREG: Right. Yeah. Yeah, that's great. So, you know, Warren's really expanding on what are — the focus we've brought to delivering something to the customer.

So, if you'd looked at the prior ten years, they pretty much had a rate strategy that, every second year, their rates would go up sort of by the cost of inflation. And that pretty much materialized year after year.

We came in immediately, just like we've done in Iowa — so we've built all that renewable in Iowa, and we've never increased rates since the date we acquired it, 1999. So, rates have been stable, and we don't ever see raising rates in Iowa till probably 2030 or 2031.

Our team took a very similar approach in Nevada, which was to, you know, stabilize it. So, rates are down probably 5-7 percent since we've owned them. So, we haven't had rate increases.

We've announced substantial rate increases (decreases) again that will take effect every two years. So just like we used to be able to have rate increases, we have a few of when we'll decrease their rates. Their rates will go down again in 2002. We've — pardon me, in two years.

And then on top of that, there's been an approach to eliminate coal, as Warren touched on. So fundamentally, when we acquired it, all their coal fleet was operating. We've retired a substantial portion of the coal fleet already. And by, I believe it's within a year of this, 2023, we'll have eliminated 100 percent of their use of coal in that state. And it was a substantial portion of their portfolio in the past. So — (applause) — team's done a great job. Thank you.

WARREN BUFFETT: Charlie, have anything?

CHARLIE MUNGER: No.

23. Portfolio managers Weschler and Combs roughly matching the S&P but making other contributions

WARREN BUFFETT: Station 5.

AUDIENCE MEMBER: Yes, hi. My name is Aaron Lanni. I'm a portfolio manager at a company called Medici out of Montreal, Quebec.

My question is actually for Todd (Combs) and Ted (Weschler), if possible.

So according to Warren, you lagged slightly behind the S&P 500 since joining Berkshire. So what recent changes, if any, have you implemented to increase your odds of beating the S&P in your respective stock portfolios over the next 10 years?

WARREN BUFFETT: Yeah, I'm not sure whether Todd or Ted are here, but they — I will tell you, but then — I'll make this the final report on it.

But on March 31st, actually, one is modest ahead, one is modestly behind. But they are extraordinary managers. It has not been — it was a tough — it's been a tough period to beat the S&P and, like I say, one of them is now ahead of the S&P over that period, one's modestly behind.

They've also helped us in just all kinds of ways. What Todd has done in connection with the medical initiative, we have — with J.P. Morgan, Amazon, I mean, I don't know how many hours a week he's worked totally on that. The things they've brought to me, what Ted did in terms of the Home Capital Group where we have essentially, in a major way — well, we stabilized a

financial institution that was under attack and experiencing runs in Canada. And he did the whole thing.

I heard about that on a Monday, and on Wednesday, we put an offer before the company. And previously to that, they probably had dozens and dozens of people combing over them and, meanwhile, they were struggling. And, you know, it was remarkable what he did and I think it's appreciated in the Toronto area.

So, we are enormously better off because the two are with us. And while we have that measurement, like I say, I'll just put it this way, they're doing better than I am anyway. So, if you ask me to report on them all the time, I'll have to report and myself all the time, and I'm not — (laughs) — that would be embarrassing compared to how they do. They do better.

They're very, very smart. They've been smart with their own money over the years. They've been smart in running other people's money over the years. And they've made us a lot of money, but they made it during a market where you'd have made a lot of money in S&P as well. Charlie?

CHARLIE MUNGER: No, I'm fine.

24. Power of American Express's brand will help fend off heavy credit card competition

WARREN BUFFETT: OK. Becky?

BECKY QUICK: This question comes from Leiders Luff (PH), Yosis Luff (PH), and Dan Gorfung (PH) of Israel. And they write to both Mr. Buffett and Mr. Munger, "Do you think that AmEx's share of mind is enough to win the credit cards race? How do you see AmEx's competitive position now compared to the past? And who is the most threatening competitor now, compared to the past?"

WARREN BUFFETT: Yeah, everybody's a competitor, including now Apple. It has just instituted a card, I guess, in conjunction with Goldman Sachs.

Everybody — there will always be, in my view, many, many competitors in the business. Banks can't afford to leave the field. It's a growing field. They build up receivables on it.

But I wouldn't think of the credit card business as a one-model business any more than I would think of the car business as essentially being one model. I mean, Ferrari is going to make a lot of money, but they're going to have just a portion of the market.

Well, AmEx is growing around the world with individuals, it's growing around the world with small businesses. You just saw the contract they made with Delta — which is probably the ideal partner— that runs, what, for eight or nine, whatever it may be, nine or 10 years, actually.

You know, the billings go up per capita, they go up — the coverage spreads. And they're going to have loads of competition, and they always will. But they had — you know, that's something — J.P. Morgan, you know, took on the Platinum Card. It was a competitor, and the Platinum Card had the highest renewal rates that they've had. And they increased the price I think from 450 to \$550 during a competitive battle, and retention improved, and new business improved, and 68 percent or so of the new business was millennials.

I mean, it is a — it is not an identical product with anything else. And as a premium card, it has a clientele which is large. It may only be — it may be X percent of the market, it may be three-quarters of X percent, or whatever it may be. It isn't for the person that likes to have five cards and look every day at which one provides the most rewards that day or in what gas stations or something of the sort.

But it's got a very large constituency that has a renewal rate, a usage rate, that's the envy of everybody else in the industry. So, I like our American Express position very well. Charlie?

Charlie, anything on American Express?

CHARLIE MUNGER: No. (Laughter) No, I think we own the world as long as the technology stays the same.

WARREN BUFFETT: No, we — it's an interesting thing.

CHARLIE MUNGER: I have no opinion about technology.

WARREN BUFFETT: This year — (laughter) — the technology is not the whole thing. I mean, you know, fortunately. I mean, it —

If you look at credit card usage, there are a lot of different things motivating different people to use different various types of payment systems. And there's a lot of them that are growing. There are some of them that are marginal. And American Express is an extraordinary operation.

And I think this year, our share of the earnings — well, by next year, our share of the earnings of American Express will be equal to the cost of our position. We'll be earning a hundred percent on what that position cost us, and I think it will grow.

And I think the number of shares will go down and our interest will go up without us laying out a dime. So, it's —

CHARLIE MUNGER: As you say, we own the world if it doesn't change.

WARREN BUFFETT: Well, even if it changes some. The world has changed a lot. American Express was formed in 1850.

CHARLIE MUNGER: No, I'm talking about WeChat.

WARREN BUFFETT: You can talk about all kinds of competitors, but —

CHARLIE MUNGER: Yeah.

WARREN BUFFETT: But the — American Express actually was an express company, formed in 1850, like I say, by Wells and Fargo, of all people. And, you know, for a while they carried these big trunks around of valuables. And then the railroads came along and that wasn't going to work very well anymore, so they went into traveler's checks.

And it's a very interesting thing. In 1950, when I was living at 116th and Broadway, they were down at 65 Broadway, and they were the most important name in travel. They were synonymous with the integrity of their traveler's checks. And the whole company, in a record year for travel, earned \$3 million. \$3 million. What a bond trader earns now in my lifetime, that's what they've done with — and their hand going in was the traveler's check, which has more or less disappeared.

But American Express, the power of that brand, intelligently used, going into the credit card business, where they entered much later than the Diners Club, later than Carte Blanche, but they came to dominate the luxury end of the credit card business.

It's a fantastic story, and I'm glad we own 18 percent of it.

25. Occidental came to us for a \$10B loan because we could do it quickly

WARREN BUFFETT: OK, Jay?

JAY GELB: Actually, I'm going to ask something about Occidental Petroleum. I'm surprised it hasn't been asked yet.

So, Berkshire has committed to providing \$10 billion in financing in the form of an 8 percent preferred share and attached warrants for Occidental's proposed acquisition of Anadarko.

This is the first time Berkshire has committed to such a large preferred share investment since the acquisition of Heinz in 2013.

What did you find attractive about the Occidental deal, in terms of its business? And should we expect other large financing transactions in the future, as a way for Berkshire to deploy a portion of its excess cash?

WARREN BUFFETT: I don't think the Occidental transaction will be the last one we do. (Laughs)

There may be one, you know, in a month. They may be one three or four years from now. It won't be identical. I hope it's larger.

But the point is, we're very likely to get the call because we can do something that really I don't think — no institution can do it. I mean, they've got committees that have to pass on it, and they want to have so-called MAC clauses, Material Adverse Changes. They want to do this and that.

And if somebody wants a lot of certain money for a deal, you know, they've seen that I can get a call on Friday afternoon, and they can make a date with me on Saturday, and on Sunday, it's done. And they absolutely know that they have \$10 billion and we're not going to tell them how to structure their transaction or do anything else. They've got it.

And there will be times in the future when something, not identical, but similar, comes along, and we're the one to call. And I hope its larger than 10 billion. But —

It could be — it could be we'll do — you know, in the next five years. It could be we'll do a lot of money, additional money in things similar to this, not identical. And it could be that nothing will happen.

But if there are any \$10 billion, or \$20 billion, or maybe even \$50 billion two-day transactions, if there are any in the world, believe me, they'll think of Berkshire Hathaway for sure in terms of what number to call. Charlie?

CHARLIE MUNGER: Well, I like it. (Laughter)

WARREN BUFFETT: I called Charlie as soon as we made the — I called Ron Olson first because I was worried that he might have a conflict. And in about ten minutes, he had — I told him we — it had to be done by Monday night. And Cravath was being told the same thing by Occidental.

And it was very late on Monday night, but all the papers were put in order. And Munger, Tolles was in Los Angeles, and Cravath was in New York, and I was in Omaha. And I didn't do that much; Mark Hamburg did a lot of the work. He was at work on Sunday on other things when I went down (laughs) to meet with the Occidental people.

And it was the product of people who understood us, understood how we operate, and both with an incentive to put all the manpower necessary on the job.

And like I say, I think their board of directors met at 10 o'clock on Monday night to approve it. But they could announce it Tuesday morning, and that's what they wanted to do. And with Berkshire, they could do it.

26. We have no formula for assessing risk

WARREN BUFFETT: OK, station 6.

AUDIENCE MEMBER: Good afternoon, my name's Tony McCall and I'm from Montgomery, Alabama. And my question is about your disciplined risk evaluation approach and how you balance that with the fact that perseverance and determination and grit are often necessary for success.

WARREN BUFFETT: Well, I'm not — I certainly like determination and grit in the — with the people we work for.

But we don't have any formula that evaluates risk, but we certainly make our own calculation of risk versus reward in every transaction we do.

And that's true whether it's marketable securities, that's true whether it's private investments, that's true whether it's making an investment in a business.

And sometimes we're wrong, and we're going to be wrong sometimes in the future. You can't make a lot of decisions in this business without being wrong. But we don't think the procedure — or the results — would be changed favorably by having lots of committees and lots of spreadsheets and that sort of thing. It just — you know —

If I had a group under me, they would try and figure out what I wanted the answer to be, and they would tell me what I wanted to hear.

And I've watched that approach at 20 public companies. And what the CEO wants to do, they may spend a lot of time getting there, but the investment banker gets there, and the internal committees get there, — or the internal operations — get there.

The calculations are — it's the same as the insurance business with Ajit (Jain). Ajit gets calls on insurance deals, and you have to think through that deal.

The main thing is you have — are you reasonably sure that you know what you're doing? And if it gets past that hurdle, then we go on to figure out the math of gain versus loss and how much loss we can afford to take in anything. And we're willing to take what sounds like large losses if we think that the rewards are more likely and proportional. Charlie?

CHARLIE MUNGER: I've got nothing.

WARREN BUFFETT: It's very disappointing — we have no formulas around Berkshire. We don't sit down and write a bunch, you know — have people work till midnight calculating things and putting spreadsheets together.

And if the hurdle rate is 15 percent or something, having them all come out at 15.1 or 15.2, because that's what's going to happen. I mean, you're going to get the numbers you want to hear and to an extreme degree.

27. Buffett describes some of the dishonest business propositions it gets

WARREN BUFFETT: The proposals we see from the investment world — I've got to tell you about one because it illustrates what goes on.

We received a proposition the other day — and I'll disguise the numbers a little bit so somebody can pick it out — but it was a private company, and we'll say it was earning a hundred million dollars a year. But the seller of the business and the investment banker suggested that we should look at the earnings as being 110 million dollars a year, because as a private company they had to pay their top people in cash, which was expensed.

But we could pay them in stock options and things like that, which weren't expensed, or were explained as not really counting and therefore we could report 110 million dollars if we gave away something we didn't want to give away.

But by essentially — by sort of lying about our accounting, we could add 10 million dollars in earnings, and they wanted us to pay them because they couldn't do it and we could do it. And therefore — at this point, they're losing me of course, totally.

But it — it's just astounding the accounting games that are played. All the adjustments are why the place should really be — will be — earning more than before. It's a business.

We also had one that came in from a private equity firm and by a mistake we got the email that was sent to the manager from the email from the private equity firm that owned it, to the manager, in terms of making projections for it.

And they told them to add 15 percent because they said Buffett will discount it by 15 percent or 20 percent anyway. (Laughs)

So just add 15 percent to offset his conservatism. You know, it's not an elegant business, as Charlie will tell you. (Laughter)

You have any better stories, Charlie? (Laughter)

CHARLIE MUNGER: It's bad enough.

WARREN BUFFETT: OK, Andrew —

CHARLIE MUNGER: It's really very bad enough.

ANDREW ROSS SORKIN: Thank you, Warren. I think it's —

CHARLIE MUNGER: Why do we want our leading citizens lying and cheating?

28. Buffett would bet against a car company like Tesla being able to compete on auto insurance

WARREN BUFFETT: Andrew?

ANDREW: I believe it's my final question and admittedly it's a two-parter, but it's the same topic.

Elon Musk says that Tesla will start to offer insurance for its cars and can price it better than a typical insurance company because of the data it collects from all of the vehicles on the road.

You've talked about the threat of autonomous vehicles on the insurance business. But what about to GEICO of automobile themselves getting into the insurance business?

And on a very similar topic, Tesla recently announced that they are shifting to an online-only sales model. And several traditional auto dealerships are also reducing their property holdings as car buyers increasingly use smart phones and the internet to shop for cars. What does this portend for Berkshire Hathaway Automotive?

WARREN BUFFETT: Yeah. Actually, General Motors had a company for a long time called Motors Insurance Company and various companies have tried it.

I would say that the success of the auto companies getting insurance business are probably about as likely as the success of the insurance companies getting into the auto business.
(Laughter)

I worry much more about Progressive than all of the auto company possibilities that I can see, in terms of getting insurance business. It's not an easy business at all.

And I would bet against any company in the auto business being any kind of an unusual success.

The idea of using telematics, in terms of studying people's drivers habits, that's spreading quite widely. And it is important to have data on how people drive, how hard they break, how much they swerve, all kinds of things.

So, I don't doubt the value of the data but I don't think that the — the auto companies will have any advantage to that. I don't think they'll make money in the insurance business.

Using the internet to shop for cars is like, you know, using the internet for shopping for everything. It's another competitor. And there's no question that people will look for better ways.

The gross margin on new cars is about 6 percent or thereabouts. So, there's not lots of room in the game. But that will be a method and that will sell some cars.

And if there are, you know — it's another competitor. But I don't think it destroys the auto dealer who takes good care of the customers and is there to service the customers.

It's not an overwhelming threat, but it's obviously something that's going to be around and will sell some cars. Charlie?

CHARLIE MUNGER: Again, nothing. (Laughter)

29. Buffett: I'm betting all my wealth on the survival of Berkshire's culture

WARREN BUFFETT: OK. Gregg?

GREGG WARREN: Warren, a lot of Berkshire's success over the years has come from the fact that you and Charlie have had the luxury of being patient, waiting for the right opportunities to come along to put excess capital to work, even if it has led to a buildup of large amounts of cash on the balance sheet.

This has historically worked out well for shareholders, as you and Charlie have been able to take full advantage of the disruptions in equity and credit markets or special situations like we saw with the Oxy deal, to negotiate deals on terms that ultimately benefit Berkshire shareholders.

That said, there is an opportunity cost attached to your decision to hold onto so much cash, one that investors have been willing to bear, primarily by forgoing a return of excess capital, dividends, and share repurchases, as well as seeing lower returns on cash holdings.

As we look forward, how certain can we be that this will still be the case once you're no longer running the show, especially if Berkshire's returns are expected to be lower over time. And is it not more likely that the next managers at Berkshire will have to manage the eventual migration of Berkshire from an acquisition and investment platform to a returning capital to shareholders vehicle?

WARREN BUFFETT: Yeah. Well, that's certainly a possibility. I mean, that's a possibility under me. It's a possibility under the successor. I mean, it's a question of can you invest truly large sums reasonably well. You can't do it as well as you can do small sums. There's no question about that.

But we will have to see how that works out over many years because certain years lots of opportunities, huge opportunities, present themselves and other years there are totally dry holes.

So that's not a judgment you can make in a one-year period or a three-year period. It's certainly a judgment you can make over time though.

And I personally — my estate will have basically nothing but Berkshire in it for some time as it gets disbursed to philanthropies. And I have a section in there which says to the trustees, in effect, to manage it — I have a section in there that says — ignore the — your exempt, from my standpoint, from the law that trustees normally should diversify and do all that sort of thing.

And I want the entire amount that they have to be kept in Berkshire as they distribute it over time to the philanthropies. And I don't worry at all about the fact — I would like to have a very large sum go to the philanthropies, and I don't worry at about the fact that it essentially will all be in Berkshire. And I'm willing to make that decision while I'm alive, which will continue for some years after I die.

So, I have a lot of confidence in the ability of the Berkshire culture to endure and that we have the right people to make sure that that happens. I'm betting my entire net worth on that. And that doesn't give me pause at all.

I rewrite my will every few years, and write it the same way in respect to the Berkshire holdings. Charlie?

CHARLIE MUNGER: I don't own any indexes. And I have always been willing to own just two or three stocks. And I have not minded that everybody who teaches finance in law school and business school teaches that what I'm doing is wrong. It isn't wrong. It's worked beautifully.

I don't think you need a portfolio of 50 stocks if you know what you're doing. And I hope my heirs will just sit.

WARREN BUFFETT: My heirs hope that I'll change my will. (Laughter)

30. "Having the right partners in life is enormously important"

WARREN BUFFETT: OK, station 7.

AUDIENCE MEMBER: Hi. Good afternoon, Mr. Buffett and Mr. Munger. My name is Bill He (PH), and I'm from Vancouver, Canada. You two make up an iconic duo. And growing up, I found your investment strategies very admirable. And so, my question is, how do you deal with conflicts when they arise between the two of you?

WARREN BUFFETT: Are you applying personal conflicts in terms of doing something ourselves versus having Berkshire, do it? Or — oh, between the two of you. I'm just in —

Charlie and I literally, and people find this hard to believe, but in 60 years we've never had an argument. We have disagreed about things and we'll probably keep occasionally disagreeing about this or that.

But if you define an argument as something where emotion starts entering into it, or anger or anything of the sort, it just doesn't happen.

I think that Charlie is smarter than I am, but I also think that there are certain things where I've spent more on them than he has. And sometimes we both think we're right. And generally, I get my way because Charlie is willing to do it that way and he's never second-guessed me when things have been wrong. And I wouldn't dream of second-guessing him if he were doing something that was wrong — that turned out to be wrong. We will never have a conflict, basically. Charlie?

CHARLIE MUNGER: Well, the issue isn't how long — how we get along, the issue is how is the company going to work when we're gone? And the answer is fine. It's going to work fine.

WARREN BUFFETT: We're lucky that, you know, I ran into him when I was, what, 28 years old. And — we both worked in the same grocery store and he grew up less than a block away from where I now live and everything. But I did not know who Charlie Munger was — (laughs) — until I was 28.

But clearly, we're in sync in how we see the world. And we're in sync on business decisions, basically.

Charlie would do fewer things than I would, but that's because I'm spending my time on this while he's designing dormitories or something. (Laughter)

And we both keep busy in our own ways. And we have a lot of fun dividing the labor like we do.

But you really want to work — I mean, having the right partners in life, particularly the right spouse, but having the right partners in life is enormously important. I mean, it's more fun with a partner, both in personal life and in business life. And you probably get more accomplished, too.

But you just have a better time. It would not be any fun to do work in a little room and make a ton of money trading around securities but never working with another human being.

So, I recommend finding — well, Charlie gave some advice in the movie, finding the best person that will have you or something like that. (Laughs) Sort of a limited objective.

CHARLIE MUNGER: But it's not hard to be happy if you're a collector and don't run out of money.

Collecting is intrinsically fun. Just think who — how many people who you've known your whole life who were collectors who didn't run out of money, who weren't happy collecting? That's why we've been collecting all our lives.

You know, it's a very interesting thing. There's always a new rock to be turned over. And it's interesting.

WARREN BUFFETT: Yeah. And in a certain way we've collected friends that make our lives better and that we have a good time with. And it's very important, you know, who you select as your heroes or friends. And I've been lucky in this. I mean, it was only because of the doctor named Eddie Davis and his wife that Charlie and I even met.

But if you keep doing enough things, some will work out very lucky. And the best ones are ones that involve lifelong involvement with other people.

We've got some in our directors, a number of our directors, that have had similar impacts on me.

So, I recommend that you look for somebody better than you are and then try to be like they are.

CHARLIE MUNGER: It's funny, you know, we've lost people along the way. And when I lost Warren's secretary I thought, "Oh, my God. She was so wonderful. Gladys (Kaiser). We'll never get another one." Becki (Amick) is better. (Laughter)

And then we had Verne McKenzie, who was a wonderful chief financial officer. He's gone and the current incumbent (Marc Hamburg) is better. We've been very lucky. And maybe the shareholders will be lucky a few more times. (Laughter)

31. Expand you circle of competence if you can, but don't force it

WARREN BUFFETT: OK. Station 8. (Laughter)

AUDIENCE MEMBER: Hi, Warren. Hi, Charlie. My name is Jacob (PH). I'm a shareholder from China and also a proud graduate of Columbia Business School. Thanks for having us here. (Cheers)

My question is, our world is changing at a faster pace today versus 40 years ago and even more so going forward. And in this context, for each of us individually, should we expand our circle of competence continuously over time? Or should we stick with the existing circle but risk having a shrinking investment universe? Thank you.

WARREN BUFFETT: Well, obviously you should, under any conditions, you should expand your circle of competence —

CHARLIE MUNGER: If you can.

WARREN BUFFETT: If you can. Yeah. (Laughter)

And I've expanded mine a little bit over time. But —

CHARLIE MUNGER: If you can't — I'd be pretty cautious.

WARREN BUFFETT: Yeah. You can't force it. You know. If you told me that I had to, you know, become an expert on physics or, you know —

CHARLIE MUNGER: Dance maybe the lead in a ballet, Warren. That would be a sight. (Laughter)

WARREN BUFFETT: Yeah, well. That's one I hadn't really —

CHARLIE MUNGER: (Inaudible) now.

WARREN BUFFETT: That's one you may be thinking about, but I— (laughter) — it hadn't even occurred to me. (Laughter)

But, you know, it's ridiculous. That doesn't mean you can't expand it at all. I mean, I did learn about some things as I've gone along in a few businesses.

In some cases, I've learned that I'm incompetent, which is actually a plus, then you've discarded that one.

But it doesn't really — the world is going to change. And it's going to keep changing. It's changing every day. And that makes it interesting. You know.

And as it changes, certainly within what you think is your present existing circle, you have to — you should be the master of figuring that one out or it really isn't your circle of competence.

And if you get a chance to expand it somewhat as you go along —

I've learned some about the energy business from Walter (Scott) and Greg (Abel) as we've worked together, but I'm not close to their level of competence on it. But I do know more than I used to know. And so, you get a chance to expand it a bit.

Usually, I would think normally your core competence is probably something that sort of fits the way the mind has worked.

Some people have what I call a “money mind.” And they will work well in certain types of money situations.

It isn't so much a question of IQ. The mind is a very strange thing. And people have specialties, whether in chess or bridge. I see it in different people that can do impossible — what seem to me — impossible things. And they're really kind of, as Charlie would say, stupid in other areas — (laughs) — you know.

So just keep working on it. But don't think you have to increase it and therefore start bending the rules. Anything further, Charlie?

CHARLIE MUNGER: No.

32. It's easy to make 50% on a million, but much more difficult on larger amounts

WARREN BUFFETT: Station 9. We're just about — yeah, we got time for a couple more.

AUDIENCE MEMBER: My name is John Dorso (PH), and I'm from New York.

Mr. Buffett, you've said that you could return 50 percent per annum, if you were managing a one-million-dollar portfolio. What type of strategy would you use? Would you invest in cigar butts, i.e., average businesses at very cheap prices? Or would it be some type of arbitrage strategy? Thank you.

WARREN BUFFETT: It might well be the arbitrage strategy, but in a very different, perhaps, way than customary arbitrages, a lot of it.

One way or another, I can assure you, if Charlie was working with a million, or I was working with a million, we would find a way to make that with essentially no risk, not using a lot of leverage or anything of the sort.

But you change the one million to a hundred million and that 50 goes down like a rock.

There are little fringe inefficiencies that people don't spot. And you do get opportunities occasionally to do. But they don't really have any applicability to Berkshire. Charlie?

CHARLIE MUNGER: Well, I agree totally. It's just you used to say that large amounts of money, they develop their own anchors. You're just — it gets harder and harder.

I've just seen genius after genius with a great record and pretty soon they got 30 billion and two floors of young men and away goes the good record. That's just the way it works.

WARREN BUFFETT: When Charlie —

CHARLIE MUNGER: It's hard as the money goes up.

WARREN BUFFETT: When Charlie was a lawyer, initially, I mean, you were developing a couple of real estate projects. I mean, if you really want to make a million dollars — or 50 percent on a million — and you're willing to work at it — that's doable. But it just has no applicability to managing huge sums. Wish it did, but it doesn't.

CHARLIE MUNGER: Yeah. Lee Louley (PH), using nothing but the float on his student loads, had a million dollars, practically, shortly after he graduated as a total scholarship student. He found just a few things to do. And did them.

33. We've tried, but See's Candies gets no traction outside California

WARREN BUFFETT: OK. Station 10.

AUDIENCE MEMBER: Hello, Warren and Charlie. I'm Luis Cobo (PH) from Panama. I'm a proud Berkshire Hathaway shareholder since 10 years ago.

I've been looking at See's Candies, and I'm a pretty good fan of them. And I see Charlie is as well throughout our meeting.

And even with all our consumption — and you know, the company has given us generous profits over the past decades.

Why do you think the company has not grown to the scale of Mars or Hershey's, and what do you think we could do to make this company grow and become a bigger part of our company, being such an amazing product?

WARREN BUFFETT: Well, we've probably had a dozen or so ideas over the years. And we used to really focus on it because it was a much more sizable part of our business. In fact, it was practically our only business aside from insurance.

And like I say, we've had 10 or 12 ideas. Some of them we tried more than once. And as we got a new manager they've tried them. And the truth is none of them really work.

And the business is extraordinarily good in a very small niche. Boxed chocolates are something that everybody likes to receive, or maybe give it as a gift, both sides of it.

And relatively few of the people go out and buy to consume themselves. If I leave a box of chocolates open at the office — we've only got 25 people — but it's gone, you know, almost immediately.

If I take it as a gift to somebody, they're happy to get it. And if you leave the box open at a dinner party again, they're all gone. But those same people that so readily grab it when it's right

there in front of them, do not walk out to a candy store very often and buy it just to eat themselves. They're not going to buy. It's very much a gift product.

It does not grow worldwide. Very interesting thing. People in these — last time I checked, people in the west prefer milk chocolate, people in the east prefer dark chocolate. People in the west like big, chunky pieces. People in the east will take miniatures.

We've tried to move it geographically many, many, many, many times. Because it would be so wonderful if it — when it works it works wonderfully. But it doesn't travel that well.

If we open a store in the east, we get enormous traffic for a while and everybody says, "We've been waiting for you to come." And then it finally — we end up with a store that does X pounds per year when we need one and a half X in the same square footage to make terrific returns.

And we've tried everything because the math is so good when it works. And overall, we have a business that doesn't — chocolate consumption generally doesn't grow that much. But yeah, go ahead Charlie —

CHARLIE MUNGER: Yeah, well, we failed in turning our little candy company into Mars or Hershey's for the same reason that you fail to get the Nobel Prize in physics and achieve immortality. (Laughter)

It's too tough for us. (Laughter)

WARREN BUFFETT: But we put 25 million dollars into it. And it's given us over two billion dollars of pre-tax income, well over two billion. And we've used it to buy other businesses. And if we were the typical company and had bought that business and tried desperately to use all the retained earnings within the candy business I think we'd have fallen on our face.

I think that it just illustrates that all these formulas, you know, you learn or that having a strategic plan to use all the capital or something — some businesses work in a fairly limited area. Others really play out over this —

Dr. Pepper, you know, has — I don't know what the percentage is now, but it might be at 10 or 12 percent market share or something like that in Dallas or maybe it's eight. And then you go to Detroit or Boston and it's less than 1 percent. I'm not sure about the numbers currently.

But you'd think in a mobile society, you know, with Dr. Pepper having been around since the time that Coke was founded in 1886 — it's amazing how certain things travel, certain things don't travel.

You know, candy bars — you mentioned Hershey. I mean, Cadbury doesn't do that well here and Hershey doesn't do that well in the U.K. And here we are, we all look alike. But somehow, we eat different candy bars. It's very interesting to observe.

And the idea that you have some formula for businesses that provide that each one should pursue the course they're on because they made it in X, they should try to find other ways to make it in X. We're quite willing to find it in A, B, C, D, E, or F — the money is fungible.

And I think, actually, it has worked very much to our advantage to have that philosophy. So, anything further, Charlie?

CHARLIE MUNGER: I once told a very great man at dinner after he'd written a very great book, I said, "You know, you're never going to write another great book like that." And he was deeply offended. And I've read his four subsequent books and I'm totally right. (Laughter)

To write one great book is a lot to do in one lifetime. And people aren't holding back on you when they don't do more. It's hard.

WARREN BUFFETT: Yeah. But you ought to make the most of the first one you got. (Laughs)

CHARLIE MUNGER: Yeah.

WARREN BUFFETT: Yeah, you're lucky. You know.

CHARLIE MUNGER: Yes.

WARREN BUFFETT: And we were very fortunate. I would've blown the chance to buy See's Candy, but Charlie said, "Don't be so cheap," basically. And we still got it at a pretty good price. And we learned a lot —

CHARLIE MUNGER: It's amazing how much we've learned over the years.

WARREN BUFFETT: Yeah, we've learned —

CHARLIE MUNGER: And if we hadn't, the record would be so much worse.

WARREN BUFFETT: Yeah.

CHARLIE MUNGER: At any given time, what we already knew was not going to be enough to take us to the next step. That's what makes it difficult. Think of all the people you know that have tried to take one extra step and have fallen off a cliff.

WARREN BUFFETT: Well, on that happy note — (laughter) — we will conclude the meeting. (Applause and cheering)

Thank you. Thank you.

Thank you.

Thank you, but save of it for next year. We may need it then.

Just give us a carry-forward on the rest of it, and thank you.

We'll come back at 3:45. We will conduct the business meeting, and it doesn't — we have no — nothing on the proxy to vote on, but we will be back here in 15 minutes.

And if you enjoy a process, you can stick around and watch us reelect our board.

Thank you. Thanks for coming.

34. Formal business meeting and election of board members

WARREN BUFFETT: The meeting will now come to order.

I'm Warren Buffett, chairman of the company and I welcome you to this 2019 — 2019 annual meeting of shareholders.

This morning I introduced the Berkshire Hathaway directors who are present.

Also with us today are partners in the firm of Deloitte and Touche, our auditors.

Jennifer Tselentis is the assistant secretary of Berkshire Hathaway and she will make a written record of the proceedings.

Becki Amick has been appointed inspector of elections at this meeting, and she will certify to the count of votes cast in the election for directors and the motions to be voted upon at this meeting.

The named proxy holders for this meeting are Walter Scott and Marc Hamburg.

Does the assistant secretary have a report of the number of Berkshire shares outstanding entitled to vote and represented at the meeting?

Jennifer?

JENNIFER TSELENTIS: Yes, I do. As indicated in the proxy statement that accompanied the notice of this meeting that was sent to all shareholders of record on March 6, 2019, the record date for this meeting, there were 724,765 shares of Class A Berkshire Hathaway common stock outstanding, with each share entitled to one vote on motions considered at the meeting, and 1,371,697,551 shares of Class B Berkshire Hathaway common stock outstanding, with each vote entitled to 1/10,000th of one vote on motions considered at the meeting.

Of that number 503,181 Class A shares and 839,707,642 Class B shares are represented at this meeting by proxies returned through Thursday evening, May 2nd.

WARREN BUFFETT: Thank you. That number represents a quorum and we will therefore directly proceed with the meeting.

First order of business will be a reading of the minutes of the last meeting of shareholders, and I recognize Mr. Walter Scott, who will place a motion before the meeting.

WALTER SCOTT: I move that the reading of the minutes of the last meeting of shareholders be dispensed with and the minutes be approved.

WARREN BUFFETT: Do I hear a second?

RON OLSON: I second the motion.

WARREN BUFFETT: Motion has been moved and seconded. We will vote on the motion by voice vote. All those in favor say aye.

VOICES: Aye.

WARREN BUFFETT: Opposed? The motion's carried.

Next item of business is to elect directors. If a shareholder is present who did not send in a proxy or wishes to withdraw a proxy previously sent in, you may vote in person for the election of directors and other matters to be considered in this meeting.

Please identify yourselves to one of the meeting officials in the aisles so that you can receive a ballot.

I recognize Mr. Walter Scott to place a motion before the meeting with respect to election of directors.

WALTER SCOTT: I move that Warren Buffett, Charles Munger, Greg Abel, Howard Buffett, Stephen Burke, Susan Decker, William Gates, David Gottesman, Charlotte Guyman, Ajit Jain, Thomas Murphy, Ronald Olson, Walter Scott, and Meryl Witmer be elected as directors.

WARREN BUFFETT: Is there a second?

RON OLSON: I second the motion.

WARREN BUFFETT: It's been moved and seconded that Warren Buffett, Charles Munger, Greg Abel, Howard Buffett, Steve Burke, Susan Decker, Bill Gates, David Gottesman, Charlotte

Guyman, Ajit Jain, Tom Murphy, Ron Olson, Walter Scott, and Meryl Witmer be elected as directors.

Are there any other nominations? Or any discussion? The nominations are ready to be acted upon. If there are any shareholders voting in person they should now mark the ballot on the election of directors and deliver that ballot to one of the meeting officials in the aisles.

Miss Amick, when you are ready you may give your report.

BECKI AMICK: My report is ready. The ballot of the proxy holders in response to proxies that were received through last Thursday evening, cast not less than 543,703 votes for each nominee. That number exceeds a majority of the number of the total votes of all Class A and Class B shares outstanding.

The certification required by Delaware law of the precise count of the votes will be given to the secretary to be placed with the minutes of this meeting.

WARREN BUFFETT: Thank you, Miss Amick. Warren Buffett, Charles Munger, Greg Abel, Howard Buffett, Steve Burke, Susan Decker, Bill Gates, David Gottesman, Charlotte Guyman, Ajit Jain, Tom Murphy, Ron Olson, Walter Scott, and Meryl Witmer have been elected as directors.

We now — we now have a motion from Walter Scott.

WALTER SCOTT: I move the meeting be adjourned.

WARREN BUFFETT: Is there a second?

RON OLSON: I second the motion.

WARREN BUFFETT: A motion to adjourn has been made and seconded. We will vote by voice. Is there any discussion? If not, all in favor say aye.

VOICES: Aye.

File this return with Collector of Internal Revenue on or before March 15, 1945. Any balance of tax due (item 8, below) must be paid in full with return. See separate Instructions for filling out return.

FORM 1040
Treasury Department
Internal Revenue Service

U. S. INDIVIDUAL INCOME TAX RETURN

FOR CALENDAR YEAR 1944

1944

or fiscal year beginning JANUARY 1, 1944, and ending JANUARY 1, 1945

EMPLOYEES.—Instead of this form, you may use your Withholding Receipt, Form W-2 (Rev.), as your return, if your total income was less than \$5,000, consisting wholly of wages shown on Withholding Receipts or of such wages and not more than \$100 of other wages, dividends, and interest.

Do not write in these spaces

File Code _____

Serial No. _____

District _____

(Cashier's Stamp)

NAME WARREN E. BUFFETT
(PLEASE PRINT. If this return is for a husband and wife, use both first names)

ADDRESS _____
(PLEASE PRINT. Street and number or rural route)

Washington, D. C. Social Security No. (if any) _____
(City or town, postal zone number) (State)

Your Exemptions

1. List your own name. If married and your wife (or husband) had no income, or if this is a joint return of husband and wife, list name of your wife (or husband). List names of other close relatives with 1944 incomes of less than \$500 who received more than one-half of their support from you. If this is a joint return of husband and wife, list dependent relatives of both.

NAME (Please print)	Relationship	NAME (Please print)	Relationship
Your name <u>Warren E. Buffett</u>	<u>x x x x x x x x</u>		

Your Income

2. Enter your total wages, salaries, bonuses, commissions, and other compensation received in 1944, BEFORE PAY-ROLL DEDUCTIONS for taxes, dues, insurance, bonds, etc. Members of armed forces and persons claiming traveling or reimbursed expenses, see Instruction 2.

PRINT EMPLOYER'S NAME	WHERE EMPLOYED (CITY AND STATE)	AMOUNT
<u>WASHINGTON Newspaper routes.</u>	<u>Employed as</u>	\$ _____
<u>independent merchant.</u>		<u>364.00</u>

3. Enter here the total amount of your dividends and interest (including interest from Government obligations unless wholly exempt from taxation) 364.00

4. If you received any other income, give details on page 3 and enter the total here 228.50

5. Add amounts in items 2, 3, and 4, and enter the total here 592.50

If item 5 includes income of both husband and wife, show husband's income here, \$ _____; wife's income here, \$ _____

How to Figure Your Tax

IF YOUR INCOME WAS LESS THAN \$5,000.—You may find your tax in the tax table on page 2. This table, which is provided by law, is based on the same tax rates as are used in the Tax Computation on page 4. The table automatically allows about 10 percent of your total income for charitable contributions, interest, taxes, casualty losses, medical expenses, and miscellaneous expenses. If your expenditures and losses of these classes amount to more than 10 percent, it will usually be to your advantage to itemize them and compute your tax on page 4.

IF YOUR INCOME WAS \$5,000 OR MORE.—Disregard the tax table and compute your tax on page 4. You may either take a standard deduction of \$500 or itemize your deductions, whichever is to your advantage.

HUSBAND AND WIFE.—If husband and wife file separate returns, and one itemizes deductions, the other must also itemize deductions.

Tax Due or Refund

6. Enter your tax from table on page 2, or from line 15, page 4 7.00

7. How much have you paid on your 1944 income tax?

(A) By withholding from your wages (Attach Withholding Receipts, Form W-2) 00.00

(B) By payments on 1944 Declaration of Estimated Tax 00.00

Enter total here → 7.00

8. If your tax (item 6) is larger than payments (item 7), enter BALANCE OF TAX DUE here 7.00

9. If your payments (item 7) are larger than your tax (item 6), enter the OVERPAYMENT here _____

Check (✓) whether you want this overpayment: Refunded to you ; or Credited on your 1945 estimated tax

If you filed a return for a prior year, what was the latest year? No

To which Collector's office was it sent? XX

To which Collector's office did you pay amount claimed in item 7 (B), above? XX

Is your wife (or husband) making a separate return for 1944? XX

If "Yes," write below: _____ ("Yes" or "No")

Name of wife (or husband) XX

Collector's office to which sent XX

I declare under the penalties of perjury that this return (including any accompanying schedules and statements) has been examined by me and to the best of my knowledge and belief is a true, correct, and complete return.

The Security I Like Best

WARREN E. BUFFETT

Buffett-Falk & Co., Omaha, Nebr.

Government Employees Insurance Co.

Full employment, boomtime profits and record dividend payments do not set the stage for depressed security prices. Most industries have been riding this wave of prosperity during the past five years with few ripples to disturb the tide.

The auto insurance business has not shared in the boom. After the staggering losses of the immediate postwar period, the situation began to right itself in 1949. In 1950, stock casualty companies again took it on the chin with underwriting experience the second worst in 15 years. The recent earnings reports of casualty companies, particularly those with the bulk of writings in auto lines, have diverted bull market enthusiasm from their stocks. On the basis of normal earning power and asset factors, many of these stocks appear undervalued.

The nature of the industry is such as to ease cyclical bumps. Auto insurance is regarded as a necessity by the majority of purchasers. Contracts must be renewed yearly at rates based upon experience. The lag of rates behind costs, although detrimental in a period of rising prices as has characterized the 1945-1951 period, should prove beneficial if deflationary forces should be set in action.

Other industry advantages include lack of inventory, collection, labor and raw material problems. The hazard of product obsolescence and related equipment obsolescence is also absent.

Government Employees Insurance Corporation was organized in the mid-30's to provide complete auto insurance on a nationwide basis to an eligible class including: (1) Federal, State and municipal government employees; (2) active and reserve commissioned officers and the first three pay grades of non-commissioned officers of the Armed Forces; (3) veterans who were eligible when on active duty; (4) former policyholders; (5) faculty members of universities, colleges and schools; (6) government contractor employees engaged in defense work exclusively, and (7) stockholders.

Warren E. Buffett

The company has no agents or branch offices. As a result, policyholders receive standard auto insurance policies at premium discounts running as high as 30% off manual rates. Claims are handled promptly through approximately 500 representatives throughout the country.

The term "growth company" has been applied with abandon during the past few years to companies whose sales increases represented little more than inflation of prices and general easing of business competition. GEICO qualifies as a legitimate growth company based upon the following record:

Year—	Premiums Written	Policyholders
1936---	\$103,696.31	3,754
1940---	768,057.86	25,514
1945---	1,638,562.09	51,697
1950---	8,016,975.79	143,944

Of course the investor of today does not profit from yesterday's growth. In GEICO's case, there is reason to believe the major portion of growth lies ahead. Prior to 1950, the company was only licensed in 15 of 50 jurisdictions including D. C. and Hawaii. At the beginning of the year there were less than 3,000 policyholders in New York State. Yet 25% saved on an insurance bill of \$125 in New York should look bigger to the prospect than the 25% saved on the \$50 rate in more sparsely settled regions.

As cost competition increases in importance during times of recession, GEICO's rate attraction should become even more effective in diverting business from the brother-in-law. With insurance rates moving higher due to inflation, the 25% spread in rates becomes wider in terms of dollars and cents.

There is no pressure from agents to accept questionable applicants or renew poor risks. In States where the rate structure is inadequate, new promotion may be halted.

Probably the biggest attraction of GEICO is the profit margin advantage it enjoys. The ratio of underwriting profit to premiums earned in 1949 was 27.5% for GEICO as compared to 6.7% for the 135 stock casualty and surety companies summarized by Best's. As experience turned for the worse in 1950, Best's aggregate's profit margin dropped to

3.0% and GEICO's dropped to 18.0%. GEICO does not write all casualty lines; however, bodily injury and property damage, both important lines for GEICO, were among the least profitable lines. GEICO also does a large amount of collision writing, which was a profitable line in 1950.

During the first half of 1951, practically all insurers operated in the red on casualty lines with bodily injury and property damage among the most unprofitable. Whereas GEICO's profit margin was cut to slightly above 9%, Massachusetts Bonding & Insurance showed a 16% loss, New Amsterdam Casualty an 8% loss, Standard Accident Insurance a 9% loss, etc.

Because of the rapid growth of GEICO, cash dividends have had to remain low. Stock dividends and a 25-for-1 split increased the outstanding shares from 3,000 on June 1, 1948, to 250,000 on Nov. 10, 1951. Valuable rights to subscribe to stock of affiliated companies have also been issued.

Benjamin Graham has been Chairman of the Board since his investment trust acquired and distributed a large block of the stock in 1948. Leo Goodwin, who has guided GEICO's growth since inception, is the able President. At the end of 1950, the 10 members of the Board of Directors owned approximately one-third of the outstanding stock.

Earnings in 1950 amounted to \$3.92 as contrasted to \$4.71 on the smaller amount of business in 1949. These figures include no allowance for the increase in the unearned premium reserve which was substantial in both years. Earnings in 1951 will be lower than 1950, but the wave of rate increases during the past summer should evidence themselves in 1952 earnings. Investment income quadrupled between 1947 and 1950, reflecting the growth of the company's assets.

At the present price of about eight times the earnings of 1950, a poor year for the industry, it appears that no price is being paid for the tremendous growth potential of the company.

This is part of a continuous forum appearing in the "Chronicle," in which each week, a different group of experts in the investment and advisory field from all sections of the country participate and give their reasons for favoring a particular security.

WARREN E. BUFFETT

Buffett-Falk & Co., Omaha, Nebr.

Western Insurance Securities Common Stock

Again my favorite security is the equity stock of a young, rapidly growing and ably managed insurance company. Although Government Employees Insurance Co., my selection of 15 months ago, has had a price rise of more than 100%, it still appears very attractive as a vehicle for long-term capital growth.

Rarely is an investor offered the opportunity to participate in the growth of two excellently managed and expanding insurance companies on the grossly undervalued basis which appears possible in the case of the Western Insurance Securities Company. The two operating subsidiaries, Western Casualty & Surety and Western Fire, wrote a premium volume of \$26,009,929 in 1952 on consolidated admitted assets of \$29,590,142. Now

Warren E. Buffett

licensed in 38 states, their impressive growth record, both absolutely and relative to the industry, is summarized in Table I below.

Western Insurance Securities owns 92% of Western Casualty and Surety, which in turn owns 99.95% of Western Fire Insurance. Other assets of Western Insurance Securities are minor, consisting of approximately \$180,000 in net quick assets. The capitalization consists of 7,000 shares of \$100 par 6% preferred, callable at \$125; 35,000 shares of Class A preferred, callable at \$60, which is entitled to a \$2.50 regular dividend and participates further up to a maximum total of \$4 per share; and 50,000 shares of common stock. The arrears on the Class A presently amount to \$36.75.

The management headed by Ray DuBoc is of the highest grade. Mr. DuBoc has ably steered the company since its inception in 1924 and has a reputation in the insurance industry of being a man of outstanding integrity and ability. The second tier of executives is also of top caliber. During the formative years of the company, senior charges were out of line with the earning power of the enterprise. The reader can clearly perceive why the same senior charges that caused such great difficulty when premium volume ranged about the \$3,000,000 mark

would cause little trouble upon the attainment of premium volume in excess of \$26,000,000.

Adjusting for only 25% of the increase in the unearned premium reserve, earnings of \$1,367,063 in 1952, a very depressed year for auto insurers, were sufficient to cover total senior charges of \$129,500 more than 10 times over, leaving earnings of \$24.74 on each share of common stock.

It is quite evident that the common stock has finally arrived, although investors do not appear to realize it since the stock is quoted at less than twice earnings and at a discount of approximately 55% from the December 31, 1952 book value of \$86.26 per share. Table II indicates the postwar record of earnings and dramatically illustrates the benefits being realized by the common stock because of the expanded earnings base. The book value is calculated with allowance for a 25% equity in the unearned premium reserve and is after allowance for call price plus arrears on the preferreds.

Since Western has achieved such an excellent record in increasing its industry share of premium volume, the reader may well wonder whether standards have been compromised. This is definitely not the case. During the past ten years Western's operating ratios have proved quite superior to the average multiple line company. The combined loss and expense ratios for the two Western companies as reported by the Alfred M. Best Co. on a case basis are compared in Table III with similar ratios for all stock fire and casualty companies.

The careful reader will not overlook the possibility that Western's superior performance has been due to a con-

centration of writings in unusually profitable lines. Actually the reverse is true. Although represented in all major lines, Western is still primarily an automobile insurer with 60% of its volume derived from auto lines. Since automobile underwriting has proven generally unsatisfactory in the postwar period, and particularly so in the last three years, Western's experience was even more favorable relative to the industry than the tabular comparison would indicate.

Western has always maintained ample loss reserves on unsettled claims. Underwriting results in the postwar period have shown Western to be over-reserved at the end of each year. Triennial examinations conducted by the insurance commissioners have confirmed these findings.

Turning to their investment picture, we of course find a growth in invested assets and investment income paralleling the growth in premium volume. Consolidated net assets have risen from \$5,154,367 in 1940 to their present level of \$29,590,142. Western follows an extremely conservative investment policy, relying upon growth in premium volume for expansion in investment income. Of the year-end portfolio of \$21,889,243, governments plus a list of well diversified high quality municipals total \$20,141,246 or 92% and stocks only \$1,747,997 or 8%. Net investment income of \$474,472 in 1952 was equal to \$6.14 per share of Western Insurance common after minority interest and assuming senior charges were covered entirely from investment income.

The casualty insurance industry during the past several years has suffered staggering losses on automobile

insurance lines. This trend was sharply reversed during late 1952. Substantial rate increases in 1951 and 1952 are being brought to bear on underwriting results with increasing force as policies are renewed at much higher premiums. Earnings within the casualty industry are expected to be on a very satisfactory basis in 1953 and 1954.

Western, while operating very profitably during the entire trying period, may be expected to report increased earnings as a result of expanding premium volume, increased assets, and the higher rate structure. An earned premium volume of \$30,000,000 may be conservatively expected by 1954. Normal earning power on this volume should average about \$30.00 per share, with investment income contributing approximately \$8.40 per share after deducting all senior charges from investment income.

The patient investor in Western Insurance common can be reasonably

assured of a tangible acknowledgment of his enormously strengthened equity position. It is well to bear in mind that the operating companies have expanded premium volume some 550% in the last 12 years. This has required an increase in surplus of 350% and consequently restricted the payment of dividends. Recent dividend increases by Western Casualty should pave the way for more prompt payment on arrearages. Any leveling off of premium volume will permit more liberal dividends while a continuation of the past rate of increase, which in my opinion is very unlikely, would of course make for much greater earnings.

Operating in a stable industry with an excellent record of growth and profitability, I believe Western Insurance common to be an outstanding vehicle for substantial capital appreciation at its present price of about 40. The stock is traded over-the-counter.

Restless Nights

When kidney function slows down, many
folks complain of nagging backache, head-
aches, dizziness and loss of pep and energy.
Don't suffer restless nights with these dis-
comforts if reduced kidney function is get-
ting you down—due to such common causes
as stress and strain, over-exertion or expo-
sure to cold. Minor bladder irritations due
to cold or wrong diet may cause getting up
nights or frequent passages.

Don't neglect your kidneys if these condi-
tions bother you. Try Doan's Pills—a mild
diuretic. Used successfully by millions for
over 50 years. It's amazing how many times
Doan's give happy relief from these discom-
forts—help the 15 miles of kidney tubes and fil-
ters flush out waste. Get Doan's Pills today!

The Security I Like Best

A continuous forum in which, each week, a different group of experts in the investment and advisory field from all sections of the country participate and give their reasons for favoring a particular security.

(The articles contained in this forum are not intended to be, nor are they to be regarded, as an offer to sell the securities discussed.)

WARREN E. BUFFETT
Manager—Several Private Investment Groups
Omaha, Nebr.

HOME PROTECTIVE CO.
(A Life Insurance Stock)

Home Protective Co. probably represents the last "undiscovered" equity security of a major life insurance company. This lack of investor awareness causes the security to sell at less than half of the lowest price-earnings ratio placed on comparable companies. Home Protective is currently selling at less than four times earnings. Any education of investors to the facts concerning the company should result in a substantially higher appraisal.

Warren E. Buffett

Home Protective has only 61,463 shares of stock outstanding. The company owns 98 1/2% of the outstanding stock of the Home Life Insurance Co. of America, a leading Pennsylvania insurer with over 400,000 policyholders. After allowing for inter-company items, Home Protective has very little in the way of other assets and liabilities. As a practical matter, with only 1 1/2% of the stock of Home Life held by others, Home Protective Co. is the Home Life Insurance Co. of America from a stockholder standpoint.

Whereas some years back the company had a very dubious financial position, strict adherence to the highest standards of investment in the placement of new funds plus utilization of retained earnings in very substantial charges against over-valued assets have given Home a very strong financial picture. While in 1946 government-guaranteed mortgages only accounted for about 13% of assets, they now represent over 50% of assets which is greatly above the industry average. During the same period the average rate earned on assets has increased from 2.04% to 3.60%. This gain based on present assets of \$1,100 per share amounts to over \$16 per share annually.

Home's business is entirely non-participating. The stockholder need make no guesses as to what belongs to him and what really belongs to the policyholder. Currently Home has close to \$300 million of insurance in force with practically no low-profit group. The business is almost entirely ordinary and industrial with the latter fully as profitable as the former. The lapse ratio of the company has been very low indicating well-seasoned business and experienced mortality has been excellent.

Dividends have been small while the company has been writing down assets to realistic values and the 50-cent annual rate will probably be continued for some years while the capital base is enlarged in line with the amount of business on the books. However, the earnings power has been maintaining a steady march upward and with a continuation of higher yields, low lapsation and favorable mortality, a greater base of business should create further increases in earnings. With each share of Home Protective representing \$1,100 in assets, a 1/2 of 1% change in interest rates represents

a \$5.50 per share change in earning power. While it takes considerable time to be fully effective, we have witnessed such a change within the past year and it has not yet been reflected in Home's earnings.

The company possesses an additional "kicker" in large holdings of contiguous undeveloped land on the Main Line in Philadelphia. Given proper zoning such holdings can have substantially greater value, particularly when related to only 61,463 shares outstanding.

Adjusting for changes in insurance in force at conservative rates, the following earnings are indicated for the past six years:

Year	Adjusted Earnings per Share
1931	\$9.92
1932	12.72
1933	12.25
1934	15.09
1935	24.42
1936	22.62

A continuation of such increases which appears likely added to greater investor recognition should provide substantial capital gains to today's buyer at the \$5 level in the Over-the-Counter market.

Southdown Sugars, Inc.
The security I like best offers stability, high intrinsic value and built-in growth of income which should have appeal during this time of unsettled market conditions, generally.

G. Shelby Friedrichs

Southdown Sugars, Inc. owns in fee over 46,000 acres of land located in the most attractive on-shore area for the exploration of oil and gas in the United States—south Louisiana. Although operating a stable and profitable cane sugar business, the mineral income, after taxes, from acreage leased to major oil companies last year exceeded net income from sugar operations, and will increase materially over the coming years. Southdown Sugars enjoys the advantages of participation in the results of production operations on its fee acreage without assuming any of the attendant risks. In addition, the land value of much of Southdown's property for industrial, commercial and residential purposes, adds substantially to the intrinsic value of the stock.

The company is basically a completely integrated producer and refiner of cane sugar, operating three raw sugar factories and one refinery. Southdown has approximately 18,000 acres of cultivable land and purchases cane from other growers to supply the capacity requirements of its sugar factories. The company also imports Cuban raw sugar to fill refinery requirements. Income from

this operation has been in the neighborhood of \$1,500,000 per annum, before taxes.

The exploration for oil and gas in south Louisiana, dating back to the early 1930s, has had a marked effect on the company. Nearly all of the 46,000 acres of fee land have been under lease to major oil companies in recent years, and Southdown has been receiving royalty income since the discovery of the Gibson Field in Terrebonne Parish in 1937. Lease and royalty income has increased from \$550,500 to \$1,275,000 (before taxes) in the last five years (average 26% per annum) and gives every indication of continuing to increase at approximately this rate.

The development of the oil and gas industry, combined with the discovery of substantial sulphur deposits, plus large reserves of salt and an ample supply of fresh water, have combined to make south Louisiana a center for the petro-chemical industry. Plans have been announced by such companies as Dow Chemical, W. R. Grace, Kaiser Aluminum, Otis revero and duPont for the investment of more than \$250 million in plants located along the Mississippi River between New Orleans and Baton Rouge. Additions to the world's largest oil refinery—Esso's Baton Rouge plant—to the Shell plant at Norco and to Standard Oil of Indiana's refinery at Destrehan have also served to further industrialize this area. The discovery of oil and gas in the Gulf of Mexico, off the Louisiana coast, has also served to intensify activity in this area and has brought considerable expansion in oil field equipment and allied industries.

The result of all of this has been to bring about much improvement in land values, particularly those situated along strategic waterways, such as the Mississippi River, the Intra-Coastal Canal, etc., and the major highways. This influx of industry has also brought substantial increases in the population of the area, adding to the values of land for residential purposes. Approximately 13,000 acres of Southdown's land is located on the Mississippi River and all of the remainder is traversed by either main highways or other waterways, or both.

In an attempt to measure the intrinsic values that have thus been created, my firm (after consultation with oil geologists and land men and real estate experts) has made the accompanying appraisal of Southdown's properties. The values attributed are of the "horse-back variety" and take into consideration mineral values as well as surface values. In my

The Security I Like Best

A continuous forum in which, each week, a different group of experts in the investment and advisory field from all sections of the country participate and give their reasons for favoring a particular security.

(The articles contained in this forum are not intended to be, nor are they to be regarded, as an offer to sell the securities discussed.)

WARREN E. BUFFETT
Manager, Several Private Investment Groups, Omaha, Neb.

Oil and Gas Property Management, Inc.

A more fitting title for my selection would be "The Inflation Hedge I Like Best." Should inflation continue O & G may well be the vehicle to give the investor the same super-charged performance that highly leveraged investment trusts and warrants did in the early 40's.

Warren E. Buffett

O & G was organized in 1953 by interests affiliated with the Empire Trust to buy and manage producing oil and gas properties. The management is of the highest caliber and the Empire's reputation and experience in oil matters has undoubtedly been of considerable value. Purchases have been made subject to substantial oil payments with a large portion of income in early years used to extinguish these payments. This method might be compared to real estate purchased subject to large mortgages with rental income, exclusive of that portion needed for operating expenses, utilized for mortgage reduction. The tax laws facilitate this method very

Item	Gross Reserves	Net Reserve for Oil, & Debs.	Est. Gross Value of Net Reserves
Oil & Plant Products	38,017,000 lbs.	56,000,000 MCF	\$73,130,000 (\$2.75/bbl.)
Gas	500,957,000 MCF	136,500,000 MCF	\$17,862,000 (30¢ MCF)

The net reserves for stock and debentures reflect the reduction from gross reserves of amounts sufficient to retire oil payments and loans. The debentures are income bonds and are not expected to pay their interest (which cumulates) until most of the oil payments have been liquidated. Accordingly, it may be estimated that approximately \$15 million will be required to retire the debentures with interest. Operating expenses of course must be deducted from the gross values in the last column of the table and in the case of plant products, which represent half the oil reserves, will be more than average. Allowing \$35 million for operating expenses and possible taxes still leaves a potential for the common of \$40 million. Future acquisitions could increase this substantially.

The 380,000 shares of common have a total market value of about \$5 million which makes the arithmetic of the picture fascinating. An increase in the price of oil of 15 cents per barrel or 1 cent per MCF in the case of gas is equal to the entire market value of the common. If oil over the next few years were to increase in price 50 cents per barrel, the gain in value would be equal to almost 400% of the current total market price of the common.

At the end of 1955 the company had about \$49 million of oil payments and about \$17 million of loans and debentures ahead of the 380,000 shares of common. However, over \$33 million of the payments is applicable to one property and it is important to note that payments are obligations of only the specific property, not the company. The balance of payments amounted to less than \$16 million and were reduced by \$4

considerably when applied to oil by allowing all payments as a direct exclusion from income. Accounting-wise, the result is to show a very small gross income while the equity is being built up substantially. Accordingly, the financial services do not show accurately the operating picture of O & G and the interested reader should study the annual reports of the company.

The equity money for O & G was originally raised by the sale of \$10 million income debentures with 300,000 shares of stock attached. This issue was exceptionally well placed in large blocks with Wall Street houses, investment trusts, etc. The underwriting fee on the sale amounted to about 1/4 of 1%. An additional 80,000 shares of common were sold to the promoting group with the Empire Trust reputedly owning over 50,000 shares in a subsidiary. Large issues of warrants and options are conspicuous by their absence.

The equity money of O & G was invested by the end of 1954. Thus the company has acquired its properties on a somewhat more reasonable basis than might be expected at current higher prices for oil in the ground.

The table below shows the substantial reserves of the company and illustrates the dynamic possibilities of the small issue of common stock even should no increase in oil and gas prices occur. Figures are based on the 1955 annual report and we understand there has been little change since that date.

It is interesting to compare O & G with its more well-known counterpart—Producing Properties, Inc. This company also started with about \$10 million of equity capital although it didn't get under way until early 1955. At a recent date PP's production was running about 2,200 barrels per day against over 7,000 for O & G and their net reserves were also less than a third those of O & G. On the other hand, they had invested only about half of their equity money so it is not to be implied that they were doing a poorer job of investing the money—it is just that they got off to a later start. However, PP common is selling in the market for about \$14 million and, in our opinion, represents less value and potential than is present in O & G selling for \$5 million. If O & G were to command only the same valuation, it would mean a price of over \$33 per share.

O & G also owns a half interest in Yemen Development Corp. which holds a concession on two-thirds of Yemen covering 40,000 square miles including a large basin area. Geological reports are favorable although Suez interest will undoubtedly delay testing this area. Offsetting this plus potential in the picture is a minus property of O & G is involved in litigation concerning gas prices. O & G's position has been upheld by the FCC; however, the matter is now before the courts.

O & G common, selling around 14 in the Over-the-Counter Market, should do very well if present oil prices are maintained and presents outstanding possibilities

**This Week's

Century Engineers, Inc.—Robert D. Tucker, Research Dept., Morgan & Co., Los Angeles, Calif. (Page 2)

should inflation continue. Behind \$65 million of obligations with an estimated gross value of oil and gas offsetting these obligations of \$150 million, the \$5 million market valuation on the common seems to offer considerably higher chances for gain than for loss. A small investment in O & G should do the job that a many times larger investment in a non-leveraged oil holding would do while exposing the holder to a much smaller maximum loss.

ROBERT D. TUCKER

Research Department,
Morgan & Co., Los Angeles, Calif.
Member Los Angeles Stock Exchange
Century Engineers, Inc.

Century Engineers is a highly competent technical organization which was formed in 1949 with the express aim of getting together a

Robert D. Tucker

group of engineers well qualified in several fields to be the over-flow engineering department for large companies and the overall engineering department for small companies. This was the basis of the company's beginning and its early activity. However, it soon became evident that to take advantage of the creative ability of the engineers they should be supplemented with prototype shop facilities and, eventually, with manufacturing facilities.

From the 1949 beginning wherein three engineers produced a total gross revenue of \$36,000 in 1956 when a total company organization of approximately 350 people will gross approximately \$6.8 million, this plan has been closely followed. The engineering and scientific personnel at Century are men who are well qualified to discuss theoretical problems with military scientists one minute and discuss fabrication problems with their own experimental mechanics the next.

Century is presently operating in five separate, but not unrelated, fields of activity. Their ultimate aim of having overall systems capability for a complete weapon system is presently subdivided into the following fields:

- (1) **Aircraft Armament:** Century has designed and produced various airborne rocket launchers, for all sizes of rockets now in production. Also launchers and pylons for missiles.
- (2) **Electro-mechanical Division:** This field includes precision data recording cameras, timing devices and various servo mechanisms. Details of the military items in this field are classified.
- (3) **Aircraft Structures:** Century Engineers has participated in the design of major structural components of current military aircraft. They have designed and

December 13th, 1972

~~Mr. Charles N. Huggins, President,~~
~~See's Candy Shops, Inc.,~~
3423 Latienega Boulevard,
Los Angeles, California. 90016.

Dear Chuck:

I was out at Brandeis a couple of days ago, and have a few strong impressions to pass along:

1. People are going to be affected not only by how our candy tastes but, obviously, by what they hear about it from others as well as the "retailing environment" in which it appears. The latter includes the class of store, the method of packaging, the condition in which it appears, and the surrounding merchandise. Just as the New Yorker creates a different "editorial environment" for a Lord & Taylor ad than does the Village Voice, so do the surroundings in which our candy is offered affect potential customers' mental - and even gastronomical - impression of our quality. You, of course, know this far better than I.
2. To date, we have always maintained an incredibly pure approach to distribution which undoubtedly contributes substantially to the public's image of our product.
3. At Brandeis, our product suffers in every comparative way against Stover's. They have an extremely well organized, well displayed and attractive area featuring nothing but their candy. Brandeis has taken a number of our boxes and placed them on a counter with 25 other offerings of cheap bulk candy, and other run-of-the-mill products. They have taken a standard card sign out of their own display department and put a few descriptive lines on it, which is not much different than the card next to it which might say "Jelly Beans, 99¢ a lb.". The one open package displaying the contents of our box has pieces out of place, empty wrappers, and generally presents a jumbled appearance.
4. In the case of the average customer at Brandeis, we are not maintaining an image but developing an image. It seems obvious to me that if we push further with department store distribution, we are going to

Mr. Charles N. Huggins
December 13th, 1972
Page #2

have to have very tight controls regarding merchandising conditions. They will have to be offered in a way that establishes them as something very special - and this probably means adequate display area insulated from inferior products, appropriate signs relating to the See's legend, and attractive open display boxes which are packaged so as to insure a first-class presentation.

All of this, of course, reflects the benefit of a first small scale test. If we decide to go ahead, we will have ample time to prepare for next year so that we can be sure we are represented only in quality stores in an absolutely quality manner.

When we get outside of our own territory, we may well want to have some descriptive material. Perhaps we could have a little booklet called "The Most Famous Kitchen in the World", or something of that sort. Coor's gets a lot of mileage out of the fact that all of their beer comes from one brewery, and I do think there is a certain mystique attached to products with a geographical uniqueness. Maybe grapes from one little eighty-acre vineyard in France are really the best in the whole world, but I have always had a suspicion that about 99% of it is in the telling and about 1% is in the drinking.

We might be able to tell quite a story about the little kitchen in California that has become the kitchen known 'round the world. If we prepare something along this line, it ought to be extremely well done and should form the basis of the legend that we eventually want to have permeate the country. Such a booklet, along with really classy display and appropriate advertising by Marshall Field's, Rich's, Jordan Marsh, etc., could well enhance our image rather than diminish it - which would be the case if we merchandised in the Brandeis manner. Incidentally, I also think we should put territorial limitations on the franchise. Younker's should not be allowed to come over to Omaha, nor Brandeis to go to Des Moines and sell the candy. It should be very hard to get, available only periodically, and then (to the consumer) apparently only in limited quantities.

With best personal regards,

Sincerely,

Warren E. Buffett

Mr. Melvin S. Cohen, President,
National Presto Industries, Inc.,
Eau Claire, Wisconsin. 54701.

Dear Mr. Cohen:

In case you haven't seen the latest edition of The Intelligent Investor, I thought you might enjoy it - particularly because of the reference to National Presto.

I talked to Ben Graham on Wednesday - his 79th birthday - and he tells me that he owns 1,000 shares of National Presto. Ben has practically no active interest in the ownership of securities, so he has paid you the supreme compliment.

I hope that one of these days I have the chance to meet you personally. I am going to be on the West Coast during the summer and, should you find yourself in the Los Angeles area, please be sure to give me a call at (b)(7)(C) so we can get together.

Sincerely,

Warren E. Buffett

WEB/glk

PENSIONS

There are two aspects of the pension cost problem upon which management can have a significant impact: (1) maintaining rational control over pension plan promises to employees and (2) increasing investment returns on pension plan assets.

The Irreversible Nature of Pension Promises

To control promises rationally, it is necessary to understand the basic arithmetic and practical rules governing pension plans.

The first thing to recognize, with every pension benefit decision, is that you almost certainly are playing for keeps and won't be able to reverse your decision subsequently if it produces subnormal profitability.

As a practical matter, it is next to impossible to decrease pension benefits in a large profitable company - or even a large marginal one. The plan may embody language unequivocally declaring the company's right to terminate at any time and providing that contributions shall be solely at the option of the company. But the law has eroded much of the significance such "out" clauses were presumed to have, and operating practicalities render any residual rights to terminate moot.

So, rule number one regarding pension costs has to be to know what you are getting into before signing up. Look before you leap. There probably is more managerial ignorance on pension costs than any other cost item of remotely similar magnitude. And, as will become so expensively clear to citizens in future decades, there has been even greater electorate ignorance of governmental pension costs. Actuarial thinking simply is not intuitive to most minds. The lexicon is arcane, the numbers seem unreal, and making promises never quite triggers the visceral response evoked by writing a check.

In no other managerial area can such huge aggregate liabilities - which will be reflected in progressively increasing annual costs and cash requirements - be created so quickly and with so little immediate financial pain. Like pressroom labor practices, small errors will compound. Care and caution are in order.

Deceptive Arithmetic of "Promise Now - Pay Later"

If you promise to pay me \$500 per month for life, you have just expended - actuarially but, nevertheless, in a totally tangible sense - about \$65,000. If you are financially good for such a lifetime promise, you would be better off (if I have an average expectancy regarding longevity for one my age) handing me a check for \$50,000. But it wouldn't feel the same.

PENSIONS

There are two aspects of the pension cost problem upon which management can have a significant impact: (1) maintaining rational control over pension plan promises to employees and (2) increasing investment returns on pension plan assets.

The Irreversible Nature of Pension Promises

To control promises rationally, it is necessary to understand the basic arithmetic and practical rules governing pension plans.

The first thing to recognize, with every pension benefit decision, is that you almost certainly are playing for keeps and won't be able to reverse your decision subsequently if it produces subnormal profitability.

As a practical matter, it is next to impossible to decrease pension benefits in a large profitable company - or even a large marginal one. But the law has eroded much of the significance such "out" clauses were presumed to have, and operating practicalities render any residual rights to terminate moot.

So, rule number one regarding pension costs has to be to know what you are getting into before signing up. Look before you leap. There probably is more managerial ignorance on pension costs than any other cost item of remotely similar magnitude. And, as will become so expensively clear to citizens in future decades, there has been even greater electorate ignorance of governmental pension costs. Actuarial thinking simply is not intuitive to most minds. The lexicon is arcane, the numbers seem unreal, and making promises never quite triggers the visceral response evoked by writing a check.

In no other managerial area can such huge aggregate liabilities - which will be reflected in progressively increasing annual costs and cash requirements - be created so quickly and with so little immediate financial pain. Like pressroom labor practices, small errors will compound. Care and caution are in order.

Deceptive Arithmetic of "Promise Now - Pay Later"

If you promise to pay me \$500 per month for life, you have just expended - actuarially but, nevertheless, in a totally tangible sense - about \$65,000. If you are financially good for such a lifetime promise, you would be better off (if I have an average expectancy regarding longevity for one my age) handing me a check for \$50,000. But it wouldn't feel the same.

And, if you promise to pay me 1,000 hamburgers a month for life which, superficially, may sound equivalent to the previous proposition (assuming a present hamburger price of 50¢), you have created an obligation which, in an inflationary world, becomes most difficult to evaluate. This creates a risk we talk of later as an "earthquake risk". One thing is certain. You won't find an insurance company willing to take the 1,000-hamburgers-a-month obligation off your hands for \$65,000 - or even \$130,000. While hamburgers equate to 50¢ now, the promise to pay hamburgers in the future does not equate to the promise to pay fifty-cent pieces in the future.

So, before plans are introduced or amended, the financial consequences (particularly in a world of significant inflation which I believe to be close to a certainty)* should be clearly understood by you. Consulting actuaries are very good at making calculations. They are frequently terrible at making the assumptions upon which the calculations are based. In fact, they well may be peculiarly ill-equipped to make the most important assumptions if the world is one of economic discontinuities. They are trained to be conventional. Their self-interest in obtaining and retaining business would be ill-served if they were to become more than mildly unconventional. And being conventional on the crucial assumptions basically means accepting historical experience adjusted by a moderate nudge from current events. This works fine in forecasting such factors as mortality and morbidity, works reasonably well on items such as employee turnover, and can be a disaster in estimating the two most important elements of the pension cost equation, which are fund earnings and salary escalation.

Illustrated Elemental Actuarial Principles

To illustrate a few actuarial principles worth understanding, but without employing the technical jargon and the asterisks, let's use the example of your household. Assume that you, personally, make irrevocable promises to pay pensions of \$300 per month for life after they reach 65 to, say, four household employees. To make it easy, let's say that they each are 55 years of age at present. If you make that promise today, you have reduced your net worth today by about

* My views regarding inflationary possibilities are more extreme than those of most respected observers. It is difficult to substantiate a dogmatic view, since conclusions rest more upon social and political judgments than upon economic training and analysis. You should recognize the subjective nature of the reasoning leading to my pessimistic conclusions regarding inflation over the longer term - and not be reluctant to correct accordingly.

\$70,000. (For simplicity's sake, I am ignoring some variables such as sex of employees - women live longer and therefore cost more - death before 65, etc. In calculating such factors the actuaries shine.)

Why are you immediately \$70,000 poorer? Well, if you set aside a \$70,000 fund now and invest it at 7% interest - and let all such interest remain in the fund to be compounded - the principal value of the fund will grow to about \$140,000 in ten years when your employees reach 65. And to buy them a lifetime annuity of \$3,600 per year will then cost about \$35,000 each, utilizing the entire accumulated capital of the fund. So if you make the promise and it is binding - legally or morally - figure you have spent today \$70,000, even though you don't have to pay out a dime of cash for ten years.

Now take it one step further and assume that your employees each are earning \$600 per month but, instead of promising them \$300 per month upon retirement, you promise them 50% of their salary at the time they retire. If their increases run 7.2% per year - and they probably will in the world I foresee - they will be earning \$1,200 per month by the time they reach 65. And it will now cost you \$70,000 each to purchase annuities for them to fulfill your promise. The actual cost, today, of modifying your promise from 50% of present pay to 50% of terminal pay was to exactly double the fund that needed to be set aside now from \$70,000 to \$140,000.

Many pension plans use final average pay (usually the average of the last five years, or the highest consecutive five years in the last ten years employed) and some use career average pay. I am not arguing here which should be used, but am illustrating the dramatic difference in costs that can occur because of rather minor-appearing changes in wording.

Pension costs in a labor intensive business clearly can be of major size and an important variable in the cost picture, particularly in a world characterized by high rates of inflation. I emphasize the latter factor to the point of redundancy because most managements I know - and virtually all elected officials in the case of governmental plans - simply never fully grasp the magnitude of liabilities they are incurring by relatively painless current promises. In many cases in the public area the bill in large part will be handed to the next generation, to be paid by increased taxes or by accelerated use of the printing press. But in a corporation the bill will have to be paid out of current and future revenues - with interest - and frequently with what is, in effect, a cost-of-living escalator.

The "Earthquake Risk"

In Germany, in the great inflation of the early 1920s, the entire Daimler Benz (Mercedes) Automobile Company was selling in the market for the price of 300 motor cars. Almost all past investments were nearly worthless, and current salary levels were astronomical in relation to past history. Under such conditions, or conditions far short of such an extreme, the burden of any pension benefits owed by a business, which are based on current salary levels though related to much earlier service in employment, must be backed almost exclusively by the current value (earning power) of the business. Advance funding simply evaporates.

For example, assume that salaries (and the cost of living) are moving upward at 25% per year and the pension fund is earning 10% per year - a set of assumptions not ridiculously different from what exists in England at the moment. Under such conditions, funds put aside for retirement immediately begin to shrink in relation to promised benefits. Every month fewer hamburgers can be purchased from the funds contributed to the pension plan - even after accumulating dividends and interest on the funds.

Almost no one chooses to think about this sort of "earthquake risk" in dealing with pension plans, any more than people choose to spend much time thinking about nuclear war. It may be my earlier-mentioned bias, or my mathematical bent, but I believe some "unthinkable" inflation-related calculations should be made - and even considered - before any company assumes open-ended pension obligations guaranteeing a large number of persons absolute protection against inflation by gearing benefits without limit to final pay or escalating benefits to persons already retired, based on changes in the cost of living.

Thus, the really devastating possibility regarding private pension plans is sustained double-digit inflation. When salaries move ahead at a substantially higher rate than investment returns and benefits are tied to final salaries (or, even more expensively, cost-of-living increases after retirement as in recent rubber and aluminum contracts), it is virtually impossible to pre-fund obligations. Like it or not, you become much like the Social Security Fund, absent the power to tax. Should that occur, future purchasers of the products of the company must be willing to do so at prices that reflect not only the wages of current workers, but the promises to past workers. Some businesses will have economic characteristics allowing them to pass along these costs, but others will have major troubles. On balance, I believe we are in relatively favorable businesses under

such circumstances. I do not believe this problem can be solved by the investment process. I mention it for completeness, not because I have answers - and to urge caution in making pension benefit promises subject to dramatic escalation through substantial attrition in the purchasing power of money.

Now let's look at funding and investment behavior appropriate to an economic world at least reasonably similar to the past, recognizing that such a world is far from a certainty.

The Investment Management Problem Inherent in All Pension Plans

Once having committed to provide pensions, how do we pay? The law and prudent business practice mandate that we start putting aside funds on a fairly orderly and consistent basis from which we can fulfill our promises. In this manner we pay the employee currently while he is being productive for the company, and we simultaneously set up a savings account (collectively, not individually) which will accumulate at interest so as to purchase an annuity (not actually "purchased" in most plans, of course, just assured by the pension fund) for him at retirement which will discharge our promise to pay him throughout his non-productive years. Thus, our current cost and current cash requirements (if our estimates are accurate as to what we will earn on the savings account as well as other estimates regarding turnover, salary escalation, longevity, etc.) will reflect his total lifetime employment costs to us spread rather evenly over his productive years.

(This advance funding treatment, matching full current costs against current production, contrasts with the Social Security Plan's program which essentially taxes current producers to pay current non-producers. This simply means moving a portion of current national output of goods and services over from those who produced it to those who are non-producing, and to whom promises have been made. If such a system had been in effect for a very long time, the demographic profile remained fairly constant, the promises remained fairly constant, and there was no inflation, the net effect from such a pay-as-you-go approach would not substantially differ from an advance funding basis. However, these conditions do not exist which may make for various problems - including some that exacerbate inflation and thus have negative fall-out for the economics of private plans.)

Because a business corporation, unlike the Federal government, has to create a "savings account" - an investment accumulating and investment

management operation of some sort - to properly fund its pension plan, it must make investment management decisions with respect to pension plan assets.

The History of Corporate Pension Plan Management
Act One - The Awakening

A few decades ago pensions were a relatively new thing at most companies, so that the "savings accounts" were in their formative stages and therefore much smaller. Furthermore, promises were fractions of those presently made, so that the amount eventually required in the savings account to purchase the required annuity at retirement was correspondingly smaller.

Thus the amounts paid into pension funds ("savings accounts") were largely forgotten so far as managerial responsibility was concerned until the great awakening of the 1960s. At that time managements noticed:

(1) The funds had grown to the point where they sometimes were 25% to 50% of the net worth of the company - often making the assets employed in the savings account larger than those employed in the company's largest division. Here are a few figures which I have handy from year-end 1972:

<u>Company</u>	<u>(In Millions)</u>	
	<u>Corporate Net Worth</u>	<u>Pension Fund Assets</u>
A & P	\$ 599	\$ 236
DuPont	3,268	1,817
Firestone	1,251	423
IBM	7,565	1,023
U. S. Steel	3,577	2,239

So, while U. S. Steel had a visible \$3.6 billion in net operating assets which management probably spent 99% plus of their business hours thinking about, they had \$2.2 billion in the "bank", whose economic results would impact future values for the shareholders, dollar for dollar, with the economic results of the steel assets. There literally were years when the savings account earned more than was earned out of all operating assets of the steel business. (In fairness to U. S. Steel, it should be mentioned that they were one of the pioneers in recognizing the importance of pension assets - and have done a better-than-average job through in-house management.)

(2) The returns actually realized on the "savings account" had an enormous impact on costs. A sustained 1% change in earning rate could easily swing the annual cost to the contributing company by 15%.

(3) During a period when equities had produced fabulous returns, many of the plans had been invested largely in bonds - which not only bore low fixed rates of 3% to 5% in the earlier periods, but also had suffered significant shrinkages in market values as interest rates increased secularly. (If interest rates go up, bond prices must go down - and if the bonds are long-term and the rates rise sharply, prices go into a power dive.)

(4) Many managements thus saw their largest division earning dismal rates of return with substantial market value shrinkage in the bond component, while all around them high returns were being realized from stocks with little apparent effort or talent. If a company had \$100 million invested in its engine division earning 12% by managerial zeal and ingenuity, why tolerate \$100 million in its pension fund "division" poking along at only 4% because of inattention - particularly when increasing the \$4 million to some larger figure would have the same impact in future earnings for owners as raising margins on engines. Intensive effort on production, research and sales might only produce an increase from 12% to 13% in the engine area, since decisions already had been so near to optimal, but it was easy to imagine 4% becoming 10% in the pension fund area if just average results were attained in equity investment. And, of course, who would settle for being just average?

The History of Corporate Pension Plan Management
Act Two - The Great Leap

And so the hunt was on. Wall Street abhors a commercial vacuum. If the will to believe stirs within the customer, the merchandise will be supplied - without warranty. When franchise companies are wanted by investors, franchise companies will be found - and recommended by the underwriters. If there are none to be found, they will be created. Similarly, if above-average investment performance is sought, it will be promised in abundance - and at least the illusion will be produced.

Initially those who know better will resist promising the impossible. As the clientele first begins to drain away, advisors will argue the unsoundness of the new trend and the strengths of the old methods. But

when the trickle gives signs of turning into a flood, business Darwinism will prevail and most organizations will adapt. This is what happened in the money management field.

The banks had traditionally been the major money managers (leaving aside insured plans) and, by and large, their investing as well as their communication had been lackluster. They felt obliged to seek improvement, or at least the appearance of improvement, as corporate managers searched for yardsticks by which to make their decisions as to whom care of this newly discovered giant "division" should be granted. The corporate managers naturally looked for groups with impressive organizational charts, lots of young talent, hungry but appropriately conscious of responsibility, (heavy on MBAs from good schools), a capacity for speed in decision making and action - in short, organizations that looked something like they perceived themselves. And they looked for a record of recent performance.

Unfortunately, they found both.

A little thought, of course, would convince anyone that the composite area of professionally managed money can't perform above average. It simply is too large a portion of the entire investment universe. Estimates are that now about 70% of stock market trading is accounted for by professionally managed money. Any thought that 70% of the environment is going to substantially out-perform the total environment is analagous to the fellow sitting down with his friends at the poker table and announcing: "Well, fellows, if we all play carefully tonight, we all should be able to win a little."*

So, clearly the almost universal expectations of above-average performance in pension fund management were doomed to disappointment. These disappointments were certain to be amplified by a corollary affliction that frequently accompanies pressure for investment performance - higher turnover rates. It is difficult to measure turnover

* : An interesting example of this line of thinking (sub-species: wishful) occurs in the April, 1975, Conference Board "Trends in Pension Fund Administration" article which Marty sent me the other day. In a carefully written "Investment Guidelines" statement by a manufacturing company, it is announced: "We believe it is reasonable to expect long-term results superior to the usual market indexes, and the S & P 500 in particular. Specifically, we look for performance better than this index in all types of market environments." And yes, Virginia, maybe every football team can have a winning season this year.

costs with precision, but they certainly must run at least 2% on average when applied to the round trip of purchase and sale. If an investment manager, striving for not only acceptable quarterly performance but also for the appearance of behaving as other highly-thought-of managers are known to be behaving,* moves aggressively to keep his portfolio in the "right" stocks, he easily can average turnover rates of 25% per year. When the performance rage peaked, drastically higher turnover figures were recorded with some managers.

In any event, a 25% turnover rate among professionals as a group, with 2% costs attached to such turnover, reduces group performance by 1/2 of 1% per annum (\$1½ billion per year on \$300 billion of assets). This means that, instead of chance dispersal of results causing half of all managers to fall above the unmanaged performance level (which has no transaction costs) and half to be below, the frictional drag of turnover costs causes well over half to perform worse than what "average" might be assumed to be.

For the reasons set forth above, almost all recent investment management performance by pension funds of large corporations has been fair to poor. Specifically, the Becker study (most comprehensive of all pension investment measuring services) reports the following:

	<u>Overall Annual Return</u>	
	<u>S & P 500</u>	<u>Becker Median Result*</u>
Last 3 market cycles, (6/30/62 to 12/31/74)	5.3%	4.1%
Last 2 market cycles, (9/30/66 to 12/31/74)	2.1%	0.4%
Last single market cycle, (6/30/70 to 12/31/74)	2.2%	(0.3%)

*Excludes bond segment of portfolios so that equity management only is measured against the equity yardstick.

* In the short term, it frequently is better to look smart than to be smart, particularly if your employment is to be decided by a rather brief interview. If the fans are going to decide your hiring status based on only a few swings, it is prudent to develop a batting style that will remind them of Joe DiMaggio or Ted Williams, even if long-range your percentage of solid hits with that style is small and you know you obtain better results batting cross-handed.

Is There Hope? Can a Wise Corporation Assure Superior Investment Performance for its Pension Plan?

If above-average performance is to be their yardstick, the vast majority of investment managers must fail. Will a few succeed - due either to chance or skill? Of course. For some intermediate period of years a few are bound to look better than average due to chance - just as would be the case if 1,000 "coin managers" engaged in a coin-flipping contest. There would be some "winners" over a 5 or 10-flip measurement cycle. (After five flips, you would expect to have 31 with uniformly "successful" records - who, with their oracular abilities confirmed in the crucible of the marketplace, would author pedantic essays on subjects such as pensions.)

In addition to the ones benefitting from short-term luck, I believe it possible that a few will succeed - in a modest way - because of skill. I do not believe they can be identified solely by a study of their past record. They may be operating with a coin that they know favors heads, and be calling heads each time, but their bare statistical record will not be distinguishable from the larger group who have been calling flips indiscriminately and have been lucky - so far.

It may be possible, if you know a good deal about investments as well as human personality, to talk with a manager who has a decent record and find that he is using methods which really give an advantage over other investors, and which appear to be likely to provide continued superiority in the future. This requires a very wise and informed client - and even then is not free from pitfalls.

For openers, there is one huge, obvious pitfall. I am virtually certain that above-average performance cannot be maintained with large sums of managed money. It is nice to think that \$20 billion managed under one roof will produce financial resources which can hire some of the world's most effective investment talent. After all, doesn't the big money at Las Vegas attract the most effective entertainers to its stages? Surely \$50 million annually of fees on \$20 billion of managed assets will allow (a) an array of industry specialists covering minute-by-minute developments affecting companies within their purview; (b) top-flight economists to study the movement of the tides; and (c) nimble, decisive portfolio managers to translate this wealth of information into appropriate market action.

It just doesn't work that way.

Down the street there is another \$20 billion getting the same input. Each such organization has its own group of bridge experts cooperating on identical hands - and they all have read the same book and consulted the same computers. Furthermore, you just don't move \$20 billion or any significant fraction around easily or inexpensively - particularly not when all eyes tend to be focused on the same current investment problems and opportunities. An increase in funds managed dramatically reduces the number of investment opportunities, since only companies of very large size can be of any real use in filling portfolios. More money means fewer choices - and the restriction of those choices to exactly the same bill of fare offered to others with ravenous financial appetites.

In short, the rational expectation of assuring above average pension fund management is very close to nil.

Illustrations of Reality in Pension Fund Investment Management

I recently received some interesting figures from a pension fund involving about \$250 million of assets. The 9-1/2 year record through June 30, 1975 of the three major banks involved (managing \$20 - \$50 million per bank) follows, compared to "average" as defined in two ways, the S & P 500 and the D-J Industrials:

	<u>Annual Compounded Rate of Return (including Dividends)</u>
Dow-Jones Industrials	+2.8%
S & P 500	+3.8%
Continental Illinois	+1.8%
First National City	+1.0%
Morgan Guaranty	+3.4%

Until recently, Chase had managed a comparable segment of the funds but was terminated because of poor performance - probably worse than the other banks shown above. Each percentage point plus or minus affected this fund by about \$2 to \$4 million over the time period measured.

A further interesting calculation was made. On June 30, of the portfolio held by Continental, 64% of the securities held, measured by market value, also were in the Morgan portfolio and 44% were duplicated in the First National City portfolio. Similar overlap was demonstrated in other ways.

I am familiar enough with the record of this fund to state that no unusual constraints have been placed on the managers, and no special factors have to be recognized to interpret the numbers. I believe that Morgan's above-average record here, compared to that of other large banks, is typical of its relative performance at other pension funds. I also feel the predictive value of that relative standing to be low.

Pensions & Investments magazine recently rated the 35 largest banks for which five-year performance records of commingled equity funds were available. Ten did as well as or better than the S & P, consistent with what might be expected according to probability theory if everyone were operating solely according to chance and there was a modest drag on performance caused by transaction costs. More importantly, I know of no set of statistics which would demonstrate any opposite view relating to managers handling large amounts of money.

The evidence all seems to confirm that it is unwise to expect above-average investment results from a corporate pension plan, conventionally managed.

Major Options in Pension Fund Management

With respect to pension fund investments in securities, several paths can be followed, singly or in combination:

(1) One or more large conventional money managers may be retained, with the expectation that performance will be slightly poorer than "average" because of costs involved. If the manager is very large and conventional - any major bank will do - directors of the corporation should run no risk of imprudent behavior as fiduciaries under the new ERISA statute. Conventional behavior is safe - even when the potential litigants have the benefit of hindsight. If we should go this route, I see no reason to change from Morgan.

(2) Management in security selection can be, in essence, abandoned by simply creating a portfolio which is equivalent to "average". This minimizes turnover and management costs, and probably accomplishes about the same result as (1) - perhaps with just a touch more potential liability for results, since a tacit admission has been made that no effort is being expended to "manage". Several funds have been established fairly recently to duplicate the averages, quite explicitly embodying

the principle that no management is cheaper, and slightly better than average paid management after transaction costs. This policy could be implemented by participating in such funds, or on a do-it-yourself basis.

(3) A manager can be found handling smaller amounts whose record has been good for the right reasons.

Then hope that no one else finds him.

Good records of any type usually have attracted massive money flows - whether the record was based on unusual skill, luck, or even, occasionally, semi-fraudulent activity which has "manufactured" the record. Even those records which I believe to have been based at least partially on skill have wilted when subjected to torrents of money.

A further problem is that in no case were the superior records I have observed based upon institutional skills which could be maintained despite changes in the faces. Rather, the good results have been accomplished by a single individual or, at most, a few, working in fairly specialized areas in which the great bulk of investment money simply had no interest. It has been very difficult to out-think the pack on General Motors, IBM, Sears, etc. Rather, the unusual records - and there have been few that have been maintained - have been achieved by those who have worked relatively neglected fields in which competition was light.*

Many pension funds, including the fund to which I referred earlier, have attempted to find superior but relatively unknown managers still working with small sums. This often involves dozens of interviews and usually comes down to the past record,

* Your win-loss percentage in tennis will not be determined by the absolute level of ability that you possess. Rather, it will be determined by your ability to select inferior opponents. If you select with care it will be quite easy to attain a winning percentage higher than, say, Cliff Richey while he is playing on the tour. Application of this principle is the key element in bridge, poker, or investments. (Harder to apply in the latter, however - it is easier to identify a couple of palookas at the bridge table.)

particularly the recent past, plus an articulate practitioner who "looks" reasonable and respectable. In my opinion, based only on impressions, the overall record from this selection process has been poor and very likely worse than the mildly below-average record of the major money manager.

The reason isn't too hard to see (particularly with a rear view mirror). Much of Wall Street is a succession of fashions. Obviously some individuals will have hit the most recent fashion, and their record will look correspondingly good - maybe sensationally good if they have a reckless streak and have played a particular trend very hard. But fashion-hitting never has been successfully maintained, to my knowledge. And the manager primarily selected for recent hot performance knows what he is expected to do. He is to perform - and quickly. So the new small manager's decisions frequently are characterized by high turnover, major mistakes, even more furious activity to catch up, etc. It has not happened every time, but my hunch is that the sum total performance of the relatively unknown go-go managers for pension funds has been worse than the lumbering, stiff-legged minuet performed by the major banks.

(4) A fixed income (bonds) investment strategy can be followed, which presently allows returns of about 9% per annum that can be locked in for some time. This option currently is becoming somewhat more popular, should be quite defensible under ERISA, and will look good or bad, depending upon what returns from equity holdings develop over the next decade or two. This essentially is the same decision that was made by default several decades ago by many companies, except the rates then were 4% instead of 9%. I do not recommend an attempt by us to go back and forth from bonds to stocks. This is a skill possessed by few, if any - and certainly not by a group. If we could master this particular form of alchemy, there would be little reason to do anything else.

The comfort level produced by this option is likely to be high under any conditions except high rates of inflation - which will produce distress under all of the options discussed herein.

(5) My final option - and the one to which I lean, although not at anything like a 45-degree angle - is mildly unconventional, thereby causing somewhat more legal risk for directors.* It may differ from other common stock programs, more in attitude than in appearance, or even results. It involves treating portfolio management decisions much like business acquisition decisions by corporate managers.

The directors and officers of the company consider themselves to be quite capable of making business decisions, including decisions regarding the long-term attractiveness of specific business operations purchased at specific prices. We have made decisions to purchase several television businesses, a newspaper business, etc. And in other relationships we have made such judgments covering a much wider spectrum of business operations.

Negotiated prices for such purchases of entire businesses often are dramatically higher than stock market valuations attributable to well-managed similar operations. Longer term, rewards to owners in both cases will flow from such investments proportional to the economic results of the business. By buying small pieces of businesses through the stock market rather than entire businesses through negotiation, several disadvantages occur: (a) the right to manage, or select managers, is forfeited; (b) the right to determine dividend policy or direct the areas of internal reinvestment is absent; (c) ability to borrow long-term against the business assets (versus against the stock position) is greatly reduced; and (d) the opportunity to sell the business on a full-value, private-owner basis is forfeited.

These are important negative factors but, if a group of investments are carefully chosen at a bargain price, it can minimize the impact of a single bad experience in, say, the management area, which cannot be corrected. And occasionally there is an

* I am leaving most of the legal discussion out of this memo - partly due to space considerations and partly because it is not my field. In general, the safest course is to behave as most others are behaving - and to trust in the expertise of large, well-regarded conventional organizations. I also believe it is defensible - although not as automatically defensible - to diversify among a group of well-financed entrenched businesses purchased at reasonable valuations of earnings and assets.

offsetting advantage which can be of very substantial value - but for which nothing should be paid at the time of purchase. That relates to the periodic tendency of stock markets to experience excesses which cause businesses - when changing hands in small pieces through stock transactions - to sell at prices significantly above privately-determined negotiated values. At such times, holdings may be liquidated at better prices than if the whole business were owned - and, due to the impersonal nature of securities markets, no moral stigma need be attached to dealing with such unwitting buyers.

Stock market prices may bounce wildly and irrationally but, if decisions regarding internal rates of return of the business are reasonably correct - and a small portion of the business is bought at a fraction of its private-owner value - a good return for the fund should be assured over the time span against which pension fund results should be measured.

It might be asked what the difference is between this approach and simply picking stocks a la Morgan, Scudder, Stevens, etc. It is, in large part, a matter of attitude, whereby the results of the business become the standard against which measurements are made rather than quarterly stock prices. It embodies a long time span for judgment confirmation, just as does an investment by a corporation in a major new division, plant or product. It treats stock ownership as business ownership with the corresponding adjustment in mental set. And it demands an excess of value over price paid, not merely a favorable short-term earnings or stock market outlook. General stock market considerations simply don't enter into the purchase decision.

Finally, it rests on a belief, which both seems logical and which has been borne out historically in securities markets, that intrinsic business value is the eventual prime determinant of stock prices. In the words of my former boss: "In the short run the market is a voting machine, but in the long run it is a weighing machine."

Specifically, it probably is possible to invest the \$12 million in our pension fund in a dozen businesses (maybe more; ERISA emphasizes diversification) with current intrinsic value (measured by private-owner valuations and transactions) attributable to our investment of, say, \$20 million and current earnings of at least \$1.5 million. The portion of such earnings paid out to us clearly is worth 100 cents on the dollar, and a reasonable

batting average by the managements of companies in which we invest should result in the portion reinvested having similar value. If this is the case, such a "pension division" operation will produce better returns than bond investment at current rates.

The main long-term risk would be that future returns on capital obtained by our "division managers" would turn sour. In some individual case that undoubtedly would prove true. It might well be that there also would be a favorable surprise or two. That is true of any acquisition program. The one substantial advantage that this "division" would have would be attractive purchase prices - far below those available for purchasers of entire businesses. If purchases could not be made on such a "bargain" basis, we simply would wait until they could. A second advantage would be the flexibility provided by a public stock market, allowing portions of business operations to be acquired or divested much more easily than entire operating businesses.

It must be emphasized that measurement of this program would have to be based on the progress in our share of earnings and assets of the constituent companies - not short-term market movements. We would expect substantial increases in earnings, dividends and asset values over, say, a decade just as we expect with our operating divisions at Washington Post. We would, in mental approach, have created a new diversified division, currently capitalized at about \$12 million, which is expected to earn a better-than-bond rate with which to eventually pay retired employees. In a sense, this is what was done in the profit-sharing fund when it accumulated Washington Post stock throughout earlier years - basically a wise decision because the business earned very well internally and thereby grew in value at a substantial rate. It was an attractive partially-owned business, acquired at an attractive price. Until market prices were introduced, which complicated things, the funds built up through this self-owning division were significantly larger than would have been achieved by buying bonds or the general run of common stocks.

If it should be decided to implement such a policy, recommendations should be obtained from qualified analysts who clearly understand our rather unusual selection criteria. This could be handled on a quite infrequent basis.

As mentioned earlier, a policy also could be followed combining more than one option. Most combinations have been (1) and (3), or (1) and (4), but (4) and (5) could well be more logical.

Pension Asset Management in the Scale of Business Priorities

Of course, the desirability of even considering something non-conventional (not to be equated with more risk; the exclusive benefit provision of ERISA requires fiduciaries to discharge their duties "solely in the interests of the participants and beneficiaries") relates to the relative impact pension results can have on overall earnings. One of my friends always reminds me: "If a thing's not worth doing at all, it's not worth doing well." If our pension assets were \$1 million and likely to grow only a few hundred thousand dollars a year, it would be ridiculous to think of any activity that might incur even unwarranted criticism, let alone litigation. On the other hand, if we had U. S. Steel's pension situation, we might want to make a truly top priority project out of pension asset management (as they have), even if we might slightly increase personal risks to directors by so doing.

We fall in between although, if you look through to the plans to which we contribute but don't manage (Guild, mechanical, etc.)* we are moving more in the direction of U. S. Steel. It is likely that within ten years we will have \$40 million in our direct pension "division" and further substantial sums in other plans presently on an indirect basis. Earnings of businesses purchased through this "division" should run at least \$5 million per year.

* In prior years it was felt that by limiting contributions to union plans to so much per shift, or per hour, management was relieved of responsibility for any specific level of benefits, as well as pension fund administration. The shield of this "hands off" position is eroding and we should recognize that we may well have responsibility at some future date for benefits promised under these plans, which we originally thought involved only defined contributions. With this in prospect, we may wish to gain at least partial command over fund investments in this area.

Summing up:

(1) If the economic world turns out to be one of sustained double-digit inflation - probably still unlikely but not unthinkable - among the carnage will be private pension plans. The investment process can do little to modify that disaster. Hope lies mainly in the care with which past promises have been made, and the ownership of a business whose economic characteristics allow pass-through pricing which includes a large part of past labor costs, as well as full current costs.

(2) In a more orderly world, the care with which promises have been worded remains important, but on a scale that diminishes as inflation moderates. Conventional approaches to money management should not be expected to produce above average results. But average will be perfectly acceptable at low inflation rates.

(3) A mildly non-conventional investment approach, emphasizing a business approach to security selection, gives some opportunity for long-term results slightly above average without corresponding increase in investment risk.

Warren E. Buffett

October 14, 1975

July 22nd, 1976

Mr. George D. Young,
National Indemnity Company,
3024 Harney Street,
Omaha, Nebraska. 68131.

Dear George:

Thanks very much for your memo of July 19th regarding GEICO which I believe summarizes well the problems attendant to the specific property treaty we are discussing, as well as the general problems associated with reinsurance of any type at GEICO. I still am willing to explore further the GEICO property treaty - if they subsequently decide that it fits their needs - and today committed to Jack Byrne that we would take a 1% quota share of their entire book. This increase from .8 of 1% was pursuant to his request in order to help him attain the 25% mark by the shareholders meeting tomorrow.

I consider the overall quota share to be an acceptable - but not exciting - piece of business. Under normal conditions we would take nothing like 1%, obviously, since that makes it by far the largest reinsurance treaty on our books, and involves substantial risks along with a limited prospect of profit. I also do not like the feature that provides for a credit to GEICO for interest earnings on funds held by us. In effect, we are making this contract number one in size for the reinsurance department, whereas the contractual terms make it less attractive than most of our other contracts.

However, I have three reasons for taking this unusually large portion of the quota share arrangement, and these same reasons also apply to my interest in the property treaty.

1. I hope it is not a governing factor in any way, but I do have some sentimental reasons for wishing GEICO to survive. GEICO has enumerated all of the hard headed reasons, such as the State Financial Guaranty funds, etc. I just have

Mr. George D. Young
July 22nd, 1976
Page #2

pulled out of the bottom drawer of my desk a statement of my net worth at the end of 1951 when I was 21 years old. I showed net assets of \$19,737, of which \$13,125 was in GEICO stock. That was the year when I first started selling securities, and I told everyone who would listen to me that they should put every cent they could scrape together into GEICO. A number of friends and relatives did so, and enjoyed a significant change in their financial fortunes because of this. It provided the first big boost to my own small savings, as well as an even more important boost to my reputation in the Omaha investment community.

During those early years, when I followed the company, the people involved couldn't have been nicer. Leo Goodwin was running things then and was helpful. Even moreso was L. A. Davidson. He was personally encouraging and forthcoming with information regarding the business, which enabled me to develop a depth of conviction which I have felt few times since about any security.

2. At that time I felt that GEICO possessed an extraordinary business advantage in a very large industry that was going to continue to grow. Since that time they never have lost that advantage - the ability to give the policyholder back in losses a greater percentage of the premium dollar than any other auto insurance company in the country, while still providing a profit to the company. I always have been attracted to the low cost operator in any business and, when you can find a combination of (i) an extremely large business, (ii) a more or less homogenous product, and (iii) a very large gap in operating costs between the low cost operator and all of the other companies in the industry, you have a really attractive investment situation. That situation prevailed twenty-five years ago when I first became interested in the company, and it still prevails.

The company managed to nullify this advantage - and even more than nullify it - by inadequate recognition of loss costs through poor techniques of loss reserving. This led to improper pricing of product, with the result that a product which could have been sold at a profit was sold at a loss. But the important point to note is that the company had not lost its position as a low cost operator; they merely had

Mr. George D. Young
July 22nd, 1976
Page #3

mismanaged their loss information which caused the product to be priced inadequately. I believe the advantages of a 13% acquisition cost ratio are as important as ever. I also believe that practically no other companies are going to achieve costs near that figure in the future. Therefore, GEICO, properly managed, should prosper if they can pull themselves back from the financial precipice.

I like very much what Jack Byrne says about reducing policies in force. It seems to me that such an approach - rather than an obsession with growth - is very likely to reconstruct the situation whereby they can give the policyholder an unusually high percentage of the dollar back in losses and still make good profits for themselves

3. The crucial factor, then, becomes whether they can get past their present financial difficulties. Much of the press - witness Time last week - assumes that they can't. Until recently, I was unclear myself as to their possibilities in this regard. If they had been at all wishy-washy in obtaining rate increases or biting the bullet generally, I don't think they would have made it. However, the size of the rate increases they have instituted, along with the underwriting results they have published for April and May, have convinced me that their combined ratio will come down to tolerable limits within a fairly short time.

Even this would not have been enough if Mr. Wallach were inclined to put them into receivership because of the unwillingness of the industry to accept his 40% plan. When he did not move to do so after the June 23rd deadline, it convinced me that he was not going to act precipitously to terminate a business that fundamental economic logic still dictated had a bright future ahead of it. When he did not bow his back over the non-subscription to his 40% plan, I believe the company's future became assured. I decided then to buy stock, which is the most tangible evidence I can give you as to my assessment of the Company's chances for survival.

Therefore, George, I will take the responsibility for making the decision that GEICO survives as a business entity. You should make any underwriting judgments that you wish, with this as the premise - if I am wrong about their survival, it will be my fault and not yours. I do not want to go overboard because of sentiment,

Mr. George D. Young

Page #4

but I certainly want us to make every effort to come up with proposals that make business sense to us and are useful to them. I do not want more of the overall quota share because I consider the terms too disadvantageous to the reinsurer, all things considered. But, if a property treaty can be put together with a prospect of gain that more than balances the risk of loss, let's proceed.

Sincerely,

Warren E. Buffett

Investor Who Piled Up \$100 Million in the '60s Piles Up Firms Today

Warren Buffett Considers His New Life More Fun; The Country-Club Caper

From Stamps to Newspapers

By JONATHAN R LAING

Staff Reporter of THE WALL STREET JOURNAL

OMAHA, Neb — The soaring stock markets of the 1960s created many a star among professional portfolio managers, but few shone as brightly as Warren Buffett.

Operating quietly from his home town of Omaha, Mr. Buffett parlayed a \$100,000 investment partnership into \$100 million in just 13 years. Then, displaying a judicious sense of timing, he closed down the fund and distributed the gains among more than 100 partners in 1969, just before the market suffered the first of its periodic tumbles of the 1970s.

These days the 46-year-old Mr. Buffett is again attracting attention, but for a different reason. Pyramiding the \$25 million that he himself made from the fund, he has bought control of a conglomeration of businesses—ranging from financial institutions and insurance companies to newspapers and candy stores—whose assets total more than \$1 billion. Most recently, a company controlled by Mr. Buffett acquired the Buffalo Evening News, the largest newspaper in upstate New York, for \$33 million.

Indeed, a major cause of Mr. Buffett's visibility lately has been his growing prominence in the newspaper field.

"A Tremendous Relief"

"I'm having a lot of fun because I'm only going into businesses that I find interesting and where I like the people running them, and their products," Mr. Buffett says. "It's a tremendous relief being out of money management. I'm not constantly thinking about business anymore. During the partnership my ego was on the line, and I was trying to lead the league in hitting every year."

Mr. Buffett, a bespectacled man of medium height and medium build whose hairline is receding, is a curious mixture of the sophisticated and homespun. He dresses conservatively and drinks nothing harder than Pepsi-Cola. His talk is larded with sports imagery and Main Street colloquialisms, yet he frequently quotes Bertrand Russell. An editor at the Washington Post, where Mr. Buffett has considerable influence these days, says:

"There's a lot more to Warren than just his business ability and 'aw shucks' manner. He understands the First Amendment along with profit-and-loss statements."

The keystone of the Buffett empire is Berkshire Hathaway Inc., a once-rundown New England textile concern that the Buffett partnership bought control of in the mid-1960s after the company's stock had sunk below its liquidating value. Since then, Mr. Buffett, who is Berkshire Hathaway's chairman and controls 53% of its stock, has revived the company by using its excess cash to diversify into the auto and casualty insurance field and acquire Illinois National Bank & Trust Co. of Rockford, Ill., a highly profitable regional bank. In 1976, Berkshire Hathaway had operating earnings of \$16.1 million on revenues of \$139 million.

Stamps and Candy

Mr. Buffett also controls some 61% of the stock of Blue Chip Stamps, a Western trading-stamp concern that posted 1976 earnings of \$11.7 million on revenues of \$88 million. Blue Chip, in turn, owns 99% of See's Candy Shops Inc., a West Coast chocolate maker and retailer; 80% of Wesco Financial Corp. of Pasadena, Calif., a savings-and-loan association; and now the Buffalo Evening News. Finally, Mr. Buffett has a controlling interest in Diversified Retailing Co., operator of a discount women's-apparel chain of about 80 stores.

But his influence extends beyond the companies he controls: These companies, in turn, have large stockholdings, totaling \$100 million, in a number of others. Among the holdings are a 10% interest in Washington Post Co.—owner of the Post, Newsweek magazine, the Trenton (N.J.) Times and five television and radio stations—25% of Pinkerton's Inc., the security concern, and a 15% slice of Government Employees Insurance Co.

These holdings also include substantial investment positions in Affiliated Publications Inc., publisher of the Boston Globe; Munsingwear Inc., the clothing manufacturer; and two advertising concerns; Ogilvy & Mather and Interpublic Group, the holding company for McCann-Erickson.

Mr. Buffett's management style is low-key. He rarely makes changes in management personnel and he takes little part in day-to-day operating decisions, preferring to concentrate on acquisitions and the management of his companies' assets.

"I Like Guys Who Forget"

"I usually don't need to get involved because I'm careful to buy well-run companies from owners who built the enterprises and stay on to run them," he says. "I like guys who forget that they sold the business to me and run the show like proprietors. When I marry the daughter, she continues to live with her parents."

Mr. Buffett's office reflects his unassuming attitude. Shoehorned into three rooms of a new office building overlooking Omaha are Mr. Buffett; J. Verne McKenzie, secretary-treasurer of Berkshire Hathaway; William Scott, a former investor in and assistant manager of the Buffett partnership, and two secretaries. Mr. Scott works only a five-hour day managing the \$140 million municipal-bond portfolio of Berkshire Hathaway's insurance and bank subsidiaries.

"Most companies would have at least half a dozen full-time people running a bond fund of that size," Mr. Buffett observes, "but Bill illustrates the fact that money management doesn't take a lot of feverish effort. He spends most of his day playing handball and rehearsing his polka band. I

Please Turn to Page 27, Column 1

The Collector: Man Who Piled Up Millions Piles Up Companies Today

Continued From First Page

like to call him the world's richest polka player next to Lawrence Welk."

Wall Street sources close to Mr. Buffett say that his stock investments in the past few years have been largely dictated by his concern over inflation. David Gottesman, senior partner of the New York investment concern First Manhattan Corp., says:

"Warren has been largely restricting himself to companies which he feels offer some protection against inflation in that they have a unique product, low capital needs and the ability to generate cash. For example, Warren likens owning a monopoly or market-dominant newspaper to owning an unregulated toll bridge. You have relative freedom to increase rates when and as much as you want."

Such considerations prompted Mr. Buffett last summer to persuade fellow trustees of Grinnell College in Iowa to spend \$13 million to buy the NBC television affiliate in Dayton, Ohio, for the school's endowment fund. "It seemed to me," he says, "that the station's profits would keep pace with the college's costs better than traditional investments. After all, the advertising budgets from which broadcasters derive most of their revenues tend to reflect current dollars and rise with the gross national product."

Mr. Buffett has taken some lumps several years ago, for example, Berkshire Hathaway lost half of a \$8 million investment in Vornado Inc., a discount retailing concern based in New Jersey. "The stock looked undervalued when I bought it, but I proved to be incredibly wrong about the discount department-store business," Mr. Buffett says. "It turned out that the industry was over-stored, and Vornado and the rest of the discounters were getting killed by competition from K mart stores."

Also, Mr. Buffett's forays into the trading-stamp business have been less than signal successes. He took a substantial loss on a stock investment in Sperry & Hutchinson Co., in 1974, and his Blue Chip Stamps stockholding, acquired mainly in 1969 and 1970, has been a lackluster performer.

His First Newspapers

Mr. Buffett made his first newspaper acquisition in 1969 when Berkshire Hathaway bought the Sun Newspapers, neighborhood weeklies in Omaha. Two years later, Blue Chip tried to buy the Cincinnati Enquirer but was outbid. Since then, in addition to the Washington Post and Buffalo Evening News transactions, Buffett companies have made profitable investments in Booth Newspapers Inc. of Michigan (the position now has been acquired by S. I. Newhouse, who has taken over Booth) and the Texas-based Harte-Hanks Newspapers Inc., which runs 25 dailies and 46 other papers around the country. Mr. Buffett describes his Harte-Hanks interest as well under 1%.

His interest in newspapers is more than just financial, Mr. Buffett says. "Let's face it," he says, "newspapers are a hell of a lot more interesting a business than, say, making couplers for rail cars. While I don't get involved in the editorial operations of the papers I own, I really enjoy being part of institutions that help shape society."

Despite his protestations to the contrary, Mr. Buffett has sometimes been more than a mere absentee owner. Five years ago he played a crucial role in an expose of the inordinate wealth of Omaha's fabled Boys Town, an expose that earned the Sun Newspapers a Pulitzer Prize. Mr. Buffett recalls:

"I knew of an IRS regulation that required charitable foundations to publicly disclose their assets for the first time, so I told

our editor to get a copy of the Boys Town filing. I'd heard a lot of rumors during my fund days about Boys Town's large stockholdings, but even I was staggered when we found out that the home, which was constantly pleading poverty and caring for less than 700 kids, had accumulated assets of more than \$200 million."

Role at the Post

According to insiders, Mr. Buffett has become increasingly influential at the Washington Post Co., which is headed and controlled by 59-year-old Katharine Graham. Mr. Buffett has been a director of the company since 1974 (a year after he bought his 10% nonvoting interest), and more recently he was named chairman of its finance committee. He has come to function as an unpaid executive, traveling to Washington at least once a month, often staying at Mrs. Graham's Georgetown home.

"Buffett has become Kay's financial guru and also acts as mentor for her son Donald, who is being groomed to take over eventually," says a former Post executive. "He started out by helping improve Post Co.'s image on Wall Street and revamping its pension plan. Now she consults him on every important decision."

"Of course I talk to him about potential acquisitions and other important matters," Mrs. Graham says. "I'd be silly not to, considering his superlative business acumen and analytical ability."

A Wall Street source close to Mr. Buffett

says that his newspaper investments don't arise out of any desire to be a newspaper mogul. "Warren likes lively, interesting people, and he loves moving in the circle of politicians and other luminaries that Kay Graham has introduced him to," the source says. "He plays tennis with Ben Bradlee (the Post's executive editor). He gets to sit in the VIP area at the political conventions and presidential debates. He really revels in the whole scene."

Part of Mr. Buffett's fascination with newspapers arises from his intense interest in public affairs. Although his father, who served in the U.S. House of Representatives, was a conservative Republican, Mr. Buffett considers himself a Democrat and has given financial support to a number of liberal Democratic politicians.

An Early Interest

Mr. Buffett recalls being intrigued with the world of finance even as a youth. He soaked up much market lore from his father, who ran a small brokerage house in Omaha before winning his House seat when Warren was 12. After graduating from high school in Washington, Mr. Buffett sailed through college in three years. It was at the University of Nebraska that he chanced upon "The Intelligent Investor," a book by Benjamin Graham that Mr. Buffett says was at the root of his later investment success. In the book, Mr. Graham, no relation to Katharine Graham, preached a defensive, statistical approach to stock investment, based on companies' "intrinsic value"—what a private owner would be willing to pay for a business based on its net worth or, better yet, on only its cash and other current assets after deducting all liabilities.

Upon graduation from college in 1950, Mr. Buffett enrolled in Columbia University's

graduate school of business, where Mr. Graham was teaching a course on finance. The two men became friends, and in 1954 Mr. Buffett, after three years as a stockbroker in Omaha, went to work for Graham-Newman Corp., a New York investment fund headed by Mr. Graham.

Two years later Mr. Buffett and his wife, Susan, whom he had married in Omaha in 1952, returned to Omaha; Mr. Graham had retired from Graham-Newman. Mr. Buffett started his investment partnership shortly thereafter with four relatives and three friends. The lion's share of its trading profits came from investments in stocks that were undervalued according to Mr. Graham's criteria.

One of the partnership's outstanding successes was an investment in American Express Co. that more than tripled in value in two years, yielding the fund a \$20 million trading gain. Mr. Buffett bought the stock in late 1963 following the shares' collapse in the wake of the company's involvement in a salad-oil scandal. Many bank trust departments and other institutions were selling the stock because they thought the scandal would shake public confidence in the company's traveler's checks.

Convinced by Talks

But Mr. Buffett's talks with a number of banks, restaurants, travel agencies and others convinced him otherwise. He found that use of American Express traveler's checks hadn't dropped; what's more, the company was fast developing a dominant share of the travel and entertainment credit-card market.

In 1969, Mr. Buffett sensed a change in the investment climate, so he folded the fund. The bargain issues were all but gone, casualties of the long bull market and the conglomerate acquisition boom. Anyway,

Mr. Buffett was tired of the pressure to perform.

These days Mr. and Mrs. Buffett divide their time between their home in Omaha—a rambling house with an attached racketball court—and a ranch house in Laguna Beach, Calif. With two of their three children grown and the third at Stanford University, Mrs. Buffett has found time to pursue a singing career in several Omaha nightclubs.

Mr. and Mrs. Buffett have been involved in a number of civil-rights efforts. They were among the first gentiles to join an all-Jewish country club in Omaha in an attempt to force all-gentile clubs to admit Jews. "It was silly that many Jewish families that had been in Omaha for years and are important to the city were barred from some of our clubs," Mr. Buffett says. "Besides, the food was better at the Jewish club."

How Inflation Swindles the Equity Investor

The central problem in the stock market is that the return on capital hasn't risen with inflation. It seems to be stuck at 12%.

By Warren E. Buffett

FORTUNE -- It is no longer a secret that stocks, like bonds, do poorly in an inflationary environment. We have been in such an environment for most of the past decade, and it has indeed been a time of troubles for stocks. But the reasons for the stock market's problems in this period are still imperfectly understood.

There is no mystery at all about the problems of bondholders in an era of inflation. When the value of the dollar deteriorates month after month, a security with income and principal payments denominated in those dollars isn't going to be a big winner. You hardly need a Ph.D. in economics to figure that one out.

It was long assumed that stocks were something else. For many years, the conventional wisdom insisted that stocks were a hedge against inflation. The proposition was rooted in the fact that stocks are not claims against dollars, as bonds are, but represent ownership of companies with productive facilities. These, investors believed, would retain their value in real terms, let the politicians print money as they might.

And why didn't it turn out that way? The main reason, I believe, is that stocks, in economic substance, are really very similar to bonds.

I know that this belief will seem eccentric to many investors. They will immediately observe that the return on a bond (the coupon) is fixed, while the return on an equity investment (the company's earnings) can vary substantially from one year to another. True enough. But anyone who examines the aggregate returns that have been earned by companies during the postwar years will discover something extraordinary: the returns on equity have in fact not varied much at all.

The coupon is sticky

In the first 10 years after the war -- the decade ending in 1955 -- the Dow Jones industrials had an average annual return on year-end equity of 12.8%. In the second decade, the figure was 10.1%. In the third decade it was 10.9%. Data for a larger universe, the [Fortune 500](#) (whose history goes back only to the mid-1950s), indicate somewhat similar results: 11.2% in the decade ending in 1965, 11.8% in the decade through 1975. The figures for a few exceptional years have been substantially higher (the high for the 500 was 14.1% in 1974) or lower (9.5% in 1958 and 1970), but over the years, and in the aggregate, the return in book value tends to keep coming back to a level around 12%. It shows no signs of exceeding that level significantly in inflationary years (or in years of stable prices, for that matter).

For the moment, let's think of those companies, not as listed stocks, but as productive enterprises. Let's also assume that the owners of those enterprises had acquired them at book value. In that case, their own return would have been around 12% too. And because the return has been so consistent, it seems reasonable to think of it as an "equity coupon."

In the real world, of course, investors in stocks don't just buy and hold. Instead, many try to outwit their fellow investors in order to maximize their own proportions of corporate earnings. This thrashing about, obviously fruitless in aggregate, has no impact on the equity coupon but reduces the investor's portion of it, because he incurs substantial frictional costs, such as advisory fees and brokerage charges. Throw in an active options market, which adds nothing to the productivity of American enterprise but requires a cast of thousands to man the casino, and frictional costs rise further.

Stocks are perpetual

It is also true that in the real world investors in stocks don't usually get to buy at book value. Sometimes they have been able to buy in below book; usually, however, they've had to pay more than book, and when that happens there is further pressure on that 12%. I'll talk more about these relationships later. Meanwhile, let's focus on the main point: as inflation has increased, the return on equity capital has not. Essentially, those who buy equities receive securities with an underlying fixed return just like those who buy bonds.

Of course, there are some important differences between the bond and stock forms. For openers, bonds eventually come due. It may require a long wait, but eventually the bond investor gets to renegotiate the terms of his contract. If current and prospective rates of inflation make his old coupon look inadequate, he can refuse to play further unless coupons currently being offered rekindle his interest. Something of this sort has been going on in recent years.

Stocks, on the other hand, are perpetual. They have a maturity date of infinity. Investors in stocks are stuck with whatever return corporate America happens to earn. If corporate America is destined to earn 12%, then that is the level investors must learn to live with. As a group, stock investors can neither opt out nor renegotiate. In the aggregate, their commitment is actually increasing. Individual companies can be sold or liquidated and corporations can repurchase their own shares; on balance, however, new equity flotations and retained earnings guarantee that the equity capital locked up in the corporate system will increase. So, score one for the bond form. Bond coupons eventually will be renegotiated; equity "coupons" won't. It is true, of course, that for a long time a 12% coupon did not appear in need of a whole lot of correction.

The bondholder gets it in cash

There is another major difference between the garden variety of bond and our new exotic 12% "equity bond" that comes to the Wall Street costume ball dressed in a stock certificate. In the usual case, a bond investor receives his entire coupon in cash and is left to reinvest it as best he can. Our stock investor's equity coupon, in contrast, is partially retained by the company and is reinvested at whatever rates the company happens to be earning. In other words, going back to our corporate

universe, part of the 12% earned annually is paid out in dividends and the balance is put right back into the universe to earn 12% also.

The good old days

This characteristic of stocks -- the reinvestment of part of the coupon -- can be good or bad news, depending on the relative attractiveness of that 12%. The news was very good indeed in the 1950s and early 1960s. With bonds yielding only 3 or 4%, the right to reinvest automatically a portion of the equity coupon at 12% was of enormous value. Note that investors could not just invest their own money and get that 12% return. Stock prices in this period ranged far above book value, and investors were prevented by the premium prices they had to pay from directly extracting out of the underlying corporate universe whatever rate that universe was earning. You can't pay far above par for a 12% bond and earn 12% for yourself.

But on their retained earnings, investors could earn 12%. In effect, earnings retention allowed investors to buy at book value part of an enterprise that, in the economic environment then existing, was worth a great deal more than book value.

It was a situation that left very little to be said for cash dividends and a lot to be said for earnings retention. Indeed, the more money that investors thought likely to be reinvested at the 12% rate, the more valuable they considered their reinvestment privilege, and the more they were willing to pay for it. In the early 1960s, investors eagerly paid top-scale prices for electric utilities situated in growth areas, knowing that these companies had the ability to re-invest very large proportions of their earnings. Utilities whose operating environment dictated a larger cash payout rated lower prices.

If, during this period, a high-grade, noncallable, long-term bond with a 12% coupon had existed, it would have sold far above par. And if it were a bond with a further unusual characteristic -- which was that most of the coupon payments could be automatically reinvested at par in similar bonds -- the issue would have commanded an even greater premium. In essence, growth stocks retaining most of their earnings represented just such a security. When their reinvestment rate on the added equity capital was 12% while interest rates generally were around 4%, investors became very happy -- and, of course, they paid happy prices.

Heading for the exits

Looking back, stock investors can think of themselves in the 1946-66 period as having been ladled a truly bountiful triple dip. First, they were the beneficiaries of an underlying corporate return on equity that was far above prevailing interest rates. Second, a significant portion of that return was reinvested for them at rates that were otherwise unattainable. And third, they were afforded an escalating appraisal of underlying equity capital as the first two benefits became widely recognized. This third dip meant that, on top of the basic 12% or so earned by corporations on their equity capital, investors were receiving a bonus as the Dow Jones industrials increased in price from 133% of book value in 1946 to 220% in 1966. Such a marking-up process temporarily allowed investors to achieve a return that exceeded the inherent earning power of the enterprises in which they had invested.

This heaven-on-earth situation finally was "discovered" in the mid-1960s by many major investing institutions. But just as these financial elephants began trampling on one another in their rush to equities, we entered an era of accelerating inflation and higher interest rates. Quite logically, the marking-up process began to reverse itself. Rising interest rates ruthlessly reduced the value of all existing fixed-coupon investments. And as long-term corporate bond rates began moving up (eventually reaching the 10% area), both the equity return of 12% and the reinvestment "privilege" began to look different.

Stocks are quite properly thought of as riskier than bonds. While that equity coupon is more or less fixed over periods of time, it does fluctuate somewhat from year to year. Investors' attitudes about the future can be affected substantially, although frequently erroneously, by those yearly changes. Stocks are also riskier because they come equipped with infinite maturities. (Even your friendly broker wouldn't have the nerve to peddle a 100-year bond, if he had any available, as "safe.") Because of the additional risk, the natural reaction of investors is to expect an equity return that is comfortably above the bond return -- and 12% on equity versus, say, 10% on bonds issued by the same corporate universe does not seem to qualify as comfortable. As the spread narrows, equity investors start looking for the exits.

But, of course, as a group they can't get out. All they can achieve is a lot of movement, substantial frictional costs, and a new, much lower level of valuation, reflecting the lessened attractiveness of the 12% equity coupon under inflationary conditions. Bond investors have had a succession of shocks over the past decade in the course of discovering that there is no magic attached to any given coupon level: at 6%, or 8%, or 10%, bonds can still collapse in price. Stock investors, who are in general not aware that they too have a "coupon," are still receiving their education on this point.

Five ways to improve earnings

Must we really view that 12% equity coupon as immutable? Is there any law that says the corporate return on equity capital cannot adjust itself upward in response to a permanently higher average rate of inflation? There is no such law, of course. On the other hand, corporate America cannot increase earnings by desire or decree. To raise that return on equity, corporations would need at least one of the following: (1) an increase in turnover, i.e., in the ratio between sales and total assets employed in the business; (2) cheaper leverage; (3) more leverage; (4) lower income taxes; (5) wider operating margins on sales.

And that's it. There simply are no other ways to increase returns on common equity. Let's see what can be done with these.

We'll begin with turnover. The three major categories of assets we have to think about for this exercise are accounts receivable, inventories, and fixed assets such as plants and machinery.

Accounts receivable go up proportionally as sales go up, whether the increase in dollar sales is produced by more physical volume or by inflation. No room for improvement here.

With inventories, the situation is not quite so simple. Over the long term, the trend in unit inventories may be expected to follow the trend in unit sales. Over the short term, however, the physical turnover rate may bob around because of special influences -- e.g., cost expectations, or bottlenecks.

The use of last-in, first-out (LIFO) inventory-valuation methods serves to increase the reported turnover rate during inflationary times. When dollar sales are rising because of inflation, inventory valuations of a LIFO company either will remain level (if unit sales are not rising) or will trail the rise in dollar sales (if unit sales are rising). In either case, dollar turnover will increase.

During the early 1970s, there was a pronounced swing by corporations toward LIFO accounting (which has the effect of lowering a company's reported earnings and tax bills). The trend now seems to have slowed. Still, the existence of a lot of LIFO companies, plus the likelihood that some others will join the crowd, ensures some further increase in the reported turnover of inventory.

The gains are apt to be modest

In the case of fixed assets, any rise in the inflation rate, assuming it affects all products equally, will initially have the effect of increasing turnover. That is true because sales will immediately reflect the new price level, while the fixed asset account will reflect the change only gradually, i.e., as existing assets are retired and replaced at the new prices. Obviously, the more slowly a company goes about this replacement process, the more the turnover ratio will rise. The action stops, however, when a replacement cycle is completed. Assuming a constant rate of inflation, sales and fixed assets will then begin to rise in concert at the rate of inflation.

To sum up, inflation will produce some gains in turnover ratios. Some improvement would be certain because of LIFO and some would be possible (if inflation accelerates) because of sales rising more rapidly than fixed assets. But the gains are apt to be modest and not of a magnitude to produce substantial improvement in returns on equity capital. During the decade ending in 1975, despite generally accelerating inflation and the extensive use of LIFO accounting, the turnover ratio of the Fortune 500 went only from 1.18/1 to 1.29/1.

Cheaper leverage? Not likely. High rates of inflation generally cause borrowing to become dearer, not cheaper. Galloping rates of inflation create galloping capital needs; and lenders, as they become increasingly distrustful of long-term contracts, become more demanding. But even if there is no further rise in interest rates, leverage will be getting more expensive because the average cost of the debt now on corporate books is less than would be the cost of replacing it. And replacement will be required as the existing debt matures. Overall, then, future changes in the cost of leverage seem likely to have a mildly depressing effect on the return on equity.

More leverage? American business already has fired many, if not most, of the more-leverage bullets once available to it. Proof of that proposition can be seen in some other Fortune 500 statistics: in the 20 years ending in 1975, stockholders' equity as a percentage of total assets declined for the 500 from 63% to just under 50%. In other words, each dollar of equity capital now is leveraged much more heavily than it used to be.

What the lenders learned

An irony of inflation-induced financial requirements is that the highly profitable companies -- generally the best credits -- require relatively little debt capital. But the laggards in profitability never can get enough. Lenders understand this problem much better than they did a decade ago -- and are correspondingly less willing to let capital-hungry, low-profitability enterprises leverage themselves to the sky.

Nevertheless, given inflationary conditions, many corporations seem sure in the future to turn to still more leverage as a means of shoring up equity returns. Their managements will make that move because they will need enormous amounts of capital -- often merely to do the same physical volume of business -- and will wish to get it without cutting dividends or making equity offerings that, because of inflation, are not apt to shape up as attractive. Their natural response will be to heap on debt, almost regardless of cost. They will tend to behave like those utility companies that argued over an eighth of a point in the 1960s and were grateful to find 12% debt financing in 1974.

Added debt at present interest rates, however, will do less for equity returns than did added debt at 4% rates in the early 1960s. There is also the problem that higher debt ratios cause credit ratings to be lowered, creating a further rise in interest costs.

So that is another way, to be added to those already discussed, in which the cost of leverage will be rising. In total, the higher costs of leverage are likely to offset the benefits of greater leverage.

Besides, there is already far more debt in corporate America than is conveyed by conventional balance sheets. Many companies have massive pension obligations geared to whatever pay levels will be in effect when present workers retire. At the low inflation rates of 1955-65, the liabilities arising from such plans were reasonably predictable. Today, nobody can really know the company's ultimate obligation. But if the inflation rate averages 7% in the future, a 25-year-old employee who is now earning \$12,000, and whose raises do no more than match increases in living costs, will be making \$180,000 when he retires at 65.

Of course, there is a marvelously precise figure in many annual reports each year, purporting to be the unfunded pension liability. If that figure were really believable, a corporation could simply ante up that sum, add to it the existing pension-fund assets, turn the total amount over to an insurance company, and have it assume all the corporation's present pension liabilities. In the real world, alas, it is impossible to find an insurance company willing even to listen to such a deal.

Virtually every corporate treasurer in America would recoil at the idea of issuing a "cost-of-living" bond -- a noncallable obligation with coupons tied to a price index. But through the private pension system, corporate America has in fact taken on a fantastic amount of debt that is the equivalent of such a bond.

More leverage, whether through conventional debt or unhooked and indexed "pension debt," should be viewed with skepticism by shareholders. A 12% return from an enterprise that is debt-free is far

superior to the same return achieved by a business hocked to its eyeballs. Which means that today's 12% equity returns may well be less valuable than the 12% returns of 20 years ago.

More fun in New York

Lower corporate income taxes seem unlikely. Investors in American corporations already own what might be thought of as a Class D stock. The Class A, B, and C stocks are represented by the income-tax claims of the federal, state, and municipal governments. It is true that these "investors" have no claim on the corporation's assets; however, they get a major share of the earnings, including earnings generated by the equity buildup resulting from retention of part of the earnings owned by the Class D shareholders.

A further charming characteristic of these wonderful Class A, B, and C stocks is that their share of the corporation's earnings can be increased immediately, abundantly, and without payment by the unilateral vote of any one of the "stockholder" classes, e.g., by congressional action in the case of the Class A. To add to the fun, one of the classes will sometimes vote to increase its ownership share in the business retroactively -- as companies operating in New York discovered to their dismay in 1975. Whenever the Class A, B, or C "stockholders" vote themselves a larger share of the business, the portion remaining for Class D -- that's the one held by the ordinary investor -- declines.

Looking ahead, it seems unwise to assume that those who control the A, B, and C shares will vote to reduce their own take over the long run. The Class D shares probably will have to struggle to hold their own.

Bad news from the FTC

The last of our five possible sources of increased returns on equity is *wider operating margins on sales*. Here is where some optimists would hope to achieve major gains. There is no proof that they are wrong. But there are only 100 cents in the sales dollar and a lot of demands on that dollar before we get down to the residual, pretax profits. The major claimants are labor, raw materials, energy, and various non-income taxes. The relative importance of these costs hardly seems likely to decline during an age of inflation.

Recent statistical evidence, furthermore, does not inspire confidence in the proposition that margins will widen in a period of inflation. In the decade ending in 1965, a period of relatively low inflation, the universe of manufacturing companies reported on quarterly by the Federal Trade Commission had an average annual pretax margin on sales of 8.6%. In the decade ending in 1975, the average margin was 8%. Margins were down, in other words, despite a very considerable increase in the inflation rate.

If business was able to base its prices on replacement costs, margins would widen in inflationary periods. But the simple fact is that most large businesses, despite a widespread belief in their market power, just don't manage to pull it off. Replacement cost accounting almost always shows that corporate earnings have declined significantly in the past decade. If such major industries as oil, steel, and aluminum really have the oligopolistic muscle imputed to them, one can only conclude that their pricing policies have been remarkably restrained.

There you have the complete lineup: five factors that can improve returns on common equity, none of which, by my analysis, are likely to take us very far in that direction in periods of high inflation. You may have emerged from this exercise more optimistic than I am. But remember, returns in the 12% area have been with us a long time.

The investor's equation

Even if you agree that the 12% equity coupon is more or less immutable, you still may hope to do well with it in the years ahead. It's conceivable that you will. After all, a lot of investors did well with it for a long time. But your future results will be governed by three variables: the relationship between book value and market value, the tax rate, and the inflation rate.

Let's wade through a little arithmetic about book and market value. When stocks consistently sell at book value, it's all very simple. If a stock has a book value of \$100 and also an average market value of \$100, 12% earnings by business will produce a 12% return for the investor (less those frictional costs, which we'll ignore for the moment). If the payout ratio is 50%, our investor will get \$6 via dividends and a further \$6 from the increase in the book value of the business, which will, of course, be reflected in the market value of his holdings.

If the stock sold at 150% of book value, the picture would change. The investor would receive the same \$6 cash dividend, but it would now represent only a 4% return on his \$150 cost. The book value of the business would still increase by 6% (to \$106) and the market value of the investor's holdings, valued consistently at 150% of book value, would similarly increase by 6% (to \$159). But the investor's total return, i.e., from appreciation plus dividends, would be only 10% versus the underlying 12% earned by the business.

When the investor buys in below book value, the process is reversed. For example, if the stock sells at 80% of book value, the same earnings and payout assumptions would yield 7.5% from dividends (\$6 on an \$80 price) and 6% from appreciation -- a total return of 13.5%. In other words, you do better by buying at a discount rather than a premium, just as common sense would suggest.

During the postwar years, the market value of the Dow Jones industrials has been as low as 84% of book value (in 1974) and as high as 232% (in 1965); most of the time the ratio has been well over 100%. (Early this spring, it was around 110%.) Let's assume that in the future the ratio will be something close to 100%, meaning that investors in stocks could earn the full 12%. At least, they could earn that figure before taxes and before inflation.

7% after taxes

How large a bite might taxes take out of the 12%? For individual investors, it seems reasonable to assume that federal, state, and local income taxes will average perhaps 50% on dividends and 30% on capital gains. A majority of investors may have marginal rates somewhat below these, but many with larger holdings will experience substantially higher rates. Under the new tax law,

as *Fortune* observed last month, a high-income investor in a heavily taxed city could have a marginal rate on capital gains as high as 56%.

So let's use 50% and 30% as representative for individual investors. Let's also assume, in line with recent experience, that corporations earning 12% on equity pay out 5% in cash dividends (2.5% after tax) and retain 7%, with those retained earnings producing a corresponding market-value growth (4.9% after the 30% tax). The after-tax return, then, would be 7.4%. Probably this should be rounded down to about 7% to allow for frictional costs. To push our stocks-as-disguised-bonds thesis one notch further, then, stocks might be regarded as the equivalent, for individuals, of 7% tax-exempt perpetual bonds.

The number nobody knows

Which brings us to the crucial question -- the inflation rate. No one knows the answer on this one -- including the politicians, economists, and Establishment pundits, who felt, a few years back, that with slight nudges here and there unemployment and inflation rates would respond like trained seals.

But many signs seem negative for stable prices: the fact that inflation is now worldwide; the propensity of major groups in our society to utilize their electoral muscle to shift, rather than solve, economic problems; the demonstrated unwillingness to tackle even the most vital problems (e.g., energy and nuclear proliferation) if they can be postponed; and a political system that rewards legislators with reelection if their actions appear to produce short-term benefits even though their ultimate imprint will be to compound long-term pain.

Most of those in political office, quite understandably, are firmly against inflation and firmly in favor of policies producing it. (This schizophrenia hasn't caused them to lose touch with reality, however; Congressmen have made sure that their pensions -- unlike practically all granted in the private sector -- are indexed to cost-of-living changes after retirement.)

Discussions regarding future inflation rates usually probe the subtleties of monetary and fiscal policies. These are important variables in determining the outcome of any specific inflationary equation. But, at the source, peacetime inflation is a political problem, not an economic problem. Human, behavior, not monetary behavior, is the key. And when very human politicians choose between the next election and the next generation, it's clear what usually happens.

Such broad generalizations do not produce precise numbers. However, it seems quite possible to me that inflation rates will average 7% in future years. I hope this forecast proves to be wrong. And it may well be. Forecasts usually tell us more of the forecaster than of the future. You are free to factor your own inflation rate into the investor's equation. But if you foresee a rate averaging 2% or 3%, you are wearing different glasses than I am.

So there we are: 12% before taxes and inflation; 7% after taxes and before inflation; and maybe zero percent after taxes and inflation. It hardly sounds like a formula that will keep all those cattle stampeding on TV.

As a common stockholder you will have more dollars, but you may have no more purchasing power. Out with Ben Franklin ("a penny saved is a penny earned") and in with Milton Friedman ("a man might as well consume his capital as invest it").

What widows don't notice

The arithmetic makes it plain that inflation is a far more devastating tax than anything that has been enacted by our legislatures. The inflation tax has a fantastic ability to simply consume capital. It makes no difference to a widow with her savings in a 5% passbook account whether she pays 100% income tax on her interest income during a period of zero inflation, or pays *no* income taxes during years of 5% inflation. Either way, she is "taxed" in a manner that leaves her no real income whatsoever. Any money she spends comes right out of capital. She would find outrageous a 120% income tax, but doesn't seem to notice that 6% inflation is the economic equivalent.

If my inflation assumption is close to correct, disappointing results will occur not because the market falls, but in spite of the fact that the market rises. At around 920 early last month, the Dow was up 55 points from where it was 10 years ago. But adjusted for inflation, the Dow is down almost 345 points -- from 865 to 520. And about half of the earnings of the Dow had to be withheld from their owners and reinvested in order to achieve even that result.

In the next 10 years, the Dow would be doubled just by a combination of the 12% equity coupon, a 40% payout ratio, and the present 110% ratio of market to book value. And with 7% inflation, investors who sold at 1800 would still be considerably worse off than they are today after paying their capital-gains taxes.

I can almost hear the reaction of some investors to these downbeat thoughts. It will be to assume that, whatever the difficulties presented by the new investment era, they will somehow contrive to turn in superior results for themselves. Their success is most unlikely. And, in aggregate, of course, impossible. If you feel you can dance in and out of securities in a way that defeats the inflation tax, I would like to be your broker -- but not your partner.

Even the so-called tax-exempt investors, such as pension funds and college endowment funds, do not escape the inflation tax. If my assumption of a 7% inflation rate is correct, a college treasurer should regard the first 7% earned each year merely as a replenishment of purchasing power. Endowment funds are earning *nothing* until they have outpaced the inflation treadmill. At 7% inflation and, say, overall investment returns of 8%, these institutions, which believe they are tax-exempt, are in fact paying "income taxes" of 87.5%.

The social equation

Unfortunately, the major problems from high inflation rates flow not to investors but to society as a whole. Investment income is a small portion of national income, and if per capita real income could grow at a healthy rate alongside zero real investment returns, social justice might well be advanced. A market economy creates some lopsided payoffs to participants. The right endowment of vocal chords, anatomical structure, physical strength, or mental powers can produce enormous piles of

claim checks (stocks, bonds, and other forms of capital) on future national output. Proper selection of ancestors similarly can result in lifetime supplies of such tickets upon birth. If zero real investment returns diverted a bit greater portion of the national output from such stockholders to equally worthy and hardworking citizens lacking jackpot-producing talents, it would seem unlikely to pose such an insult to an equitable world as to risk Divine Intervention.

But the potential for real improvement in the welfare of workers at the expense of affluent stockholders is not significant. Employee compensation already totals 28 times the amount paid out in dividends, and a lot of those dividends now go to pension funds, nonprofit institutions such as universities, and individual stockholders who are not affluent. Under these circumstances, if we now shifted all dividends of wealthy stockholders into wages -- something we could do only once, like killing a cow (or, if you prefer, a pig) -- we would increase real wages by less than we used to obtain from one year's growth of the economy.

The Russians understand it too

Therefore, diminishment of the affluent, through the impact of inflation on their investments, will not even provide material *short-term* aid to those who are not affluent. Their economic well-being will rise or fall with the general effects of inflation on the economy. And those effects are not likely to be good.

Large gains in real capital, invested in modern production facilities, are required to produce large gains in economic well-being. Great labor availability, great consumer wants, and great government promises will lead to nothing but great frustration without continuous creation and employment of expensive new capital assets throughout industry. That's an equation understood by Russians as well as Rockefellers. And it's one that has been applied with stunning success in West Germany and Japan. High capital-accumulation rates have enabled those countries to achieve gains in living standards at rates far exceeding ours, even though we have enjoyed much the superior position in energy.

To understand the impact of inflation upon real capital accumulation, a little math is required. Come back for a moment to that 12% return on equity capital. Such earnings are stated after depreciation, which presumably will allow replacement of present productive capacity -- *if* that plant and equipment can be purchased in the future at prices similar to their original cost.

The way it was

Let's assume that about half of earnings are paid out in dividends, leaving 6% of equity capital available to finance future growth. If inflation is low -- say, 2% -- a large portion of that growth can be real growth in physical output. For under these conditions, 2% more will have to be invested in receivables, inventories, and fixed assets next year just to duplicate this year's physical output -- leaving 4% for investment in assets to produce more physical goods. The 2% finances illusory dollar growth reflecting inflation and the remaining 4% finances real growth. If population growth is 1%, the 4% gain in real output translates into a 3% gain in real per capita net income. That, very roughly, is what used to happen in our economy.

Now move the inflation rate to 7% and compute what is left for real growth after the financing of the mandatory inflation component. The answer is nothing -- if dividend policies and leverage ratios remain unchanged. After half of the 12% earnings are paid out, the same 6% is left, but it is all conscripted to provide the added dollars needed to transact last year's physical volume of business. Many companies, faced with no real retained earnings with which to finance physical expansion after normal dividend payments, will improvise. How, they will ask themselves, can we stop or reduce dividends without risking stockholder wrath? I have good news for them: a ready-made set of blueprints is available.

In recent years the electric-utility industry has had little or no dividend-paying capacity. Or, rather, it has had the power to pay dividends if investors agree to buy stock from them. In 1975 electric utilities paid common dividends of \$3.3 billion and asked investors to return \$3.4 billion. Of course, they mixed in a little solicit-Peter-to-pay-Paul technique so as not to acquire a Con Ed (**ED**) reputation. Con Ed, you will remember, was unwise enough in 1974 to simply tell its shareholders it didn't have the money to pay the dividend. Candor was rewarded with calamity in the marketplace.

The more sophisticated utility maintains -- perhaps increases -- the quarterly dividend and then ask shareholders (either old or new) to mail back the money. In other words, the company issues new stock. This procedure diverts massive amounts of capital to the tax collector and substantial sums to underwriters. Everyone, however, seems to remain in good spirits (particularly the underwriters).

More joy at AT&T

Encouraged by such success, some utilities have devised a further shortcut. In this case, the company declares the dividend, the shareholder pays the tax, and -- presto -- more shares are issued. No cash changes hands, although the IRS, spoilsport as always, persists in treating the transaction as if it had.

AT&T (**T**), for example, instituted a dividend-reinvestment program in 1973. This company, in fairness, must be described as very stockholder-minded, and its adoption of this program, considering the folkways of finance, must be regarded as totally understandable. But the substance of the program is out of *Alice in Wonderland*.

In 1976, AT&T paid \$2.3 billion in cash dividends to about 2.9 million owners of its common stock. At the end of the year, 648,000 holders (up from 601,000 the previous year) reinvested \$432 million (up from \$327 million) in additional shares supplied directly by the company.

Just for fun, let's assume that all AT&T shareholders ultimately sign up for this program. In that case, no cash at all would be mailed to shareholders -- just as when Con Ed passed a dividend. However, each of the 2.9 million owners would be notified that he should pay income taxes on his share of the retained earnings that had that year been called a "dividend." Assuming that "dividends" totaled \$2.3 billion, as in 1976, and that shareholders paid an average tax of 30% on these, they would end up, courtesy of this marvelous plan, paying nearly \$700 million to the IRS. Imagine the joy of shareholders, in such circumstances, if the directors were then to double the dividend.

The government will try to do it

We can expect to see more use of disguised payout reductions as business struggles with the problem of real capital accumulation. But throttling back shareholders somewhat will not entirely solve the problem. A combination of 7% inflation and 12% returns will reduce the stream of corporate capital available to finance real growth.

And so, as conventional private capital-accumulation methods falter under inflation, our government will increasingly attempt to influence capital flows to industry, either unsuccessfully as in England or successfully as in Japan. The necessary cultural and historical underpinning for a Japanese-style enthusiastic partnership of government, business, and labor seems lacking here. If we are lucky, we will avoid following the English path, where all segments fight over division of the pie rather than pool their energies to enlarge it.

On balance, however, it seems likely that we will hear a great deal more as the years unfold about underinvestment, stagflation, and the failures of the private sector to fulfill needs.

You Pay A Very High Price In The Stock Market For A Cheery Consensus

Pension-fund managers continue to make investment decisions with their eyes firmly fixed on the rearview mirror. This generals-fighting-the-last-war approach has proven costly in the past and will likely prove equally costly this time around.

Stocks now sell at levels that should produce long-term returns far superior to bonds. Yet pensions managers, usually encouraged by corporate sponsors they must necessarily please (“whose bread I eat, his song I sing”), are pouring funds in record proportions into bonds.

Meanwhile, orders for stocks are being placed with an eyedropper. Parkinson—of Parkinson’s law fame—might conclude that the enthusiasm of professionals for stocks varies proportionately with the recent pleasure derived from ownership. This always was the way John Q. Public was expected to behave. John Q. Expert seems similarly afflicted. Here’s the record.

In 1972, when the Dow earned \$67.11, or 11% on beginning book value of 607, it closed the year selling at 1,020, and pension managers couldn’t buy stocks fast enough. Purchases of equities in 1972 were 105% of net funds available (i.e., bonds were sold), a record except for the 122% of the even more buoyant prior year. This two-year stampede increased the equity portion of total pension assets from 61% to 74%—an all-time record that coincided nicely with a record-high price for the Dow. The more investment managers paid for stocks, the better they felt about them.

And then the market went into a tailspin in 1973-74. Although the Dow earned \$99.04 in 1974, or 14% on beginning book value of 690, it finished the year selling at 616. A bargain? Alas, such bargain prices produced panic rather than purchases; only 21% of net investable funds went into equities that year, a 25-year record low. The proportion of equities held by private noninsured

pension plans fell to 54% of net assets, a full 20-point drop from the level deemed appropriate when the Dow was 400 points higher.

By 1976, the courage of pension managers rose in tandem with the price level, and 56% of available funds was committed to stocks. The Dow that year averaged close to 1,000, a level then about 25% above book value.

In 1978, stocks were valued far more reasonably, with the Dow selling below book value most of the time. Yet a new low of 9% of net funds was invested in equities during the year. The first quarter of 1979 continued at very close to the same level.

By these actions, pension managers, in record-setting manner, are voting for purchase of bonds—at interest rates of 9% to 10%—and against purchase of American equities at prices aggregating book value or less. But these same pension managers probably would concede that those American equities, in aggregate and over the longer term, would earn about 13% (the average in recent years) on book value. And, overwhelmingly, the managers of their corporate sponsors would agree.

Many corporate managers, in fact, exhibit a bit of schizophrenia regarding equities. They consider their own stocks to be screamingly attractive. But, concomitantly, they stamp approval on pension policies rejecting purchases of common stocks in general. And the boss, while wearing his acquisition hat, will eagerly bid 150% to 200% of book value for businesses typical of corporate America but, wearing his pension hat, will scorn investment in similar companies at book value. Can his own talents be so unique that he is justified both in paying 200 cents on the dollar for a business if he can get his hands on it, and in rejecting it as an unwise pension investment at 100 cents on the dollar if it must be left to be run by his companions at the Business Roundtable?

A simple Pavlovian response may be the major cause of this puzzling behavior. During the last decade, stocks have produced pain—both for corporate sponsors and for the investment managers the sponsors hire. Neither group wishes to return to the scene of the accident. But the pain has not been produced because business has performed badly, but rather because stocks

have underperformed business. Such underperformance cannot prevail indefinitely, any more than could the earlier overperformance of stocks versus business that lured pension money into equities at high prices.

Can better results be obtained over, say, 20 years from a group of 9 1/2% bonds of leading American companies maturing in 1999 than from a group of Dow-type equities purchased, in aggregate, at around book value and likely to earn, in aggregate, around 13% on that book value? The probabilities seem exceptionally low. The choice of equities would prove inferior only if either a major sustained decline in return on equity occurs or a ludicrously low valuation of earnings prevails at the end of the 20-year period. Should price/earnings ratios expand over the 20-year period—and that 13% return on equity be averaged—purchases made now at book value will result in better than a 13% annual return. How can bonds at only 9 1/2% be a better buy?

Think for a moment of book value of the Dow as equivalent to par, or the principal value of a bond. And think of the 13% or so expectable average rate of earnings on that book value as a sort of fluctuating coupon on the bond—a portion of which is retained to add to principal amount just like the interest return on U.S. Savings Bonds. Currently our “Dow Bond” can be purchased at a significant discount (at about 840 vs. 940 “principal amount,” or book value of the Dow. Figures are based on the old Dow, prior to the recent substitutions. The returns would be moderately higher and the book values somewhat lower if the new Dow had been used.). That Dow Bond purchased at a discount with an average coupon of 13%—even though the coupon will fluctuate with business conditions—seems to me to be a long-term investment far superior to a conventional 9 1/2% 20-year bond purchased at par.

Of course, there is no guarantee that future corporate earnings will average 13%. It may be that some pension managers shun stocks because they expect reported returns on equity to fall sharply in the next decade. However, I don't believe such a view is widespread.

Instead, investment managers usually set forth two major objections to the thought that stocks should now be favored over bonds. Some say earnings currently are overstated, with real earnings after replacement-value depreciation far less than those reported. Thus, they say, real 13% earnings

aren't available. But that argument ignores the evidence in such investment areas as life insurance, banking, fire-casualty insurance, finance companies, service businesses, etc.

In those industries, replacement-value accounting would produce results virtually identical with those produced by conventional accounting. And yet, one can put together a very attractive package of large companies in those fields with an expectable return of 13% or better on book value and with a price which, in aggregate, approximates book value. Furthermore, I see no evidence that corporate managers turn their backs on 13% returns in their acquisition decisions because of replacement-value accounting considerations.

A second argument is made that there are just too many question marks about the near future; wouldn't it be better to wait until things clear up a bit? You know the prose: "Maintain buying reserves until current uncertainties are resolved," etc. Before reaching for that crutch, face up to two unpleasant facts: The future is never clear; you pay a very high price in the stock market for a cheery consensus. Uncertainty actually is the friend of the buyer of long-term values.

If anyone can afford to have such a long-term perspective in making investment decisions, it should be pension-fund managers. While corporate managers frequently incur large obligations in order to acquire businesses at premium prices, most pension plans have very minor flow-of-funds problems. If they wish to invest for the long term—as they do in buying those 20- and 30-year bonds they now embrace—they certainly are in a position to do so. They can, and should, buy stocks with the attitude and expectations of an investor entering into a long-term partnership.

Corporate managers who duck responsibility for pension management by making easy, conventional or faddish decisions are making an expensive mistake. Pension assets probably total about one-third of overall industrial net worth and, of course, bulk far larger in the case of many specific industrial corporations. Thus, poor management of those assets frequently equates to poor management of the largest single segment of the business. Soundly achieved higher returns will produce significantly greater earnings for the

corporate sponsors and will also enhance the security and prospective payments available to pensioners.

Managers currently opting for lower equity ratios either have a highly negative opinion of future American business results or expect to be nimble enough to dance back into stocks at even lower levels. There may well be some period in the near future when financial markets are demoralized and much better buys are available in equities; that possibility exists at all times. But you can be sure that at such a time the future will seem neither predictable nor pleasant. Those now awaiting a “better time” for equity investing are highly likely to maintain that posture until well into the next bull market.

March 5, 1982

The Honorable John Dingell,
U. S. House of Representatives,
Rayburn House Building,
Washington, D. C. 20515.

Dear Mr. Dingell:

This letter is to comment upon the likely sources for trading activity that will develop in any futures market involving stock indices. My background for this commentary is some thirty years of practice in various aspects of the investment business, including several years as a securities salesman. The last twenty-five years have been spent as a financial analyst, and I currently have the sole responsibility for an equity portfolio that totals over \$600 million. I am enclosing copies of several articles that relate to my experience in the investment field.

It is impossible to predict precisely what will develop in investment or speculative markets, and you should be wary of any who claim precision. I think the following represents a reasonable expectancy:

1. A role can be performed by the stock index future contract in aiding the risk-reducing efforts of the true investor. An investor may quite logically conclude that he can identify undervalued securities, but also conclude that he has no ability whatsoever to predict the short-term movements of the stock market. This is the view I maintain in my own efforts in investment management. Such an investor may wish to "zero out" market fluctuations and the continual shorting of a representative index offers him the chance to do just that. Presumably an investor with \$10 million of undervalued equities and a constant short position of \$10 million in the index will achieve the net rewards or penalties attributable solely to his skill in selection of specific securities, and have no worries that these results will be swamped - or even influenced - by the fluctuations of the general market. Because there are costs involved - and because most investors believe that, over the long term, stock prices in general will advance - I think there are relatively few investment professionals who will operate in such a constantly hedged manner. But I also believe that it is a rational way to behave and that a few professionals, who wish always to be "market neutral" in their attitude and behavior, will do so.

2. As previously stated, I see a logical risk-reducing strategy that involves shorting the futures contract. I see no corresponding investment or hedging strategy whatsoever on the long side. By definition, therefore, a very maximum of 50% of the futures transactions can be entered into with the expectancy of risk reduction and not less than 50% (the long side) must act in a risk-accentuating or gambling manner.

3. The actual balance would be enormously different than this maximum 50/50 division between risk reducers and risk accentuators. The propensity to gamble is always increased by a large prize versus a small entry fee, no matter how poor the true odds may be. That's why Las Vegas casinos advertise big jackpots and why state lotteries headline big prizes. In securities, the unintelligent are seduced by the same approach in various ways, including: (a) "penny stocks", which are "manufactured" by promoters precisely because they snare the gullible - creating dreams of enormous payoffs but with an actual group result of disaster, and (b) low margin requirements through which financial experience attributable to a large investment is achieved by committing a relatively small stake.

4. We have had many earlier experiences in our history in which the high total commitment/low down payment phenomenon has led to trouble. The most familiar, of course, is the stock market boom in the late 20s that was accompanied and accentuated by 10% margins. Saner heads subsequently decided that there was nothing pro-social about such thin-margined speculation and that, rather than aiding capital markets, in the long run it hurt them. Accordingly, margin regulations were introduced and made a permanent part of the investing scene. The ability to speculate in stock indices with 10% down payments, of course, is simply a way around the margin requirements and will be immediately perceived as such by gamblers throughout the country.

Brokers, of course, favor new trading vehicles. Their enthusiasm tends to be in direct proportion to the amount of activity they expect. And the more the activity, the greater the cost to the public and the greater the amount of money that will be left behind by them to be spread among the brokerage industry. As each contract dies, the only business involved is that the loser pays the winner. Since the casino (the futures market and its supporting cast of brokers) gets paid a toll each time one of these transactions takes place, you can be sure that it will have a great interest in providing very large numbers of losers and winners. But it must be remembered that, for the players, it is the most clear sort of a "negative sum game". Losses and gains cancel out before expenses; after expenses the net loss is substantial. In fact, unless such losses are quite substantial, the casino will

The Hon. John Dingell

Page #3

terminate operations since the players' net losses comprise the casino's sole source of revenue. This "negative sum" aspect is in direct contrast to common stock investment generally, which has been a very substantial "positive sum game" over the years simply because the underlying companies, on balance, have earned substantial sums of money that eventually benefits their owners, the stockholders.

6. In my judgment, a very high percentage - probably at least 95% and more likely much higher - of the activity generated by these contracts will be strictly gambling in nature. You will have people wagering as to the short-term movements of the stock market and able to make fairly large wagers with fairly small sums. They will be encouraged to do so by brokers who will see rapid turnover of customers' capital - the best thing that can happen to a broker in terms of his immediate income. A great deal of money will be left behind by these 95% as the casino takes its bite from each transaction.

7. In the long run, gambling-dominated activities that are identified with traditional capital markets, and that leave a very high percentage of those exposed to the activity burned, are not going to be good for capital markets. Even though people participating in such gambling activity are not investors and what they are buying really are not stocks, they still will feel that they have had a bad experience with the stock market. And after having been exposed to the worst face of capital markets, they understandably may, in the future, take a dim view of capital markets generally. Certainly that has been the experience after previous waves of speculation. You might ask if the brokerage industry is not wise enough to look after its own long-term interests. History shows them to be myopic (witness the late 1960s); they often have been happiest when behavior was at its silliest. And many brokers are far more concerned with how much they gross this month than whether their clients - or, for that matter, the securities industry - prosper in the long run.

We do not need more people gambling in non-essential instruments identified with the stock market in this country, nor brokers who encourage them to do so. What we need are investors and advisors who look at the long-term prospects for an enterprise and invest accordingly. We need the intelligent commitment of investment capital, not leveraged market wagers. The propensity to operate in the intelligent, pro-social sector of capital markets is deterred, not enhanced, by an active and exciting casino operating in somewhat the same arena, utilizing somewhat similar language and serviced by the same work force.

In addition, low-margined activity in stock-equivalents is inconsistent with expressed public policy as embodied in margin requirements. Although index futures have slight benefits to the investment professional wishing to "hedge out" the market, the net effect of high-volume futures markets in stocks indices is likely to be overwhelmingly detrimental to the security-buying public and, therefore, in the long run to capital markets generally.

Sincerely,

Warren E. Buffett

1. The Superinvestors of Graham-and-Doddsville

by Warren E. Buffett

EDITOR'S NOTE: This article is an edited transcript of a talk given at Columbia University in 1984 commemorating the fiftieth anniversary of Security Analysis, written by Benjamin Graham and David L. Dodd. This specialized volume first introduced the ideas later popularized in The Intelligent Investor. Buffett's essay offers a fascinating study of how Graham's disciples have used Graham's value investing approach to realize phenomenal success in the stock market.

Is the Graham and Dodd “look for values with a significant margin of safety relative to prices” approach to security analysis out of date? Many of the professors who write textbooks today say yes. They argue that the stock market is efficient; that is, that stock prices reflect everything that is known about a company's prospects and about the state of the economy. There are no undervalued stocks, these theorists argue, because there are smart security analysts who utilize all available information to ensure unfailingly appropriate prices. Investors who seem to beat the market year after year are just lucky. “If prices fully reflect available information, this sort of investment adeptness is ruled out,” writes one of today's textbook authors.

Well, maybe. But I want to present to you a group of investors who have, year in and year out, beaten the Standard & Poor's 500 stock index. The hypothesis that they do this by pure chance is at

least worth examining. Crucial to this examination is the fact that these winners were all well known to me and pre-identified as superior investors, the most recent identification occurring over fifteen years ago. Absent this condition—that is, if I had just recently searched among thousands of records to select a few names for you this morning—I would advise you to stop reading right here. I should add that all these records have been audited. And I should further add that I have known many of those who have invested with these managers, and the checks received by those participants over the years have matched the stated records.

Before we begin this examination, I would like you to imagine a national coin-flipping contest. Let's assume we get 225 million Americans up tomorrow morning and we ask them all to wager a dollar. They go out in the morning at sunrise, and they all call the flip of a coin. If they call correctly, they win a dollar from those who called wrong. Each day the losers drop out, and on the subsequent day the stakes build as all previous winnings are put on the line. After ten flips on ten mornings, there will be approximately 220,000 people in the United States who have correctly called ten flips in a row. They each will have won a little over \$1,000.

Now this group will probably start getting a little puffed up about this, human nature being what it is. They may try to be modest, but at cocktail parties they will occasionally admit to attractive members of the opposite sex what their technique is, and what marvelous insights they bring to the field of flipping.

Assuming that the winners are getting the appropriate rewards from the losers, in another ten days we will have 215 people who have successfully called their coin flips 20 times in a row and who, by this exercise, each have turned one dollar into a little over \$1 million. \$225 million would have been lost, \$225 million would have been won.

By then, this group will really lose their heads. They will probably write books on "How I Turned a Dollar into a Million in Twenty Days Working Thirty Seconds a Morning." Worse yet, they'll probably start jetting around the country attending seminars on efficient coin-flipping and tackling skeptical professors with, "If it can't be done, why are there 215 of us?"

But then some business school professor will probably be rude enough to bring up the fact that if 225 million orangutans

had engaged in a similar exercise, the results would be much the same—215 egotistical orangutans with 20 straight winning flips.

I would argue, however, that there *are* some important differences in the examples I am going to present. For one thing, if (a) you had taken 225 million orangutans distributed roughly as the U.S. population is; if (b) 215 winners were left after 20 days; and if (c) you found that 40 came from a particular zoo in Omaha, you would be pretty sure you were on to something. So you would probably go out and ask the zookeeper about what he's feeding them, whether they had special exercises, what books they read, and who knows what else. That is, if you found any really extraordinary concentrations of success, you might want to see if you could identify concentrations of unusual characteristics that might be causal factors.

Scientific inquiry naturally follows such a pattern. If you were trying to analyze possible causes of a rare type of cancer—with, say, 1,500 cases a year in the United States—and you found that 400 of them occurred in some little mining town in Montana, you would get very interested in the water there, or the occupation of those afflicted, or other variables. You know that it's not random chance that 400 come from a small area. You would not necessarily know the causal factors, but you would know where to search.

I submit to you that there are ways of defining an origin other than geography. In addition to geographical origins, there can be what I call an *intellectual* origin. I think you will find that a disproportionate number of successful coin-flippers in the investment world came from a very small intellectual village that could be called Graham-and-Doddsville. A concentration of winners that simply cannot be explained by chance can be traced to this particular intellectual village.

Conditions could exist that would make even that concentration unimportant. Perhaps 100 people were simply imitating the coin-flipping call of some terribly persuasive personality. When he called heads, 100 followers automatically called that coin the same way. If the leader was part of the 215 left at the end, the fact that 100 came from the same intellectual origin would mean nothing. You would simply be identifying one case as a hundred cases. Similarly, let's assume that you lived in a strongly patriarchal society

and every family in the United States conveniently consisted of ten members. Further assume that the patriarchal culture was so strong that, when the 225 million people went out the first day, every member of the family identified with the father's call. Now, at the end of the 20-day period, you would have 215 winners, and you would find that they came from only 21.5 families. Some naive types might say that this indicates an enormous hereditary factor as an explanation of successful coin-flipping. But, of course, it would have no significance at all because it would simply mean that you didn't have 215 individual winners, but rather 21.5 randomly distributed families who were winners.

In this group of successful investors that I want to consider, there has been a common intellectual patriarch, Ben Graham. But the children who left the house of this intellectual patriarch have called their "flips" in very different ways. They have gone to different places and bought and sold different stocks and companies, yet they have had a combined record that simply can't be explained by random chance. It certainly cannot be explained by the fact that they are all calling flips identically because a leader is signaling the calls to make. The patriarch has merely set forth the intellectual theory for making coin-calling decisions, but each student has decided on his own manner of applying the theory.

The common intellectual theme of the investors from Graham-and-Doddsville is this: they search for discrepancies between the *value* of a business and the *price* of small pieces of that business in the market. Essentially, they exploit those discrepancies without the efficient market theorist's concern as to whether the stocks are bought on Monday or Thursday, or whether it is January or July, etc. Incidentally, when businessmen buy businesses—which is just what our Graham & Dodd investors are doing through the medium of marketable stocks—I doubt that many are cranking into their purchase decision the day of the week or the month in which the transaction is going to occur. If it doesn't make any difference whether all of a business is being bought on a Monday or a Friday, I am baffled why academicians invest extensive time and effort to see whether it makes a difference when buying small pieces of those same businesses. Our Graham & Dodd investors, needless to say, do not discuss beta, the capital asset pricing model, or covariance in returns among securities. These are not subjects of

any interest to them. In fact, most of them would have difficulty defining those terms. The investors simply focus on two variables: price and value.

I always find it extraordinary that so many studies are made of price and volume behavior, the stuff of chartists. Can you imagine buying an entire business simply because the price of the business had been marked *up* substantially last week and the week before? Of course, the reason a lot of studies are made of these price and volume variables is that now, in the age of computers, there are almost endless data available about them. It isn't necessarily because such studies have any utility; it's simply that the data are there and academicians have worked hard to learn the mathematical skills needed to manipulate them. Once these skills are acquired, it seems sinful not to use them, even if the usage has no utility or negative utility. As a friend said, to a man with a hammer, everything looks like a nail.

I think the group that we have identified by a common intellectual home is worthy of study. Incidentally, despite all the academic studies of the influence of such variables as price, volume, seasonality, capitalization size, etc., upon stock performance, no interest has been evidenced in studying the methods of this unusual concentration of value-oriented winners.

I begin this study of results by going back to a group of four of us who worked at Graham-Newman Corporation from 1954 through 1956. There were only four—I have not selected these names from among thousands. I offered to go to work at Graham-Newman for nothing after I took Ben Graham's class, but he turned me down as overvalued. He took this value stuff very seriously! After much pestering he finally hired me. There were three partners and four of us at the "peasant" level. All four left between 1955 and 1957 when the firm was wound up, and it's possible to trace the record of three.

The first example (see Table 1, pages 549–550) is that of Walter Schloss. Walter never went to college, but took a course from Ben Graham at night at the New York Institute of Finance. Walter left Graham-Newman in 1955 and achieved the record shown here over 28 years.

Here is what "Adam Smith"—after I told him about Walter—wrote about him in *Supermoney* (1972):

He has no connections or access to useful information. Practically no one in Wall Street knows him and he is not fed any ideas. He looks up the numbers in the manuals and sends for the annual reports, and that's about it.

In introducing me to [Schloss] Warren had also, to my mind, described himself. "He never forgets that he is handling other people's money and this reinforces his normal strong aversion to loss." He has total integrity and a realistic picture of himself. Money is real to him and stocks are real—and from this flows an attraction to the "margin of safety" principle.

Walter has diversified enormously, owning well over 100 stocks currently. He knows how to identify securities that sell at considerably less than their value to a private owner. *And that's all he does.* He doesn't worry about whether it's January, he doesn't worry about whether it's Monday, he doesn't worry about whether it's an election year. He simply says, if a business is worth a dollar and I can buy it for 40 cents, something good may happen to me. And he does it over and over and over again. He owns many more stocks than I do—and is far less interested in the underlying nature of the business: I don't seem to have very much influence on Walter. That's one of his strengths; no one has much influence on him.

The second case is Tom Knapp, who also worked at Graham-Newman with me. Tom was a chemistry major at Princeton before the war; when he came back from the war, he was a beach bum. And then one day he read that Dave Dodd was giving a night course in investments at Columbia. Tom took it on a noncredit basis, and he got so interested in the subject from taking that course that he came up and enrolled at Columbia Business School, where he got the MBA degree. He took Dodd's course again, and took Ben Graham's course. Incidentally, 35 years later I called Tom to ascertain some of the facts involved here and I found him on the beach again. The only difference is that now he owns the beach!

In 1968 Tom Knapp and Ed Anderson, also a Graham disciple, along with one or two other fellows of similar persuasion, formed Tweedy, Browne Partners, and their investment results appear in Table 2. Tweedy, Browne built that record with very wide diversification. They occasionally bought control of businesses, but the record of the passive investments is equal to the record of the control investments.

Table 3 describes the third member of the group who formed Buffett Partnership in 1957. The best thing he did was to quit in 1969. Since then, in a sense, Berkshire Hathaway has been a continuation of the partnership in some respects. There is no single index I can give you that I would feel would be a fair test of investment management at Berkshire. But I think that any way you figure it, it has been satisfactory.

Table 4 shows the record of the Sequoia Fund, which is managed by a man whom I met in 1951 in Ben Graham's class, Bill Ruane. After getting out of Harvard Business School, he went to Wall Street. Then he realized that he needed to get a real business education so he came up to take Ben's course at Columbia, where we met in early 1951. Bill's record from 1951 to 1970, working with relatively small sums, was far better than average. When I wound up Buffett Partnership I asked Bill if he would set up a fund to handle all our partners, so he set up the Sequoia Fund. He set it up at a terrible time, just when I was quitting. He went right into the two-tier market and all the difficulties that made for comparative performance for value-oriented investors. I am happy to say that my partners, to an amazing degree, not only stayed with him but added money, with the happy result shown.

There's no hindsight involved here. Bill was the only person I recommended to my partners, and I said at the time that if he achieved a four-point-per-annum advantage over the Standard & Poor's, that would be solid performance. Bill has achieved well over that, working with progressively larger sums of money. That makes things much more difficult. Size is the anchor of performance. There is no question about it. It doesn't mean you can't do better than average when you get larger, but the margin shrinks. And if you ever get so you're managing two trillion dollars, and that happens to be the amount of the total equity evaluation in the economy, don't think that you'll do better than average!

I should add that in the records we've looked at so far, throughout this whole period there was practically no duplication in these portfolios. These are men who select securities based on discrepancies between price and value, but they make their selections very differently. Walter's largest holdings have been such stalwarts as Hudson Pulp & Paper and Jeddo Highland Coal and New York Trap Rock Company and all those other names that come instantly to mind to even a casual reader of the business pages. Tweedy

Browne's selections have sunk even well below that level in terms of name recognition. On the other hand, Bill has worked with big companies. The overlap among these portfolios has been very, very low. These records do not reflect one guy calling the flip and fifty people yelling out the same thing after him.

Table 5 is the record of a friend of mine who is a Harvard Law graduate, who set up a major law firm. I ran into him in about 1960 and told him that law was fine as a hobby but he could do better. He set up a partnership quite the opposite of Walter's. His portfolio was concentrated in very few securities and therefore his record was much more volatile but it was based on the same discount-from-value approach. He was willing to accept greater peaks and valleys of performance, and he happens to be a fellow whose whole psyche goes toward concentration, with the results shown. Incidentally, this record belongs to Charlie Munger, my partner for a long time in the operation of Berkshire Hathaway. When he ran his partnership, however, his portfolio holdings were almost completely different from mine and the other fellows mentioned earlier.

Table 6 is the record of a fellow who was a pal of Charlie Munger's—another non-business school type—who was a math major at USC. He went to work for IBM after graduation and was an IBM salesman for a while. After I got to Charlie, Charlie got to him. This happens to be the record of Rick Guerin. Rick, from 1965 to 1983, against a compounded gain of 316 percent for the S&P, came off with 22,200 percent, which, probably because he lacks a business school education, he regards as statistically significant.

One sidelight here: it is extraordinary to me that the idea of buying dollar bills for 40 cents takes immediately with people or it doesn't take at all. It's like an inoculation. If it doesn't grab a person right away, I find that you can talk to him for years and show him records, and it doesn't make any difference. They just don't seem able to grasp the concept, simple as it is. A fellow like Rick Guerin, who had no formal education in business, understands immediately the value approach to investing and he's applying it five minutes later. I've never seen anyone who became a gradual convert over a ten-year period to this approach. It doesn't seem to be a matter of IQ or academic training. It's instant recognition, or it is nothing.

Table 7 is the record of Stan Perlmeter. Stan was a liberal arts major at the University of Michigan who was a partner in the advertising agency of Bozell & Jacobs. We happened to be in the same building in Omaha. In 1965 he figured out I had a better business than he did, so he left advertising. Again, it took five minutes for Stan to embrace the value approach.

Perlmeter does not own what Walter Schloss owns. He does not own what Bill Ruane owns. These are records made *independently*. But every time Perlmeter buys a stock it's because he's getting more for his money than he's paying. That's the only thing he's thinking about. He's not looking at quarterly earnings projections, he's not looking at next year's earnings, he's not thinking about what day of the week it is, he doesn't care what investment research from any place says, he's not interested in price momentum, volume, or anything. He's simply asking: What is the business worth?

Table 8 and Table 9 are the records of two pension funds I've been involved in. They are not selected from dozens of pension funds with which I have had involvement; they are the only two I have influenced. In both cases I have steered them toward value-oriented managers. Very, very few pension funds are managed from a value standpoint. Table 8 is the Washington Post Company's Pension Fund. It was with a large bank some years ago, and I suggested that they would do well to select managers who had a value orientation.

As you can see, overall they have been in the top percentile ever since they made the change. The Post told the managers to keep at least 25 percent of these funds in bonds, which would not have been necessarily the choice of these managers. So I've included the bond performance simply to illustrate that this group has no particular expertise about bonds. They wouldn't have said they did. Even with this drag of 25 percent of their fund in an area that was not their game, they were in the top percentile of fund management. The Washington Post experience does not cover a terribly long period but it does represent many investment decisions by three managers who were not identified retroactively.

Table 9 is the record of the FMC Corporation fund. I don't manage a dime of it myself but I did, in 1974, influence their decision to select value-oriented managers. Prior to that time they had selected managers much the same way as most larger companies. They now

rank number one in the Becker survey of pension funds for their size over the period of time subsequent to this “conversion” to the value approach. Last year they had eight equity managers of any duration beyond a year. Seven of them had a cumulative record better than the S&P. All eight had a better record last year than the S&P. The net difference now between a median performance and the actual performance of the FMC fund over this period is \$243 million. FMC attributes this to the mindset given to them about the selection of managers. Those managers are not the managers I would necessarily select but they have the common denominator of selecting securities based on value.

So these are nine records of “coin-flippers” from Graham-and-Doddsville. I haven’t selected them with hindsight from among thousands. It’s not like I am reciting to you the names of a bunch of lottery winners—people I had never heard of before they won the lottery. I selected these men years ago based upon their framework for investment decision-making. I knew what they had been taught and additionally I had some personal knowledge of their intellect, character, and temperament. It’s very important to understand that this group has assumed far less risk than average; note their record in years when the general market was weak. While they differ greatly in style, these investors are, mentally, always *buying the business, not buying the stock*. A few of them sometimes buy whole businesses. Far more often they simply buy small pieces of businesses. Their attitude, whether buying all or a tiny piece of a business, is the same. Some of them hold portfolios with dozens of stocks; others concentrate on a handful. But all exploit the difference between the market price of a business and its intrinsic value.

I’m convinced that there is much inefficiency in the market. These Graham-and-Doddsville investors have successfully exploited gaps between price and value. When the price of a stock can be influenced by a “herd” on Wall Street with prices set at the margin by the most emotional person, or the greediest person, or the most depressed person, it is hard to argue that the market always prices rationally. In fact, market prices are frequently nonsensical.

I would like to say one important thing about risk and reward. Sometimes risk and reward are correlated in a positive fashion. If someone were to say to me, “I have here a six-shooter and I have

slipped one cartridge into it. Why don't you just spin it and pull it once? If you survive, I will give you \$1 million." I would decline—perhaps stating that \$1 million is not enough. Then he might offer me \$5 million to pull the trigger twice—now that would be a positive correlation between risk and reward!

The exact opposite is true with value investing. If you buy a dollar bill for 60 cents, it's riskier than if you buy a dollar bill for 40 cents, but the expectation of reward is greater in the latter case. The greater the potential for reward in the value portfolio, the less risk there is.

One quick example: The Washington Post Company in 1973 was selling for \$80 million in the market. At the time, that day, you could have sold the assets to any one of ten buyers for not less than \$400 million, probably appreciably more. The company owned the *Post*, *Newsweek*, plus several television stations in major markets. Those same properties are worth \$2 billion now, so the person who would have paid \$400 million would not have been crazy.

Now, if the stock had declined even further to a price that made the valuation \$40 million instead of \$80 million, its beta would have been greater. And to people who think beta measures risk, the cheaper price would have made it look riskier. This is truly Alice in Wonderland. I have never been able to figure out why it's riskier to buy \$400 million worth of properties for \$40 million than \$80 million. And, as a matter of fact, if you buy a group of such securities and you know anything at all about business valuation, there is essentially no risk in buying \$400 million for \$80 million, particularly if you do it by buying ten \$40 million piles for \$8 million each. Since you don't have your hands on the \$400 million, you want to be sure you are in with honest and reasonably competent people, but that's not a difficult job.

You also have to have the knowledge to enable you to make a very general estimate about the value of the underlying businesses. But you do not cut it close. That is what Ben Graham meant by having a margin of safety. You don't try and buy businesses worth \$83 million for \$80 million. You leave yourself an enormous margin. When you build a bridge, you insist it can carry 30,000 pounds, but you only drive 10,000-pound trucks across it. And that same principle works in investing.

In conclusion, some of the more commercially minded among

you may wonder why I am writing this article. Adding many converts to the value approach will perforce narrow the spreads between price and value. I can only tell you that the secret has been out for 50 years, ever since Ben Graham and Dave Dodd wrote *Security Analysis*, yet I have seen no trend toward value investing in the 35 years that I've practiced it. There seems to be some perverse human characteristic that likes to make easy things difficult. The academic world, if anything, has actually backed away from the teaching of value investing over the last 30 years. It's likely to continue that way. Ships will sail around the world but the Flat Earth Society will flourish. There will continue to be wide discrepancies between price and value in the marketplace, and those who read their Graham & Dodd will continue to prosper.

Tables 1–9 follow:

TABLE 1 Walter J. Schloss

Year	S&P Overall Gain, Including Dividends (%)	WJS Ltd Partners Overall Gain per year (%)	WJS Partnership Overall Gain per year (%)		
1956	7.5	5.1	6.8	Standard & Poor's 28¼ year compounded gain	887.2%
1957	-10.5	-4.7	-4.7		
1958	42.1	42.1	54.6	WJS Limited Partners 28¼ year compounded gain	6,678.8%
1959	12.7	17.5	23.3		
1960	-1.6	7.0	9.3	WJS Partnership 28¼ year compounded gain	23,104.7%
1961	26.4	21.6	28.8		
1962	-10.2	8.3	11.1	Standard & Poor's 28¼ year annual compounded rate	8.4%
1963	23.3	15.1	20.1		
1964	16.5	17.1	22.8	WJS Limited Partners 28¼ year annual compounded rate	16.1%
1965	13.1	26.8	35.7		
1966	-10.4	0.5	0.7	WJS Partnership 28¼ year annual compounded rate	21.3%
1967	26.8	25.8	34.4		
1968	10.6	26.6	35.5		

During the history of the Partnership it has owned over 800 issues and, at most times, has had at least 100 positions. Present assets under management approximate \$45 million. The difference between returns of the partnership and returns of the limited partners is due to allocations to the general partner for management.

* Annualized

Rank indicates the fund's performance against the A.C. Becker universe.

Rank is stated as a percentile: 1 = best performance, 100 = worst.

Three Lectures by Warren Buffett to Notre Dame Faculty, MBA Students and Undergraduate Students

Spring, 1991

Lightly edited by Whitney Tilson, WTilson@T2PartnersLLC.com

Highlights

[The transcript of Buffett's lectures is 39 pages. For those of you who don't have the time to read the entire transcript, we've pulled out some of the highlights – the most interesting things Buffett said and/or the things that we've never heard him say anywhere else.]

Keys to Investment Success

I found some strange things when I was 20 years old. I went through Moody's Bank and Finance Manual, about 1,000 pages. I went through it twice. The first time I went through, I saw a company called Western Insurance Security Company in Fort Scott, Kansas. They owned 92%, at that time, of the Western Casualty and Surety Company. Perfectly sound company. I knew people that represented them in Omaha. Earnings per share \$20, stock price \$16. (garbled) ... much more than that. I ran ads in the Fort Scott, Kansas paper to try and buy that stock – it had only 300 or 400 shareholders. It was selling at one times earnings, it had a first class [management team]...

[Tape ends here]

... Incidentally, I would say that almost everybody I know in Wall Street has had as many good ideas as I have, they just had a lot of [bad] ideas too. And I'm serious about that. I mean when I bought Western Insurance Security selling at \$16 and earning \$20 per share, I put half my net worth into it. I checked it out first – I went down to the insurance commission and got out the convention statements, I read Best's, and I did a lot of things first. But, I mean, my dad wasn't in it, I'd only had one insurance class at Columbia – but it was not beyond my capabilities to do that, and it isn't beyond your capabilities.

Now if I had some rare insight about software, or something like that – I would say that, maybe, other people couldn't do that – or biotechnology, or something. And I'm not saying that every insight that I have is an insight that somebody else could have, but there were all kinds of people that could have understood American Express Company as well as I understood it in '62. They may have been...they may have had a different temperament than I did, so that they were paralyzed by fear, or that they wanted the crowd to be with them, or something like that, but I didn't know anything about credit cards that they didn't know, or about travelers checks. Those are not hard products to understand. But what I did have was an intense interest and I was willing, when I saw something I wanted to do, to do it. And if I couldn't see something to do, to not do anything. By far, the most important quality is not how much IQ you've got. IQ is not the scarce factor. You need a reasonable amount of intelligence, but the *temperament* is 90% of it.

That's why Graham is so important. Graham's book [[The Intelligent Investor](#)] talks about the qualities of temperament you have to bring to the game, and that is the game.

Require a Statement Before Being Allowed to Buy a Stock

You shouldn't buy a stock, in my view, for any other reason than the fact that you think it's selling for less than it's worth, considering all the factors about the business.

I used to tell the stock exchange people that before a person bought 100 shares of General Motors they should have to write out on a [piece of paper:] "I'm buying 100 shares of General Motors at X" and multiply that by the number of shares "and therefore General Motors is worth more than \$32 billion" or whatever it multiplies out to, "because ... [fill in the reasons]" And if they couldn't answer that question, their order wouldn't be accepted.

That test *should be applied*. I should never buy anything unless I can fill out that piece of paper. I may be wrong, but I would know the answer to that. "I'm buying Coca Cola right now, 660 million shares of stock, a little under \$50. The whole company costs me about \$32 billion dollars." Before you buy 100 shares of stock at \$48 you ought to be able to answer "I'm paying \$32 billion today for the Coca Cola Company because..." [Banging the podium for emphasis.] If you can't answer that question, you shouldn't buy it. If you *can* answer that question, and you do it a few times, you'll make a lot of money.

Tests of a Good Business

A couple of fast tests about how good a business is. First question is "how long does the management have to think before they decide to raise prices?" You're looking at marvelous business when you look in the mirror and say "mirror, mirror on the wall, how much should I charge for Coke this fall?" [And the mirror replies, "More."] That's a great business. When you say, like we used to in the textile business, when you get down on your knees, call in all the priests, rabbis, and everyone else, [and say] "just another half cent a yard." Then you get up and they say "We won't pay it." It's just night and day. I mean, if you walk into a drugstore, and you say "I'd like a Hershey bar" and the man says "I don't have any Hershey bars, but I've got this unmarked chocolate bar, and it's a nickel cheaper than a Hershey bar" you just go across the street and buy a Hershey bar. *That* is a good business.

The ability to raise prices – the ability to differentiate yourself in a real way, and a real way means you can charge a different price – *that* makes a great business.

I'll try this on the students later: What's the highest price of a daily newspaper in the United States? [Pause] [This is what he said to the students later: Most of you are familiar with it. The highest priced daily newspaper in the United States, with any circulation at all, is the *Daily Racing Form*. It sells about 150,000 copies a day, and it has for about 50 years, and it's either \$2.00 or \$2.25 (they keep raising prices) and it's essential. If you're heading to the racetrack and you've got a choice between betting on your wife's birthday, and Joe's Little Green Sheet, and the *Daily Racing Form*, if you're a serious racing handicapper, you want *The Form*. You can charge \$2.00 for *The Form*, you can charge \$1.50, you can charge \$2.50 and people are going to buy it. It's like selling needles to addicts, basically. It's an essential business. It will be an essential business five or 10 years from now. You have to decide whether horse racing will be around five or 10 years from now, and you have to decide whether there's any way people will get their information about past performances of different horses from different sources. But

you've only got about two questions to answer, and if you answer them, you know the business will make a lot of money. *The Form* has huge profit margins, incidentally. Wider than any other newspaper. They charge what they want to basically. It's an easy to understand business – so easy to understand.]

There are products like that, and there are products like sheet steel. And they're night and day.

Agony vs. Ecstasy Businesses: Example 1

It does make a difference what kind of a business you get associated with. For that reason I've set forth in this little handout Company A and Company E. I'm not going to tell you for the moment what these companies are. I'm going to tell you one thing about the two companies. One of the companies, to the point of where this cuts off, lost its investors more money than virtually any business in the world. The other company made its owner more money than virtually any company in the world. So one of these two companies, Company A and Company E, has made one of its owners one of the five wealthiest people in the world, while the other company made its owners appreciably poorer, probably more so than any other company to that point in time.

Now I'll tell you a little bit about these companies (we're leading up to the question of whether the business makes a difference). Company A had thousands of MBAs working for it. Company E had none. I wanted to get your attention. Company A had all kinds of employee benefit programs, stock options, pensions, the works. Company E never had stock options. Company A had thousands of patents – they probably held more patents than just about any company in the United States. Company E never invented anything. Company A's product improved dramatically in this period, Company E's product just sat.

So far, based on what I've told you, does anybody have any idea of which company was the great success, and why?

If you get to buy one of these two companies, and this is all you know, and you get to ask me one question to decide on which one to buy. If you ask me the right question, you will probably make the right decision about the company's stock, and one will make you enormously wealthy.

[Audience asks questions]

Both companies make products used every day. They started as necessities, highly useful, nothing esoteric about either one, although company A does have all these patents. There's more technology involved in company A.

[How many companies compete with either one?]

Good question, very good question. In effect, neither company had any competition. And that might differentiate in some cases.

Well, I'll tell you a little more about it. Company A is known as company A because it was in agony, and Company E, as Company E, because it was in ecstasy. Company A is American Telephone and Telegraph. I've omitted eight zeros on the left hand side, and the American

Telephone and Telegraph Company, at the end of 1979, was selling for \$10 billion less than the shareholders had either put in or left in the business. In other words, if shareholder's equity was "X" the market value was X minus \$10 billion. So the money that shareholders had put in, or left in, the business had shrunk by \$10 billion in terms of market value.

Company E, the excellent company, I left off only six zeros. And that happens to be a company called Thompson Newspapers. Thomson Newspapers, which most of you have probably never heard of, actually owns about 5% of the newspapers in the United States. But they're all small ones. And, as I said, it has no MBAs, no stock options – still doesn't – and it made its owner, Lord Thompson. He wasn't Lord Thompson when he started – he started with 1,500 bucks in North Bay, Ontario buying a little radio station but, when he got to be one of the five richest men, he became Lord Thompson.

...The telephone company, with the patents, the MBAs, the stock options, and everything else, had one problem, and that problem is illustrated by those figures on that lower left hand column. And those figures show the plant investment in the telephone business. That's \$47 billion, starting off with, growing to \$99 billion over an eight or nine year period. More and more and more money had to be tossed in, in order to make these increased earnings, going from \$2.2 billion to \$5.6 billion.

So, they got more money, but you can get more money from a savings account if you keep adding money to it every year. The progress in earnings that the telephone company made was only achievable because they kept on shoving more money into the savings account and the truth was, under the conditions of the '70s, they were not getting paid commensurate with the amount of money that they had to shove into the pot, whereas Lord Thompson, once he bought the paper in Council Bluffs, never put another dime in. They just mailed money every year. And as they got more money, he bought more newspapers. And, in fact, he said it was going to say on his tombstone that he bought newspapers in order to make more money in order to buy more newspapers [and so on].

The idea was that, essentially, he raised prices and raised earnings there every year without having to put more capital into the business.

One is a marvelous, absolutely sensational business, the other one is a terrible business. If you have a choice between going to work for a wonderful business that is not capital intensive, and one that is capital intensive, I suggest that you look at the one that is not capital intensive. I took 25 years to figure that out, incidentally.

Agony vs. Ecstasy Businesses: Example 2 (two Berkshire Hathaway companies)

On the next page, I've got a couple of other businesses here. Company E is the ecstasy on the left. You can see earnings went up nicely: they went from \$4 million to \$27 million. They only employed assets of \$17 million, so that is really a wonderful business. On \$17 million they earned \$27 million, 150% on invested capital. That is a good business. The one on the right, Company A, the agony, had \$11 or \$12 million tied up, and some years made a few bucks, and in some years lost a few bucks.

Now, here again we might ask ourselves, “What differentiates these companies?” Does anybody have any idea why company E might have done so much better than Company A? Usually somebody says at this point “maybe company E was better managed than company A.” There’s only one problem with that conclusion and that is, Company E and Company A had the same manager – me!

The company E is our candy business, See’s Candies out in California. I don’t know how many of you come from the west, but it dominates the boxed chocolate business out there and the earnings went from \$4 million to \$27 million, and in the year that just ended they were about \$38 million. In other words, they mail us all the money they make every year and they keep growing, and making more money, and everybody’s very happy.

Company A was our textile business. That’s a business that took me 22 years to figure out it wasn’t very good. Well, in the textile business, we made over half of the men’s suit linings in the United States. If you wore a men’s suit, chances were that it had a Hathaway lining. And we made them during World War II, when customers couldn’t get their linings from other people. Sears Roebuck voted us “Supplier of the Year.” They were wild about us. The thing was, they wouldn’t give us another half a cent a yard because nobody had ever gone into a men’s clothing store and asked for a pin striped suit with a Hathaway lining. You just don’t see that.

As a practical matter, if some guy’s going to offer them a lining for 79 cents, [it makes no difference] who’s going to take them fishing, and supplied them during World War II, and was personal friends with the Chairman of Sears. Because we charged 79½ cents a yard, it was “no dice.”

See’s Candies, on the other hand, made something that people had an emotional attraction to, and a physical attraction you might say. We’re almost to Valentine’s Day, so can you imagine going to your wife or sweetheart, handing her a box of candy and saying “Honey, I took the low bid.”

Essentially, every year for 19 years I’ve raised the price of candy on December 26. And 19 years goes by and everyone keeps buying candy. Every *ten* years I tried to raise the price of linings a fraction of a cent, and they’d throw the linings back at me. Our linings were just as good as our candies. It was much harder to run the linings factory than it was to run the candy company. The problem is, just because a business is lousy doesn’t mean it isn’t difficult.

In the end, I like to think anyway that if Alfred P. Sloan [the legendary CEO of General Motors during its heyday] came back and tried to run the lining business, it wouldn’t make as much money as a good business. The product was undifferentiated. The candy product is differentiated. (Garbled story of Hershey Bar and Coke versus unbranded but modestly cheaper products).

You really want something where, if they don’t have it in stock, you want to go across the street to get it. Nobody cares what kind of steel goes into a car. Have you ever gone into a car dealership to buy a Cadillac and said “I’d like a Cadillac with steel that came from the South Works of US Steel.” It just doesn’t work that way, so that when General Motors buys they call in

all the steel companies and say “here’s the best price we’ve got so far, and you’ve got to decide if you want to beat their price, or have your plant sit idle.”

The Importance of Management: Cap Cities vs. CBS

I put one business in here, CBS versus Cap Cities in 1957, when my friend Tom Murphy took over Cap Cities. They had a little bankrupt UHF station in Albany. They ran it out of a home for retired nuns. And it was very appropriate because they had to pray every day. At that time CBS was the largest advertising medium in the world: \$385 million in revenues whereas Cap Cities had \$900,000 in revenues. Cap Cities made \$37,000 a year and they paid my friend Murph \$12,000 a year. CBS made \$48 million pretax. Cap Cities was selling for \$5 million in the market and priced on the come, while CBS was selling for \$500 million.

Now, if you look at the two companies, Cap Cities has a market value of about \$7 billion and CBS has a market value of about \$2 billion. They were both in the same business, broadcasting. Neither one had, certainly Cap Cities didn’t have, any patents. Cap Cities didn’t have anything that CBS didn’t have. And somehow CBS took a wonderful business that was worth \$500 million, and over about 30 years they managed a little increase – peanuts – while my friend Murphy, with exactly the same business, with one little tiny UHF station in Albany, (bear in mind that CBS had the largest stations in New York City and Chicago) and my friend Murph just killed them. And you say “how can that happen?” And that’s what you ought to study in business school. You ought to study Tom Murphy at Cap Cities. And you also ought to study Bill Paley [who was the CEO] at CBS.

We have a saying around Berkshire that “all we ever want to know is where we’re going to die, so we’ll never go there.” And CBS is what you don’t want. It’s as important not to do what CBS did, and it is important to do what Cap Cities did. Cap Cities did a lot of things right, but if CBS had done the same things right, Cap Cities would have never come close.

They had all the IQ at CBS that they had at Cap Cities. They had 50 times as many people, and they were all coming to work early and going home late. They had all kinds of strategic planners, they had management consultants. They had more than I can say. Yet they *lost*. They lost to a guy that started out with a leaky rowboat, at the same time the other guy left in the QE II. By the time they got into New York, the guy in the rowboat brought in more cargo than the QE II did. There’s a real story in that. And you can understand broadcasting, so it’s really worth studying what two people in the same field did, and why one succeeded so much and one failed.

I couldn’t resist kicking in the last page: the only public offering Cap Cities ever made, back in 1957 which raised, as you can see, \$300,000. And this was when they were going to buy the station in Raleigh/Durham. The only public offering of stock the company’s every made (aside: they sold us a block of stock when they bought ABC). And if you look very carefully you’ll see that the underwriting commission – they took two firms to get this sold – the total underwriting commission was \$6,500 bucks.

The Perils of the “Mindless Imitation of One’s Peers”

The last thing I want to show you, before we get onto your questions, is an ad that was run June 16, 1969, for 1,000,000 shares of American Motors. This is a reproduction from the *Wall Street*

Journal of that day. Now does anybody notice anything unusual about that ad?

[Guesses from audience.]

Everybody in that ad has disappeared. There are 37 investment bankers that sold that issue, plus American Motors, and they are *all* gone. Maybe that's why they call them tombstone ads. Now the average business of the New York Stock exchange in 1969 was 11 million shares. Average volume now is *fifteen* times as large. Now here's an industry whose volume has grown 15 to 1 in 20 years. Marvelous growth in the financial world. And here are 37 out of 37, and those are some of the biggest names on Wall Street, and some of them had been around the longest, and 37 out of 37 have disappeared. And that's why I say you ought to think about [the long-term durability of a business?] because these people obviously didn't.

These were run by people with high IQs, by people that worked ungodly hard. They were people that had an intense interest in success. They worked long hours. They *all* thought they were going to be leaders on Wall Street at some point, and they all went around, incidentally, giving advice to other companies about how to run their business. That's sort of interesting.

You go to Wall Street today, and there's some company the guy hadn't heard of two weeks before and he's trying to sell you. He will lay out this computer run of the next 10 years, yet he doesn't have the faintest idea of what his own business is going to earn next week!

Here are a group of 37. And the question is, how can you get a result like that? That is not a result that you get by chance. How can people who are bright, who work hard, who have their own money in the business – these are not a bunch of absentee owners – how can they get such a bad result? And I suggest that's a good thing to think about before you get a job and go out into the world.

I would say that if you had to pick one thing that did it more than anything else, it's the mindless imitation of one's peers that produced this result. Whatever the other guy did, the other 36 were like a bunch of lemmings in terms of following. That's what's gotten all the big banks in trouble for the past 15 years. Every time somebody big does something dumb, other people can hardly wait to copy it. If you do nothing else when you get out of here, do things *only* when they make sense to you. You ought to be able to write "I am going to work for General Motors because ... "I am buying 100 shares of Coca Coals stock because..." And if you can't write an intelligent answer to those questions, don't do it.

I proposed this to the stock exchange some years ago: that everybody be able to write out "I am buying 100 shares of Coca Cola Company, market value \$32 billion, because" and they wouldn't take your order until you filled that thing out.

I find this very useful when I write my annual report. I learn while I think when I write it out. Some of the things I think I think, I find don't make any sense when I start trying to write them down and explain them to people. You ought to be able to explain why you're taking the job you're taking, why you're making the investment you're making, or whatever it may be. And if it can't stand applying pencil to paper, you'd better think it through some more.

People in that ad did a lot of things that could not have stood that test. Some *major* bankers in the United States did a lot of things that could not meet that test. One of the bankers in the United States, who's in plenty of trouble now, bragged a few years ago he never made a loan. And, from the way things are starting to look, he's never going to collect on one either.

You should not be running one the major banks in the United States without having made loans. I mean, you learn about human nature, if nothing else, when you make loans.

The Perils of Leverage

The question is whether LBOs and junk bonds and so on have hurt the country in some fundamental way in terms of its competitiveness vis-à-vis the world. I wouldn't go that far, but I think on balance it's been a huge minus on the financial scene. Extreme leverage has been, generally speaking, a net minus. The analogy has been made (and there's just enough truth to it to get you in trouble) that in buying some company with enormous amounts of debt, that it's somewhat like driving a car down the road and placing a dagger on the steering wheel pointed at your heart. If you do that, you will be a better driver – that I can assure you. You will drive with unusual care. You also, someday, will hit a small pothole, or a piece of ice, and you will end up gasping. You will have fewer accidents, but when they come along, they'll be fatal. Essentially, that's what some of corporate America did in the last 10 years. And it was motivated by huge fees. And it was motivated by greed.

The most extreme case I saw was a television station. About three years ago, a television station in Tampa sold for an amount where, when they had to borrow the money, the interest amounted to more than the total sales of the station. If everybody donated their labor, if they donated their programming, if they donated their utilities, they still wouldn't have enough to pay the interest. They went crazy. And you can buy those bonds at 15 cents on the dollar. Charlie Keating's enterprise [Lincoln Savings and Loan Association in California, which became the nation's largest thrift failure] had a bunch of them too. There's a lot of crazy stuff that went on in the last five or six years. The fees on that deal, they paid \$365 million for the station, they borrowed \$385 million and you can guess where the extra money went. It went into the pockets of the people who put the deal together.

Donald Trump and the Perils of Leverage

Where did Donald Trump go wrong? The big problem with Donald Trump was he never went right. He basically overpaid for properties, but he got people to lend him the money. He was terrific at borrowing money. If you look at his assets, and what he paid for them, and what he borrowed to get them, there was never any real equity there. He owes, perhaps, \$3.5 billion now, and, if you had to pick a figure as to the value of the assets, it might be more like \$2.5 billion. He's a billion in the hole, which is a lot better than being \$100 in the hole because if you're \$100 in the hole, they come and take the TV set. If you're a billion in the hole, they say "hang in there Donald."

It's interesting why smart people go astray. That's one of the most interesting things in business. I've seen all sorts of people with terrific IQs that end up flopping in Wall Street or business because they beat themselves. They have 500 horsepower engines, and get 50 horsepower out of

them. Or, worse than that, they have their foot on the brake and the accelerator at the same time. They really manage to screw themselves up.

... I would suggest that the big successes I've met had a fair amount of Ben Franklin in them. And Donald Trump did not.

Life Tends to Snap You at Your Weakest Link

One of the things you will find, which is interesting and people don't think of it enough, with most businesses and with most individuals, life tends to snap you at your weakest link. So it isn't the strongest link you're looking for among the individuals in the room. It isn't even the average strength of the chain. It's the weakest link that causes the problem.

It may be alcohol, it may be gambling, it may be a lot of things, it may be nothing, which is terrific. But it is a real weakest link problem.

When I look at our managers, I'm not trying to look at the guy who wakes up at night and says "E = MC²" or something. I am looking for people that function very, very well. And that means not having any weak links. The two biggest weak links in my experience: I've seen more people fail because of liquor and leverage – leverage being borrowed money. Donald Trump failed because of leverage. He simply got infatuated with how much money he could borrow, and he did not give enough thought to how much money he could pay back.

Keys to Avoiding Trouble and Leading a Happy Life

You really don't need leverage in this world much. If you're smart, you're going to make a lot of money without borrowing. I've never borrowed a significant amount of money in my life. Never. Never will. I've got no interest in it. The other reason is I never thought I would be way happier when I had 2X instead of X. You ought to have a good time all the time as you go along. If you say "I'm taking this job – I don't really like this job but in three years it will lead to this," forget it. Find one you like right now.

Full Transcripts

Lecture to Faculty

Thank you. When you asked me what I did, in this year's annual report I tried to describe what I do...

[Told Beemer the Clown story; excerpt from 1990 Berkshire Hathaway [annual letter](#):

Much of the extra value that exists in our businesses has been created by the managers now running them. Charlie and I feel free to brag about this group because we had nothing to do with developing the skills they possess: These superstars just came that way. Our job is merely to identify talented managers and provide an environment in which they can do their stuff. Having done it, they send their cash to headquarters and we face our only other task: the intelligent deployment of these funds.

My own role in operations may best be illustrated by a small tale concerning my granddaughter, Emily, and her fourth birthday party last fall. Attending were other children, adoring relatives, and Beemer the Clown, a local entertainer who includes magic tricks in his act.

Beginning these, Beemer asked Emily to help him by waving a "magic wand" over "the box of wonders." Green handkerchiefs went into the box, Emily waved the wand, and Beemer removed blue ones. Loose handkerchiefs went in and, upon a magisterial wave by Emily, emerged knotted. After four such transformations, each more amazing than its predecessor, Emily was unable to contain herself. Her face aglow, she exulted: "Gee, I'm really good at this."

And that sums up my contribution to the performance of Berkshire's business magicians - the Blumkins, the Friedman family, Mike Goldberg, the Heldmans, Chuck Huggins, Stan Lipsey and Ralph Schey. They deserve your applause.]

We've never had a meeting of our managers. The fellow that runs the candy company we bought 19 years ago [See's Candies], last year came to Omaha because he and his wife wanted to see what the annual meeting was like, but he'd never come to Omaha [before that]. We've never had a meeting with his board. We moved the company's headquarters from Los Angeles to San Francisco because his wife liked living in San Francisco better than Los Angeles. We adapt our operations to the people that run our businesses.

We've got a uniform company in Cincinnati, Fechheimers. Does about \$100 million. Bought it about five years ago. A fellow read the annual report where I list what I'm looking for. I run an ad in the annual report (I believe in advertising) and this fellow walked in and said "I fit those parameters, and the business does" and we made a deal with him. I've never visited Cincinnati. I've not seen that plant. It may be a [hoax] - for all I know, he makes up these little reports every five (garbled). But he sends me cash, and I like that.

So it's a very peculiar operation. I bought a business eight years ago from an 89-year-old woman who started with \$500, never put in another dime, and it was making about \$12 million before taxes (about \$18 million now). She doesn't know what accruals are, she doesn't know any of that sort of thing. She got mad at her grandsons, who work at the company, a few years ago, so she quit and went into competition with us. This taught me that the next time I buy a business from an 89-year-old woman, I'm getting a non-compete agreement. This woman now runs another successful business.

She's a marvelous woman. She walked out of Russia. She landed in Seattle with a tag around her neck. She couldn't speak a word of English. Fort Dodge, Iowa was where her relatives were. She got to Fort Dodge about 1920 or 1919, and they didn't have a penny. She brought over seven siblings, as well as her mother and father, and that took her eight or 10 years, sending \$50 bucks at a time. She made it selling used clothing. She started this company in 1937 with \$500. She was boycotted by most of the suppliers, the main carpet companies in town. They took her into court on violation of fair trade laws. When she got before the judge, Judge Chase, she said "Judge, I paid \$3 a yard for this. Brandeis (a carpet store) paid \$3 too. They sell it for \$6.99. I sell it for \$3.99. Tell me how much you want me to rob people. If you tell me to rob them \$1 a yard, I'll charge them \$4.99." The newspaper picks up all this and the judge comes in and buys \$1,400 worth of carpet. She beat them in court four times and every time she killed them.

This company is now the largest home furnishings store, by a factor of 2 to 1, over any home furnishings store in the United States. It does \$160 million from one location. That one store makes about \$18 million pretax. It has a 500,000 square foot warehouse (garbled).

That woman, who got an honorary degree from NYU business school about five or six years ago (garbled). You cannot beat her record. If you tell her this room is 38 by 16, she will tell you how many square yards it is, just like that. And she's 97. She'll tell you how many yards it is at \$5.99, the extension, and she'll have the sales tax, and she'll knock off something if you're a nice fresh face. And that's it. She can do it all as fast as I've said that. She sold me the business in 30 seconds. She talked to me and told me how much she'd wanted. She'd never had an audit. I didn't need an audit. Her word was better than the Bank of England.

We make all our deals that way. Our total legal and accounting fees on that deal, which was a \$60 million deal, we had to file a 10Q with the SEC, we had to file a Hart-Scott-Rodino filing, our total legal and accounting fee came to \$1,400 bucks. All on one page. There's a mark where her name is. It says "Mrs. B on behalf of herself and her children." She only owned 20% of the business. She made her mark, and the deal was cut.

All our deals are done like that. We've made all our deals, essentially, on the first contact. We never get warranties, we never get anything.

These people are rich, and we have to figure out if they're the kind of people to keep working after they've sold out. We have to decide if they're working because they love the business, or because they love money. And, if they love money, they're not of any use to us because I can't give them enough money after they've got all the money [from selling us] their business.

They've got to love the business. I would say that if we do anything very well at Berkshire, it's spotting the kind of people that, after they are very rich, will work even harder. We get no budgets from them. We have one board of directors meeting a year, which follows the shareholders meeting. No one has to come in. All they have to do is run the businesses. And we've got a bunch of those now.

They mail me the money – that's the second part of their job. And it's my job to allocate capital. They can do whatever makes sense in the candy business, or the newspaper business, but they don't have to go out and do a bunch of foolish things. We like businesses that generate cash. Sometimes we have something to do with it, sometimes we don't. We prefer to buy businesses with it but if we can't buy businesses with it, we buy pieces of businesses called stocks.

Our biggest holdings: we own 7% of the Coca Cola Company, worth about \$2 billion. Your Chairman here [referring to the President of Coca Cola, Don Keough, who was also Chairman of Notre Dame's board] used to live across the street from me in Omaha 30 years ago when he was a salesman for Butternut Coffee. He had six kids, making \$200 bucks a week, and starving to death. He was telling at lunch how he went into his boss one day, and told him about the six kids, about the parochial school, paying him \$200 bucks a week and "it just ain't easy pal", and while he was doing this his boss, Paul Gallagher [the owner of Butternut Coffee], reached into his desk and pulled out a scissors and starting cutting strands off his fraying shirt. He walked away. Fortunately, things have improved some.

We have 7% of Coke. There are 660 million eight ounce servings of Coca Cola products being served around the world today, so in effect, we've got a 45 million soft drink business with our 7%. We think of businesses that way. I say to myself "just increase the price a penny and that's another \$450,000 a day for Berkshire." I mean, it's a nice sort of thing. When I go to bed at night I figure that by the time I wake up 200 million Cokes will have been consumed. We've got some Gillette too, and every night I think about two billion plus men's hair growing and four billion women's legs with hair. It goes all night when I sleep.

So we buy businesses I can understand, whether all of them or small parts of them. We never buy anything that I don't think I can understand. I may be wrong about whether I understand it or not, but we've never owned a share of a technology company. There's all kinds of businesses I don't understand. I don't worry about that. Why should I (garbled). You mentioned Cities Service Preferred, I didn't understand that very well when I bought it. Ever since I met Ben Graham, I was 19, I read his book when I was 18, it made nothing but sense to me. Buy pieces of businesses you can understand when they're offered to you for quite a bit less than they're worth. That's all there is to it. That's what we try to do with 100% of the business, 7% of the business, or whatever. My partner Charlie Munger and I have been together for about 15 years, and that's all we do. And we'll never do anything else.

Mrs. B is that way. I couldn't have given her \$200 million worth of Berkshire Hathaway stock when I bought the business because she doesn't understand stock. She understands cash. She understands furniture. She understands real estate. She doesn't understand stocks, so she doesn't have anything to do with them. If you deal with Mrs. B in what I would call her circle of

competence... She is going to buy 5,000 end tables this afternoon (if the price is right). She is going to buy 20 different carpets in odd lots, and everything else like that [snaps fingers] because she understands carpet. She wouldn't buy 100 shares of General Motors if it was at 50 cents a share.

I would say that the most important thing in business, and investments, which I regard as the same thing, from our standpoint, is being able to accurately define your circle of competence. It isn't a question of having the biggest circle of competence. I've got friends who are competent in a whole lot bigger area than I am, but they stray outside of it.

In that book [Father, Son & Co.](#) [subtitle: My Life at IBM and Beyond] you may have read, that Tom Watson Junior recently wrote, he quoted his father as saying "I'm no genius. I'm smart in spots but I stay around those spots." And that's all there is to it in investments – and business. I always tell the students in business school they'd be better off when they got out of business school to have a punch card with 20 punches on it. And every time they made an investment decision they used up one of those punches, because they aren't going to get 20 great ideas in their lifetime. They're going to get five, or three, or seven, and you can get rich off five, or three, or seven. But what you can't get rich doing is trying to get one every day. The very fact that you have, in effect, an unlimited punch card, because that's the way the system works, you can change your mind every hour or every minute in this business, and it's kind of cheap and easy to do because we have markets with a lot of liquidity – you can't do that if you own farms or [real estate] – and that very availability, that huge liquidity which people prize so much is, for most people, a curse, because it tends to make them want to do more things than they can intelligently do.

If we can do one intelligent thing a year we are ecstatic. You can negotiate us down to one every two or three years without working very hard. That's all you need. You need very few good ideas in your lifetime. You have to be willing to have the discipline to say, "I'm not going to do something I don't understand." Why should I do something I don't understand? That's why I find it an advantage to be in Omaha instead of New York. I worked in New York for a few years, and people were coming up to me on the corner and whispering in my ear all the time. I was getting excited all the time. I was a wonderful customer for the brokers.

Let's talk about what you're interested in.

[Comment from audience]

That's a problem. It helps to have the efficient market out there. It's very nice to have people out there saying, "none of this does any good." It's a real advantage to have. I don't think it's as strong now, but you really had the revealed truths, for a decade or so, saying it didn't do any good to think. Investments presumably means businesses too. And once you say investments are all priced efficiently, you presumably have to go on and say businesses are priced efficiently, and you're just throwing darts all the time. If this group were a bunch of chess players, or a bunch of bridge players, and they were all convinced that it did not pay to think about what to do, you'd have an enormous advantage. We've had tens of thousands of students in business schools taught that it's [a waste of time to think].

You mentioned the five-sigma event; actually it was Bill Sharpe out at Stanford many years ago. My friend Charlie says that “as the record gets longer it’s easier to add a sigma than it is to reevaluate the theory.” Which is sort of true. I think it was Ken Galbraith that said “Economists are most economical about ideas. They make the ones they learn in school last a lifetime.”

[Tape flipped here]

The market generally is pretty efficient. You take the 30 stocks in the Dow and a bunch of very smart minds all looking at them and having the same information and most of the time, not all of the time, they’ll be priced efficiently. So what? You only have to be right a few times. Sometimes it’s very strange things. Sometimes it’s panic (garbled).

In ‘74 you could have bought the Washington Post when the whole company was valued at \$80 million. Now at that time the company was debt free, it owned the *Washington Post* newspaper, it owned *Newsweek*, it owned the CBS stations in Washington D.C. and Jacksonville, Florida, the ABC station in Miami, the CBS station in Hartford/New Haven, a half interest in 800,000 acres of timberland in Canada, plus a 200,000-ton-a-year mill up there, a third of the *International Herald Tribune*, and probably some other things I forgot. If you asked any one of thousands of investment analysts or media specialists about how much those properties were worth, they would have said, if they added them up, they would have come up with \$400, \$500, \$600 million.

Bob Woodward one time said to me “tell me how to make some money” back in the ‘70s, before he’d made some money himself on a movie and a book. I said “Bob, it’s very simple. Assign yourself the right story. The problem is you’re letting Bradley assign you all the stories. You go out and interview Jeb Magruder.” I said “Assign yourself a story. The story is: what is the Washington Post Company worth? If Bradley gave you that story to go out and report on, you’d go out and come back in two weeks, and you’d write a story that would make perfectly good sense. You’d find out what a television station sells for, you’d find out what a newspaper sells for, you’d evaluate temperament.” I said “You are perfectly capable of writing that story. It’s much easier than finding out what Bill Casey is thinking about on his deathbed. All you’ve got to do is assign yourself that story.”

“Now, if you come back, and the value you assign the company is \$400 million, and the company is selling for \$400 million in the market, you still have a story but it doesn’t do you any good financially. But if you come back and say it’s \$400 million and it’s selling for \$80 million, that screams at you. Either you are saying that the people that are running it are so incompetent that they’re going to blow the \$400 million, or you’re saying that they’re crooked and that they’re operating Bob Vesco style. Or, you’ve got a screaming buy when you can buy dollar bills for 20 cents. And, of course, that \$400 million, within eight or 10 years, with essentially the same assets, [is now worth] \$3 or \$4 billion.”

That is not a complicated story. We bought in 1974, from not more than 10 sellers, what was then 9% of the Washington Post Company, based on that valuation. And they were people like Scudder Stevens, and bank trust departments. And if you asked any of the people selling us the

stock what the business was worth, they would have come up with an answer of \$400 million. And, incidentally, if it had gone down to \$60 or \$40 million, the beta would have been higher of course, and it would have therefore been [viewed as] a riskier asset. There is no risk in buying the stock at \$80 million. If it sells for \$400 [million] steadily, there's much more risk than if it goes from \$400 million to \$80 million.

But that's all there is to business. But now you say "I don't know how to evaluate the Washington Post." It isn't that hard to evaluate the Washington Post. You can look and see what newspapers and television stations sell for. If your fix is \$400 and it's selling for \$390, so what? You can't [invest safely with such a small margin of safety]. If your range is \$300 to \$500 and it's selling for \$80 you don't need to be more accurate than that. It's a business where that happens.

At the time we bought Coca Cola just two years ago, [we ended up buying] 7% of the company. We paid a billion dollars, so we were paying \$14 billion, essentially, for the whole thing. You can sit down in five minutes – I mean, everybody here understands Coca Cola. If Philip Morris were to buy Coca Cola that day, they would have paid \$30 billion. And they wouldn't have sold it for that. And you wouldn't have sold it for that. The company's actually repurchasing stock at the time. So, in effect, they're buying for you. They're buying out your partners, at 50 cents on the dollar or less, which is a magnificent sort of business, and there are no morals to it. It's an easy business. There's no doubt about it.

I don't know a thing now that I didn't know at 19 when I read that book. For eight year prior to that I was a chartist. I loved all that stuff. I had charts coming out my ears. Then, all of a sudden a fellow explains to me that you don't need all that, just buy something for less than it's worth.

[Question from audience]

The world, generally, is treated much more favorably in relation to buying businesses than we are because we're restricted now to buying big businesses, or pieces of big businesses. And that is a big disadvantage. As Charlie says "there could be worse things."

You'll find this interesting. At market, we've probably got \$7 or \$8 billion in equities. In 1970, Berkshire had about \$15 million in equities. We owned more securities then than we own now. We do not have it solved by buying more things. Every now and then we find something. In our annual report this year [we disclosed that] we made two large purchases. Each one was \$300 or \$400 million. Every now and then you'll get an opportunity. And when they come, they come for 15 minutes [I think that's what he said]. Some days it's raining gold. Not very often, but when it is, you've got to be out there. And that will happen periodically. It'll happen, but you can't make it happen. In the meantime, you let the cash pile up if that's what happens.

[Question from audience about how many of his investment ideas are pitched to him by others.]

Practically none. The *Wall Street Journal* is my deal source. There are 1,700 or 1,800 of America's companies that I'm generally familiar with – a good many of them. And every day

they move around the prices of them. So here's a business broker's office if you want to call it that. And sometimes they change them pretty dramatically, like October 19th of '87. But they change them dramatically. And that is a great start. Any business that I buy will be measured against the yardstick of that business brokers office in Section C of the *Wall Street Journal*.

In terms of deals, our standards are such that very few are going to meet it. We are much more likely to find one from an owner, who owns the business himself, who wants to sell it to someone like us, and if they want to sell to someone like us, we're the only one like us. I can promise them, a) since I control Berkshire, the only one who can double cross them or lie to them is me. If they start with the XYZ company, XYZ can be taken over tomorrow, the directors can get a new strategic [plan] tomorrow, they can have McKinsey come in and tell them to do something different tomorrow. And no one can really make them a promise there like I can make them a promise. I can tell them exactly what will and won't happen when I make a deal, and to some people that is very important.

It's important to me with Berkshire. I've got a lot of things in my will about (garbled) is better, and all kinds of things. I care where that goes, the same way I care about anything else I've spent my lifetime working on. When I run into somebody like that, we've got an advantage. To some extent, they know about us, and I'll hear about them, but not very many. They're very few. And they're usually older when it happens. Sometimes they've got other members of the family in the business that are inactive and want to take the money out. We've arraigned, in three of our businesses, with younger generations to take 18%, or 15%, or 20% of the equity. We can do a lot of things, in terms of meeting objectives, that some owners may [appreciate] although most owners [don't have complex requirements]. But it is not a question of answering the phone and taking an investment banker's call.

In terms of marketable securities or new offerings, we've never bought anything [that's been pitched to us by an investment banker or broker]. We don't pay any attention to investment bankers or brokers. It's not an efficient use of our time [to read their] reports. We read hundreds and hundreds of annual reports every year. I own 100 shares of everything. I find this much more reliable than asking to be put on a mailing list.

I was reading the Gillette report. I noticed that they'd bought in a bunch of stock. I'd known that before. Their net worth was below zero, which doesn't make a lot of difference, but I thought it might bother them, with the kind of history the company had. So I saw the name of a director that was a friend of mine, Joe Sisco. I called Joe and said "I don't know the people up there, but if they're interested in doing something in the way of financing I would be interested and, if they're not, I'll never bother them." Joe called me back in a couple of days, Coleman Mockler and I got together and we put \$600 million in.

We bought Scott Fetzer (World Book, Kirby Vacuum, and all sorts of things). It had been mixed up for about a year and a half, being sort of in play. I'd never met Ralph Schey, never talked to him on the phone, never had any contact with him at all. And I wrote him a letter that said "here's our annual report. If you're interested in talking to me we'll pay cash, our check will clear, it will be a one-page deal. If you're not interested, I'll never bother you again, and you'll never hear again, and throw the letter out." He called me back, we met in Chicago on a Sunday

and we made a deal that night, [signed the documents the] next week, and that was it.

[Question from audience: Wwhat was it about Gillette that appealed to you?]

I can understand (garbled) and shaving, the price flexibility, what I call the moat around the business. The most important thing with me in evaluating businesses is figuring out how big the moat is around the business. I want to know how big the capital is on the inside and then I want to know how big the moat is around it. What you love is big capital and a big moat. Obviously. World Book has a real moat. Kirby has a real moat. You can figure that out if you [studied] the distribution process and everything.

I've been in the textile business. We made half of the men's linings in the United States for 25 years.

[re: Gillette] It was the kind of business we'd put capital into on the right basis.

One of the biggest early things was American Express back in 1962 at the time of the salad oil scam. There was a guy named De Angelis in Bayonne, New Jersey.

American Express had a field warehousing company which was a tiny, tiny, little subsidiary, with \$12 [million] in capital. The field warehousing company's job was to certify that inventories really existed. That was their job. They stuck their name on it, and you could take those certificates that said there was a given amount of whatever there was, and you could borrow against these certificates. Tino De Angelis had this tank farm about 15 miles from lower Manhattan. And the American Express field warehousing company authenticated the existence of salad oil in these tanks. And, at one time, they were authenticating the existence of more salad oil than the Department of Agriculture, in its monthly reports, was saying existed in the United States. But they never told us of that discrepancy. Late in 1962, right at the time Kennedy was assassinated, within a day or two, the thing blew. A couple of New York Stock Exchange firms went broke – Ira Haupt, (garbled), maybe one other – because they lent on these phony certificates.

And American Express, which never even thought of this little field warehousing operation, it was nothing, compared to their money order business, credit card, and travel, all of a sudden, they've got this little subsidiary, not the parent company, but the subsidiary, that was on the hook for tens and tens of millions of dollars, and nobody knows how much. And that is the nice thing about fraud (garbled)...

There was one other little wrinkle which was terribly interesting. American Express was not a corporation. It then was the only major publicly traded security that was a joint stock association. As such, the ownership of the company was assessable. If it turned out that the liabilities were greater than the assets, [then] the ownership was assessable. So every trust department in the United States panicked. I remember the Continental Bank held over 5% of the company and all of a sudden not only do they see that the trust accounts were going to have stock worth zero, but it could get assessed. The stock just poured out, of course, and the market got slightly inefficient for a short period of time.

The American Express Company was a unique company to understand. You could look at that credit card and you knew it was a winner. Diner's Club had been the first, Carte Blanche had come along, but the American Express Card was killing them. They had raised prices every time. Their retention rate was higher. And finally, they raised prices, and Diner's Club didn't go along, and their growth far outstripped Diner's Club even though they were selling at a higher price. So this was a dynamite asset.

The traveler's check business had 60% of the traveler's check business in the world while selling their checks at a higher price than the banks, B of A and what was then First National Citibank, which were the two main competitions. So here were two guys, B of A and First National City, undercutting them on price for 60 years and they still had 2/3 of the market. That is a moat around the business. I went out and did a little check to make sure this thing wasn't affecting them and we bought 5% of the American Express Company for \$20 million, which means the whole company was selling for about \$150 million at that time. The whole American Express Company, synonymous with financial integrity and money substitutes around the world. When they closed the banks, when Roosevelt closed the banks, he exempted American Express Traveler's Checks, so they substituted as US currency. It was not a business that should have been selling for \$150 million, but everyone was terrified. It was very hard to tell how it would all come out in the end. But, probably, it was going to be between \$60 and \$100 million, and that was a lot more money back then in '62 than it is now. I just took the attitude that they'd declared a dividend of \$75 million, sent it out and it got lost. Would that have caused a panic – somebody else gets your dividend but you don't.

No one would have argued about the value of American Express. They just didn't want to own it for a while. That's what you're buying periodically. They didn't want to own the Washington Post in '74. All you've got to do is find one, two or three businesses like that in a lifetime, load up when you do, and not do anything in between. There will be bigger whales in the ocean and they'll (garbled). There will be more of those as we go along. It's harder when you're working with more money, but there'll always be something.

[Question from audience]

Well, I would say this. If we were working with \$25 million – so we could sort of look at the whole universe of stocks – I would guess that you could find 15 or 20 out of three or four thousand that you would find that were A) selling for substantially less than they're worth, and B) that the intrinsic value of the business was going to grow at a compound rate which was very satisfactory.

You don't want to buy a dollar bill that's sitting for 50 cents, and it demands positive capital, and it's going to be a dollar bill ten years from now. You want a dollar bill that's going to compound at 12% for [a long time]. And, you want to be around some competent people. Just the same thing as if you went in and bought a Ford dealership in South Bend. The same exact thought processes goes through you mind if some friend called you tonight and said "I'd like you to go into the Ford dealership" or whatever, is exactly the kind of thought as goes through mind about all the other businesses that are in Standard and Poor's.

When I was 20, I went through Moody's and Standard and Poor's page by page – twice – because that is it, that's the universe. The universe is much smaller now, unfortunately.

I found some strange things when I was 20 years old. I went through Moody's Bank and Finance Manual, about 1,000 pages. I went through it twice. The first time I went through, I saw a company called Western Insurance Security Company in Fort Scott, Kansas. They owned 92%, at that time, of the Western Casualty and Surety Company. Perfectly sound company. I knew people that represented them in Omaha. Earnings per share \$20, stock price \$16. (garbled) ... much more than that. I ran ads in the Fort Scott, Kansas paper to try and buy that stock – it had only 300 or 400 shareholders. It was selling at one times earnings, it had a first class [management team]...

[Tape ends here]

... Incidentally, I would say that almost everybody I know in Wall Street has had as many good ideas as I have, they just had a lot of [bad] ideas too. And I'm serious about that. I mean when I bought Western Insurance Security selling at \$16 and earning \$20 per share, I put half my net worth into it. I checked it out first – I went down to the insurance commission and got out the convention statements, I read Best's, and I did a lot of things first. But, I mean, my dad wasn't in it, I'd only had one insurance class at Columbia – but it was not beyond my capabilities to do that, and it isn't beyond your capabilities.

Now if I had some rare insight about software, or something like that – I would say that, maybe, other people couldn't do that – or biotechnology, or something. And I'm not saying that every insight that I have is an insight that somebody else could have, but there were all kinds of people that could have understood American Express Company as well as I understood it in '62. They may have been...they may have had a different temperament than I did, so that they were paralyzed by fear, or that they wanted the crowd to be with them, or something like that, but I didn't know anything about credit cards that they didn't know, or about travelers checks. Those are not hard products to understand. But what I did have was an intense interest and I was willing, when I saw something I wanted to do, to do it. And if I couldn't see something to do, to not do anything. By far, the most important quality is not how much IQ you've got. IQ is not the scarce factor. You need a reasonable amount of intelligence, but the *temperament* is 90% of it.

That's why Graham is so important. Graham's book [[The Intelligent Investor](#)] talks about the qualities of temperament you have to bring to the game, and that is the game. Now I can (garbled).

He may not know anything about a Coca Cola, or something of that sort, but that isn't what makes you the money. What makes you the money is your attitude going in, your attitude toward stock market fluctuations. There's two chapters in [The Intelligent Investor](#), chapter 8 and chapter 20, they're more important than everything that's been written on investments, in my view, before or since. And there's no specific technical knowledge in those things. It just tells you what frame of mind to be in when you come to the game. And people just don't get it. But that is not because I'm particularly skillful. And bear in mind that I didn't have that

(garbled). It's not like I was Mozart and sat down at five or something. I mean I was churning things, I was computing odd lot statistics, I mean I loved all that stuff because I always liked numbers and playing around with them. It was like baseball averages or something. But what I needed was a philosophical bedrock position from which I could then go out and look at businesses, and probe through that filter, and decide whether that's [a bargain or not]. And that's Ben Graham's contribution. And that's the game. You don't have to be that smart. You don't have to know advanced accounting. It may *help* if you know something, particularly accounting. But the fact that you don't know it may restrict your universe some.

[Garbled comment from audience]

It goes back to a debate I was having with Mike Jensen [a proponent of the efficient market theory who famously wrote in 1978 that "there is no other proposition in economics which has more solid empirical evidence supporting it than the Efficient Market Hypothesis"]. [I rebutted the efficient market hypothesis in] [The \[Super\]Investors of Graham and Doddsville](#). It was an address I gave on the 50th anniversary of [Security Analysis](#). Dave Dodd was there – 90 years old, marvelous guy. And in that room were a half a dozen or more of us who had gone on to study or work, or have some association with Ben Graham. We weren't all five-sigma types, but we've always gotten five-sigma, or three-sigma, or something results. So it isn't because he had carefully culled us out from all over the country, like the Notre Dame football team. We were there just because we kind of stumbled in. And we listened to the guy and then went out and applied it in different ways – totally different ways. I mean, Walter Schloss [has always] owned hundreds of different stocks. Walter is not a 150 IQ guy. Charlie Munger is. There were all different types of [people] with a common philosophical bond. They did not learn any little secrets of technique – they did not learn any systems.

Everybody wants a system. I mean they come to our annual meeting (garbled) the book guy, or the price/earnings, "do I buy them on Monday?" They all want some [system] that you can run through a computer and simulate it out. I mean I tell 'em if past performance were the key to it, the Forbes 400 would consist of librarians. Everybody would be looking it up. It doesn't work that way. They *want* it to work that way. It would be so nice if it did, but it is not that way. It's like picking out a basketball team. You look for guys who are seven feet tall, you look for a guy who can stay in school, there are a whole bunch of things. And there are certain things that point you toward getting the best five guys out there on the court. But I can't give them a formula. I can't say "here's a little formula and if you go to Emporia, Kansas and apply this formula without actually seeing the guys play basketball and working with them, you'll pick up the best basketball team." You won't.

[Garbled question from audience]

To me, it's absolutely fascinating that the teaching of investments has really retrogressed from 40 years ago, and I think it's probably because the teachers are more skillful. They learn all these huge mathematical techniques and (garbled) and they have so much fun manipulating numbers they're missing something very simple. And I think they have, on balance (aside: I say this at Stanford or Harvard), sent people off with the wrong message. And I get letters from students about it. I don't see what the reason for having an investment course is unless you teach people

how to analyze the value of investments. If people thought there was nothing of utility that you could impart on the subject, except for the fact that there is nothing you can do useful, then I don't understand... And I know it isn't true because I've seen people teach other people how to make unusual returns over a 30- or 40-year T-Note.

Phil Caret wrote a book on investing in 1924. He's still alive, he's a shareholder of Berkshire, he's 92 or 93 years old. He writes me letters that say "I approve of your no dividend policy because when I get older, then I want to start getting dividends." But Phil Caret has got a record of 70 years. That is a *lot* of investments and it is a superior investment record. Not done exactly the same as Graham, but it's the same general approach. Even Keynes came to that view. He started out as a market timer. But in the '30s he [changed approaches]. [Keynes later said: "As time goes on, I get more and more convinced that the right method in investment is to put fairly large sums into enterprises which one thinks one knows something about."]

You can't teach people a formula. You can't come in at the start of the term, and when they get all through, understand $E=MC$ squared. It's not like teaching geometry or something.

You shouldn't buy a stock, in my view, for any other reason than the fact that you think it's selling for less than it's worth, considering all the factors about the business.

I used to tell the stock exchange people that before a person bought 100 shares of General Motors they should have to write out on a [piece of paper:] "I'm buying 100 shares of General Motors at X" and multiply that by the number of shares "and therefore General Motors is worth more than \$32 billion" or whatever it multiplies out to, "because ... [fill in the reasons]" And if they couldn't answer that question, their order wouldn't be accepted.

That test *should be applied*. I should never buy anything unless I can fill out that piece of paper. I may be wrong, but I would know the answer to that. "I'm buying Coca Cola right now, 660 million shares of stock, a little under \$50. The whole company costs me about \$32 billion dollars." Before you buy 100 shares of stock at \$48 you ought to be able to answer "I'm paying \$32 billion today for the Coca Cola Company because..." [Banging the podium for emphasis.] If you can't answer that question, you shouldn't buy it. If you *can* answer that question, and you do it a few times, you'll make a lot of money.

[From the audience: "Well, you bought it, how did you answer it?"]

Well, it was only \$14 billion. I would say this: "If you added a penny to price of every Coca Cola sold in the world this year, that would add \$2 billion to pretax earnings." Now you tell me whether you think there's a penny, worldwide, of price flexibility per serving of Coke. Well, the answer is "you *know* there is."

When they bought the Coca Cola Company, the Candler family bought it from Pembertons back in 1904 or 1906, they paid \$2,000 for the company. If the Pemberton family had reserved a penny a serving royalty a serving, the Coca Cola company would be sending \$2 *billion* to the Pemberton family every year and you wouldn't even see the difference in the figures. It's there.

Now that's not true when I was selling [men's suit] linings [Berkshire Hathaway's original business]. I sold men's suit linings for 20 years. We tried to raise our price a half a cent a yard, and on an 80-cent-a-yard product, people who'd done business with us for 80 years slammed the door in our face. (garbled) ... "but half a cent a yard"... Nobody ever went into a store and said "I'd like to buy a pinstripe suit with a Hathaway lining." Never. They say "I want a coat" all over the world.

Now in this country, Pepsi is, unfortunately, more or less coexistent with Coke. This is their weakest market. They make more in Japan, with less than half the people and way less per capita usage than they make in the United States. Around the world a guy says "I'll sell you an unmarked cola a penny cheaper" ... it isn't going to happen. That is the fastest test.

A couple of fast tests about how good a business is. First question is "how long does the management have to think before they decide to raise prices?" You're looking at marvelous business when you look in the mirror and say "mirror, mirror on the wall, how much should I charge for Coke this fall?" [And the mirror replies, "More."] That's a great business. When you say, like we used to in the textile business, when you get down on your knees, call in all the priests, rabbis, and everyone else, [and say] "just another half cent a yard." Then you get up and they say "We won't pay it." It's just night and day. I mean, if you walk into a drugstore, and you say "I'd like a Hershey bar" and the man says "I don't have any Hershey bars, but I've got this unmarked chocolate bar, and it's a nickel cheaper than a Hershey bar" you just go across the street and buy a Hershey bar. *That* is a good business.

The ability to raise prices – the ability to differentiate yourself in a real way, and a real way means you can charge a different price – *that* makes a great business.

I'll try this on the students later: What's the highest price of a daily newspaper in the United States? [Pause] The highest priced daily newspaper in the United States is the *Daily Racing Form*. 150,000 copies a day, \$2.25 a copy, they go up in 25 cent intervals, and it doesn't affect circulation at all. Why? There is no substitute. If you go to the track, assuming you're a forms player, you don't want "Joe's Little Green Sheet", you want *The Form*. And it doesn't make any difference what it costs! There is no substitute. And that's why they've got a 65% pretax margin. It doesn't take a genius to figure it out.

There are products like that, and there are products like sheet steel. And they're night and day.

[From Audience: You said you only had to have a couple of good ideas, we at Notre Dame had a good one in having you here.] [Applause]

Lecture to MBA Students

I'll talk for a few minutes on some of the things that relate to this handout I've got, so if everybody has one, or looks with their neighbor, we'll get the (garbled) about how to make a lot of money in stocks as we go along.

Eddie Cantor had a problem with Goldman Sachs in the late '20s. [Cantor was a popular entertainer who lost his fortune in the crash.] He did not do very well in something he bought from them, so he worked them into his routine when he performed, and he told (garbled).

You know Wall Street is a place that people drive to in Rolls Royces to get advice from people who ride to work on the subway.

I'd like to talk to you for just a few minutes about what I regard as the most important thing in investments and also in terms of your career. Because in your career what train you get on makes a lot of difference. Because frequently, perhaps generally, when people get out of business school, they don't give enough thought to exactly what sort of train they're going to get on. And it makes a tremendous difference whether you get involved in a prosperous company, one that's going to really do well. On balance, you want to go with a company whose stock is going to be a good investment over the years because there's going to be much more opportunity, there's going to be more money made, you're going to (garbled). And if you get involved with some of the businesses I've been involved with like trading stamps (garbled).

[Buffett is warning students to stay away from declining businesses such as Blue Chip Stamps, though this was in fact a highly successful investment. In the book [Damn Right!](#), Janet Lowe wrote: "During the late 1960s and early 1970s, Munger, Guerin and Buffett gradually acquired a controlling interest in Blue Chip Stamps. This small company issued trading stamps, which merchants distributed. Customers collected and redeemed the stamps for merchandise. The investors saw untapped potential in the company's float account – the difference between stamps issued and stamps redeemed. Using this pool of capital, Blue Chip's controlling investors acquired several other companies: Wesco Financial, See's Candies and The Buffalo Evening News."]

It does make a difference what kind of a business you get associated with. For that reason I've set forth in this little handout Company A and Company E. I'm not going to tell you for the moment what these companies are. I'm going to tell you one thing about the two companies. One of the companies, to the point of where this cuts off, lost its investors more money than virtually any business in the world. The other company made its owner more money than virtually any company in the world. So one of these two companies, Company A and Company E, has made one of its owners one of the five wealthiest people in the world, while the other company made its owners appreciably poorer, probably more so than any other company to that point in time.

Now I'll tell you a little bit about these companies (we're leading up to the question of whether the business makes a difference). Company A had thousands of MBAs working for it. Company E had none. I wanted to get your attention. Company A had all kinds of employee benefit programs, stock options, pensions, the works. Company E never had stock options. Company A

had thousands of patents – they probably held more patents than just about any company in the United States. Company E never invented anything. Company A’s product improved dramatically in this period, Company E’s product just sat.

So far, based on what I’ve told you, does anybody have any idea of which company was the great success, and why?

If you get to buy one of these two companies, and this is all you know, and you get to ask me one question to decide on which one to buy. If you ask me the right question, you will probably make the right decision about the company’s stock, and one will make you enormously wealthy.

[Audience asks questions]

Both companies make products used every day. They started as necessities, highly useful, nothing esoteric about either one, although company A does have all these patents. There’s more technology involved in company A.

[How many companies compete with either one?]

Good question, very good question. In effect, neither company had any competition. And that might differentiate in some cases.

Well, I’ll tell you a little more about it. Company A is known as company A because it was in agony, and Company E, as Company E, because it was in ecstasy. Company A is American Telephone and Telegraph. I’ve omitted eight zeros on the left hand side, and the American Telephone and Telegraph Company, at the end of 1979, was selling for \$10 billion less than the shareholders had either put in or left in the business. In other words, if shareholder’s equity was “X” the market value was X minus \$10 billion. So the money that shareholders had put in, or left in, the business had shrunk by \$10 billion in terms of market value.

Company E, the excellent company, I left off only six zeros. And that happens to be a company called Thomson Newspapers. Thomson Newspapers, which most of you have probably never heard of, actually owns about 5% of the newspapers in the United States. But they’re all small ones. And, as I said, it has no MBAs, no stock options – still doesn’t – and it made its owner, Lord Thompson. He wasn’t Lord Thompson when he started – he started with 1,500 bucks in North Bay, Ontario buying a little radio station but, when he got to be one of the five richest men, he became Lord Thompson. I met him one time in England as a matter of fact, in 1972, and went up to see him. He’d never heard of me, but he was a very important guy. (I’d heard of him!)

I said, “Lord Thompson, you own the newspaper in Council Bluffs, Iowa. Council Bluffs is right across the river from Omaha, where I live, four or five miles from my house. I said, “Lord Thompson, You own the Council Bluffs [Daily Nonpareil?]. I don’t suppose you’d ever think of selling it?” He said “I wouldn’t think of it.”

I said “Lord Thompson, you’ve bought this paper in Council Bluffs, and you’ve never seen the paper, never seen the town, but I do notice that every year you raise prices.” (garbled)

He's got the only way to talk to people – his was the only “megaphone” for merchants to announce commercial news in Council Bluffs. He said “I figured that out before you did.”

I said, “If you ever raise prices to the point where it's counterproductive (garbled).”

Then [I said] “I've got only one other question: How do you figure out how much to charge people? You look like a man of awesome commercial instincts – you started with a \$1,500 radio station, now you're worth \$4 or \$5 billion dollars.”

He said “Well, that's another good question. I just tell my US managers to try and make 45% pretax and figure that's not gouging.” And as I got to the elevator, he said “If you ever hear of a newspaper you don't want to buy, call me. Collect.”

I rode down and that was two years of business school. I mean, try to make 45% and call me collect if you ever find a paper you don't want to buy.

The telephone company, with the patents, the MBAs, the stock options, and everything else, had one problem, and that problem is illustrated by those figures on that lower left hand column. And those figures show the plant investment in the telephone business. That's \$47 billion, starting off with, growing to \$99 billion over an eight or nine year period. More and more and more money had to be tossed in, in order to make these increased earnings, going from \$2.2 billion to \$5.6 billion.

So, they got more money, but you can get more money from a savings account if you keep adding money to it every year. The progress in earnings that the telephone company made was only achievable because they kept on shoving more money into the savings account and the truth was, under the conditions of the '70s, they were not getting paid commensurate with the amount of money that they had to shove into the pot, whereas Lord Thompson, once he bought the paper in Council Bluffs, never put another dime in. They just mailed money every year. And as they got more money, he bought more newspapers. And, in fact, he said it was going to say on his tombstone that he bought newspapers in order to make more money in order to buy more newspapers [and so on].

The idea was that, essentially, he raised prices and raised earnings there every year without having to put more capital into the business.

One is a marvelous, absolutely sensational business, the other one is a terrible business. If you have a choice between going to work for a wonderful business that is not capital intensive, and one that is capital intensive, I suggest that you look at the one that is not capital intensive. I took 25 years to figure that out, incidentally.

On the next page, I've got a couple of other businesses here. Company E is the ecstasy on the left. You can see earnings went up nicely: they went from \$4 million to \$27 million. They only employed assets of \$17 million, so that is really a wonderful business. On \$17 million they earned \$27 million, 150% on invested capital. That is a good business. The one on the right, Company A, the agony, had \$11 or \$12 million tied up, and some years made a few

bucks, and in some years lost a few bucks.

Now, here again we might ask ourselves, “What differentiates these companies?” Does anybody have any idea why company E might have done so much better than Company A? Usually somebody says at this point “maybe company E was better managed than company A.” There’s only one problem with that conclusion and that is, Company E and Company A had the same manager – me!

The company E is our candy business, See’s Candies out in California. I don’t know how many of you come from the west, but it dominates the boxed chocolate business out there and the earnings went from \$4 million to \$27 million, and in the year that just ended they were about \$38 million. In other words, they mail us all the money they make every year and they keep growing, and making more money, and everybody’s very happy.

Company A was our textile business. That’s a business that took me 22 years to figure out it wasn’t very good. Well, in the textile business, we made over half of the men’s suit linings in the United States. If you wore a men’s suit, chances were that it had a Hathaway lining. And we made them during World War II, when customers couldn’t get their linings from other people. Sears Roebuck voted us “Supplier of the Year.” They were wild about us. The thing was, they wouldn’t give us another half a cent a yard because nobody had ever gone into a men’s clothing store and asked for a pin striped suit with a Hathaway lining. You just don’t see that.

As a practical matter, if some guy’s going to offer them a lining for 79 cents, [it makes no difference] who’s going to take them fishing, and supplied them during World War II, and was personal friends with the Chairman of Sears. Because we charged 79½ cents a yard, it was “no dice.”

See’s Candies, on the other hand, made something that people had an emotional attraction to, and a physical attraction you might say. We’re almost to Valentine’s Day, so can you imagine going to your wife or sweetheart, handing her a box of candy and saying “Honey, I took the low bid.”

Essentially, every year for 19 years I’ve raised the price of candy on December 26. And 19 years goes by and everyone keeps buying candy. Every *ten* years I tried to raise the price of linings a fraction of a cent, and they’d throw the linings back at me. Our linings were just as good as our candies. It was much harder to run the linings factory than it was to run the candy company. The problem is, just because a business is lousy doesn’t mean it isn’t difficult.

In the end, I like to think anyway that if Alfred P. Sloan [the legendary CEO of General Motors during its heyday] came back and tried to run the lining business, it wouldn’t make as much money as a good business. The product was undifferentiated. The candy product is differentiated. (Garbled story of Hershey Bar and Coke versus unbranded but modestly cheaper products).

You really want something where, if they don’t have it in stock, you want to go across the street to get it. Nobody cares what kind of steel goes into a car. Have you ever gone into a car

dealership to buy a Cadillac and said “I’d like a Cadillac with steel that came from the South Works of US Steel.” It just doesn’t work that way, so that when General Motors buys they call in all the steel companies and say “here’s the best price we’ve got so far, and you’ve got to decide if you want to beat their price, or have your plant sit idle.”

I put one business in here, CBS versus Cap Cities in 1957, when my friend Tom Murphy took over Cap Cities. They had a little bankrupt UHF station in Albany. They ran it out of a home for retired nuns. And it was very appropriate because they had to pray every day. At that time CBS was the largest advertising medium in the world: \$385 million in revenues whereas Cap Cities had \$900,000 in revenues. Cap Cities made \$37,000 a year and they paid my friend Murph \$12,000 a year. CBS made \$48 million pretax. Cap Cities was selling for \$5 million in the market and priced on the come, while CBS was selling for \$500 million.

Now, if you look at the two companies, Cap Cities has a market value of about \$7 billion and CBS has a market value of about \$2 billion. They were both in the same business, broadcasting. Neither one had, certainly Cap Cities didn’t have, any patents. Cap Cities didn’t have anything that CBS didn’t have. And somehow CBS took a wonderful business that was worth \$500 million, and over about 30 years they managed a little increase – peanuts – while my friend Murphy, with exactly the same business, with one little tiny UHF station in Albany, (bear in mind that CBS had the largest stations in New York City and Chicago) and my friend Murph just killed them. And you say “how can that happen?” And that’s what you ought to study in business school. You ought to study Tom Murphy at Cap Cities. And you also ought to study Bill Paley [who was the CEO] at CBS.

We have a saying around Berkshire that “all we ever want to know is where we’re going to die, so we’ll never go there.” And CBS is what you don’t want. It’s as important not to do what CBS did, and it is important to do what Cap Cities did. Cap Cities did a lot of things right, but if CBS had done the same things right, Cap Cities would have never come close.

They had all the IQ at CBS that they had at Cap Cities. They had 50 times as many people, and they were all coming to work early and going home late. They had all kinds of strategic planners, they had management consultants. They had more than I can say. Yet they *lost*. They lost to a guy that started out with a leaky rowboat, at the same time the other guy left in the QE II. By the time they got into New York, the guy in the rowboat brought in more cargo than the QE II did. There’s a real story in that. And you can understand broadcasting, so it’s really worth studying what two people in the same field did, and why one succeeded so much and one failed.

I couldn’t resist kicking in the last page: the only public offering Cap Cities ever made, back in 1957 which raised, as you can see, \$300,000. And this was when they were going to buy the station in Raleigh/Durham. The only public offering of stock the company’s every made (aside: they sold us a block of stock when they bought ABC). And if you look very carefully you’ll see that the underwriting commission – they took two firms to get this sold – the total underwriting commission was \$6,500 bucks.

The last thing I want to show you, before we get onto your questions, is an ad that was run June 16, 1969, for 1,000,000 shares of American Motors. This is a reproduction from the *Wall Street*

Journal of that day. Now does anybody notice anything unusual about that ad?

[Guesses from audience.]

Everybody in that ad has disappeared. There are 37 investment bankers that sold that issue, plus American Motors, and they are *all* gone. Maybe that's why they call them tombstone ads. Now the average business of the New York Stock exchange in 1969 was 11 million shares. Average volume now is *fifteen* times as large. Now here's an industry whose volume has grown 15 to 1 in 20 years. Marvelous growth in the financial world. And here are 37 out of 37, and those are some of the biggest names on Wall Street, and some of them had been around the longest, and 37 out of 37 have disappeared. And that's why I say you ought to think about [the long-term durability of a business?] because these people obviously didn't.

These were run by people with high IQs, by people that worked ungodly hard. They were people that had an intense interest in success. They worked long hours. They *all* thought they were going to be leaders on Wall Street at some point, and they all went around, incidentally, giving advice to other companies about how to run their business. That's sort of interesting.

You go to Wall Street today, and there's some company the guy hadn't heard of two weeks before and he's trying to sell you. He will lay out this computer run of the next 10 years, yet he doesn't have the faintest idea of what his own business is going to earn next week!

Here are a group of 37. And the question is, how can you get a result like that? That is not a result that you get by chance. How can people who are bright, who work hard, who have their own money in the business – these are not a bunch of absentee owners – how can they get such a bad result? And I suggest that's a good thing to think about before you get a job and go out into the world.

I would say that if you had to pick one thing that did it more than anything else, it's the mindless imitation of one's peers that produced this result. Whatever the other guy did, the other 36 were like a bunch of lemmings in terms of following. That's what's gotten all the big banks in trouble for the past 15 years. Every time somebody big does something dumb, other people can hardly wait to copy it. If you do nothing else when you get out of here, do things *only* when they make sense to you. You ought to be able to write "I am going to work for General Motors because ... "I am buying 100 shares of Coca Coals stock because..." And if you can't write an intelligent answer to those questions, don't do it.

I proposed this to the stock exchange some years ago: that everybody be able to write out "I am buying 100 shares of Coca Cola Company, market value \$32 billion, because" and they wouldn't take your order until you filled that thing out.

I find this very useful when I write my annual report. I learn while I think when I write it out. Some of the things I think I think, I find don't make any sense when I start trying to write them down and explain them to people. You ought to be able to explain why you're taking the job you're taking, why you're making the investment you're making, or whatever it may be. And if it can't stand applying pencil to paper, you'd better think it through some more.

People in that ad did a lot of things that could not have stood that test. Some *major* bankers in the United States did a lot of things that could not meet that test. One of the bankers in the United States, who's in plenty of trouble now, bragged a few years ago he never made a loan. And, from the way things are starting to look, he's never going to collect on one either.

You should not be running one the major banks in the United States without having made loans. I mean, you learn about human nature, if nothing else, when you make loans.

[Question and Answer With Students]

That jewelry store, it's an interesting story, I'll take an extra minute. We bought a furniture store about five or six years ago. We bought it from a woman who was 89 [Rose Blumkin, the legendary Mrs. B]. That woman came to this country with a tag around her neck from Russia. She walked out of Russia, and the Red Cross truck got her in Seattle and (garbled) then Fort Dodge, Iowa and sent her there. And she saved money. She sold used clothes and that sort of thing, and she brought over seven siblings, plus her mother and father. She sent over \$50 bucks at a time to get the rest of the family over here.

In 1937, she would have been 44 at the time, she started a store with \$500, a home furnishings store. That's all the money she ever put into it. Last year it made \$18 million, pretax. It's become the largest home furnishings store in the country. And she put everybody out of business. She doesn't know accounting, she's never had an audit, she doesn't know what accruals mean, she doesn't know what depreciation means, but she knows how to run a business. And, unfortunately, two years ago she got mad at her grandchildren and she went out and quit and started competing with us, which shows you how stupid I was not to get a non-compete agreement from an 89-year-old woman! She is now in business right across the street, and works seven days a week at 97 years of age. And if you tell her that this room is 27 by 31, she will tell you how many square yards it is just like that, at \$6.99 a yard, and how much that comes to plus tax. She can do it just like that. She cannot read or write. She has never been to school a day in her life. But she knows how to run a business.

One of the sisters she brought over, also to Omaha, was a woman named Rebecca. She went through Latvia, and the border guard took the money when she got to Latvia, and she had to sit in Latvia for a year until her sister got another \$50 bucks to bring her over here. They got over here, and it took them 20 odd years to get enough money to buy into a tiny little jewelry store. And I bought that business a couple of years ago from the Friedman family, which is Mrs. B's sister. Incidentally, Mrs. B is 97, and her three other (garbled).

In any event, in that jewelry store last year, the sales were up 18%. I believe it's the second largest jewelry store in the United States, next to Tiffany's main location, and it uses *exactly* the same formula the furniture store used in building up the largest home furnishings store. The people that run them never went to business school, and they stress the things that Ben Franklin would stress. Essentially, their business is pure Ben Franklin. Tell truth and give people service. Ben Franklin said "take care of thy shop and it will take care of thee." Now that's old fashioned in terms of the phraseology, but it's that simple. And, the truth is that family... If you were at our

jewelry store last Saturday like I was, Ike Friedman who is 65, 66, was there. His mother, Mrs. Friedman, came in – she’s 89 years old – *Wall Street Journal* under her arm. You’ve got his son there, his only son, two sons-in-law, two daughters in there, they’re all busy. The family’s worth tens and tens and tens of millions of dollars. They don’t do it ‘cause they have to, they do it ‘cause they like to.

The one thing we’ve done well in buying businesses is the people who sold them were in love with their business and not in love with money. If they’re in love with money we can’t do it, but if they’re in love with their business we get along very well because we leave them alone.

Actually Fran Blumkin, the wife of Louis Blumkin, who’s now Chairman of the Furniture Mart, comes in on Saturday, and works Tuesday, to help out Louis’ cousins. And she sells jewelry all the time there. It’s a great business. Berkshire bought a great business. It gets better, and better, and better. And *no-one* can knock ‘em off.

That’s one of the things I always ask myself: If you give someone hundreds of millions of dollars, or billions of dollars, [can you hurt a particular business?] You can’t hurt the Furniture Mart or Borsheim’s.

[Question: When you look at a company, how do you value it, how do you decide how much to pay for it, and after that, would you say how much you’d sell it for.]

Well, we won’t sell it. We just don’t sell businesses. If we had a business that would permanently lose money, or we had a manager lie to us, or cheat us, or (garbled). But we will never sell a business just because we get a wonderful offer for it. My house isn’t for sale. The children aren’t for sale. The businesses aren’t for sale. I tell shareholders that. That may make me crazy, but that’s who they’re getting in with, and they might as well know it. It is not a game we’re playing, like gin rummy, where we pick up one card and discard another.

And I think good human relationships... I work with nothing but people I like. There’s not one person I work with that causes my stomach to churn in the least. In fact, I feel like tap dancing. I work with nothing but people I like. Well, just think how fortunate you are if you’re 60 years of age and that’s the way you’re going to be able to spend your life. These people are wonderful to work with. I mean, Ike Friedman...we never disagree. Charlie Munger, my partner, and I have never had a disagreement in 30 years. And, why in the world [would I sell businesses run by people I like] so that I can be worth 110% of X, instead of X, when I die? It will all be in the foundation anyway. Why should I go around discarding people like that who are in the business, for some people who might not turn out so well? So I’m not interested in selling at all.

Now, in terms of buying, a) I’ve got to like the people. I’m just not interested in marrying for money. That might have been great when I was 12, but it would be crazy now for me to marry someone for money. Why should I marry in business for money? It just doesn’t make sense. I get associated with these people, so I want to buy the people I like, and I want to buy businesses I understand, and then I don’t want to think too much. And, paying too much simply comes out.

If you can tell me what all of the cash in and cash out of a business will be, between now and

judgment day, I can tell you, assuming I know the proper interest rate, what it's worth. It doesn't make any difference whether you sell yo-yo's, hula hoops, or computers. Because there would be a stream of cash between now and judgment day, and the cash spends the same, no matter where it comes from. Now my job as an investment analyst, or a business analyst, is to figure out where I may have some knowledge, what that stream of cash will be over a period of time, and also where I don't know what the stream of cash will be. I don't have the faintest idea of where Digital Equipment will be in next week, let alone the next 10 years. I just don't know. I don't even know what they do. And I never would know what they did. Even if I thought I knew what they did, I wouldn't know what they did. Hershey bars I understand.

So, my job is to look at the universe of things I can understand – I can understand Ike Friedman's jewelry store – and then I try to figure what that stream of cash, in and out, is going to be over a period of time, just like we did with See's Candies, and discounting that back at an appropriate rate, which would be the long term Government rate. [Then,] I try to buy it at a price that is significantly below that. And that's about it. Theoretically, I'm doing that with all the businesses in the world – those that I can understand.

Every day, when I turn to the *Wall Street Journal*, back in the C Section, that's like a big business brokerage ad. It's just like a business broker saying "you can buy part of AT&T for this, part of General Motors for that, General Electric..." And unlike most business broker's ads, it's nice because they change the price every day. And you don't have to do business with any of them. So you just sit there, day by day, and you yawn, and you insult the broker if you want to, and talk to your newspaper, anything you want to, because someday, there's going to be some business I understand selling for way less than the value I arrived at. It doesn't have anything to do with book value, although it does have to do with earnings power over a period of time. It usually relates, fairly closely, to cash [flow]. And, when you find something you understand, if you find five ideas in your lifetime and you're right on those five, you're going to be very rich.

You know I always tell business students that if you got a punch card when you got out of here, and it only had 20 businesses on it, and every time you made an investment decision they took a punch, and when the 20 were gone you were all done, it would be wonderful. You're not going to get more than 20 investment ideas in a lifetime. I'm not going to get more than 20 great ideas. And the important thing is that you recognize them when you see them, and that you do something about them.

So, when we find something we understand, if we're buying all of the business, I want to like the people. If we're buying part of the business, it's less important. We want to buy things we understand, and we want to buy them very cheap. If we don't understand them, we don't buy them. If they're not cheap, we don't buy them. If we can buy them with Tom Murphy, my friend, at an attractive price, we do that in a second.

We bought 5% of the Walt Disney Company in 1966. It cost us \$4 million dollars. \$80 million bucks was the valuation of the whole thing. 300 and some acres in Anaheim. The Pirate's ride had just been put in. It cost \$17 million bucks. The whole company was selling for \$80 million. Mary Poppins had just come out. Mary Poppins *made* about \$30 million that year, and seven years later you're going to show it to kids the same age. It's like having an oil well where all the

oil seeps back in. Now the [numbers today are] probably different, but in 1966 they had 220 pictures of one sort or another. They wrote them all down to zero – there were no residual values placed on the value of any Disney picture up through the '60s. So [you got all of this] for \$80 million bucks, and you got Walt Disney to work for you. It was incredible. You didn't have to be a genius to know that the Walt Disney company was worth more than \$80 million. \$17 million for the Pirate's Ride. It's unbelievable. But there it was. And the reason was, in 1966 people said, "Well, Mary Poppins is terrific this year, but they're not going to have another Mary Poppins next year, so the earnings will be down." I don't care if the earnings are down like that. You know you've still got Mary Poppins to throw out in seven more years, assuming kids squawk a little. I mean there's no better system than to have something where, essentially, you get a new crop every seven years and you get to charge more each time.

\$80 million dollars [sigh]. I went out to see Walt Disney (he'd never heard of me; I was 35 years old). We sat down and he told me the whole plan for the company – he couldn't have been a nicer guy. It was a joke. If he'd privately gone to some huge venture capitalist, or some major American corporation, if he'd been a private company, and said "I want you to buy into this. This is a deal," they would have bought in based on a valuation of \$300 or \$400 million dollars. The very fact that it was just sitting there in the market every day convinced [people that \$80 million was an appropriate valuation]. Essentially, they ignored it because it was so familiar. But that happens periodically on Wall Street.

I wanted to go see Mary Poppins, to see if she'd be recycled, and she was showing at the Loews Theater on 45th and Broadway in New York, and here I am with a briefcase at 2:00 in the afternoon heading in to see Mary Poppins. I almost felt like I had to rent a kid.

[Question from audience.]

There's very little relationship between Walt Disney and Salomon. In Salomon we have lent them, in effect, \$700 million on a preferred which matures in five equal installments, starting five years from now, which is also convertible. And this is primarily a fixed income investment with an interesting conversion privilege attached to it. But it is not primarily an equity investment. We get a 9% dividend which, because of the corporate dividend tax credit, converts to something over 7% on an after-tax basis. It's a form of lending money. It's an alternative to municipal bonds or something of that sort. It is *not* an investment like Coca Cola, or the Washington Post, or Cap Cities, which are pure equity investments.

We would rather, and this is nothing negative on Salomon, buy more things like Coca Cola. You know, those are the things that really cause excitement, because those are super businesses as far as the eye can see. Salomon is a perfectly decent business, but it's just not the same kind of business. Neither is Champion Paper or US Air, which we've done the same thing for. If we had way less money, we wouldn't be doing those things, as opposed to the Coca Cola thing. It's because we can't find more of those. And we should own some fixed income investments because of our [insurance business].

[Question from audience.]

Well, I started out when I was 20. I had just finished Ben Graham's course. And I took Moody's Manuals – they had investment manuals – and I took Standard and Poor's, where they put them all together, and do them all alphabetically, and I went through them all page by page. And things jumped out at me. I saw Western Insurance Services, in Fort Scott, Kansas, looking in Moody's Bank and Finance Manuals. I'd never heard of Western Insurance Services until I turned that page that said Western Insurance Services. It showed earnings per share of \$20 and the high was \$16. Now that may not turn out to be something you can make a lot of money on, but the odds are good. It's like a basketball coach seeing a guy 7'3" walk through the door. He may not be able to stay in school, and may be very uncoordinated, but he's very large. So I went down to the Nebraska Insurance Department, and I got the convention reports on their insurance companies, and I read Best's. I didn't have any background in insurance. But I knew I could understand it if I worked at it for a while. And all I was really trying to do was disprove this thing. I was really trying to figure out something that was wrong with this. Only there wasn't anything wrong. It was a perfectly good insurance company, a better than average underwriter, and you could buy it at one times earnings. I ran ads in the Fort Scott, Kansas paper to buy this stock when it was \$20. But it came through turning the pages. No one tells you about it. You get 'em by looking.

I read hundreds of annual reports every year. I don't talk to any brokers – I don't want to talk to brokers. People are not going to give you great ideas. On the other hand, getting them is not that difficult. If you'd read the Disney report in 1966, believe me, you'd have known as much about Disney then as now. You wouldn't have Michael Eisner, you'd have Walt Disney running it. And you could have multiplied, at two million shares outstanding (garbled).

Cap Cities at that time was an act of faith. You had to believe in Tom Murphy. You could not see (garbled).

(Garbled) and some of you will be stars, and some of you will be less than stars. But it won't correlate with your IQ at all. But you have it already. And everybody in the room has it. I'll give you a little question. Let's think about this. Let's say that everyone here got a bonus when they left Notre Dame. Let's say for \$25,000 you could buy a 10% interest in the income of any one of your classmates that you wanted to. Now, what are you thinking about? You can take anybody in this room, and for \$25,000 buy a 10% interest in their income for life. If they make \$25,000 the first year, you make \$2,500. If they're unemployed, you don't get anything. If they get stock options, you get 10% of the stock options. What are you thinking about as you look around? Are you thinking about which ones are the smartest? It's interesting what ingredients you think now are what's going to produce that in the classroom. I would suggest that you start thinking about, assuming you have a 10% interest, what qualities you want to have. I know I would take Tom Murphy. Why? Well, he's got an IQ, there's no question about that. But, that's something one or two others might have as well.

Think about why you picked him or her, and how much of that is transferable to you. And it usually won't be anything you can't attain yourself. But if it's qualities of character, or qualities of enthusiasm, or whatever it may be, most of those things you can pick up.

[Question from audience.]

Well, we will do that anytime we feel that a dollar we retain in the company is not going to be worth more than a dollar in market price. And that can happen. I mean, as we get bigger, it's more likely to happen. But so far, every dollar we've kept in the company has translated into more than a dollar in market price, so that anybody who wanted to take \$10 a share out, or \$50 a share out, is better off having us keep the \$50, having it appraised in the market at \$60, \$70, or \$80 and selling a little piece. They actually come out dollars ahead by doing that. But, when we can't use the money for any extended period, not for a month or three months, but a period of years, when we find out that we don't have ways to use money in a way that creates more than a dollar of market value for each dollar reinvested, then we won't.

I couldn't attend the 50th birthday of one of my friends so I sent him a telegram "may you live until Berkshire splits." That doesn't apply to cash dividends. It will be a market failure but, nevertheless, that may be what happens.

[Question from audience.]

Well, I won't comment too much on that. The question is whether Security Pacific and Wells Fargo, two of the four largest banks in California, were in talks late last year, and a story appeared in the *Wall Street Journal* talking about this a week or two ago. They were in talks last year about merging. And that excited some people because Wells had done a particularly good job when they took over Crocker four years ago, or so. And then the deal, the Security Pacific/Wells Fargo thing, did not happen. And then the story leaked out so it's in the paper. Security Pacific is probably an \$80 billion bank. Wells Fargo, I know, is a \$50 billion bank. It would have created what would have been the second largest bank in the country, next to Citicorp.

My guess is there will be some bank mergers in the next few years, but they may be more suicide pacts than mergers. There's going to be a lot of action, not all good by a long shot, in banks, simply because there's so much trouble there. The big problem in merging two banks these days is that you don't know what's in the other guy's loan portfolio – because too often *he* doesn't know. And people didn't used to worry about that five or 10 years ago, and they worry about it a whole lot now because, if they merge with the wrong bank, they can go broke.

C&S, the Citizens and Southern Bank of Atlanta, merged with Sovereign earlier this year. Sovereign has got a lot of real estate problems in the Washington D.C. area, and that merger took place less than 12 months ago.

Al Lerner merged his Equitable Trust Company in Baltimore into the old Maryland National. Al Lerner is a very, very, smart fellow. And he merged his own company, which he had a lot of his own money in, he merged it in with MNC and in six months MNC was in huge trouble. The stock was 10% of what the value was when he merged it six months ago. And Al just got in with something where he didn't know how bad it was. But that was easy to do. So, everybody is super careful about that, and this is why there's a problem, because to look at a Wells Fargo with assets of \$50 billion, and Security Pacific with \$80 billion, and if there's \$2 or \$3 billion in there that's no good, that wipes out equity. That's a tough decision to make.

[Question from audience.]

Right now, in property/casualty insurance, generally speaking, prices are lousy, which means business is terrible. We have found a few things to do that will be in our annual report. We've found a few things that are OK, they're not like they were four or five years ago, but they're keeping us out of bars. And that's what we look for in times like this. But that is a *very* interesting business. When that guy was predicting an earthquake near New Madrid we wrote a two month policy against a \$3 billion earthquake for some crazy rate as a percentage of everything. We ought to keep that guy out there.

We've had a chance to do some very interesting things in insurance. It's a very tricky business. We are getting in claims on policies we wrote in 1970. We're not getting in any premium, we're just getting in claims. They tell the story in insurance ...

[Told burying dad in a rented suit story. From the 2001 Berkshire Hathaway [annual letter](#):

Even when companies have the best of intentions, it's not easy to reserve properly. I've told the story in the past about the fellow traveling abroad whose sister called to tell him that their dad had died. The brother replied that it was impossible for him to get home for the funeral; he volunteered, however, to shoulder its cost. Upon returning, the brother received a bill from the mortuary for \$4,500, which he promptly paid. A month later, and a month after that also, he paid \$10 pursuant to an add-on invoice. When a third \$10 invoice came, he called his sister for an explanation. "Oh," she replied, "I forgot to tell you. We buried dad in a rented suit."

There are a lot of "rented suits" buried in the past operations of insurance companies. Sometimes the problems they signify lie dormant for decades, as was the case with asbestos liability, before virulently manifesting themselves. Difficult as the job may be, it's management's responsibility to adequately account for *all* possibilities. Conservatism is essential. When a claims manager walks into the CEO's office and says "Guess what just happened," his boss, if a veteran, does not expect to hear it's good news. Surprises in the insurance world have been far from symmetrical in their effect on earnings.]

We literally will pay hundreds of thousand of dollars for things that happened years back. On the other hand, overall, it can be a good business if you're disciplined. We have a rule, we're very Japanese in that, we never lay off anybody. We tell them, in times like this where we're writing way less than we were writing a few years ago, we tell them that under no conditions will they be laid off for lack of business because otherwise they'll go out and write some business. I mean, it's the easiest thing in the world to do. And we tell them we'll buy them golf memberships, country club memberships, if they'll promise to play golf during business hours, because we don't want them in the office during business under terms that are generally available these days. So we occasionally run into a good big deal, and we keep busy that way, but we are operating at 1/4 speed. We have a lot of people that are doing crossword puzzles, which is fine. It beats whatever

else they'd be doing. You do not want energetic people in a lousy business.

[Question from audience.]

I read all kinds of business publications. I read a lot of industry publications. Coming in today on the plane (garbled). I'll grab whatever comes in the morning. American Banker comes every day, so I'll read that. I'll read the *Wall Street Journal*. Obviously. I'll read Editor and Publisher, I'll read Broadcasting, I'll read Property Casualty Review, I'll read Jeffrey Meyer's Beverage Digest. I'll read everything. And I own 100 shares of almost every stock I can think of just so I know I'll get all the reports. And I carry around prospectuses and proxy material. Don't read broker's reports. You should be very careful with those.

[Question from audience.]

I think the *Wall Street Journal* is essential. I spend 45 minutes a day with the *Wall Street Journal*. Actually, I got up the night before, about 11:00... I frequently read it at night. But I'll read anything. Actually, I probably spend five or six hours a day on reading. We have no meetings at Berkshire. We have a directors meeting once a year, after the shareholders meeting, at lunch. And at the end, I say "I'll see you next year." It's a very economical operation. We don't have a slide projector. We don't have a calculator. We do not have meetings on anything. If I take Ike Friedman, and bring him to a meeting, I've probably lost \$20,000 or something. He should be out there selling. There just isn't anything to meet about. He's having meetings in his head all the time about the jewelry store. I'm having meetings in my head about what to do with the money.

[Question from audience.]

We don't attend any seminars, or trade things. I get all this stuff about how to incorporate in the Cayman Islands or how to never write a check to the IRS. We don't do any of that stuff. There's not much goes on at the place, and that's probably just as well. Every now and then we get a chance to do something and we do it as best as we can.

When Coca Cola got to where it was attractive, for seven or eight months we bought every share of Coca Cola we could. We bought what, on the old stock, 23 million shares, we probably bought that on 150 trading days, that's 160,000 shares a day. You gotta do it when the time is right to do it.

[Question from audience about the possibility of buying British companies.]

I look at them. I read the Financial Times every day. We've looked at, and we've come close, very close, to one deal. There's another proposition I've got right now from somebody. But so far, we haven't done anything. But I don't rule it out.

If Coca Cola were located in London, and was an English company, and did business exactly like they do, it would be worth slightly less than [if it were a US company]. But overall, I'd do it. Obviously.

We've looked at a lot [at foreign companies]. [But] we've got a \$3 trillion pond in terms of market value in this country. And if I can't make money in a \$3 trillion pond, I can't make money in an \$8 trillion pond. We tend to look in the \$3 trillion pond mostly.

[Question from audience.]

Usually they won't. And I tell them, almost always, they shouldn't. I'm going to have a letter in the annual report this year which I've sent many times to possible sellers of businesses. And the one thing I tell them is you're not richer when you sell a business. You've got a wonderful asset that will be worth more money later on. I wouldn't be talking to you if I didn't think this was the case. If it takes care of a specific problem you have, and you want somebody that meets these certain parameters, we'll talk. If it doesn't, that great. You've got something better than I've got, because I've got cash, and I've got a problem, and you've got a good business, and you don't have a problem.

Mrs. B wasn't richer when she sold me the business. She did have one son and, at that time, three grandsons in the business, and she had three daughters and their husbands, and a bunch of their children who weren't in the business, and everybody owned 20% of it. So she thought there would be some sort of problem when she died. She was a strong enough matriarchal figure that there weren't and problems when she lived – she told them what to do, and that was it. But, when she was gone, she could see trouble. You saw it down at the Louisville Courier/Journal a couple of years ago with the Bingham family. You get a lot of money, but somebody gets unhappy. Sometimes the in-laws get unhappy. Some people prefer to solve that problem themselves, when they're alive, rather than have some trust department try and solve it when they dead. But, I don't want people selling to me because they think they're getting richer, I want them selling to me because it solves some particular problem, and I can help them solve it.

I can do things that other companies can't do. I can arrange the transfer of some of the ownership of the business to another generation. I can promise them it won't get resold. Virtually no other American company can do that. If the XYZ company goes out and buys See's or Borsheim's, the President of XYZ company can say "we're not going to sell it" but he may be taken over himself, his board of directors may tell him to do something, McKinsey may come in next week and say "get out of this business and get into some other business." You can get double crossed in a lot of ways that there's no moral stigma attached to, but that's just the way the cards fall. With me that can't happen. The only thing that can happen bad to them is if I double cross them. So they have to make a judgment whether I'm lying to them. I can't come back to them later and say the board's told me we've got to get out of the jewelry business, there's this great offer that's come in, I've got this fiduciary responsibility, blah, blah, blah, blah. That won't happen.

[Question from audience.]

They're rich because they've already gotten rich by having the company. All they're going to do, if they take money from me, is they're going pay some taxes, and they're going to invest in some other business. They might buy Berkshire, they might buy General Motors, they might buy

government bonds, but they already had a good business. And they don't have to pay the taxes. So they are not getting richer.

I can help them with some problems. When Ike at Borsheim's came to me I said "look, I will pay you X, and I will show you how to get more money than that, and here is how you can do it." He said "I'm not interested."

[Question from audience.]

We don't want what I call the used cigar butts, where you get one free puff and that's it (garbled comment from audience). Well, partly I don't have the people to stick in anyway. And I don't want to go through the human travail that's involved in that.

I don't want to go through it, basically. And, if you have your choice, we'll just think in terms of looks now, but marrying some gal that's the girl of your dreams and having another one and saying "If I send her to the psychotherapist for five years and have some plastic surgery" well maybe it will work [tape ends].

Lecture to Undergraduate Students

[Tape picks up in middle of lecture.]

...we let the operating managers run their businesses, and we have them send the money to Omaha. And then we try to buy more businesses. And sometimes we can buy all of a business, and sometimes we can only buy part of it. But we're the largest shareholder of the Coca Cola Company, we're the largest shareholder of Capital Cities/ABC Broadcasting, we're the largest shareholder of Gillette Company, and then probably Champion Paper, Geico, the insurance company, the Wells Fargo bank. There's quite a few.

We buy entire businesses, or we buy tiny pieces of businesses called "stocks" and we have the same approach to it. And if the capital comes in, we're willing to do either one. In this year's annual report, in answer to the question of what I do, I tell the story of my granddaughter's birthday party...

[Told Beemer the Clown story again]

I sit there in Omaha and wave my magic wand. But, I've got all these Beemers out there, running businesses. They run them exceptionally well. Our businesses are generally characterized by unusual market strength and terrific continuity of management. Almost everybody that works for us is independently rich because we've usually bought their business. And they've received a lot of money from us. And one of the main parts of my job is to figure out, when I'm sitting across the table from John Smith and I'm going to hand him a check for \$50 or \$100 million, I have to decide whether he's going to get out of bed the next morning. And it's very important to me that he is just as interested in running his business, and he thinks of it as his business, the next day, and the next year, and the next decade, as he was when he owned it all himself. With a lot of people, there's no way to buy that. You can't set up an incentive compensation scheme that accomplishes that because they've already got all the money they need. You really have to make a judgment as to whether they run their business because they love business or because they love money. If they love money, we don't have a chance. We can pay them a lot of money, but they've already got a lot of money. They never need to come to work another day in their life after they sell out to us, and yet virtually all of them works harder now than they've ever worked before. The main reason for this is that they're that type – that is the way they're put together.

Secondarily, we try to provide an environment for them which is exactly like what we'd want if we were running a business. The main thing we would want is we would not want a lot of second guessing, we would not want a lot of home office meetings, we would not want a lot of supervision from some group Vice President at headquarters. We just would not want a lot of nonsense. We would like to run our own business in our own way. If you were a great golfer, and let's just say, going back to my generation, you were Arnold Palmer, you'd basically play golf because you like to play golf. But if he was playing golf, and we were doing it for money, and in some way I owned him, and I kept saying "why don't you use a four iron instead of a five iron, and why don't you aim a littler further to the right" after a while he'd wrap the club around my neck. And rightly so. If you get really talented people, you've got to give them a chance to do their own thing.

We bought a uniform company in Cincinnati five years ago, a \$100 million company. I've never been to Cincinnati. I've never seen a factory of theirs, I don't know what their offices look like. I know the people quite well.

We've got a candy company, See's Candies in California. We sold 13.5 million tons of boxed chocolates last year and made \$39 million before taxes. The fellow that runs it has been running it from the day we bought it 19 years ago. We made a deal with him, and in 30 seconds worked out an incentive compensation agreement. In 30 seconds. Never wrote it down, never had a lawyer. That deal is still the same deal 19 years later. He's been to Omaha exactly once. Last year he came to the annual meeting to see whether there really was a Berkshire Hathaway in Omaha. We've never had a group meeting of any kind. We don't force anything on them. We actually moved the headquarters of the company from Los Angeles to San Francisco because his wife liked living in San Francisco better than she like Los Angeles. Instead of having a guy with a wife that was considerably less happy living in LA, it was a lot easier to move the business to San Francisco, so that's where it comes from now.

We have no retirement age. We had a woman running a business for us, we'd bought her business when she was 89, and she was Chairman of the Board, and she ran it for us until she got mad two years ago and left at 95, because, foolishly, I'd forgotten to get a non-compete agreement from this 89-year-old woman when we made the deal. She now competes with us across the street. She works seven days a week. We've never let anybody go because of age. We had one fellow, ran a savings and loan for us in Pasadena [Wesco Financial], he kept trying to get me to get somebody else, he was 75 years old. [He'd say] "you've got to get another guy in here" and I'd say "Louis, how's your mother?" She lived to be 93 and that ended the conversation.

So we have a business with very few rules. The only rules the managers have is to basically think like owners. We want those people thinking exactly like they own those businesses themselves. Psychologically, we don't even want them to think there is a Berkshire Hathaway. They know they will never get sold. They don't have to sit around and wonder if there's going to be a takeover raid on Berkshire.

Let's talk a little bit about what you're interested in. This is a little bit different group than I usually talk to, it's almost always been MBAs in the past, and it's quite refreshing to get a mixture of liberal arts people in, so you can throw anything at me that you care to – nothing's off limits.

[Question from audience.]

They hardly get richer because they sell to me. I tell them "If you come to me, and you've got a wonderful business, I can't make you richer than you are. If you sell to me for \$100 million, it's only because your business is worth \$100 million. And you'll pay a lot of taxes and you won't have \$100 million. If you take the remainder after-tax and buy General Motors and AT&T you'll have a lot of businesses you don't understand, instead of one you do understand. There's no reason to sell to me to get richer. I always tell people the only reason I'm buying is because I think it's going to be worth more. If they are selling to me simply to stick a lot of money into

their own pocket, it's the wrong reason. But frequently....

One woman was 89 when she sold to me. She had four children. One worked in the business, three didn't work in the business. She had multitudes of grandchildren. three of them worked in the business, two of them didn't. The stock was divided equally, 20% with each branch, plus 20% she kept. As long as she was around, she was an enormously strong personality, there weren't going to be any problems because she was going to tell people what he answers were. The day she died, she felt that there would be a developing situation where people didn't work and wanted to get the money out of the business and that the people who did work would resent the fact that the people who didn't work were cashing in. You get a lot of that as families move along. So she preferred to solve it herself by getting cash for the members of the family that weren't involved in the business, and then I moved the ownership of the remaining people down to the lowest generation of the ones that were in the business. That happens a variety of times.

The uniform company we own in Cincinnati had an LBO some years earlier and there were four or five venture capital firms there and they just wanted to take a quick profit. The guy who ran it realized he'd made a mistake when he sold out to a group like that in the first place, so he steered it to us. He wrote me out of the blue.

I've got a little ad in my annual report every year. We're in advertising businesses (garbled) and this year it's under the section "Help, Help." I tell them the kinds of businesses we want to buy. This fellow had seen that in Cincinnati, wrote me a letter and said "I'm your guy." And I looked at him and said "You are my guy." We bought out all the venture capitalists, but we kept the family in. And they run the business. It's that kind of thing that comes along.

The Scott Fetzer company, which is 20 other businesses, World Book, Kirby, 20 others, Campbell Hausfeld, almost a billion of sales. They had been a New York Stock Exchange company and there was a takeover attempt, even Ivan Boesky was involved, they had a whole raft of things. I'd never met the fellow then. I wrote him a letter, I said "Dear Mr. Schey: Here's what we are..." I sent him an annual report and said "If you want to do businesses with someone whose checks will clear, who won't bother you, here's all the shoes that will drop (I told him all the bad things about us), a one-page letter. Sent it. (Kind of difficult to get all the bad things about us on one page.) I said "If you want to talk about it, I'll meet you, and if you don't, throw the letter away." He called me up, we met on a Sunday in Chicago, made a deal that night and, in a week, the deal was done. That was five or six years ago – I've been to Cleveland twice, not because I needed to be. He runs that business exactly like he [owned it himself]. \$97 million pretax earnings.

[Question from audience.]

I don't know if everybody could hear that. In that past, at least in some departments, you've heard that there is no such thing as buying an undervalued stock, or making money in stocks, that the market is efficient, and that everything is priced right at all times relative to the known information about it. Therefore, there's no use thinking. And, of course, from my standpoint I'd like to have everyone believe that, because it's a terrific advantage to be in a game where your opponent has been taught not to think. I wish the people I played

bridge would. An appreciable percentage of the money in Wall Street is managed by people who believe that. It's the old story that if there's a \$20 bill on the floor there's no sense picking it up because it can't be there. That thinking, I would say, prevailed extensively 10 years ago. I would say there's a little less of it now. All I can tell you is it simply isn't true.

The last class I told of how, in 1966 or so, we bought 5% of the Disney company for \$4 million. The whole company was selling for \$80 million! They'd written off all their films, Snow White, Three Little Pigs, Fantasia, all 220 some of them, written down to zero. You got 300 acres down in Anaheim and all of Disneyland for zero. The Pirate Ride had just been put in that year – \$17 million it cost, yet the whole company was selling for \$80 million. It was a joke. Mary Poppins made \$30 million that year. They were going to recycle Mary Poppins seven years later, they were going to recycle Snow White seven years later. It's like an oil field where the oil seeps back in, and every seven years a new crop of kids comes along and they all want to see Snow White. And they drive their parents crazy until they get to see it. Well, that whole company was selling for \$80 million. You don't have to be a financial analyst, you don't have to be finance major, to know that's a ridiculous valuation. Eleven million people a year go to Disneyland. That's seven bucks a person and you get the (garbled) thrown in free. It was a joke. And Walt Disney would tell you, if you went out to see him, would tell you all about the values, and what he had planned. It just happens occasionally in securities.

Now, an efficient market theorist would tell you that \$80 million is the correct value on the Walt Disney company. And he's wrong. You do not have to have very many like that in a lifetime. It's not very esoteric, it does not require some insight into what's going to cure AIDS, or what's going to be the best computer five years from now, or the best software manufacturer – it doesn't require anything like that. It just requires figuring out whether people will be eating Hershey bars or drinking Coca Cola.

This company [Coke] you could have bought one share of stock for \$40 in 1919, when they went public. If you reinvested the dividends, you'd be worth a million now. There are 150 countries in the world where they sell this and in every single one of them per capital consumption goes up every year. It's not that complicated. The Chairman of your [Notre Dame's] Board, Don Keough – I don't know if you're familiar with that; he is also the President of Coca Cola – used to live across the street from me in Omaha in 1960. He was a coffee salesman for Butternut Coffee, making \$200 a week. And if you knew Don Keough there was no way that, if you put Don Keough together with Coke, you were going to miss. There really isn't any way they won't be selling a lot more Coca Cola products five years from now than they are now. And, they'll be making more money on each one. If you raise the price of each one of these a penny, it's \$2 billion a year.

[Question from audience.]

The question is whether LBOs and junk bonds and so on have hurt the country in some fundamental way in terms of its competitiveness vis-à-vis the world. I wouldn't go that far, but I think on balance it's been a huge minus on the financial scene. Extreme leverage has been, generally speaking, a net minus. The analogy has been made (and there's just enough truth to it

to get you in trouble) that in buying some company with enormous amounts of debt, that it's somewhat like driving a car down the road and placing a dagger on the steering wheel pointed at your heart. If you do that, you will be a better driver – that I can assure you. You will drive with unusual care. You also, someday, will hit a small pothole, or a piece of ice, and you will end up gasping. You will have fewer accidents, but when they come along, they'll be fatal. Essentially, that's what some of corporate America did in the last 10 years. And it was motivated by huge fees. And it was motivated by greed.

The most extreme case I saw was a television station. About three years ago, a television station in Tampa sold for an amount where, when they had to borrow the money, the interest amounted to more than the total sales of the station. If everybody donated their labor, if they donated their programming, if they donated their utilities, they still wouldn't have enough to pay the interest. They went crazy. And you can buy those bonds at 15 cents on the dollar. Charlie Keating's enterprise [Lincoln Savings and Loan Association in California, which became the nation's largest thrift failure] had a bunch of them too. There's a lot of crazy stuff that went on in the last five or six years. The fees on that deal, they paid \$365 million for the station, they borrowed \$385 million and you can guess where the extra money went. It went into the pockets of the people who put the deal together.

[Question: Is it comparable to say the same thing about companies and our government debt?]

No, it really isn't comparable. The important thing on government debt is how much is owed externally. If this group landed on an island someplace, we were stranded, and the only person we could do business with was another islander, and we all went to work producing rice, and we worked hard eight hours, and we had just enough rice to stay alive. If we worked out some internal system where some people worked 10 hours a day, and some other people worked six hours a day, and the people who worked six hours a day "borrowed" two hours worth of rice daily from the people who worked 10 hours a day, as an island we wouldn't be getting poorer. We might have some class that owed future rice, plus interest, to the people that had saved, but we would not be any worse off. We would consume all the rice we produced each day, it's just that some of us would have claim chits on each other.

If, on the other hand, we all decided to quit working, because people on the other island would work 16 hours a day, and they would ship over eight hours a day of rice to us, so we would just eat and mail them IOU's (we'd send over a guy in a canoe each night with the IOUs, they'd send over rice every day), we'd all just sit around, but the little IOUs we sent them drew interest, and then after 10 years they said "we would just as soon quit producing rice the next 10 years and you guys work 16 hours a day." That won't work so well, particularly if it's a different generation that's being asked to work the 16 hours a day later on to pay back the rice from the first generation.

External debt, something our country owes the rest of the world, is a whole different question than internal debt. The national debt is largely held internally, but the game is changing as we run a trade deficit. So the trade deficit is a threat, essentially, to living as well as we live now. We are, essentially, selling off a little piece of the farm every day, as we run a trade deficit in

order to finance our own consumption. We've got a very big rich farm, so we can sell a little piece of that farm for a long time without hardly noticing it. It's a lot like eating a little too much over time. You never see it in any one day. You don't all of a sudden get up, all of your buttons pop, and people say "God, you look fat!" It just doesn't happen. What happens is you just keep doing it so pleasantly until, after a while, you've got a helluva waistline. And that is, essentially, the situation in our trade deficit. We are giving the rest of the world claim checks on us. That has consequences over time.

In fact, we sold our building to the Japanese, but it doesn't make any difference whether it's the Japanese or anybody else. We sold our buildings at ABC two years ago for about \$175 million. That was equal to one day's trade deficit with Japan. They sent up a bunch of VCRs and things, and we sent them the title to 54th Street and 6th Avenue. And we use up the one thing and they've got the other.

It's got sort of a poetic justice to it. As a matter of fact, in 1626 I think, Peter Minuet handed a bunch of trinkets to the Indians and they paid him the island. And now, people are handing us the trinkets, and we're giving them the island. It happens every day. The trade deficit will be \$100 billion plus, and that means we are giving out IOUs to the rest of the world that will draw interest, which are claims of future production of everybody in this room.

Now the internal debt, that's an entirely different story. That person helps, but the help is commensurate with the hurt. When it goes abroad, the equation is not the same.

[Question from audience.]

The question is whether we just invest domestically or also abroad. The answer to that is, in terms of buying securities, everything we've bought, almost, has been domestic. It's not that I rule out other investments. We almost bought a pretty good sized investment in England a year or two ago, and we look at things elsewhere.

The United States is a \$3 trillion equity pool, a \$3 trillion pool of equity investments. If you can't make money in a \$3 trillion pool, you're probably not going to make money in a \$6 trillion pool.

Now, Coca Cola earns 80% of its money abroad and we hold 7% of that. Our 7% share is roughly \$100 million. Of that, roughly \$80 million comes from abroad. Coca Cola is spending an enormous amount of money in East Germany in the next year. They were in there big in March of 1990. Interestingly enough, the first Coca Cola they sold in East Germany, you may be too young for this, but it was shipped from Dunkirk where the Germans, essentially, drove the English into the sea 50 years ago. For a while all the Coca Cola was going from our big bottling plant in Dunkirk to East Germany. Now, the infrastructure has been built up within East Germany tremendously, and it will be a good market for Coke.

Coke is also in McDonald's in Moscow. The Moscow McDonald's is doing \$235,000 in business a day, 50 times the average McDonald's in this country. You think of 50 McDonald's opening and that's how much business that Moscow McDonald's has done. That's a lot of people buying Coke.

[Question from audience.]

The question was, “Have I changed my ideas over the years as my bank account has increased?” The truth is, I used to have more ideas than money and now I’ve got more money than ideas. You’ve put your finger on that particular problem, but there are worse problems.

The only ideas we’re interested in now are big ideas. We are not interested in anything that we do not think we can put at least \$100 million into, usually quite a bit more. We own fewer stocks now, with \$7 or \$8 billion, that we owned back when we had \$15 million in 1970.

We do not try and buy more and more of everything. I call that the Noah’s Ark approach to investing – have two of everything. We’ve got a very selective ark, and we only want a couple of specimens on there. It makes it more difficult, but you don’t need very many good ideas. If we get one good idea a year, that would be terrific. And if you negotiate with me, you’d get me down to one every two or three years. That’s all you need. You do not have to keep hitting home runs all the time. That’s one of the nice things about this business. If you make one decision on something like that, it takes care of a lot.

I always tell classes that, in the investment world, if you had a punch card when you got when you got out of school, and there were only 20 punches on it, and when that was done, you were all done investing, you’d make more money than having one with unlimited punches. You’d make sure you used them for the right things.

The big things are not what you do, they’re what you don’t do. Basically, we’ve had very few things we’ve lost money on. We’ve had no more good ideas than other people. But we’ve not made big mistakes – that I learned from Ben Graham. He used to say there are two rules in investing. The first: don’t lose. The second: don’t forget the first.

[Question from audience.]

The first question was, “Does the current recession change our attitude toward investing?” It doesn’t change it a nickel’s worth. If something comes along tomorrow that’s interesting, I will do it tomorrow. And it will be by exactly the same yardsticks I used whenever the business cycle was at its peak. We don’t care what businesses are doing. If the Chairman of the Federal Reserve called me tonight and said “I am really panicking and things are terrible,” I don’t care. We will do exactly what we were going to do tomorrow morning. The truth is, on balance, we will do more business when people are pessimistic. Not because we like pessimism, but because it makes for prices that are much more attractive. If you all have filling stations to sell in South Bend, I want to do business with whomever is most negative about filling stations. And that’s where I’m going to make the best buy. Times are really good and times are really bad, over a period of time. We don’t quit selling candy in July just because it isn’t Christmas. We pay *no* attention to economic forecasts. I don’t read anything [along those lines]. I read annual reports, but I don’t read anybody’s opinion about what’s going to happen next week, or next month or next year.

The second question is whether there are any special industries we favor. The only thing we favor is industries we can understand. And then, we like businesses with what I call “moats” around them. We like businesses that are protected in some way from competition. If you go in the drugstore and say “I want to buy a Hershey bar” and the guy says “I’ve got an unmarked chocolate bar that’s a nickel cheaper,” you’ll buy the Hershey bar or you’ll go across the street.

One of the interesting things to do is walk through a supermarket sometime and think about who’s got pricing power, and who’s got a franchise, and who doesn’t. If you go buy Oreo cookies, and I’m going to take home Oreo cookies or something that looks like Oreo cookies for the kids, or your spouse, or whomever, you’ll buy the Oreo cookies. If the other is three cents a package cheaper, you’ll still buy the Oreo cookies. You’ll buy Jello instead of some other. You’ll buy Kool Aid instead of Wyler’s powdered soft drink. But, if you go to buy milk, it doesn’t make any difference whether it’s Borden’s, or Sealtest, or whatever. And you will not pay a premium to buy one milk over another. You will not pay a premium to buy one [brand of] frozen peas over another, probably. It’s the difference between having a wonderful business and not a wonderful business. The milk business is not a good business.

In our candy business, Valentine’s is coming up, and See’s candy on the West Coast is a very desirable item, and very few men will want to hand their girlfriend, or wife, or whatever, and say “Here honey, I took the low bid.” It just doesn’t sell. We want things where they’re not terribly price sensitive. And if you’re going to go out and buy a car this afternoon, you’re not going to say “I’d like that red job there, but I want to be sure it has steel that came from Bethlehem steel.” You don’t care where the steel came from. And, therefore, Bethlehem’s got nothing to say to General Motors, or Ford, except what wonderful guys they are. And General Motors says “We know you’re wonderful guys, and so, if Y sells it for X dollars a ton and you’d better be \$5 under them.” Anything that differentiates your product – those are the businesses we like to be in.

We like to be in businesses I can understand. There are all kinds of businesses I don’t understand, but we’re not going to own them. Thomas Watson Sr., of IBM, in that book “Father, Son, and Company, that his son wrote, quoted his father as saying “I’m no genius, but I’m smart in spots, and I stay around those spots.” The real trick is knowing what you know, and what you don’t know. It isn’t how much you know, it’s whether you can define it well, so you know when you can take a swing at the ball, and you know when you’ve got no business swinging.

[Question from audience.]

The durability and strength of the franchise is the most important thing in figuring out [whether it’s a good business]. If you think a business is going to be around 10 or 20 years from now, and that they’re going to be able to price advantageously, that’s going to be a good business. And if somebody has to have a prayer session every time they want to raise the price a dollar a pound on whatever they’re selling, that’s not going to be a good business.

What’s the highest priced daily newspaper in the United States? Most of you are familiar with it. The highest priced daily newspaper in the United States, with any circulation at all, is the *Daily*

Racing Form. It sells about 150,000 copies a day, and it has for about 50 years, and it's either \$2.00 or \$2.25 (they keep raising prices) and it's essential. If you're heading to the racetrack and you've got a choice between betting on your wife's birthday, and Joe's Little Green Sheet, and the *Daily Racing Form*, if you're a serious racing handicapper, you want *The Form*. You can charge \$2.00 for *The Form*, you can charge \$1.50, you can charge \$2.50 and people are going to buy it. It's like selling needles to addicts, basically. It's an essential business. It will be an essential business five or 10 years from now. You have to decide whether horse racing will be around five or 10 years from now, and you have to decide whether there's any way people will get their information about past performances of different horses from different sources. But you've only got about two questions to answer, and if you answer them, you know the business will make a lot of money. *The Form* has huge profit margins, incidentally. Wider than any other newspaper. They charge what they want to basically. It's an easy to understand business – so easy to understand.

Snow White is going to show up every so often, and when she shows up, millions of kids are going, and they'll make their money, and they don't have to make the picture again. Made back in 1937 or so. It's a perpetual royalty on youth. And that's not a bad business.

[Question from audience.]

Where did Donald Trump go wrong? The big problem with Donald Trump was he never went right. He basically overpaid for properties, but he got people to lend him the money. He was terrific at borrowing money. If you look at his assets, and what he paid for them, and what he borrowed to get them, there was never any real equity there. He owes, perhaps, \$3.5 billion now, and, if you had to pick a figure as to the value of the assets, it might be more like \$2.5 billion. He's a billion in the hole, which is a lot better than being \$100 in the hole because if you're \$100 in the hole, they come and take the TV set. If you're a billion in the hole, they say "hang in there Donald."

It's interesting why smart people go astray. That's one of the most interesting things in business. I've seen all sorts of people with terrific IQs that end up flopping in Wall Street or business because they beat themselves. They have 500 horsepower engines, and get 50 horsepower out of them. Or, worse than that, they have their foot on the brake and the accelerator at the same time. They really manage to screw themselves up.

I tried this with the last class. Let's say each one of you could buy 10% of the earnings, forever, of anybody else in this room, except me. Let's charge \$50,000. And that means that if somebody gets out of here and earns \$30,000 you get a \$3,000 royalty off them. But, if they do extremely well, and become President of Coca Cola like Don Keough did, you'll make a fortune.

How are you going to think, in terms of the rest of the people here, of which one you want to buy the 10% of? Let's say we had Donald Trump here, and my friend Tom Murphy, who runs ABC, or Don Keough, and you're really betting on the lifetime of each of them, and let's say they're all in equally good health. Would you give them an IQ test? Well, you'd want to be certain they have a certain amount of IQ. Would you want to measure how strongly motivated

they were, how much they wanted to get rich? Donald Trump wanted to get rich. That might not be a great qualifier. What would you do to select that one person out of this whole crowd here, because there will be a huge difference in results here. There's not a huge difference in IQ. But there will be a huge difference in results. I would venture to say, I don't know how well this group knows each other, you come from two different schools, so I'd break it down into two groups, I would venture to say that your guesses would not be bad. They'd be better if you'd had more experience with the group, and if you've had more experience generally, but they will be way better than flipping coins. You would probably relate it to a lot of qualities, some of which would be straight from Ben Franklin – I would suggest that the big successes I've met had a fair amount of Ben Franklin in them. And Donald Trump did not.

One of the things you will find, which is interesting and people don't think of it enough, with most businesses and with most individuals, life tends to snap you at your weakest link. So it isn't the strongest link you're looking for among the individuals in the room. It isn't even the average strength of the chain. It's the weakest link that causes the problem.

It may be alcohol, it may be gambling, it may be a lot of things, it may be nothing, which is terrific. But it is a real weakest link problem.

When I look at our managers, I'm not trying to look at the guy who wakes up at night and says "E = MC²" or something. I am looking for people that function very, very well. And that means not having any weak links. The two biggest weak links in my experience: I've seen more people fail because of liquor and leverage – leverage being borrowed money. Donald Trump failed because of leverage. He simply got infatuated with how much money he could borrow, and he did not give enough thought to how much money he could pay back.

You really don't need leverage in this world much. If you're smart, you're going to make a lot of money without borrowing. I've never borrowed a significant amount of money in my life. Never. Never will. I've got no interest in it. The other reason is I never thought I would be way happier when I had 2X instead of X. You ought to have a good time all the time as you go along. If you say "I'm taking this job – I don't really like this job but in three years it will lead to this," forget it. Find one you like right now.

[Tape runs out]

SALOMON INC – A report by the Chairman on the Company’s Position and Outlook

Source - Asian Wall St Journal . 1st, November, 1991 (Advertisement)

To the Shareholders of Salomon Inc:

In this report, I want not only to tell you about Salomon Inc's third-quarter results but also to give you my thinking as to where the company must head.

From announcements we have made and from the media you have learned about the events that led to my appointment as interim Chairman of Salomon Inc on August 18. We have since continued to investigate Salomon's past actions in the Government securities market and in other areas as well. Our conclusion so far: A few Salomon employees behaved egregiously-a fact that will prove costly to you as shareholders-but the misconduct and misjudgments were limited to those few. In short, I believe that we had an extremely serious problem, but not a pervasive one.

..... CONTROLS AND COMPLIANCE

Since August 18, we have installed rules and procedures at Salomon Brothers Inc, our securities subsidiary, that we think set a standard for the industry. In addition, we have begun to monitor what goes on in Salomon Brothers in new ways-for example, by setting up a Compliance Committee of the Board-and expect in that area also to be a leader. Even so, an atmosphere encouraging exemplary behavior is probably even more important than rules, necessary though these are. During my tenure as Chairman, I will consider myself the firm's chief compliance officer and I have asked all 9,000 of Salomon's employees to assist me in that effort. I have also urged them to be guided by a test that goes beyond rules: Contemplating any business act, an employee should ask himself whether he would be willing to see it immediately described by an informed and critical reporter on the front page of his local paper, there to be read by his spouse, children and friends. At Salomon we simply want no part of any activities that pass legal tests but that we, as citizens, would find offensive.

..... OPERATING RESULTS

Ordinary operations during the third quarter produced excellent profits, in large part because of exceptionally favorable trends in the fixed-income markets. I need to alert you, however, to two major adjustments that affected the bottom line, one negatively, one positively.

In the first instance, we have set up a pre-tax legal reserve of \$200 million for potential settlements, judgments, penalties, fines, litigation expense and other related costs. In the second instance, the compensation expense we have recorded for Salomon Brothers is about \$110 million less than what might normally be expected. Because certain legal

costs may not be deductible for tax purposes, different tax rates apply to the two unusual items. Their combined effect, therefore, was a reduction in net income of about \$75 million.

LEGAL COSTS

I would like to elaborate on each of these unusual items, beginning with legal costs. No one can now estimate with any degree of certainty what the eventual direct costs of Salomon's past misdeeds and misjudgments will be to the company. (There are also very important secondary costs, such as loss of business and increased funding, costs; but, as I shall detail later, there may additionally be secondary benefits, perhaps substantial.). Whatever these costs are, however, our large equity base - \$ 4 billion – virtually insures that they will not be crippling.

We will pay any fines or penalties with dispatch and we will also try to settle valid legal claims promptly. However, we will litigate invalid or inflated claims, of which there will be many, to whatever extent necessary. That is, we will make appropriate amends for past conduct but we will be no one's patsy.

Accounting rules require that we review the size of our reserve with Our auditors and counsel. That has been, done and-based on the limited amount of information presently available-they agree with the present estimate. We will make upward or downward adjustments to the reserve ~s information and events clarify the situation.

..... **COMPENSATION**

Most of you have read articles about the high levels of compensation at Salomon Brothers. Some of you have also read discussions of incentive compensation that I have written in the Berkshire Hathaway annual report. In those, I have said that I believe a rational incentive compensation plan to be an excellent way to reward managers, and I have also embraced the concept of truly extraordinary pay for extraordinary managerial performance. I continue to subscribe to those views. But the problem at Salomon Brothers has been a compensation plan that was irrational in certain crucial respects. One irrationality has been compensation levels that overall have been too high in relation to overall results. For example, last year the securities unit earned about 10% oil equity capital-far tinder the average earned by American business-yet 106 individuals who worked for the unit earned \$1 million or more. Many of these people pet-formed exceedingly well and clearly deserved their pay. But the overall result made no sense: Though 1990 operating profits. before compensation were flat versus 1989, pay jumped by more than \$120 million. And that, of course, meant earnings for shareholders fell by the same amount.

A related irrationality is connected to the lopsided way in which Salomon has earned its profits-a matter, indeed, on which Salomon's directors were not supplied sufficient information. The data I now have available show that Salomon's lackluster overall profits of recent years resulted from a combination of excellent earnings in a few areas of the

business-operating in an honest and ethical manner, it should be added-with inadequate or non-existent earnings at the remainder. Yet the compensation plan did not take this extreme unevenness into account. In effect, the fine performance of some People Subsidized truly out-sized rewards for others. It would be understandable if a private partnership opted For such all egalitarian, share-the-wealth system. But Salomon is a publicly owned company depending on vast amounts of shareholders' capital. In such an operation, it is appropriate that the excess earnings of' the exceptional performers-that is, what they generate beyond what they are justly paid-go to the stockholders.

Of course, it is difficult to quantify performance in many vital jobs, such as compliance, audit, funding, and research. For these activities, and for operational and support jobs as well, Salomon employees should normally be paid in line with industry standards, whether profits are high or low. Our compensation plans must also both reward cooperative, for-the-good-of-the-firm behavior and recognize that some business units earn relatively little in profits but deliver valuable, if hard to quantify, collateral benefits to the firm.

All that said, there remain many jobs for which performance can be concretely measured and ought to, be. In these, employees who produce exceptional results for the firm, while operating both honorably and without excessive risk, should expect to receive first-class compensation. On the other hand, employees producing mediocre returns for owners should expect their pay to reflect this shortfall. In the past that has neither been the expectation at Salomon nor the practice.

Salomon Inc's directors have decided that total compensation at Salomon Brothers in 1991 will be slightly below the level of 1990. Through June 30, 1991, however, compensation accruals had been made at a rate that considerably exceeded 1990's. Therefore, a \$110 million downward adjustment of the accrual was made in the third quarter.

In 1991 and in the future, the top-paid people at Salomon Brothers will get much of their compensation in the form of stock, pursuant to the Equity Partnership Plat] (EPP), which previous management instituted last year and which we heartily applaud. The EPP motivates managers to think like owners, since it obliges them to hold the stock they buy for at least five years and therefore exposes them to the risks of the business as well as the opportunities. Contrast this arrangement with stock-option plans, in which managers commit money only if the game has already been won and then often move quickly to sell their shares.

In Salomon Brothers' business, which combines leverage with earnings volatility, it is particularly necessary and appropriate that the financial equation applying personally to managers be comparable to that applying to the ordinary shareholder. We wish to see the unit's managers become wealthy through ownership, not by simply free-riding on the ownership of others, I think in fact that ownership can in time bring our best managers substantial wealth, perhaps in amounts well beyond what they now think possible.

To avoid dilution, the trustee of the EPP purchases stock for the plan in the market and at some point in the future the company may itself elect to make stock repurchases to reduce the shares outstanding. Within a relatively few years Salomon Inc's key employees could own 25% or more of the business, purchased with their own compensation. The better job each employee does for the company, the more stock he or she will own.

Our pay-for-performance philosophy will undoubtedly cause some managers to leave. But very importantly, this same philosophy may induce the top performers to stay, since these people may identify themselves as .350 hitters about to be paid appropriately instead of seeing their just rewards partially assigned to lesser performers. Indeed, I am pleased to report that certain of our very best managers have already asked that the EPP be modified to allow them to substantially increase the proportion of their earnings that can be invested through the plan.

Were an abnormal number of people to leave the firm, the results would not necessarily be bad. Other men and women who share our thinking and values would then be given added responsibilities and opportunities. In the end we must have people to match our principles, not the reverse.

..... **LEVERAGE**

Our September 30th balance sheet totals are down by over \$37 billion from those of June 30th-from \$134 billion to \$97 billion. The pace of change, however, has been even more dramatic than these figures indicate: Total assets on August 16, just before I became Chairman, were about \$150 billion.

In Salomon Brothers' business, I should point out, substantial amounts of borrowed money are necessary and proper. We will continue, for example, to make large, short-term commitments to finance under-writings and block-purchases of equities, mortgages and bonds. Indeed, we expect to be a leader in these fields.

Nonetheless, we have deliberately brought our balance sheet totals down to reduce our leverage, and you will see the totals come down further in the months ahead. I am no fan of huge leverage in general, and in Salomon's case I believe that the swelling of the balance sheet that took place in the past was often done for the sake of all-too-marginal returns. Larger totals can actually lead to smaller profits: Undisciplined decision-making is a frequent consequence of ultra-easy access to funding, as both commercial and investment banks have learned in recent years.

One final, reassuring point about the balance sheet: Salomon's previous management strongly favored conservative reserving. Significant allowances for various risks of the business have been-and will be-maintained.

..... **PHIBRO ENERGY**

Phibro, the other major business owned by Salomon Inc, is achieving only mediocre profits this year after a terrific performance in 1990. Many investors recognize Phibro as a world leader in the trading of oil and related derivative instruments but are unaware of the magnitude of Phibro's oil refinery business. Phibro's four refineries typically process about 330,000 barrels of oil per day, which is equal to more than a third of the U.S. refining output of Exxon. But refining spreads this year have been narrow and Phibro's profits from this business have fallen sharply.

The company has made excellent progress, however, with White Nights (WNJE), its Siberian oil project, in which our Russian partner is Varyeganneftegaz Production Association. I have met with Anatoli Sivak, the talented Director General of Varyeganneftegaz and Chairman of WNJE, and share his enthusiasm about developments to date.

Essentially, this venture is drilling new wells and reworking existing wells in three designated fields. In payment, it is entitled to the incremental output it succeeds in producing over what the output would have been had WNJE's development not occurred.

To date, WNJE has undertaken 37 workovers, of which 25 were successful. Additionally, one new well has recently been completed. In aggregate, these wells have increased production by about 4,700 barrels per day. WNJE is receiving hard currency for its oil and the pace of drilling will accelerate. Though the project entails political and petroleum engineering risks, WNJE's potential is large.

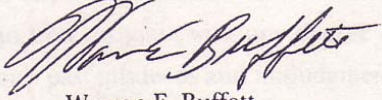

..... **CONCLUSION**

In recent years both Salomon Inc, the parent, and Phibro Energy have been treated by top management as adjuncts to Salomon Brothers. That was understandable, given that the managers of the parent came from the securities unit. Now, however, we are viewing Salomon Inc as the owner of two independent and substantial businesses, each of which will be measured by return on the equity capital it requires.

I noted earlier that there may well be future benefits that arise from our current problems. We have the prospect of correcting certain weaknesses at Salomon Brothers that were likely to remain unaddressed absent a change in management; meanwhile, the firm's strengths in large part remain intact. Though earnings volatility will always be high, Salomon Inc has the capacity amid favorable market conditions to earn substantial profits. Furthermore, I believe that we can earn these Superior returns playing aggressively in the center of the court, without resorting to close-to-the-line acrobatics. Good profits simply are not inconsistent with good behavior.

Our goal is going to be that stated many decades ago by J.P. Morgan, who wished to see his bank transact "first-class business-in a first-class way." We will judge ourselves in fact not only by the business we do, but also by the business we decline to do. As is the case at all large organizations, there will be mistakes at Salomon and even failures, but to the best of our ability we will acknowledge our errors quickly and correct them with equal promptness.

The best decision I have made since assuming my post was my appointment of Deryck Maughan as Chief Operating Officer of Salomon Brothers Inc. He, along with the management of Phibro, join me in a pledge to make Salomon Inc a company that produces superior results for clients, employees and owners.

To the Hilton Head Group

Dear Gang,

Normally, when you get a letter from the wife, partner or secretary of Joe Glutz saying, "Of course, Joe is too modest to tell you about this himself, but I know you would want to hear that...", it means that Joe is standing over the writer with a gun at his head, telling him not to look up from the xerox machine until the mailing has been completed.

This one is for real.

Today I received the 1975 annual letter of Walter J. Schloss Associates, which included a twenty-year compilation of Walter's record since he left Graham-Newman. You may remember that I went to work for Graham-Newman in 1954. Walter left in 1955. And then Graham-Newman closed up in 1956. I would prefer not to dwell on the implications of this sequence.

In any event, armed only with a monthly stock guide, a sophisticated style acquired largely from association with me, a sub-lease on a portion of a closet at Tweedy, Browne and a group of partners whose names were straight from a roll call at Ellis Island, Walter strode forth to do battle with the S & P.

On the following page is a re-cap of his yearly performance and calculations I have made regarding compounded results. The difference between the gross results and the limited partners' results is accounted for by the fact that, as General Partner, he takes 25% of the profits - a quaint and easy-to-calculate method of tribute not entirely foreign to many of you.

Walter has had five down years compared to seven for the S & P. His superiority in such down years would indicate that not only is he a man for all seasons, but that he has special strength when facing a head wind. Maybe all of you had better watch Ben Graham on Wall Street Week this Friday.

As for me, I'm going right out and buy some Hudson Pulp & Paper.

Best,

To the Lantana Group:

Eighteen years ago, I sent you the attached memo that recounted the results Walter Schloss had achieved since starting his partnership in 1955.

The other day I received Walter's 1993 tabulation which is also attached. Accompanying these performance figures is a financial statement that should inspire Ben Graham Productions to film Citizen Schloss. Please note that Walter's total office expense is about \$11,000 as compared to net income of \$19 million. Fixed assets are carried at \$2,605 (000's not omitted), but Walter would like me to mention that the cost was \$6,569 new.

I think Walter's operational style should be a lesson for us all (one Charlie has already mastered). In effect, Walter is running his office for a year on what it costs Berkshire to start the engines on The Indefensible.

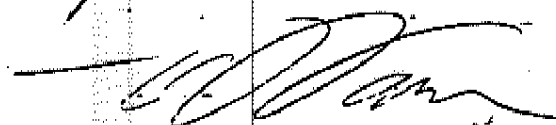

Meanwhile, Walter continues to outperform managers who work in temples filled with paintings, staff and computers. And he accomplishes this feat by rummaging among the cigar butts on the floor of capitalism: It's quite a 38-year record, a tribute to Ben as a teacher, Walter as a student, and to the advantage of a free puff.

Best regards,

Warren E. Buffett

* In 1980, \$1,500. of our distribution was a return of capital.

For the 40 year period ended December 31, 1995, the compound rate of return for the Limited Partners was 337.0% or 15.7% per year compared to a gain for the Standard & Poors Industrial Average of 52.03% or a compound rate of return of 10.4% a year.

It should be noted that most of our distributions are in the form of long term capital gains.

1994 Lecture of
The E. J. Faulkner Lecture Series

*A Colloquium with
University of Nebraska-Lincoln Students*

by
Warren E. Buffett
Chairman of the Board
Berkshire Hathaway, Inc.

Sponsored by
Woodmen Accident and Life Company
in conjunction with
The College of Business Administration-Lincoln

October 10, 1994

WARREN E. BUFFETT

Warren E. Buffett is Chairman of the Board and Chief Executive Officer of Berkshire Hathaway Inc., a company controlled by Buffett Partnerships, Ltd. from 1965. Berkshire Hathaway Inc.'s business activities include underwriting of property and casualty insurance, candy production and sales at retail, newspaper publishing, retailing home furnishings, sales of encyclopedias, sales of home cleaning units, manufacture and distribution of uniforms, retail jewelry, and manufacture, import, and distribution of furniture.

Mr. Buffett is perhaps the most highly regarded businessperson in the United States today. His advice is widely sought, and highly treasured. He serves as a Director of Capital City/ABC, the Coca-Cola Company, the Gillette Company, Salomon Inc. and USAir Group, Inc. Berkshire Hathaway has significant investments in each of these companies. His investment acumen, buttressed by the force of his reputation, honesty, and integrity were instrumental in the preservation of one of the oldest and largest investment banking houses in the world, Salomon Brothers.

Berkshire Hathaway's annual report, authored by Mr. Buffett, is widely read in the business and investment community for its sound advice, its creativity, and its humor in explaining important principles for achieving success in business. The Berkshire annual meeting has become an "event" which not only spreads the Buffett message, but enhances Berkshire's corporate coffers through visitations by shareholders to Omaha's Nebraska Furniture Mart and Borsheim's Jewelry Store, both of which are in the Berkshire Hathaway stable.

Mr. Buffett was born in Omaha to Howard H. Buffett and Leila Stahl Buffett. His father, an investment banker, served as congressman from Nebraska's second district from 1943-1949 and from 1951-1953. Mr. Buffett married Susan Thompson in April 1952. They have three children—Susan, Howard, and Peter.

Mr. Buffett graduated from Woodrow Wilson High School in Washington, D.C. in 1947, attended the Wharton School of Finance at the University of Pennsylvania from 1947-1949 and received a Bachelor of Science degree in Business Administration from the University of Nebraska in 1950. In 1951 he received a Masters degree in Economics from Columbia University. His mentor, Benjamin Graham, was one of his professors at Columbia.

Mr. Buffett serves as Life Trustee of Grinnell College; Life Trustee of the Urban Institute; Trustee of the Business Enterprise Trust, Stanford, California; Trustee of the Wellness Council of the Midlands; and as a member of the American Academy of Arts and Science. His foundation is reported to provide funding mainly on world population issues and nuclear disarmament.

Mr. Buffett resides in Omaha, Nebraska and presides over his financial empire from that city without the "luxury" of a large staff, computer modeling or Wall Street gossip.

The University of Nebraska-Lincoln College of Business Administration and Woodmen Accident and Life Company take great pleasure in welcoming Warren E. Buffett as the 1994 E. J. Faulkner lecturer.

E. J. Faulkner Lecture
October 10, 1994
Warren E. Buffett

Introduction of Warren Buffett

by Mr. John Haessler,
President and Chief Executive Officer
Woodmen Accident and Life Company

It's a great pleasure for me, both personally and on behalf of Woodmen, to welcome you to this lecture, which is 16th in a series that Woodmen has sponsored in conjunction with the College of Business Administration. We have established this lecture, as I think many of you know, in honor of E. J. Faulkner, who served for 60 years with Woodmen, 44 years as a CEO. He was a great friend and a graduate of the campus and of the College of Business Administration. Through his estate, a gift has been made and it is now being translated into the writing lab at the College of Business Administration.

We are greatly privileged and especially pleased to have Warren Buffett here. From the size of this crowd and excitement, the anticipation that's been on campus is obviously honored in the halls of the academia as well as in business.

While he needs no introduction, I think he truly deserves one. And frankly, he deserves one that will be more laudatory and flattering than I will give him, because I don't think a flowery one would comport with his sense of comfort. He's a very basic man.

Much of the activity of Mr. Buffett is highlighted on the handout that you received. He is a native Nebraskan. He was born in Omaha. He went to high school in Washington D.C. His father, who was an investment banker, also served as a congressman from the second district—Republican by the way. (Warren Buffett and I are probably the only two Democrats in this whole room.)

He received his degree from the University of Nebraska College of Business Administration; he then went to Columbia University for a masters, where he studied under Benjamin Graham, who was a friend and mentor for his life. He started, as I think many of you know, modestly in the mid-50's with a limited partnership, some friends and some relatives and about \$100,000 of his money. He's built that into the financial empire of Berkshire Hathaway, and he has now become the richest person in America.

Continued

Now, I know that some of you have seen *Forbes*, and Bill Gates has supposedly passed him in the last year. But nobody wants to tell Warren that. Today, we're going to say he is the richest person in the United States. Besides, we'd already invited him before he slipped.

But wealth is not a very good definer of the man. He has said he enjoys the process far more than the proceeds, and I think that's true. He got his wealth the old fashioned way—he earned it. And he did it not by the sweat of his brow, but by leveraging his brain. And he did it by using his own assets and not somebody else's, and certainly not somebody else's debt. He did it by thinking, and that doesn't sound too unique but in one of his annual reports, he quotes the observation of Burton Russell "that most men would rather die than think and many do." And he says this applies with unusual force in the financial world. Not only is he a thinker, he's an investor; he's not a speculator; he builds; he doesn't tear down. He creates jobs; he doesn't displace persons. And talking about investing and speculation, he writes, "Indeed, we believe that according the name 'investors' to institutions that trade actively is like calling someone who repeatedly engages in one-night stands' 'a romantic.'"

In his annual reports that you've read avidly, he quotes unusual people. Talking about diversity as not being necessarily good, he quotes Mae West, "Too much of a good thing can be wonderful." In talking about extracting himself from a bad deal that he felt was a bargain when he went into it, he refers to a gentleman in a country western song that said, "My wife ran away with my best friend and I still miss him a lot." His style, his humility, his lack of pretense is probably best represented or at least well represented in setting up some details for this lecture. One of the questions was, "Do you want extra security here?" His answer, "We don't need any security; just ask the attendees to check any soft fruit at the door."

Ladies and Gentlemen, it is a great pleasure to present a true legend in his own time, the oracle of Omaha, Warren E. Buffett.

Warren Buffett's opening remarks and conversation with students:

Testing. One million, two million, three million.... Somebody yelled out from the back, earlier, "I can't hear you." I was giving a speech a few weeks ago and the same thing happened. Somebody said, "I can't hear you." And, then someone in the front stood up and said, "I can. Let's change places."

It's really good to be here today. I have a lot of great memories of the University. My mother and father met here when my dad was editor of the *Daily Nebraskan* in 1924. My mother had worked for her father's tiny paper in West Point. And so, when she came here, she went into the *Daily Nebraskan* to apply for a job and met my dad there. Within a couple of years, they were married. Then about twenty-five years later or thereabouts, after two years at the Wharton School at the University of Pennsylvania, I transferred here and I must say that I thought that my year here was considerably superior to either of the years I'd had at Wharton. I got a lot of education. Ray Dein from here was a terrific accounting professor at that time. We were reminiscing earlier a little bit about Carl Arndt, who taught Economics. Professor Arndt, when he taught Economics, would leave the room during the exams. We thought that was very trusting of him. He explained that, well, he could do that because, although we had the same exam, he had different answers for the odd and even numbered seats.

I would like to talk to the students, primarily, a little bit about your future because an experience I had a couple of years ago may tie in with that. Then we'll get into questions and what's on your mind. But I did have an experience in 1991 that may have some applicability to you students in the room.

What happened then was that on a Friday, August 14, 1991, I received a phone call at a quarter of seven in the morning. And, it woke me up, I'm sorry to admit. That early-to-bed, early-to-rise stuff is, well, you can forget that. I'm not going to give you any of that. In any event, I got this call and on the other end were some people in a conference room, obviously on a speaker phone. They told me that the top management of Salomon had been told the previous night, by the President of the New York Federal Reserve Bank (and he is the most important man in financial markets in the world; he is not that well known, the Chairman of the Fed would be better known), but the President of the New York Fed, in terms of financial markets is number one, and his name is Jerry Corigan. Mr. Corigan had told the top management of Salomon that they were unacceptable to be running the institution; and he meant, immediately. So they decided the next morning that they were going to leave. They had to leave. And they were calling to say that as of that time there was no one there to run the institution.

That was a rather serious situation because at that time, Salomon owed more money than any other institution in the United States, with the exception of Citicorp, the big bank. Citicorp owed a little over \$200 billion. Salomon's total liabilities were just under \$150 billion. Now, \$150 billion was roughly equal to the profits of all of the companies on the New York Stock Exchange in that year. So, it was more money than the Bank of America owed. It was more money than American Express owed. It was more money than Fannie Mae owed. Only Citicorp owed more money. The problem about this \$150 billion was that basically, it almost all came due within the next couple of weeks. Unlike Citicorp or the Bank of America or Manny Hanny or the other big banks, people who had lent money to Salomon were not

protected by FDIC insurance, so they could not look to the government that way. And, they were also not protected by what's called the "Too Big To Fail Doctrine". Basically, people feel, although the Fed has not been terribly specific about it, that any of the really big banks will not be allowed to fail because the Fed is worried about a domino effect. So, if people were worried about the solvency of Citicorp or Chase or somebody like that, they didn't really worry about their deposits there because they had both FDIC insurance and they had this "Too Big To Fail Doctrine". Salomon had neither. So, we were faced with the fact all over the world, because this money was owed all over the world, that people on that Friday and the following Monday were going to want us to pay back \$140 odd billion or something close to it, which is not the easiest thing to do.

I went to New York that afternoon, and I met with Mr. Corigan that night. I won't forget that because when I went in, in kind of a light way, I said to Mr. Corigan, "The only thing I owe personally is \$70,000 on a second home I have in California and that is because the interest rate is cheap. I may need a little help," and I smiled kind of weakly. He gave me this steely look and he said, "Prepare for all eventualities". I didn't know exactly what he meant by that but I certainly thought of strychnine or something of the sort. So anyway, one immediate problem I had was that my basic job was going to be dealing with regulators and Congress and all that sort of thing. And, essentially, we had to reassure the world, between that Friday night and the following Monday morning, that Salomon was not going to collapse or we were going to have a run on the bank.

This is where the story starts becoming applicable to this group. One of the things I immediately had to do was to find somebody to run the place. This was a company with 8,000 employees; perhaps 500 or more in Tokyo and 1,000 or more in London. And, spread all over the world, we owed \$10 or \$15 billion in Japan and similar amounts in Europe. So, there was a real problem, in terms of who was actually going to run the place day to day.

This is a company that, because it has a very big government securities operation, now does over \$200 billion of business a day. You don't make very much money on it, but that's close to three times as much business as Wal-Mart does in a year. Now, it is a different sort of business. But it does require someone who knows what is going on, and I didn't know the business or the details of the business at all. So, I was faced on that Friday night with the problem of deciding who would run this place and then making a recommendation to the Board, that was going to meet on Sunday. There were about a dozen candidates for that job who were high up in Salomon. I only knew four or five of them by their faces. I knew most of the twelve by name, but I only had met four or five of them. This was the most important hiring decision in my life.

I hope all of you are going to go out and get hired in the next few years. And, it might be interesting to know what went through my mind in making that important hiring decision because it may be going through the minds of some of the people that you will be facing in the next few years. What I did was interview those twelve people. We had one discussion on Friday night because they were in an uproar about something or other, and then the next morning, I interviewed these people serially over a three- or four-hour period. Now, the good news is that I did not ask them their grades in business school. You can relax. But, the bad news is, of course, that I didn't even ask them whether they went to business school. I did not ask for their résumé. I never saw a résumé on the fellow that I decided on. I really had to decide in that time who was going to be the best person for me to go into a fox hole with and who was going to be able to lead this organization during an extremely difficult period, when people would be quitting, when customers would be badgering them,

and when lenders would be pulling out—all of that sort of thing. I didn't give them an IQ test. I had twelve people there who all were smart enough to run the place. And, most of the people in this room, a very significant majority, would be smart enough to run the place.

Most businesses do not require somebody with a staggering IQ. I wasn't looking for Forrest Gump, either. But, the dozen or so had all the IQ necessary; they had all the drive necessary. These are people who were used to working twelve hour days and had lots of push. So, it was not a question of energy. It was a question of who, in my view, with both of those qualities already a given, really was the highest quality individual. It was the person who would not stick a gun to my head after he took the job, because I couldn't afford to fire whoever came in and I couldn't afford to have him quit on me when the going got tough a week or two weeks or month later, because with one more event like that, it would have been curtains. So, I really had to be sure of the steadfastness of the individual. I had to be sure he was up to it temperamentally, because the pressures would be enormous.

The person I decided on never asked me then; he never asked me a week later; he never asked me a month later, what the pay was. Basically, he was a battlefield promotion and he behaved like he was a battlefield promotion. He could have come to me and said, "Look, I could go over to Goldman Sachs and make 'X' this year and this is going to be much tougher so I want 150% of 'X' from you". He never said a word about that. As a matter of fact, in the first year, just to set an example, he reduced his pay, running the whole place for less than he had made running the Tokyo office the year before. He never asked me to indemnify him against the lawsuits that would be forthcoming if the place failed. If things had gone bad, and you couldn't tell whether they would or not, we were going to get sued by everybody in the world. And, if Salomon had gone under, its indemnification would have been no good.

So, it would have been perfectly reasonable for this person to say, "Well look, I'll take this job but who knows what's going to happen and if it happens, Salomon isn't going to be good for it. So why doesn't Berkshire Hathaway or why don't you personally indemnify me against the lawsuits I'll be facing the rest of my life if this goes sour?" He never said a word about it. It wasn't because he was dumb and didn't know enough to ask that. He just felt it was not the right thing to do under those circumstances. So, in the end, I picked out the individual there who I felt was an outstanding human being. He never let me down. He took on that job the next day. We came out of a directors' meeting at three in the afternoon. And, there were these twelve people out there and I just walked up to him and said to him, "You're it, pal". And, we went right from there down the elevator to meet a couple hundred reporters who had come in on a Sunday afternoon and who were plenty hostile in some ways. He sat up there on the stage with me and answered questions for three hours. And, I knew then I had made the right choice.

Now, the interesting thing about that choice is that the qualities that attracted me to him were not impossible for anyone to achieve. He didn't have to be able to jump seven feet. He didn't have to be able to throw a football sixty yards. He didn't have to be able to remember every bridge hand he played the previous year or something of the sort. There was no feat of intellect or something like that. What he did was bring qualities like steadfastness and honesty. I knew he would tell me the bad news. I always worry about that with people who work for me. They don't need to tell me the good news. I just want to hear the bad news. I knew he would not get his ego involved in decisions. I knew he would not be envious or greedy or all of those things that make people unattractive. And, the truth is, that anybody can have those same qualities that Deryck Maughan, the fellow I picked, exhibited. They are not feats that are beyond anyone. They are simply a matter of deciding what you are going

to do and what kind of person you are going to make out of yourself, and then doing it.

John mentioned Ben Graham, who was my teacher at Columbia University. When he was twelve years old, he sat down and made a list of the qualities he admired in other people; and he made a list also of the qualities that he found unattractive in other people. He decided that it was just an act of will and then habit to develop those attractive qualities and to get rid of the unattractive qualities. Anybody can show up on time; they cannot claim credit for ideas that are not their own; they cannot cut corners; they can avoid envy. All of those things are doable and they make an enormous difference in how you function, not only in your job but in society subsequently.

I'll give one more illustration. Let's just assume when you got out of school, that you won a lottery of some sort and you were entitled to pick one of your classmates, and you got 10% of the earnings of that classmate for the rest of his or her life. You had about an hour to make up your mind. Now we'll leave out picking the son or daughter of the richest person around or something of the sort; let's say we're all starting from scratch. Now, who would you pick? Just think about that for a moment. You wouldn't give them an IQ test. You probably wouldn't look at their grades. You'd probably think, who's going to function best when they get out there? If they had a 300 horsepower motor, who's going to get 300 horsepower out of it instead of 150 or 100? You'd look for who is going to function best. And, you would look for people with those qualities that you admire, but which are also attainable by you and which become a matter of habit after time.

Somebody said that the chains of habit are too light to be felt until they're too heavy to be broken. It's absolutely true that the habits of behavior you start out with will follow you the rest of your life. And, as you think about that person whom you would like to buy the 10% of, the person whom you find admirable or attractive, the answer is that if you want to sit down and do it yourself, you can be the one that you would buy 10% of. It is not that difficult. One friend of mine said that in hiring they look for three things: intelligence, energy, and character. If they don't have the last one, the first two will kill you because, it's true, if you are going to hire somebody that doesn't have character, you had really better hope they are dumb and lazy, because, if they are smart and energetic, they'll get you in all kinds of trouble. Well, that's enough of the advice.

Let's tackle the questions that you are interested in. Make them as tough and impertinent as you like because it makes it more interesting for me and it probably makes it more interesting for the audience. So, feel free to throw your hard one.

Q. In a sentence or less, could you please tell me what is your personal philosophy of life? And then my follow-up question, why?

A. Well, I'm not sure I have any brilliant philosophy of life. I certainly enjoy life. I like my life as much as anybody possibly could. I mean, I love every day and one reason I do is that I am fortunate in that I only work with people I like. I consider myself very lucky to be in that position. If you work in a job where your stomach churns and you find yourself dreading going to work and all that sort of thing, essentially, that is really like marrying for money, which is probably a dumb idea under any circumstances. And, it's absolute madness if you are already rich. I've been very fortunate in that I have no stress whatsoever. I'm going to try and outlive Mrs. B. I mean it. I tap dance on the way to work. I do believe in working at something you enjoy. I gave this advice one time at Harvard when somebody asked me, "Who should I work for?" I said, "Well, go work for somebody you admire. You're bound to get a good result." A couple of weeks later, I received a call from the Dean, and he said, "What did you tell that group? They've all decided to become self-employed!"

Q. If you could look in your crystal ball, what kind of sector stocks would you look into in the next few years? What kind of stocks do you think will boom?

A. That's an academic question if I ever heard one. Just a little theoretical.

Q. What exactly do you do all day?

A. Getting right to the core here, aren't you? I spend an inordinate amount of time reading. I probably read at least six hours a day, maybe more. And I spend an hour or two on the telephone. And I think. That's about it. We have no meetings at Berkshire. We've never had. We have businesses around the country; we have some 20,000 employees, but we've only had one meeting of our managers in the twenty-some years I've been there, to talk about health care—one time. But, they never come to Omaha. We never have presentations. We don't have a slide projector. We don't do any of that sort of thing. Our board of directors meets once a year, right after the annual meeting. We have lunch and that's it, because I hate meetings, frankly. I have created something that I enjoy: I happen to enjoy reading a lot, and I happen to enjoy thinking about things. It is a little crazy, it seems to me, if you are building a business and creating a business, not to create something you are going to enjoy when you get through. It's like painting a painting. I mean, you ought to paint something you are going to enjoy looking at when you get through.

Now, I know I'm avoiding your first question about what I should buy this afternoon. I don't think much about that. I don't think at all about what the stock market will do or what given stocks will do in the very short term. We do try to own, and to look at stocks, as pieces of businesses. And, that is crucial in my view to the investing process; that is, to not think about a stock as a little ticker symbol or something that goes up or down, or something of the sort, but to think about the business that you own.... Same way if you were deciding on a business to buy in Lincoln. You might think about buying a dry cleaning store or a grocery store or whatever. You wouldn't think about what this business is going to be selling for tomorrow or next week or anything. You would think about whether it's going to be a good business over a long period of time. And that's what we try and do. So, if you look at the portfolio of Berkshire, you will see the kind of businesses that we like to own.

Our biggest single holding is Coca-Cola. We own a lot of Gillette. Those are two of the most dominant companies in the world in their field. And they are also companies that are not subject to a lot of change. We don't want to own things where the world is going to

change rapidly because I don't think I can see change that well or any better than the next fellow. So, I really want something that I think is going to be quite stable, that has very good economics going for it. Coca-Cola sells 47% of all the soft drinks in the world. That is seven hundred and fifty million eight-ounce servings a day around the world. That means if you increase the price of Coke one penny, you would add two and a half billion dollars pre-tax to the earnings. So, that's the kind of thing I can figure out. And, Gillette, I mean Gillette is marvelous. Gillette supplies over 60% of the dollar value of razor blades in the world. When I go to bed at night and I think of all those billions of males sitting there with hair growing on their faces while I sleep, that can put you to sleep very comfortably.

Q. Have you ever thought of opening your own stock school?

A. No, I've got my occupation for the rest of my life. I plan to keep running Berkshire Hathaway.

Q. The problem with money is that it tends to flow toward the emotional part of the human being. And, I guess what fascinates me about you, in what I have observed in the media and so forth, is that you tend to keep a clear, cool head. For example, when you hired that fellow from the Tokyo office, you were adding up certain factors that were tangibles. I wonder if you do the same when you buy stocks, and what happens when they turn out to be "dogs", like USAir and Salomon Brothers. Obviously, those didn't pan out as expected when you bought them; however in the fullness of time, one can never tell.

A. You can probably tell on one of them, anyway.

Q. If you are talking about Salomon Brothers, I think you once referred to them as a cash cow; however, when you buy a stock like that, how much of it is just simply a result of Warren Buffett's many, many years of reading six hours, making phone calls, and thinking at night? Or, how much of it comes down to a gambler's feel or intuition? Is it that much?

A. I would say there is no hunch or intuitiveness or anything of the sort. I mean, I try to sit down and figure out what the future economic prospects of a business are. I try to figure out whether the management is someone or some group I both trust and admire, and I try to figure out whether the price is right. I mean that: It's the right business, the right people, and the right price. There are a whole bunch of businesses I don't know the answer on. If you take all the companies on the New York Stock Exchange, a couple thousand plus, I don't have a view on a great many of them. I am familiar with them but I just don't have the faintest idea what is going to happen in the future. So, I try to narrow it down to what I call my "circle of competence". The important thing in your circle of competence is not how big the circle is. It isn't the area of it. It's how well you define the perimeter. So you know when you are in it, and you know when you are outside of it. And, if I have any advantage, it's probably that I know when I know what I'm doing, and I know when I don't know what I'm doing. That's key in the securities business. You have to make very few correct decisions in securities to get very rich. You don't have to do a hundred smart things. If we do one smart thing a year, (a) my partner will be surprised, and (b) that's plenty. I mean, that's more than enough. And, that's all I want to do. So, I'm looking for the one idea.

But you are correct that everything I look at over the years, all the reading I do and everything, comes together at some point in terms of giving me the feeling that this particular decision is within my "circle of competence". And, when it is within it, I'm willing to go very big. I do not believe in taking baby steps when you see something that you really

understand. I never want to do anything on a small scale because, what's the reason? If I'm doing it on a small scale because I'm not that sure of my opinion, I'll forget it entirely and go onto something I'm sure about.

Q. Yesterday in the *World Herald*, it was reported that a multi-millionaire with no blood relatives left \$5.6 million to the U.S. government.

A. I saw that.

Q. And that money would cover less than two minutes of government spending. If you had no blood relatives and no charitable foundation, would you leave your money to the government? Assuming, of course, it would take longer to spend your fortune.

A. Well, I have one of the blood relatives here today who's monitoring what I'm saying. I read the other day about a fellow who left all of his money to his wife on the condition that she would remarry, so at least one man would mourn his passing. I would say this, when you rule out the philanthropic, that gets tough. If you leave it to the government, you're leaving it to society, basically. I would rather leave it to people, very high-grade intelligent people, to spend in the interests of society rather than simply to reduce the debt or the deficit that year.

You know, if you told me that I couldn't leave it to an individual or to charity, I mean, at that point I would be pretty much stuck. It would be like having a 100% estate tax, in effect.

I would say that I got my money from society. If you stuck me down in the middle of Bangladesh or Peru, I wouldn't be worth a damn. I have some talents that are particularly suited to this particular economy. I get a lot from society. I get to live exactly the kind of life I want to live; and then not to give it back to society seems a little crazy to me. So, essentially, everything I have will go back. And, I will not try to direct what the trustees do ahead of time. I just want to pick very high grade people, smart people, very few people because if you get a large group, it will bureaucratize. I've got six trustees on the foundation and they will do a much better job above ground after I die than will be done if I start giving them instructions from beneath the ground. I'm very satisfied with the arrangement. The only thing I've instructed them to do is try and do something big. I don't believe in lots of little things.

Q. Well we certainly hope you live to be 150, 200. Someone with your character needs to stay around.

A. Thank you. Thank you.

Q. I was wondering if you had a role model.

A. Yes. I call them heroes, but I've had a half a dozen or so heroes in my life. I've been extremely fortunate in that none of my heroes ever let me down. I never, never had a situation where I was disappointed in any one of the half a dozen or so, starting number one with my dad. And, that's a great thing. I think it's very important to have the right heroes. Now they call them role models or whatever; but you're going to take your cues from somebody. You're going to pick up the habits, and qualities, like I talked about earlier, from somebody. Fortunately I had some terrific people who were helpful to me in that regard. I went through a period, when we first moved to Washington, where I was antisocial for awhile. And, really having the right heroes pulled me through that as well as anything.

So I say, choose your heroes carefully, and then figure out what it is about them that you admire. Then figure out how to do the same thing. It's not impossible.

Q. Was your investment with the Equity Fund of Nebraska a one time offering?

A. No. About a year or so ago, the Governor, or a group connected with the Governor, organized a fund to sponsor low income, affordable housing in the State. These funds have existed around the country and we had participated in those national funds; so he asked if we would participate in the Nebraska fund. We said yes, and we will participate in the future. I hope that the participation becomes broad, because it not only has a good social purpose, but it's a perfectly intelligent investment. So, it is not like there is any sacrifice on our part in doing this. This is something that makes economic sense for Berkshire Hathaway. And, I would hope that other businesses around the State would join in. It's not a one-time thing.

Q. How would a young entrepreneur, like myself, get start-up cash for my business?

A. Get start-up capital? Well, that's a tough question because compound interest is a little bit like rolling a snowball down a hill. You can start with a small snowball and if it rolls down a long enough hill (and my hill's now 53 years long—that's when I bought my first stock), and the snow is mildly sticky, you'll have a real snowball at the end. And then, somebody says, "How do you get the small snowball at the top of the hill?" I don't know any way to do it except spending less than you earn and saving some money, unless you are lucky enough to inherit some.

In my own case, you know that I was always interested in investing, so I started saving when I was about six and by the time I got out of school, I had about \$10,000. It is much easier to save money, obviously, before you have a family than after you have a family. I've always felt that one way to do it, if you've got a job and it's meeting your needs (in my own case, I delivered papers and that's an ideal job for a couple hours a day), is to take a second job and save all the money from that. Getting the initial stake, being ahead of the game, is enormously important in life. It is so much better to be working from a position of strength and have a loaded gun. That may be a fairly small amount of money. Ten thousand dollars doesn't sound so big, although it was probably the equivalent of close to \$100,000 now. That was my edge. If I hadn't had that, I wouldn't have had anything to work with subsequently. There isn't really any way to get capital except to spend less than you earn. That's easier when you are very young than at any other time—certainly before you have a family.

Q. Mr. Buffett, I'd just like to know if there is any truth to the rumor that you have been taking Cornhusker quarterback recruits out to dinner?

A. Nope. If I knew any good ones, I think I would, but.... If anybody here is healthy and feels like they can throw that ball sixty yards, stand up. I've got an intense interest. I think we have the best football coach in the United States. He and Nancy are both truly outstanding human beings. I know that personally. I would love to see everything come together. I think he has had a lot of bad luck this year.

Q. Mr. Buffett, I believe the Nation's tax code does not provide the incentives for businesses and individuals to save and invest. Without these incentives, the growth of the Nation's economy is limited. Would you support a broad-based consumption tax, such as a value-added tax, combined with offsetting reductions in the capital gains tax and corporate and individual tax rates, to encourage more savings and investment in our economy?

A. Well, I would say this, for various reasons, one of which is encouraging savings, but for other reasons I would favor a progressive consumption tax—a tax where the rates go up as you consume more. I would not favor a flat tax because that's proportional. That would be like having the same tax on everybody, paying the same percentage. And, I really feel, in terms of equity, that a progressive consumption tax is the most equitable tax. I also think it would have the greatest long-term benefits, although in the short term it would actually hurt the economy. But, over time, I think it would provide more investment and that will provide essentially a higher standard of living. Unless it is progressive though, it's unfair to have that or a national sales tax or anything that's strictly proportional, because it gets very regressive and, frankly, I think those people who consume far more than their fellow man are making withdrawals from society's bank effectively when they consume. I think they should pay higher rates as they get up in the high rates of consumption.

But, I've urged a progressive consumption tax and it's achieved somewhat more currency with economists and politicians now than it had 10 or 20 years ago. It was limited to a few academic areas a couple of decades ago. Senators Nunn and Domenici put out a report about 18 months ago, where they recommended something which was equivalent to that. I think they call it USA Unlimited Savings Account. I would say this, though: The tax rates are more conducive to savings now than they were when I was down here five or six years ago. It's not like the situation has gotten worse, in terms of savings. This will sound a little Pollyanna-ish, but it is still relatively easy to save money in this country compared to most economies in the world. A consumption tax or an unlimited IRA, in effect, would make it easier. But, this is not a tough economy compared to most of those around the world in which to save.

Q. Mr. Buffett, I was just wondering if Charlie authorized the flight over today or did you have to drive?

A. This gentleman is referring to the fact that I have a partner named Charlie Munger, whose grandfather was a Federal Judge in Lincoln. Charlie actually worked in my grandfather's store, but not at the same time I did. I met him later in life and he has become my partner. Charlie and I have been partners in business one way or another for decades. We've never had an argument. We have different opinions on things, but we get along extremely well. Charlie overdosed on Ben Franklin early in his life, so he thinks that a penny spent is a penny lost, or something like that. This is the guy who, you know, has a prayer session before he takes the bus and, therefore, when I bought a plane, I was going to put his name—"The Charles T. Munger"—on the plane just to stick it in him a little bit. Instead, I just decided to call the plane "The Indefensible." And that is sort of like the wolf, you know, baring his throat when he is losing to another wolf! So, I did not fly here today. But it is true that I contemplate flying to the drug store every night! I'm in love with this plane, and I'm the same person who gave all these speeches against planes in earlier years. Then I had this counter-revelation, as they call it, and now I've fallen in love with the plane and it's going to be buried with me!

Q. Mr. Buffett, does it bother you not being the richest man in America?

A. Well, as *Forbes* pointed out, they must have counted Bill Gates' house. I mean, he's got me in that department. He's a good friend of mine, incidently. We have a lot of fun together. Bill came in to Borsheim's—I can tell this because he tells it—to buy an engagement ring for Melinda, his wife. He came in to Borsheim's a year ago Easter. They were in Palm Springs, and he told Melinda it was time to go back to Seattle, and when they went to the plane, the

pilot reported the weather in Seattle, and everything else, so it sounded as if they were going to Seattle. Then Bill kept her occupied, so she didn't notice where the sun was. They landed in Omaha on Easter Sunday about four or five o'clock. We opened Borsheim's just for them. I said to Bill on his way out, "It's none of my business—who am I to give you advice?—but when I bought an engagement ring for my wife in 1951, I spent 6% of my net worth on it!" We didn't have quite as big a day that Sunday, as I'd hoped.

But as to not being the richest, the money is a by-product of something I enjoy. It's like somebody that enjoys painting; and if you can sell your paintings for a lot of money when you get through, great! If you enjoy the painting when you get through, great too! I've had as much fun working with small sums as large sums, but I have as much fun working with large sums as small sums, I might add. The same thing is true with Bill Gates. I mean, he loves what he does. He would do it if they gave him sharks' teeth instead of cash at the end of the day. And, my guess is, that helps him do it well and helps me do it well, too. But I'm keeping an eye on him. I had a dart board that somebody gave me to select stocks. I threw darts at it but it didn't work very well. So, I sent it to him last week.

Q. Mr. Buffett, I've been led to believe that you have some musical ability. And, I want to know: Do you still play the ukulele?

A. I play it very occasionally. A year from now, Mrs. B is going to attend, close to her 102nd birthday, the opening of the Rose Blumkin Performing Arts Center in Omaha, which was formerly the Astro movie theater. She bought that theater about 15 years ago, when it was going to be torn down. The reason she bought that theater is that it's the site of one of the first good things that happened to her in this country. Back in the mid-1920's, her daughter, Frances, won a prize there, a five-dollar gold piece for singing "Am I Blue?" And, at the opening a year from now, Frances is going to sing "Am I Blue?" I'll accompany her on the uke.

About my playing the ukulele—I did play it at the Press Club with the Governor. But my next appearance will be at the Astro next fall.

Q. The quality that I value most in any leader is integrity, whether that leader be in business or a leader in government or whatever. Do you feel that leaders in business today and the government do have a high degree of integrity? And, has it declined since you started your business?

A. It's very hard to say. I think the American public thinks it's probably declined as evidenced by polls. My own feeling from a fair amount of exposure to people in a lot of arenas, including political and business, is that the pattern is not terribly different from what you would find in the population. If you take any large group, you will have some kind of bell-shaped curve where you will find a lot of people in the middle, who, under most conditions, will behave well, but when they are in really difficult situations, they won't. You will find people who are just outstanding on the right-hand side of the curve and those are the people who are my heroes, frankly. I don't think it has changed much over the years; that's my impression. I think that's true in politics, too. A lot of people yearn for the good old days and all that sort of thing, but I don't think the human animal changes too much. I think the only way humans change is if they get into a new culture and adopt the mores of that culture. I think it's easier to drop down, unfortunately, if you get into a kind of jungle-type culture, than to move up if you are in some monastic-type culture. But, I don't think that the culture is materially different from what I saw in politics or in business 30 years ago.

There are some outstanding people in both, and they're really the ones to focus on and try to emulate.

Q. What do you think the government is currently doing that they should stop doing? And, if you were President, what would be the first change you would make?

A. If I were President, the first thing I'd do is demand a recount. That is a job I would not like to have. There are a lot of jobs I would not like to have, but that would probably be tops on the list. I think it's very tough because I've seen a little of it, and I've even experienced a little tiny bit. It's very tough to manage any extremely large organization. Maybe Dr. Spanier will agree with me on that, too. You have a really complex organization with loads of people that have to be decision makers under you and huge budgets. That is very difficult to manage. Then think about the fact that the most time you are going to have to do the job in is eight years. Changing cultures is really tough. I've had a little experience with that. The trick in business is to get in with a culture that's already the right kind. And, we've had good luck doing that. When we invest in a Dexter Shoe or See's Candy, that is very easy, because they have grown in a certain way because the head people think about doing the right things. I think it would be very tough in government. If I had my way, there would be a progressive consumption tax. There wouldn't necessarily be a balanced budget. But, the national debt would grow at a rate that would be less than the growth of the Gross Domestic Product. In other words, I would make sure that debt in relation to income did not increase.

But, in terms of specific programs, you know I have no great ideas. I would probably—since I'm not running for office, and this is already scheduled to come in a couple of decades—I would probably extend the age at which Social Security kicks in, because I think the world is a lot different than in 1937 or whenever the retirement age was put in at 65. I think people are very productive at that age. If you look at demographics for people under 65 to support people over 65, it is a much different chore than it was 60 years ago. I just think there are more productive years, so I would have Social Security start somewhat later. That would save a lot of money. It would also not get the vote of the AARP or other organizations.

Q. I've heard that you feel that all universities should teach a course in common sense. I was just wondering: What is your definition of common sense? What should this course teach?

A. Well, I don't know whether I've said they ought to teach a course in common sense because I'm not sure you could teach it. But, I do find it amazing how many people with high IQs get off the track. It's astounding to me how people who are really very smart manage to engage in so many self-destructive actions, and I'm not just thinking in terms of business. I have no real prescription, as I look around at the people whom I think are extremely sensible. I don't know quite how to transplant that or teach that to other people. I think a lot of people make things more complicated than they need to. There is nothing complicated about the way we invest. It is very understandable. I've felt that before people buy a stock, they should take a piece of paper and simply write "I'm buying General Motors at 47," or "I'm buying US Steel at 83." They should just write out what their reasoning is, and they should be able to get it all on one side of one piece of paper. In fact, they should be able to get it into a paragraph. Almost all of the big, great ideas in business are very simple. Sam Walton's idea was very simple at Wal-Mart. It's not hard to do. If you want to accomplish something, and this ties in a little bit with common sense maybe, you have to have focus. Mrs. B had focus. Mrs. B never went to school a day in her life, and she ran rings around all kinds of people because she's smart and energetic. She was also focused. Tom

Watson, who started IBM, was the same way. He said, "I'm no genius. I'm smart in spots, but I stay around those spots," and there is a lot to that.

Q. I'm a doctoral student in the School of Music, and my question has to do with arts funding. I'm wondering where you think the responsibility for funding for arts programs would lie. Would that be with governmental programs or with businesses or private individuals?

A. I think it's with government programs and private individuals. I mean, I think it's probably a combination needed on that. If you go back 50 or 75 years, it was entirely private. But, I think, in terms of a lot of activities like that, there is a place for both the government and for private funding.

Q. I've heard that you refuse to assist your children financially. Is this true? And, what did you get from your parents financially?

A. Well, I got all kinds of good things. But, I didn't get money. And, I really didn't want it actually. I don't think I could have been raised with a better pair of parents. That was enormously important. I don't believe in making kids rich. I just think it's wrong in terms of society. I hear these people who lecture about the debilitating effects of food stamps on the poor. They say, "You know, you give them food stamps, and they get dependent, and then the next generation wants more food stamps," and all that sort of thing. What is the difference between that and some kid who gets a lifetime supply of food stamps at birth through inheritance, you know, except the food stamps are called stocks and bonds and the welfare officer is called a trust officer? They never seem to see the debilitating effects of having some big trust fund for themselves. I basically believe that if you are rich, you should leave your kids or give them enough so they can do anything but not enough so they can do nothing. I just think that makes sense. I don't think it should be like they were born into total poverty, and I don't think they should be entitled to live a life of doing nothing, essentially living off this stored-up supply of food stamps which somebody handed them. So, that is my own personal philosophy on it.

Q. Mr. Buffett, I would like to ask you about your political involvement. This year, we've seen a lot through the media of your being finance chair for Senator Kerrey and helping Congressman Hoagland in Omaha. My concern is, it seems like at least the business publications I read and the business organizations that I'm involved with aren't real supportive of those two individuals because of maybe increased taxes, regulation, and government-run health care. Can you explain to me your involvement with that and why you support those individuals that seem to be opposed to some business incentives?

(Aside, Mr. Buffett receives a can of Cherry Coke.)

Sure. Thank you. This stuff will do wonders for you. If you are wondering, we get the profit from one out of every 14 of these, so it does my heart good.

A. I was president of the Young Republicans Club at the University of Pennsylvania in 1948 and, of course, grew up in a Republican household. I vote for plenty of Republicans. I mean, I'm not a card-carrying Democrat, although I'm a registered Democrat and have probably voted for more Democrats than Republicans. It would be pretty close. I don't like to get mixed up in politics much, but in this particular case, I've supported the two you mentioned for precisely the reason that some people are opposed to them. I felt that both Hoagland and Kerrey made a vote that they knew would be politically disadvantageous, perhaps even politically fatal. And, they did that for what they thought was for the benefit of society, whether you agree with them or not.

Now, that is the hardest thing in the world for a politician to do. It would be hard for me to do. I love the job of running Berkshire Hathaway. If I knew I was going to make some vote that might cause me to lose that job, I'm not sure how I would behave. So, I saw both of those fellows make a vote, and there was no question that it was going to hurt them politically. They had no problem assessing the mood of their own voters or voters around the country. So, they did that and I thought that was exactly the way a legislator is supposed to behave. I felt it was very important. I would have had a much different deficit reduction act than came forth, but that is not the question because you'll never be happy with every aspect of the bill. I felt it was important to the country that something be done at the time, and that was the bill to be voted on. It was a very close vote, as you know, and both of these fellows stood up and voted for it. So, I felt under those circumstances if I could help in any way by identifying with them, I would be delighted to do so. They stood up when it counted and I felt that I should, too. That's the reason, but basically I'm not big on getting involved in politics and it's not because they are Democrats. That's immaterial to me.

Q. You keep a very lean machine going at Berkshire Hathaway. How do you keep it so lean when it grows so much?

A. Well, that's a good question, because now we have 22,000 employees or maybe 23,000 or even 24,000, I guess. We probably had 1,000 twenty years ago but we've still got 10 or 11 people in headquarters. I really believe in keeping things simple. We have no inside counsel. We have no public relations people. We have no guards. We have no cafeteria. And, it's a lot easier to run that way. Frankly, I think way more gets done than if you have floor after floor of people that are reporting to people on the floor above them. I see so much waste in most companies and once it gets there, it is very hard to get rid of. It's much easier never to get there. My pal Charlie says that, "All I want to know is where I'm going to die, so I'll never go there." And, that's the way I feel about a large organization. I mean, that would be business death as far as I'm concerned; so we're not going to get there. It's not a problem keeping it down. We just don't hire anybody and we won't. I buy and sell all the stocks myself. Some people say, "How many people can you have reporting to you in a business?" That's standard organizational management stuff. They say, "The optimum number is this" or something like that. The answer is, if you've got the right kind of people, you can have tons of people. You can have dozens and dozens and dozens of people, if they know what they are doing and they like their jobs. But if you have somebody who's a clown, one is too many. They will drive you crazy. The trick is having the right people. We have been very fortunate in getting in with people who are extremely able at doing their jobs.

We bought H. H. Brown, which is a work shoe company, three years ago. It has probably 4,000 employees, and two hundred and fifty million dollars in sales. I've never been to one of their plants. No one ever has. Maybe they don't even exist. I mean, maybe those guys sit there every month and say, "What figures should we send Warren this month? \$2.8 million, will he like that? Yeah, he'll probably like that; let's mail it to him." I've got the right kind of people. If you've got the Blumkins running the Furniture Mart or something, what can I do, you know? Should I go out there and tell them we should price this stuff at \$498 retail instead of \$398? I don't know anything about it.

Three quarters of our managers are independently wealthy. They don't need to get up and go to work at all. Most of them have tens and tens of millions of dollars. So, I've got to create or I've got to maintain an environment where the thing they want to do most in the world is to go to work that day and the next day. And, I say to myself, "What would make me feel that way?" One way is to feel you are running your own show. If I had people second-guessing me all day, I would get sick of it. I would say, "What the hell do I need this

for?" And, that's exactly the way our managers would feel if I went around second-guessing them or telling them how to run their business. So, you can get by with very few people if they are good people. That's what we try to do.

Q. You said that you look at three things when you are looking at a firm. You look at management, price and people. Is your analysis of people what makes your stock prices exceptional?

A. It's one of three, but it's all three things. I think I said the "economics" of the business. I mean, you can have the most wonderful person in the world, but if they are running a textile business like we had 30 years ago, they're not going to do well. On the other hand, if they're running Coca-Cola, they are going to do sensationally. So, we want to be in a business that has fundamentally good economics like a Coca-Cola or a Gillette or something of the sort. And, then we want people and the price. But all three are very important.

Q. I've come from a family where my father works a lot and he's rather successful. How do you balance work with your family? Do you tie your wife into any of your work, or is it totally two different dimensions, two different worlds?

A. No, it's two different deals. My daughter, who is here, was doing an interview one time and explained that when she was in high school, she told people I was a securities analyst. She thought that meant I went around checking on homes or something to be sure they wouldn't be burglarized! No, work and family are two independent things. I don't consider what I do as work at all. I'm not doing this for a living; I'm doing it because I would rather do it than anything else I can think of in the world.

Q. You say in your annual report that you do not want to increase the number of investors you have through a stock swap or a split, but if you are, in a sense, a large mutual company, a large holding company, why would you not increase the amount of capital available to you?

A. Well, we haven't; we don't want to increase the amount of capital, which is different than increasing the number of shareholders, of course. We get a natural increase in capital just by the amount we earn from year to year, and that's plenty satisfactory. I do not have way more ideas than I have capital at the present. When I got out of school, I had way more ideas than capital. I was definitely capital short and at that point I did need more capital. So that's why I formed a partnership in 1956 to have some partners join with me. But, Berkshire will not need new capital as we go along. Now, the question is, "Who are going to be your shareholders?" "Who is going to sit in every seat?" If you have a million shares outstanding, somebody has to own them, preferably me. All the seats get filled and then the question is, "How do you encourage the people you want to have in those seats to attend?" It's very simple. If you stick a sign outside an auditorium and say "rock concert", you will get one group and if you say "opera", you will get another group. Either group is fine, but you'd better not have people coming who think they are going to the opera and find that they are at a rock concert, or vice versa.

So, I believe in communicating with the investment world about our objectives—how we think, and the time horizons to draw a compatible group into Berkshire—and we've done that over time. That's why the turnover in Berkshire stock is so low. We have less turnover than any stock on the New York Stock Exchange. The New York Stock Exchange doesn't like it but I like that because it means that basically the people are there who want to be there. Splitting the stock or anything like that would tend to draw a slightly different crowd; not a terrible crowd, but not a better crowd than the crowd we have already. The only way

somebody can enter is for somebody to leave. And we want to make sure that we're not losing people who identified with our objectives and time horizons, to take on people who have some other different focus.

Q. What plans have you implemented for management succession when you and Mr. Munger slow down and retire?

A. Well, that's a polite way of saying when we die. We're not going to slow down and retire; we may slow down, but we won't retire. I'll put it that way because I plan to retire about five years after I die, actually. At the annual meeting somebody always says, "What happens if you...?", and then they stutter around a little bit and they finally get, "you know, you get hit by a truck?" I say, "Well, I'm glad you are asking that instead of asking what happens if you don't get hit by a truck." My job is fairly easy. All of our operating businesses would continue just as they are. The people that are running H.H. Brown or Dexter or See's or Scott Fetzer, all know what they are doing. All I do is allocate capital. They mail me the money and then I use it to go buy something else. I also try to maintain conditions so that they want to keep working. I've got in mind people beyond the two of us who can fulfill that function. I don't want to name them at present, but it's not as if Coca-Cola (where we own almost \$5 billion worth of it, close to 8% of the company) will change when I die. People are going to keep drinking Coke the day after; in fact they will probably toast me at the funeral with Coke and so sales may spurt a little bit! There's no big slowdown that will take place. The job of the person who succeeds me will be to take that money which keeps coming in and find intelligent things to do with it in the future.

Q. What kind of management training or mentoring do you believe in and actually practice at Berkshire?

A. Well, that's interesting. We really don't do any. Perhaps half of our managers have MBAs or have had other kinds of business training. Probably half of them didn't. It's interesting to me what makes a good manager, because I think you have to understand the language of business, and you should have what I would call a "business mind" or "business orientation." But, we don't care about background at all. When I was at Salomon, I did not ask to see anyone's résumé. I didn't know where any of the dozen went to school. It just didn't make a difference to me. You know Mrs. B; if I asked her for her educational experience and she handed me a blank piece of paper, that would be fine with me. Ike Freidman, who built Borsheim's—I don't even know what he did in terms of school, or what he had done. It really is irrelevant to me. We basically like to buy into businesses where people have already succeeded and then keep them on. I would much rather have somebody who has been batting .350 or .375, buy their business and try and keep them happy than have to go out and start casting around the sandlots looking for people who tell me they are going to bat .350 or .375. I'm not saying I won't do the latter. We've done some of the latter, but when you can do the former, we like it. We find it's hard to teach a new dog old tricks. We've got some terrific managers, many of whom are over 65 and many of whom did not have a business education. I don't think a business education hurts, incidently. I got one at Penn, Nebraska and Columbia, so I went to three different business schools and learned a lot at each place. Actually, I learned more at the last two. It can be quite advantageous, but I don't think it is essential.

Q. What do you feel is the best way to get money to pay for college?

A. The best way is to have somebody give it to you. Actually, my parents paid for my college education, so I did not. I worked for Mark Seacrest at the Lincoln Journal, but I took

all that money and saved it to buy securities. You do it any way you can. If you've got a parent to give it to you, terrific. If you've got somebody that will give a scholarship to you, terrific. And, if you have to work for it, you know, that's what you have to do.

Q. I've heard the existence of a Buffett premium in regards to Berkshire Hathaway. Could you explain what that is and maybe comment on the reason for its existence.

A. Some people think we will do as well in the future as we have in the past. And, you can compare that to going out to the race track and betting on a 13-year-old horse that had a great record up to then. It's an extrapolation of the past and I don't think there is that much of a premium in it anyway, but that's just my own opinion.

Q. Mr. Buffett, I live in Los Angeles, California, which is generally regarded as being a horrible place to live anymore, but visiting my grandmother in Omaha, I find that the crime rate per capita is, I believe, worse than in Los Angeles. I don't know in the 50's and the 60's if crime was not such a forefront thing, but I'm wondering if you either politically or with your own personal fortune have any ideas on how to get us focused back on economic issues and not getting murdered on the way to the supermarket.

A. I don't necessarily want to accept the premise, and I'm not denying the premise. I just think when you compare the crime statistics of one community versus another, that can become quite tricky, because to some extent they are measuring the city, for example. Specifically, you become involved in how much of the population of the SMSA (Standard Metropolitan Statistical Area) is metropolitan in that city. I have no great answer or fast answers to any crime problems. I think the most important single thing society can do something about—although it gets very tough if you've lost it—is to maintain an outstanding public school system. I think it's essential that everyone comes as close to starting at the same starting point as possible in society.

Now, it isn't going to happen, because my kids are going to have all kinds of advantages that some low income person's kids aren't going to have. And, there is a huge disparity. There is also a disparity in the talents they are born with. There is a disparity in the environment they have. But, there shouldn't be a disparity in the education they receive from society. I think to the extent that one city after another—particularly the large ones—have lost a good public school system, that is a big contributing factor to a lot of social problems that follow. If I could do one thing, if I had a magic wand, I would try to figure out a way to have an outstanding public school system where there was no reason for anybody to send their kids, except for religious reasons, to private schools. Private schools wouldn't be needed in order to get a good education. But I know Los Angeles's public school system, at least in many parts, has deteriorated. I have friends out there and they will pay lip service to a good public school system, but they will send their kids to private school, just like our legislators do in Washington, D.C. Essentially, I don't think there is anybody in Congress who sends their kids to the public schools. I went to public school in Washington, D.C. 40 years ago, and it was first class. We had half a dozen or more kids of Senators or Congressmen at that school. Today in Washington, public school students are not getting the same shot at the opportunities in America, if they have been forced into a system that is second class. I don't have great solutions to this problem.

I know something about running business and investing, because I've been doing it for a long time. But, that does not give me great insight into a lot of the social problems of the day. One of the problems with philanthropy—and my foundation's board will have this problem with my funds—is that in business, I get to solve the easy problems. I get to wait

for fat pitches. I don't have to make a choice among 1,000 different companies. All I have to do is decide people are going to keep drinking Coke. And, there is a lot of money to be made in manufacturing and distributing it. In philanthropy and in social situations, it's just the reverse. All of the intractable problems—the ones that are really tough to solve, the ones that take decades—are the ones that get thrown at you. That's why I do feel empathy for people in politics, because they are dealing with the toughest problems. They are dealing with problems that people couldn't solve last year, or the year before, or the year before that.

Regarding philanthropy, after I die, the Buffett Foundation will be tackling problems that are terribly important, but also terribly difficult to solve, and I wish them well. And I'll understand how important the requests are that they'll receive, and how terribly difficult it will be to solve, to make decisions, and I wish them well. But I'll understand; wherever I am I'll understand, if they have difficulty accomplishing that.

Q. Mr. Buffett, how did you first get started and how did you deal with failure, if you had one?

A. How did I first get started? It depends. I bought my first stock when I was 11, but I'd been thinking about them for a long time before that. My dad was in the investment business and I used to go down to his office in the old Omaha National Bank building when I was seven or eight years old. I found out I was near-sighted because I couldn't read the quotations up on the stock board; otherwise I might have gone through life without glasses. I just got very interested in it. I started reading books on it when I was eight or nine and then I finally saved enough money to buy three shares of Cities Service preferred for \$114 in 1942, and then I just kept doing it.

Failure depends on how you define it. A lot of things go wrong in life, but that doesn't necessarily mean that they're failures. I really don't look back. I try to learn from what I see around me, but I don't try to learn by going back over this decision or that decision or what did I do wrong or the sort. I don't think about that at all. You can make a lot of mistakes. The nice thing about it is you're going to make a lot of mistakes and still do very well. That's the encouraging thing. I write about my mistakes in the report. In fact, I have a section sometimes called "mistake du jour" and unfortunately it's plural most years, too. It's not the end of the world. You don't want to make any ones that are fatal. You do not want to own securities on borrowed money because that can wipe you out. I've never borrowed money of any significant amount because I just didn't want to go back to go. Borrowed money can magnify your mistakes, and it may magnify them to the point where they wipe you out. But, there's nothing wrong with making mistakes. You should try to pick things that you understand. That is the key to what I do. Occasionally I may make a mistake when I think I understand something I don't. Another mistake that you don't see is when I pass up something that I'm capable of understanding. Those are mistakes of omission and sometimes they have been huge. I could point to mistakes like that which have cost us over a billion dollars. I knew enough to do something but for one reason or another, I didn't. Fortunately, people don't see those.

Q. Mr. Buffett, after being the richest man in America, what are your major goals now?

A. Well, as I said at the Annual Meeting, now my goal is to be the oldest man in America. That's all I want said at my funeral. I just want someone to say, "My God, he was old!" I just want to keep doing what I'm doing, as long as I can. I have no desire to bring my golf handicap down five strokes particularly; it won't go down there by itself, and I'm not going to spend time to do it. It doesn't make that much difference to me. I feel like I can have as

much fun doing what I do at this level as anything else. I really, really, really have no goals other than to stay healthy enough to keep doing the same thing I've been doing.

Q. I have a two-part question. Number one, what do you think about the future of the two-party system in America? And, number two, what do you think about the candidacy of Colin Powell for President in '96?

A. Well, what has happened, as you know, is that party identifications and loyalties have changed dramatically. I'm probably typical in that I may be registered one way or the other, but I don't really think much about that. Certainly there is no party discipline or loyalty that can be called upon to get me to vote for somebody whom I think is inferior to another candidate. I think television has contributed to that very substantially. I think the parties will continue along; I don't think they will disappear or splinter in all likelihood.

Everything I know about Colin Powell is good. I do not know him personally. He is clearly an outstanding human being. If he starts offering his opinions on various subjects, his popularity will tend to diminish because that's the nature of politics. When you have to say whether you are for or against something, you start losing people pretty fast. But, in terms of the quality of that individual, I would think he would be first-class. I have no idea really what his views are on a lot of subjects. We may learn in the next year or so.

Q. Mr. Buffett, you said that people who are better off than society have a debt to society. I find this respectable. I just am wondering, what's your debt?

A. Well, I really think in terms of material goods that overwhelmingly eventually belong to society. I think it would be obscene if I tried to consume them all myself or have my family consuming like crazy forever just because I happen to be well-adjusted to this society. The interesting thing is that we live in a market society. If you can bat .375, if you can shoot sub-par golf, if you can do what I do, if you have certain kinds of talents, the market will pay enormously for those talents. Now, it didn't pay that well for ballplayers 25 years ago because the stadiums only held 50,000 people, but television and cable have made it possible for the stadiums to hold 250 million people and that changes the economics dramatically. This market system showers rewards on people with certain types of talents. Yet it does not shower rewards on other people with talents just as important to society; maybe more important to society. An outstanding teacher, outstanding nurse or researcher may not be paid dramatically more and maybe no more than the mediocre one. But the outstanding heavyweight fighter, or the outstanding center fielder, or the outstanding stock picker, or whoever, gets incredibly more because of the way the market system works. I would not tamper with that market system, because I do think that people benefit, because it delivers the goods that people want in this country.

It has been a great system for causing an outpouring of goods and services that people want. The market system works terrifically that way. I don't think it works terrifically in terms of distribution of the rewards. And, I think you solve that in two ways. One way is you solve it through your tax system and the other way is you solve it through philanthropy. You might call this a self-imposed tax. I think you could probably find 300 public school teachers in Omaha who have contributed absolutely as much to society as some fellow like myself or somebody that bats .350, or some guy that has won the light-heavyweight boxing championship. The teachers are never going to get paid properly. Society will not reward them that way. I don't see any way for society to do that. I don't have anything in mind about some "comparable worth" type of arrangement. I think the market system is the best system for delivering goods, but then I think in terms of distributing these goods and

services produced by that market system. Both philanthropy and a progressive tax system of some sort are the appropriate methods.

Q. My question concerns something that has come to the forefront in the last couple of years in politics especially—environmental issues. We have seen an increase in the concern of this country, and around the world, with environmental issues. People say a lot of the environmental problems are a result of businesses taking technologies that are not so benign to the environment and applying them in negative ways. In your opinion, as a corporate industrial leader, what would be some criteria that should be established so that corporations could find ways to apply more benign technologies?

A. I would say on environment that we've already got legislation in place which makes it extremely painful for companies who are doing things which are environmentally harmful. I don't know all the details, but I've seen enough of the Environmental Protection Agency's operation that I think that situation has changed dramatically from 25 years ago, at least in this country. What we do about the rest of the world is another question. In a world economy, to the extent that you apply any kind of restrictions, in terms of child labor or environment or workers compensation that other countries don't impose, you have a competitive cost disadvantage. That's a price that society has to pay here, but it is a real cost.

I personally think that population is probably one of the most important issues the world faces, except for the eventual problem of nuclear proliferation. I don't know how much the proper population of the world should be or will be. I know that number is different from what it would have looked like hundred years ago, and it probably will look different a hundred years from now. But, I do know there is a number and it may be affected by technology and it may be affected by the fact that our resources are greater than we think now. If we in this room were to all embark on a space ship journey some place, which was going to last a hundred years, and they were going to put provisions in the space ship that would be ample for this group, we might not know how many more people we could take on that space ship before we endangered the ability to survive and return in a hundred years. But we would know that the number was finite. And, we would certainly err on the low side. We would not say, "Well let's just take a shot at it and have 500 more join us." It is a finite world. Man's imagination is not necessarily finite, and we can do a lot of things that we haven't even thought of with resources. But in the end, there is only so much oil and gas in the ground. We're dealing with finite resources. They're not known, but they are finite. I would say it is a terrible mistake for the human race to test what the ultimate carrying capacity of this planet is. We had better have a margin of error. I believe that population is a terribly important issue.

Now, one of the problems in society is that the most important issues are often these incremental type things. The world is not going to come to an end because tomorrow there are 200 or 250 thousand more people on the planet than there were today. That's about the number it grows every day. There is nothing apocalyptic about it. People will go on making apocalyptic projections. But, it is like eating about 300 calories more each day than you burn up; it has no effect on you today. You don't get up from the table and all of a sudden everybody says, "My God, you look fat compared to when you sat down!" But, if you keep doing it over time, the incremental problems are hard to attack because that one extra piece of pie doesn't really seem to make a difference. The 250,000 people tomorrow don't seem to make any difference, but the cumulative effects of them will make a huge difference over time, just like overeating will make a huge difference over time. The time to attack those problems is early. It's a huge determiner of the kind of environment we have. I think the time to be thinking about those issues is now.

Q. Mr. Buffett, two of the Berkshire holdings that you have were mentioned today, Coke and Gillette. Another company that has repeat daily sales like that is Wrigley. Why has Berkshire not purchased that and what would make you purchase Wrigley?

A. Well, I won't comment on whether we own or don't own anything. I mean there are certain holdings we have to show in our report, but we don't have to show all of our holdings. There are certain threshold levels, but Wrigley is obviously a strong worldwide franchise. How you may feel about the growth in units sales in chewing gum verses the growth in units sales of soft drinks is one question. How you may feel about the pricing flexibility that they have verses the pricing flexibility that Coke or Gillette may have is another. And then how you feel about the price of a stock in the company would be a major factor. I'm not going to get specific on Wrigley because I don't get specific on stocks. But, it clearly has the kind of worldwide recognition that we like.

In the case of Gillette, they improve the product periodically. I hope you buy a new Sensor Excel because it produces a very smooth shave! The ticker abbreviation used to be "GS" on the New York Stock Exchange, which stood for "good shave". There are about 21 billion blades sold every year. Gillette sells only about 7 billion of them, but they've got about 60% value share because they've done it technologically. The Sensor took 11 years to develop; that is really some product. One thing you'd find interesting: the Sensor for women has become a very big product. More Sensor for women razors were sold in the first 18 months than Sensors were sold originally in their first 18 months. That's the first time a razor's become remotely that popular with women. Normally, women use disposables or they use their husband's or boyfriend's razor. But, one thing research has shown, which is kind of interesting (those of you in the audience will take this several ways): When a man gets a nick or a scrape or cuts himself with a razor, he blames the razor. But when a woman does, she blames herself and that enters into the kind of product she wants to buy. It is also true, of course, there's only about one-tenth of the nerve receptors per square centimeter in the leg than there are in the face. So, the man tends to be more sensitive to the feel of the shave, and the woman is more sensitive to whether she gets nicks or scrapes on her legs. (There are all kinds of interesting things about razors.) People originally started shaving with rocks because it was a disadvantage in combat with other humans or animals to have something the enemy could grab you by and snap your neck with. That's diminished over the years, but that was the original reason.

Q. Mr. Buffett, in recent years, several public accounting firms have been sued by their clients because they have not met their expectations on their auditing services. I was wondering what you and Berkshire Hathaway expect from your external auditors?

A. Well, that's a good question. I said to the Federal Financial Accounting Standards Boards some years ago that I thought accountants deserved to be sued, because I thought the typical accountant certificate in those days was overstated. I did not think they were in a position in many companies to deliver that opinion and when they have been held financially accountable for the fact that they couldn't back up that opinion, I really thought that was appropriate. It may have gone overboard in some cases, but they were stating something there that people relied on. In many cases—take banks or insurance companies—they were simply not in a position to attest as they did. In our own case, we are small and controlled, and we have an internal audit staff. I'm hoping, if an outside auditor comes up with anything, it may be a potential tax idea, or it might be things our internal auditors did not spot in terms of weaknesses in the control system, or they might spot outright fraud of some sort. We haven't had that, but that's what I'm paying them to do, aside from the fact I have

to have them anyway because I'm required to by the Securities and Exchange Commission and the New York Stock Exchange. Incidentally, we have bought big firms that never had an audit, and that doesn't bother me.

When I made the deal with Mrs. Blumkin, it was on August 30, 1983. I know that because it was my birthday. I didn't want to tell her that early on, because I thought she might think I was over-eager. I told her afterwards and she said, "You bought an oil well on your birthday!" She had no audit and she just told me she owned all the land, all the buildings, and all the inventory. She told me about what the receivables were, what the business was about, that all the bills were paid, and they didn't owe any money. We never had an audit. We bought that business with a contract that was one page long.

Q. Do you have any opinions or predictions on how health care reform is going to affect the economy, in general and Berkshire Hathaway, specifically?

A. Well, as I said earlier, we had our one general meeting on health care about six or seven years ago. When you are spending 14% of the Gross Domestic Product on something that other countries are spending 9% or less, it affects your competitive position. You would like to feel that you are getting a whole lot more for your money. I have no idea how the debate is going to come out because you are talking about one-seventh of the economy and something that is emotionally charged. I do think the rate of increase in health cost has dampened considerably, but I don't think that is necessarily permanent. I think it can last for a few years and it will come back if we start getting increases in health care costs significantly above the general rate of inflation. You are going to hear a lot about health care, again, and you should.

Q. You say that you don't like to look at résumés. What do you think businesses that *do* use them find impressive about résumés?

A. Well, I would say that, if you are talking about the typical large business, they look at labels. In other words, if you get an MBA, you have the label MBA. If you get it from a certain place, you know, it says that, too. There is an awful lot of hiring done based on that. The label definitely has an economic value. I can't quantify that exactly, but it has a significant economic value. It just doesn't happen to have it with us. But if you are getting hired by IBM or General Motors or Merrill Lynch, it's going to make a difference in the way they look at you initially. I don't think it makes that much difference five years out. But I *do* think it makes a difference in starting salary. It makes a difference in your likelihood of getting hired for a great many positions. Then, it's really what you show from that point forward. But it is a very useful label in getting hired by a large company.

We don't even think of ourselves as a large company. We think of ourselves as a collection of medium-sized companies. Incidentally, we've got a fellow that runs one of our larger subsidiaries; an MBA might mean quite a bit to him. And he's the one that hires for the group. I do no hiring, except if the top person in one of our companies dies or retires. I make maybe one hiring decision every three years. They also make hiring decisions all the time, and I don't get into what criteria they use. That's entirely up to them. I don't see how you can hold somebody responsible for an operation and then start telling them how to hire people. We have no human resources department at Berkshire. Some of our subsidiaries have somebody in that position, but we have nobody at the top who in turn supervises all that. Most companies do and once they do, they start building empires. They start going to all the conventions and seminars, and then they hire assistants to do this, and it just goes on and on. So we don't start it. Two more questions, okay?

Q. Mr. Buffett, this question deals with international investment. Since you are a key person in your corporations, when you make decisions on important international portfolios, what kind of factors come into your mind when selecting a nation to invest in? What do you think about China as a "hot market" right now?

A. Well, we like companies, obviously, that have big international potential. But we're perfectly willing to buy into a company that can never go outside the region. Nebraska Furniture Mart is not going to sell anything internationally, although they will sell a lot throughout the Midwest. It's just one variable that enters in. Gillette just bought 70% of the Shanghai Razor Company, which is the largest razor company over there. Coke will sell 135 million cases this year in China, which is only two per capita, roughly, as compared to 325 per capita in the United States. That's very encouraging and they are moving very fast in China. One problem Gillette has is that the Chinese do not shave as often as Americans. But we plan to put something in Coke to change that!

Q. You support a progressive consumption tax policy. I think your idea is the best and works when our economy is booming or overheated. What do you think if our economy is in a severe recession like in 1981-82?

A. A progressive consumption tax, if enacted, would hurt the economy in the following year or maybe a couple of years, regardless of when it was introduced, simply because: If we are consuming 100% of the goods produced in the country and all of the sudden you say we're going to start saving 5%, that would take consumption down to 95%, assuming no immediate increase in output, which there wouldn't be. If you're making \$5,000 a month and you decide to save more in your family, you're going to cut consumption at that point. Later on, you may increase consumption because of the product of that investment. Any kind of a consumption tax that induces more investment will hurt the economy in the following year or two, which makes it tough to sell. That makes it tough to sell in your own household, too. If you say we're going to start saving more and consuming less, that's not necessarily a winning argument. But it is the way to build wealth over time. I would say no matter when it was introduced, it would have a bite for awhile.

Think back to 1790, when 90% of the people in the country were on farms. If some guy had come along and said we're going to develop tractors, combines, and cultivators that will put 80% of these people out of work so that a small percentage of people will be on farms, people would say, "That's terrifying, you know, we can't have that." Actually, saving and investment frees up people to do all kinds of other things, as you have seen on the long scale of 200 years of this country. It's a terrifying prospect to people in the short run, because they see the unemployment; they don't see those people being freed up to produce all kinds of other things over time. If you could have had a little video tape that you showed all the farmers in the country in 1790, and said, "Use this one tractor instead of needing all of your sons and sons-in-law and everybody else to farm this place, and you will be able to do it yourself. The other eight people will be unemployed," I would have hated to have a referendum on whether people wanted progress, in terms of better farm machinery. That is the problem with increasing the investment rate in the country. And, in a politically charged environment with sound bites on television, I'm not sure it could be sold.

Well, I want to thank you all for coming; it's been a real pleasure to return to the University of Nebraska and I hope we keep our quarterbacks healthy. Thanks.

In June 1996, Berkshire's Chairman, Warren E. Buffett, issued a booklet entitled "**An Owner's Manual***" to Berkshire's Class A and Class B shareholders. The purpose of the manual was to explain Berkshire's broad economic principles of operation. An updated version is reproduced on this and the following pages.

OWNER-RELATED BUSINESS PRINCIPLES

At the time of the Blue Chip merger in 1983, I set down 13 owner-related business principles that I thought would help new shareholders understand our managerial approach. As is appropriate for "principles," all 13 remain alive and well today, and they are stated here in italics.

1. *Although our form is corporate, our attitude is partnership. Charlie Munger and I think of our shareholders as owner-partners, and of ourselves as managing partners. (Because of the size of our shareholdings we are also, for better or worse, controlling partners.) We do not view the company itself as the ultimate owner of our business assets but instead view the company as a conduit through which our shareholders own the assets.*

Charlie and I hope that you do not think of yourself as merely owning a piece of paper whose price wiggles around daily and that is a candidate for sale when some economic or political event makes you nervous. We hope you instead visualize yourself as a part owner of a business that you expect to stay with indefinitely, much as you might if you owned a farm or apartment house in partnership with members of your family. For our part, we do not view Berkshire shareholders as faceless members of an ever-shifting crowd, but rather as co-venturers who have entrusted their funds to us for what may well turn out to be the remainder of their lives.

The evidence suggests that most Berkshire shareholders have indeed embraced this long-term partnership concept. The annual percentage turnover in Berkshire's shares is a fraction of that occurring in the stocks of other major American corporations, even when the shares I own are excluded from the calculation.

In effect, our shareholders behave in respect to their Berkshire stock much as Berkshire itself behaves in respect to companies in which it has an investment. As owners of, say, Coca-Cola or American Express shares, we think of Berkshire as being a non-managing partner in two extraordinary businesses, in which we measure our success by the long-term progress of the companies rather than by the month-to-month movements of their stocks. In fact, we would not care in the least if several years went by in which there was no trading, or quotation of prices, in the stocks of those companies. If we have good long-term expectations, short-term price changes are meaningless for us except to the extent they offer us an opportunity to increase our ownership at an attractive price.

2. *In line with Berkshire's owner-orientation, most of our directors have a major portion of their net worth invested in the company. We eat our own cooking.*

Charlie's family has 80% or more of its net worth in Berkshire shares; I have more than 98%. In addition, many of my relatives – my sisters and cousins, for example – keep a huge portion of their net worth in Berkshire stock.

Charlie and I feel totally comfortable with this eggs-in-one-basket situation because Berkshire itself owns a wide variety of truly extraordinary businesses. Indeed, we believe that Berkshire is close to being unique in the quality and diversity of the businesses in which it owns either a controlling interest or a minority interest of significance.

Charlie and I cannot promise you results. But we can guarantee that your financial fortunes will move in lockstep with ours for whatever period of time you elect to be our partner. We have no interest in large salaries or options or other means of gaining an "edge" over you. We want to make money only when our partners do and in exactly the same proportion. Moreover, when I do something dumb, I want you to be able to derive some solace from the fact that my financial suffering is proportional to yours.

3. *Our long-term economic goal (subject to some qualifications mentioned later) is to maximize Berkshire's average annual rate of gain in intrinsic business value on a per-share basis. We do not measure the economic significance or performance of Berkshire by its size; we measure by per-share progress. We are certain that the rate of per-share progress will diminish in the future – a greatly enlarged capital base will see to that. But we will be disappointed if our rate does not exceed that of the average large American corporation.*
4. *Our preference would be to reach our goal by directly owning a diversified group of businesses that generate cash and consistently earn above-average returns on capital. Our second choice is to own parts of similar businesses, attained primarily through purchases of marketable common stocks by our insurance subsidiaries. The price and availability of businesses and the need for insurance capital determine any given year's capital allocation.*

In recent years we have made a number of acquisitions. Though there will be dry years, we expect to make many more in the decades to come, and our hope is that they will be large. If these purchases approach the quality of those we have made in the past, Berkshire will be well served.

The challenge for us is to generate ideas as rapidly as we generate cash. In this respect, a depressed stock market is likely to present us with significant advantages. For one thing, it tends to reduce the prices at which entire companies become available for purchase. Second, a depressed market makes it easier for our insurance companies to buy small pieces of wonderful businesses – including additional pieces of businesses we already own – at attractive prices. And third, some of those same wonderful businesses, such as Coca-Cola, are consistent buyers of their own shares, which means that they, and we, gain from the cheaper prices at which they can buy.

Overall, Berkshire and its long-term shareholders benefit from a sinking stock market much as a regular purchaser of food benefits from declining food prices. So when the market plummets – as it will from time to time – neither panic nor mourn. It's good news for Berkshire.

5. *Because of our two-pronged approach to business ownership and because of the limitations of conventional accounting, consolidated reported earnings may reveal relatively little about our true economic performance. Charlie and I, both as owners and managers, virtually ignore such consolidated numbers. However, we will also report to you the earnings of each major business we control, numbers we consider of great importance. These figures, along with other information we will supply about the individual businesses, should generally aid you in making judgments about them.*

To state things simply, we try to give you in the annual report the numbers and other information that really matter. Charlie and I pay a great deal of attention to how well our businesses are doing, and we also work to understand the environment in which each business is operating. For example, is one of our businesses enjoying an industry tailwind or is it facing a headwind? Charlie and I need to know exactly which situation prevails and to adjust our expectations accordingly. We will also pass along our conclusions to you.

Over time, the large majority of our businesses have exceeded our expectations. But sometimes we have disappointments, and we will try to be as candid in informing you about those as we are in describing the happier experiences. When we use unconventional measures to chart our progress – for instance, you will be reading in our annual reports about insurance “float” – we will try to explain these concepts and why we regard them as important. In other words, we believe in telling you how we think so that you can evaluate not only Berkshire's businesses but also assess our approach to management and capital allocation.

6. *Accounting consequences do not influence our operating or capital-allocation decisions. When acquisition costs are similar, we much prefer to purchase \$2 of earnings that is not reportable by us under standard accounting principles than to purchase \$1 of earnings that is reportable. This is precisely the choice that often faces us since entire businesses (whose earnings will be fully reportable) frequently sell for double the pro-rata price of small portions (whose earnings will be largely unreportable). In aggregate and over time, we expect the unreported earnings to be fully reflected in our intrinsic business value through capital gains.*

We have found over time that the undistributed earnings of our investees, in aggregate, have been fully as beneficial to Berkshire as if they had been distributed to us (and therefore had been included in the earnings we officially report). This pleasant result has occurred because most of our investees are engaged in truly outstanding businesses that can often employ incremental capital to great advantage, either by putting it to work in their businesses or by repurchasing their shares. Obviously, every capital decision that our investees have made has not benefitted us as shareholders, but overall we have garnered far more than a dollar of value for each dollar they have retained. We consequently regard look-through earnings as realistically portraying our yearly gain from operations.

7. *We use debt sparingly and, when we do borrow, we attempt to structure our loans on a long-term fixed-rate basis. We will reject interesting opportunities rather than over-leverage our balance sheet. This conservatism has penalized our results but it is the only behavior that leaves us comfortable, considering our fiduciary obligations to policyholders, lenders and the many equity holders who have committed unusually large portions of their net worth to our care. (As one of the Indianapolis “500” winners said: “To finish first, you must first finish.”)*

The financial calculus that Charlie and I employ would never permit our trading a good night's sleep for a shot at a few extra percentage points of return. I've never believed in risking what my family and friends have and need in order to pursue what they don't have and don't need.

Besides, Berkshire has access to two low-cost, non-perilous sources of leverage that allow us to safely own far more assets than our equity capital alone would permit: deferred taxes and “float,” the funds of others that our insurance business holds because it receives premiums before needing to pay out losses. Both of these funding sources have grown rapidly and now total about \$117 billion.

Better yet, this funding to date has often been cost-free. Deferred tax liabilities bear no interest. And as long as we can break even in our insurance underwriting the cost of the float developed from that operation is zero. Neither item, of course, is equity; these are real liabilities. But they are liabilities without covenants or due dates attached to them. In effect, they give us the benefit of debt – an ability to have more assets working for us – but saddle us with none of its drawbacks.

Of course, there is no guarantee that we can obtain our float in the future at no cost. But we feel our chances of attaining that goal are as good as those of anyone in the insurance business. Not only have we reached the goal in the past (despite a number of important mistakes by your Chairman), our 1996 acquisition of GEICO, materially improved our prospects for getting there in the future.

In our present configuration (2012) we expect additional borrowings to be concentrated in our utilities and railroad businesses, loans that are non-recourse to Berkshire. Here, we will favor long-term, fixed-rate loans.

8. *A managerial “wish list” will not be filled at shareholder expense. We will not diversify by purchasing entire businesses at control prices that ignore long-term economic consequences to our shareholders. We will only do with your money what we would do with our own, weighing fully the values you can obtain by diversifying your own portfolios through direct purchases in the stock market.*

Charlie and I are interested only in acquisitions that we believe will raise the *per-share* intrinsic value of Berkshire’s stock. The size of our paychecks or our offices will never be related to the size of Berkshire’s balance sheet.

9. *We feel noble intentions should be checked periodically against results. We test the wisdom of retaining earnings by assessing whether retention, over time, delivers shareholders at least \$1 of market value for each \$1 retained. To date, this test has been met. We will continue to apply it on a five-year rolling basis. As our net worth grows, it is more difficult to use retained earnings wisely.*

I should have written the “five-year rolling basis” sentence differently, an error I didn’t realize until I received a question about this subject at the 2009 annual meeting.

When the stock market has declined sharply over a five-year stretch, our market-price premium to book value has sometimes shrunk. And when that happens, we fail the test as I improperly formulated it. In fact, we fell far short as early as 1971-75, well before I wrote this principle in 1983.

The five-year test should be: (1) during the period did our book-value gain exceed the performance of the S&P; and (2) did our stock consistently sell at a premium to book, meaning that every \$1 of retained earnings was always worth more than \$1? If these tests are met, retaining earnings has made sense.

10. *We will issue common stock only when we receive as much in business value as we give. This rule applies to all forms of issuance – not only mergers or public stock offerings, but stock-for-debt swaps, stock options, and convertible securities as well. We will not sell small portions of your company – and that is what the issuance of shares amounts to – on a basis inconsistent with the value of the entire enterprise.*

When we sold the Class B shares in 1996, we stated that Berkshire stock was not undervalued – and some people found that shocking. That reaction was not well-founded. Shock should have registered instead had we issued shares when our stock was undervalued. Managements that say or imply during a public offering that their stock is undervalued are usually being economical with the truth or uneconomical with their existing shareholders’ money: Owners unfairly lose if their managers deliberately sell assets for 80¢ that in fact are worth \$1. We didn’t commit that kind of crime in our offering of Class B shares and we never will. (We did *not*, however, say at the time of the sale that our stock was overvalued, though many media have reported that we did.)

11. *You should be fully aware of one attitude Charlie and I share that hurts our financial performance: Regardless of price, we have no interest at all in selling any good businesses that Berkshire owns. We are also very reluctant to sell sub-par businesses as long as we expect them to generate at least some cash and as long as we feel good about their managers and labor relations. We hope not to repeat the capital-allocation mistakes that led us into such sub-par businesses. And we react with great caution to suggestions that our poor businesses can be restored to satisfactory profitability by major capital expenditures. (The projections will be dazzling and the advocates sincere, but, in the end, major additional investment in a terrible industry usually is about as rewarding as struggling in quicksand.) Nevertheless, gin rummy managerial behavior (discard your least promising business at each turn) is not our style. We would rather have our overall results penalized a bit than engage in that kind of behavior.*

We continue to avoid gin rummy behavior. True, we closed our textile business in the mid-1980’s after 20 years of struggling with it, but only because we felt it was doomed to run never-ending operating losses. We have not, however, given thought to selling operations that would command very fancy prices nor have we dumped our laggards, though we focus hard on curing the problems that cause them to lag.

12. *We will be candid in our reporting to you, emphasizing the pluses and minuses important in appraising business value. Our guideline is to tell you the business facts that we would want to know if our positions were reversed. We owe you no less. Moreover, as a company with a major communications business, it would be inexcusable for us to apply lesser standards of accuracy, balance and incisiveness when reporting on ourselves than we would expect our news people to apply when reporting on others. We also believe candor benefits us as managers: The CEO who misleads others in public may eventually mislead himself in private.*

At Berkshire you will find no “big bath” accounting maneuvers or restructurings nor any “smoothing” of quarterly or annual results. We will always tell you how many strokes we have taken on each hole and never play around with the scorecard. When the numbers are a very rough “guesstimate,” as they necessarily must be in insurance reserving, we will try to be both consistent and conservative in our approach.

We will be communicating with you in several ways. Through the annual report, I try to give all shareholders as much value-defining information as can be conveyed in a document kept to reasonable length. We also try to convey a liberal quantity of condensed but important information in the quarterly reports we post on the internet, though I don’t write those (one recital a year is enough). Still another important occasion for communication is our Annual Meeting, at which Charlie and I are delighted to spend five hours or more answering questions about Berkshire. But there is one way we *can’t* communicate: on a one-on-one basis. That isn’t feasible given Berkshire’s many thousands of owners.

In all of our communications, we try to make sure that no single shareholder gets an edge: We do not follow the usual practice of giving earnings “guidance” or other information of value to analysts or large shareholders. Our goal is to have all of our owners updated at the same time.

13. *Despite our policy of candor, we will discuss our activities in marketable securities only to the extent legally required. Good investment ideas are rare, valuable and subject to competitive appropriation just as good product or business acquisition ideas are. Therefore we normally will not talk about our investment ideas. This ban extends even to securities we have sold (because we may purchase them again) and to stocks we are incorrectly rumored to be buying. If we deny those reports but say “no comment” on other occasions, the no-comments become confirmation.*

Though we continue to be unwilling to talk about specific stocks, we freely discuss our business and investment philosophy. I benefitted enormously from the intellectual generosity of Ben Graham, the greatest teacher in the history of finance, and I believe it appropriate to pass along what I learned from him, even if that creates new and able investment competitors for Berkshire just as Ben’s teachings did for him.

TWO ADDED PRINCIPLES

14. *To the extent possible, we would like each Berkshire shareholder to record a gain or loss in market value during his period of ownership that is proportional to the gain or loss in per-share intrinsic value recorded by the company during that holding period. For this to come about, the relationship between the intrinsic value and the market price of a Berkshire share would need to remain constant, and by our preferences at 1-to-1. As that implies, we would rather see Berkshire’s stock price at a **fair** level than a **high** level. Obviously, Charlie and I can’t control Berkshire’s price. But by our policies and communications, we can encourage informed, rational behavior by owners that, in turn, will tend to produce a stock price that is also rational. Our it’s-as-bad-to-be-overvalued-as-to-be-undervalued approach may disappoint some shareholders. We believe, however, that it affords Berkshire the best prospect of attracting long-term investors who seek to profit from the progress of the company rather than from the investment mistakes of their partners.*
15. *We regularly compare the gain in Berkshire’s per-share book value to the performance of the S&P 500. Over time, we hope to outpace this yardstick. Otherwise, why do our investors need us? The measurement, however, has certain shortcomings that are described in the next section. Moreover, it now is less meaningful on a year-to-year basis than was formerly the case. That is because our equity holdings, whose value tends to move with the S&P 500, are a far smaller portion of our net worth than they were in earlier years. Additionally, gains in the S&P stocks are counted in full in calculating that index, whereas gains in Berkshire’s equity holdings are counted at 65% because of the federal tax we incur. We, therefore, expect to outperform the S&P in lackluster years for the stock market and underperform when the market has a strong year.*

INTRINSIC VALUE

Now let’s focus on a term that I mentioned earlier and that you will encounter in future annual reports.

Intrinsic value is an all-important concept that offers the only logical approach to evaluating the relative attractiveness of investments and businesses. Intrinsic value can be defined simply: It is the discounted value of the cash that can be taken out of a business during its remaining life.

The calculation of intrinsic value, though, is not so simple. As our definition suggests, intrinsic value is an estimate rather than a precise figure, and it is additionally an estimate that must be changed if interest rates move or forecasts of future cash flows are revised. Two people looking at the same set of facts, moreover – and this would apply even to Charlie and me – will almost inevitably come up with at least slightly different intrinsic value figures. That is one reason we never give you our estimates of intrinsic value. What our annual reports do supply, though, are the facts that we ourselves use to calculate this value.

Meanwhile, we regularly report our per-share book value, an easily calculable number, though one of limited use. The limitations do not arise from our holdings of marketable securities, which are carried on our books at their current prices. Rather the inadequacies of book value have to do with the companies we control, whose values as stated on our books may be far different from their intrinsic values.

The disparity can go in either direction. For example, in 1964 we could state with certitude that Berkshire's per-share book value was \$19.46. However, that figure considerably overstated the company's intrinsic value, since all of the company's resources were tied up in a sub-profitable textile business. Our textile assets had neither going-concern nor liquidation values equal to their carrying values. Today, however, Berkshire's situation is reversed: Now, our book value *far* understates Berkshire's intrinsic value, a point true because many of the businesses we control are worth much more than their carrying value.

Inadequate though they are in telling the story, we give you Berkshire's book-value figures because they today serve as a rough, albeit significantly understated, tracking measure for Berkshire's intrinsic value. In other words, the percentage change in book value in any given year is likely to be reasonably close to that year's change in intrinsic value.

You can gain some insight into the differences between book value and intrinsic value by looking at one form of investment, a college education. Think of the education's cost as its "book value." If this cost is to be accurate, it should include the earnings that were foregone by the student because he chose college rather than a job.

For this exercise, we will ignore the important non-economic benefits of an education and focus strictly on its economic value. First, we must estimate the earnings that the graduate will receive over his lifetime and subtract from that figure an estimate of what he would have earned had he lacked his education. That gives us an excess earnings figure, which must then be discounted, at an appropriate interest rate, back to graduation day. The dollar result equals the intrinsic economic value of the education.

Some graduates will find that the book value of their education exceeds its intrinsic value, which means that whoever paid for the education didn't get his money's worth. In other cases, the intrinsic value of an education will far exceed its book value, a result that proves capital was wisely deployed. In all cases, what is clear is that book value is meaningless as an indicator of intrinsic value.

THE MANAGING OF BERKSHIRE

I think it's appropriate that I conclude with a discussion of Berkshire's management, today and in the future. As our first owner-related principle tells you, Charlie and I are the managing partners of Berkshire. But we subcontract all of the heavy lifting in this business to the managers of our subsidiaries. In fact, we delegate almost to the point of abdication: Though Berkshire has about 288,000 employees, only 24 of these are at headquarters.

Charlie and I mainly attend to capital allocation and the care and feeding of our key managers. Most of these managers are happiest when they are left alone to run their businesses, and that is customarily just how we leave them. That puts them in charge of all operating decisions and of dispatching the excess cash they generate to headquarters. By sending it to us, they don't get diverted by the various enticements that would come their way were they responsible for deploying the cash their businesses throw off. Furthermore, Charlie and I are exposed to a much wider range of possibilities for investing these funds than any of our managers could find in his or her own industry.

Most of our managers are independently wealthy, and it's therefore up to us to create a climate that encourages them to choose working with Berkshire over golfing or fishing. This leaves us needing to treat them fairly and in the manner that we would wish to be treated if our positions were reversed.

As for the allocation of capital, that's an activity both Charlie and I enjoy and in which we have acquired some useful experience. In a general sense, grey hair doesn't hurt on this playing field: You don't need good hand-eye coordination or well-toned muscles to push money around (thank heavens). As long as our minds continue to function effectively, Charlie and I can keep on doing our jobs pretty much as we have in the past.

On my death, Berkshire's ownership picture will change but not in a disruptive way: None of my stock will have to be sold to take care of the cash bequests I have made or for taxes. Other assets of mine will take care of these requirements. All Berkshire shares will be left to foundations that will likely receive the stock in roughly equal installments over a dozen or so years.

At my death, the Buffett family will not be involved in managing the business but, as very substantial shareholders, will help in picking and overseeing the managers who do. Just who those managers will be, of course, depends on the date of my death. But I can anticipate what the management structure will be: Essentially my job will be split into two parts. One executive will become CEO and responsible for operations. The responsibility for investments will be given to one or more executives. If the acquisition of new businesses is in prospect, these executives will cooperate in making the decisions needed, subject, of course, to board approval. We will continue to have an extraordinarily shareholder-minded board, one whose interests are solidly aligned with yours.

Were we to need the management structure I have just described on an immediate basis, our directors know my recommendations for both posts. All candidates currently work for or are available to Berkshire and are people in whom I have total confidence. Our managerial roster has never been stronger.

I will continue to keep the directors posted on the succession issue. Since Berkshire stock will make up virtually my entire estate and will account for a similar portion of the assets of various foundations for a considerable period after my death, you can be sure that the directors and I have thought through the succession question carefully and that we are well prepared. You can be equally sure that the principles we have employed to date in running Berkshire will continue to guide the managers who succeed me and that our unusually strong and well-defined culture will remain intact. As an added assurance that this will be the case, I believe it would be wise when I am no longer CEO to have a member of the Buffett family serve as the non-paid, non-executive Chairman of the Board. That decision, however, will be the responsibility of the then Board of Directors.

Lest we end on a morbid note, I also want to assure you that I have never felt better. I love running Berkshire, and if enjoying life promotes longevity, Methuselah's record is in jeopardy.

Warren E. Buffett
Chairman

From: Jeff Raikes
To: Warren Buffett. Berkshire
Subject: Go Huskers!
Date: Sunday, August 17, 1997 9:37 PM

Warren, I apologize in advance for this being a long note. I do hope you find it interesting, and be certain I don't expect a long reply any reply at all for that matter). Perhaps sometime well get a few minutes where I can get your reaction to the thoughts on business below.

Go Huskers!

We're looking forward to seeing you in a few weeks for the Husker game. Please let me know if there is anything I can do to make your slay in Washington more enjoyable (and a little more Husker-oriented!), and I will also check with BillG on the plans and how I might help.

I'm sad to say I'm very pessimistic about our prospects. You've probably noted that Washington is very highly ranked this year. They have Huard, arguably one of the top 2 or 3 pro-style quarterbacks in the country - and only a sophomore. And they have an outstanding defense. In the meantime, the Huskers are replacing eight starters on defense, and the spring game showed that Frost still can't throw the ball well enough. Without a balanced attack on offense, we'll have difficulty against their speed. And Huard has the potential to pick apart our secondary - we'll need an outstanding plan on pass rush, equivalent to the "Philadelphia Blitz" employed at the Nebraska vs. Florida Fiesta Bowl championship game.

I hope you're hearing better news from fall practice. People here know I'm a huge Husker fan - I can't tell you how painful it would be for me to go through two more losses to the Huskies.

The Making of An American Capitalist...

Tricia and I took the kids to Disney World, followed by a short vacation to Nantucket and Cuttyhunk (a small Island off Martha's Vineyard). I spent part of the vacation reading Lowenstein's book (The Making of an American Capitalist) - and really enjoyed it! On the way from Cuttyhunk to Boston/Logan airport, we drove down Cove Road in New Bedford trying to find the Berkshire-Hathaway mill. While I saw a few old mills, I'm not really sure which might have been the one - I was looking for the dock tower. Or perhaps it has been torn down.

The book got me thinking about your golf tournament, the after-dinner "Talk with Warren", and the inevitable question - why don't you invest in Microsoft or high technology? The Lowenstein book provided some stimulus to ponder the question, and I thought it would be fun to share some thoughts with you on the subject. But I should emphasize my intent in doing so is not to try to change your viewpoint (though I hope it doesn't reinforce your view!). I just view this as a fun discussion or intellectual exercise. While many people would see our business as complicated or hard to understand, I am absolutely convinced an astute investor can learn our business in only 3 to 4 hours (and probably less than two hours if BillG explained it!).

In some respects I see the business characteristics of Coca Cola or See's Candy as being very similar to Microsoft. I think you would love the simplicity of the operating system business. E.g. in FY96 there were 50 million PC's sold in the world, and about 80% of them were licensed for a Microsoft operating system. Although I would never write down the analogy of a "toll bridge", people outside our company might describe this business in that way. Those 40 million licenses averaged about \$45 per, for a total of about \$1.8B in revenue. By the way, the remaining 10M PC's were largely running Microsoft operating systems

– we just didn't get paid for them. This problem - piracy - if reduced, is one of the key upsides to our business.

In FY2000, there will be about 100M PC's sold. We think we can reduce piracy to 10% and license 90% or 90M of the PC's. But we also have pricing discretion- - I think I heard this term used in conjunction with your pricing decisions on See's Candy. We will be transitioning the world to a new version of our operating system, Windows NT. Today, we get more than \$100 per system for NT, but only on a small percentage of the PC's. But NT will be on closer to 70% of the PC's sold in FY2000. We can achieve average license revenue of \$80. So 90M licenses at \$80 per license totals about \$7.2B, up from just under \$2B in 3 to 4 years. And since there are effectively no COGs and a WW sales force of only 100-150 people this is a 90%+ margin business. There is an R&D charge to the business, but I'm sure the profits are probably as good as the syrup business!

There is actually upside in the number of PC's sold. Similar to your analysis of Coca Cola, the penetration of PC's in International markets leaves a lot of room for growth. In the US, the number of PC's per 1000 people is around 400 or so, but the number drops off rapidly to 100 or less in most countries, even in some of the European countries. (Unfortunately, I'm not in Seattle now so I don't have these numbers at my fingertips, but Steve Ballmer can recite them from memory.)

The business described above is what we call the OEM (Original Equipment Manufacturer) business, meaning our revenue comes from the manufacturers of the PC's. The majority of the rest of the business is called the "finished goods" business. It consists of businesses or individuals buying office productivity software, educational or entertainment software, etc. Again the structure is very simple. A PC is just a razor that needs blades, and we measure our revenue on the basis of \$ per PC, In FY96, nearly 50M PC's were purchased and Microsoft averaged about \$140 in software revenue per PC or \$7B. This amount is in addition to the OEM royalty business described above. (Steve Ballmer can recite the number of PC's and \$ per PC to you off the top of his head for just about any country in the world; BillG can probably do the same though he doesn't spend as much time on that as Steve.)

So in some sense that is it. There are a certain number of PC's that get sold, a growing amount of Microsoft software per PC, the power to use the brand to sell even more software, some pricing discretion, international market growth, and the opportunity to grow revenue by further reduction in piracy. Obviously I'm not going through all the details we'd discuss in a couple hour session, but that is the heart of the business. Of course there is the R&D invested to build the software, but that is similar to Disney continuing to produce new content, or Nebraska Furniture Mart continuing to keep their format fresh, and an Investment that BiliG manages very closely.

Even some of the new "media" businesses are really not that new or different. Take our WebTV acquisition or the Comcast deal. I see articles covering those investments and describing Microsoft as becoming a media company. The real goal is to figure out a way to get an "operating system" royalty per TV. 10's of millions of TV's per year at \$10-\$20 per TV is a nice little "operating system" business.

There is a tremendous strategic synergy between the "finished goods business" and the OEM operating system business. E.g. we have about 90% share of office productivity software with Microsoft Office, and that is a great business (about \$58, also 85%+ operating margin). But also important is the fact that this software is heavily valued by the actual users (operating systems are a bit more invisible to the user), and they resist shifting brands. If we own the key "franchises" built on top of the operating system, we dramatically widen the "moat" that protects the operating system business. I.e. if J owned the most

successful daily newspaper in Buffalo, I wouldn't want to leave it to my competitor to own the Sunday edition.

Let's build on this analogy and the strategic synergy between the operating system and the software that runs on it. It helps explain the investments we are making in Pete Higgins business (Interactive Media, like MSN, MSNBC, Expedia, Sidewalk, etc.). Again, some newspaper and magazine articles would say that Microsoft is trying to become a media company. But I prefer to view it as investing in the potential "user franchises" that will help protect our operating systems businesses in the future. We hope to make a lot of money off these franchises, but even more important is that they should protect our Windows royalty per PC, and hopefully our royalty per TV. And success in those businesses will help increase the opportunity for future pricing discretion.

So I really don't see our business as being significantly more difficult to understand than the other great businesses you've invested in. But there is one potential difference that worries me, and it is a key part of the reason I spent the time to share these thoughts with you. The difference I worry about is the "width of the moat. With Coca Cola, you can feel pretty confident that there won't be a fast shift in user preferences away from drinking sodas, and in particular Coke. In technology, we may more frequently see "paradigm shifts" where old leaders are displaced by new. Graphical user interface replaces character user interface, the Internet explodes, etc.

In the absence of a paradigm shift in technology, market shares seldom change by more than a few points. With a paradigm shift, the shares can rapidly change by dozens of points. I spent my first ten years at Microsoft building Microsoft Office. We were way behind in share most of that time (less than 10%), but the shift to graphical user interface was the paradigm shift that allowed us to displace the old leaders (Lotus 1-2-3 and WordPerfect) and now be at 90% share, of course key to this shift in share, was their failure to identify the computing paradigm shift and properly invest in it. They were the leaders and they could have chosen to cannibalize themselves. But they didn't act fast enough and were scared that investing in the new paradigm would open the door for us - ironically it was their slow pace that opened the door.

I remember one of our very first conversations in 1991. You asked me my view on what happened to IBM. I don't remember exactly what I said. I think their addiction to the power they had in the previous generations of computing, really blindsided them from the paradigm shift of the PC and client-server computing.

In technology, the moats may be narrower. It is amazing how fast the Internet exploded. Or how quickly Java gained notoriety. We have some great moats, but even so, 18 months ago analysts were questioning whether we could move quickly enough. (Obviously, that turned out to be a great time to buy Microsoft!)

I am very confident about our business for the next 5 to 10 years. But I will admit it is easier to be confident about Coke's business for the next 10 years. In short, I've long had this sneaking suspicion that it is not that you don't understand this business. In fact, BillG has probably already explained all of the above to you and I apologize for boring you with this, but it was fun and good for me to write it down.) My theory is that you don't invest in technology or Microsoft because you see the moats as narrower; too much risk and the potential for a fast paradigm shift that would too quickly undermine your equity position.

Since Microsoft is the business I understand (i.e. I have a narrow circle of competence!) and I subscribe to your Views on Investments, well over 90% of my net worth is tied up there. (Thanks to BillG, I'm well into the nine digit range.) I feel fine about having 90%+ tied up in Microsoft. We have a "safety net" of tax free municipal bonds so I know the family will be OK if something happens. And we don't intend to leave much to the kids, so I'm simply building a huge pile of chits to someday turn back to society. I do wonder about

the time period ten or twenty or more years down the road. If at some point then the outlook for Microsoft has changed, I hope I will have learned enough from your approach such that I will have the ability to identify new areas of intrinsic value and continue to grow the pile of chits at a high rate. But for now, I'm heads down selling more software...

I'm curious as to what you think about the Lowenstein book. I'm sure it is difficult to have so much of your life spread across the pages, on the other hand; there are so many things for you to be proud of. It was great to gain an understanding of Graham's approach, and more importantly your significant advancement of the approach. I found the arguments of the EMT (efficient market theoreticians) just laughable. They should spend a few days at Disney World so they can observe crowd theory in action. Believe me, the longest lines don't necessarily translate into the best value! But the best part of the book was to learn more about your values, and in particular the discipline of character that leads to your success in investing. I wish there were a magic formula for teaching this to our children!

This leaves me one final task for this note. I've done a very poor job of adequately thanking you for all the great things you've done for me - golf at Augusta, Seminole, the Buffett Classic, and in particular, the opportunity to listen in on great conversations and learn from you. I want you to know I've really appreciated your kindness, and if there is ever anything I might do to reciprocate, please let me know.

Thanks. Jeff Raikes

Subject; Re: Go Huskers!

hi, jeff;

i have so few friends who use e-mail that I only look for it once a week or so (and usually find nothing) so excuse the slowness in responding. I am also reasonably fast at typing but poor in the accuracy department and find it easier just to plow ahead rather than correct, knowing i am always writing to those who will find a little deciphering an interesting but easy challenge.

I am afraid you have the Husker-Husky situation correctly handicapped. We need a miracle and it's unlikely to happen in a stadium in which Frost will not be able to hear a word he shouts. I hope Osborne has had him working on hand signals all summer. .

Your analysis of Microsoft, why I should invest in it, and why I don't could not be more on the money. In effect the company has a royalty on a communication stream that can do nothing but grow. It's as if you were getting paid for every gallon of water starting in a small stream but with added amounts received as tributaries turned the stream into an Amazon. The toughest question is how hard to push prices and I wrote a note to Bill on that after our December meeting last year. Bell should have anticipated Bill and let someone else put in the phone infrastructure while he collected by the minute and distance (and even importance of the call if he could have figured a wait to monitor it) in perpetuity.

Coke is now getting a royalty on swallows; probably 7.2 billion a day if these average gulp is one ounce. I feel 100% sure (perhaps mistakenly) that I know the odds of this continuing-again 100% as long as cola doesn't cause cancer. Bill has an even better royalty-one which I would never bet against but don't feel i am capable of assessing probabilities about, except to the extent that with a gun to my head and forced to make a guess, i would go with it rather than against. But to calibrate whether my certainty is 80% or 55%, say, for a 20-year run would be folly. If I had to make such decisions, i would do my best but I prefer to structure investing as a no-called-strikes game and just wait for the fat one!

I watched Ted Williams on cable the other day and he referred to a book called the science of hitting which i then ran down. It has a drawing of the batters box in it that he had referred to on the show with lots of little squares in it, all parts of the strike zone. In his favorite spot, the box showed .400 reflecting what he felt he would hit if he only swung at pitches in that area. Low and outside, but still in the strike zone, he got down to .260. Of course, if he had two strikes on him, he was going to swing at that .260 pitch but otherwise he waited for one in the "happy zone" as he put it. I think the same approach makes sense in investing.

Your happy zone, because of the business experience you have had, what you see every day, your natural talents, etc. is going to be different than mine. I am sure, moreover that you can hit balls better in my happy zone than I can in yours just because they are fatter pitches in general. lets talk more about this when we get together. As a beginner I always feel that when i send off any e-mail, it is going to vanish into the ether and i would hate to have that happen with everything I know. GO HUSKERS-warren

The Bill & Warren Show

FORTUNE, 7/20/98

What do you get when you put a billionaire buddy act in front of 350 students? \$84 billion of inspiration In a meeting of incomparable minds (and unspendable net worth), Buffett and Gates muse about taking risks, motivating employees, confronting mistakes, and giving back. The result: something pretty darn close to wisdom.

The queue of students stretched through the lobby and out the door of the University of Washington's Husky Union Building in Seattle on a balmy Friday afternoon in late May. You could tell by the abundance of pressed chinos and dress shirts (and the shortage of nose rings) that this wasn't the ticket line for a Phish concert. Instead, the well-groomed group was staking out prime seats for, of all things, a lecture--albeit a very special lecture. The students and a few lucky guests were to be treated to a rare, public dialogue between the two richest businessmen in the solar system: Microsoft founder and CEO Bill Gates and Warren Buffett, chairman of Berkshire Hathaway Inc.

The billionaire buddies conceived the event to coincide with Buffett's weekend visit to Gates' home, following Microsoft's annual summit meeting for CEOs. The superinvestor and the cybertycoon asked some 350 business school students to participate in the session and invited the Public Broadcasting System and FORTUNE to document the affair. (PBS filmed the interchange and will offer copies to its affiliates for broadcast during pledge drives this fall.)

While the students milled downstairs, Gates and Buffett bantered with their wives and a small group of friends that included, among others, Katharine Graham, the former CEO of the Washington Post Co., and Bill's dad and sister. They noshed on fresh fruit in a makeshift greenroom while a makeup artist powdered Bill's nose and trimmed Warren's unruly eyebrows, much to Susie Buffett's amusement. At one point the Oracle of Omaha entertained the group with a goofy imitation of Richard Nixon's "V for victory" sign.

As showtime approached, the two gamely posed for photos and traded barbs like old college roomies. The other guests' main concern was that the titans not be too long-winded, so everyone could get back to Gates' house in time to play bridge. It felt like a convivial family reunion--granted, of one very high-powered family.

For a guest in that greenroom, perhaps the most lasting impression was the cross-generational affection between America's best-known billionaires. (For the record, on that day the 42-year-old Gates' net worth hovered around \$48 billion, compared with Buffett's \$36 billion. Buffett, who only a few years ago was considerably richer than Gates, has managed to remain 25 years older, though.) Buffett's presence seemed to calm Gates, who acted loose and gregarious despite Microsoft's legal fisticuffs with federal trustbusters and the stress of hosting several dozen prominent CEOs for the previous two days. Although Bill has finally begun to look his age--nascent crow's-feet now crease the

corners of his eyes, and he's no longer the beanpole he was--the Buffetts and Graham still dote on him like a wunderkind. He, in turn, treats them with a warm hint of deference, quite a contrast to his usual debater's demeanor.

Finally the two made their way to the stage, pausing in the wings for University of Washington Business School dean Bill Bradford's introduction. Unfortunately, the dean's remarks, which mainly praised Microsoft for hiring University of Washington students, missed the point. The funny, philosophical, extraordinary conversation that followed would be much more than a pep talk from a local employer and his pal. See for yourself.

--Brent Schlender

1. How We Got Here Warren and Bill explain how they became richer than God.

BUFFETT: I thought I ought to start this off by announcing that Bill and I have a small bet as to who would get the most applause. I suggested that I bet my house against his. We settled on a small sum, but evidently it isn't such a small sum to Bill, because just before we came out he gave me this Nebraska Cornhusker shirt to wear, and then he puts on this purple University of Washington shirt himself.

They've asked us to start out talking, the two of us, about what got us here, but then it's on to your questions. How I got here is pretty simple in my case. It's not IQ, I'm sure you'll be glad to hear. The big thing is rationality. I always look at IQ and talent as representing the horsepower of the motor, but that the output--the efficiency with which that motor works--depends on rationality. A lot of people start out with 400-horsepower motors but only get a hundred horsepower of output. It's way better to have a 200-horsepower motor and get it all into output.

So why do smart people do things that interfere with getting the output they're entitled to? It gets into the habits and character and temperament, and behaving in a rational manner. Not getting in your own way. As I said, everybody here has the ability absolutely to do anything I do and much beyond. Some of you will, and some of you won't. For the ones who won't, it will be because you get in your own way, not because the world doesn't allow you.

So I have one little suggestion for you: Pick out the person you admire the most, and then write down why you admire them. You're not to name yourself in this. And then put down the person that, frankly, you can stand the least, and write down the qualities that turn you off in that person. The qualities of the one you admire are traits that you, with a little practice, can make your own, and that, if practiced, will become habit-forming.

The chains of habit are too light to be felt until they are too heavy to be broken. At my age, I can't change any of my habits. I'm stuck. But you will have the habits 20 years from now that you decide to put into practice today. So I suggest that you look at the behavior that you admire in others and make those your own habits, and look at what you

really find reprehensible in others and decide that those are things you are not going to do. If you do that, you'll find that you convert all of your horsepower into output.

GATES: I think Warren's absolutely right about habit. I was lucky enough when I was quite young to have an exposure to computers, which were very expensive and kind of limited in what they could do, but still they were fascinating. Some friends of mine and I talked about that a lot and decided that, because of the miracle of chip technology, they would change into something that everybody could use. We didn't see any limit to the computer's potential, and we really thought writing software was a neat thing. So we hired our friends who wrote software to see what kind of a tool this could really be--a tool for the Information Age that could magnify your brainpower instead of just your muscle power.

By pursuing that with a pretty incredible focus and by being there at the very beginning of the industry, we were able to build a company that has played a very central role in what's been a pretty big revolution. Now, fortunately, the revolution is still at the beginning. It was 23 years ago when we started the company. But there's no doubt that if we take the habits we formed and stick with them, the next 23 years should give us a lot more potential and maybe even get us pretty close to our original vision--"a computer on every desk and in every home."

I was wondering how you define success, personally?

BUFFETT: I can certainly define happiness, because happy is what I am. I get to do what I like to do every single day of the year. I get to do it with people I like, and I don't have to associate with anybody who causes my stomach to churn. I tap-dance to work, and when I get there I think I'm supposed to lie on my back and paint the ceiling. It's tremendous fun. The only thing in my job that I don't like--and this just happens every three or four years--is that occasionally I have to fire somebody.

They say success is getting what you want and happiness is wanting what you get. I don't know which one applies in this case, but I do know I wouldn't be doing anything else. I'd advise you that when you go out to work, work for an organization of people you admire, because it will turn you on. I always worry about people who say, "I'm going to do this for ten years; I really don't like it very well. And then I'll do this...." That's a little like saving up sex for your old age. Not a very good idea.

I have turned down business deals that were otherwise decent deals because I didn't like the people I would have to work with. I didn't see any sense in pretending. To get involved with people who cause your stomach to churn--I say it's a lot like marrying for money. It's probably a bad idea under any circumstances, but it's absolutely crazy if you're already rich, right?

GATES: I agree that the key point is that you've got to enjoy what you do every day. For me, that's working with very smart people and it's working on new problems. Every time we think, "Hey, we've had a little bit of success," we're pretty careful not to dwell on it

too much because the bar gets raised. We've always got customer feedback telling us that the machines are too complicated and they're not natural enough. The competition, the technological breakthroughs, and the research make the computer industry, and in particular software, the most exciting field there is, and I think I have the best job in that business.

BUFFETT: Don't you think Dairy Queen is more important than that? [Berkshire Hathaway bought International Dairy Queen last fall, for \$585 million.]

GATES: You can manage Dairy Queen, Warren. I'll go and buy the Dilly Bars.

BUFFETT: We'll raise the price when you come.

Starting a new company is very risky. How do you determine when is the best opportunity to start a new company?

GATES: When I started Microsoft, I was so excited that I didn't think of it as being all that risky. It's true, I might have gone bankrupt, but I had a set of skills that were highly employable. And my parents were still willing to let me go back to Harvard and finish my education if I wanted to.

BUFFETT: You've always got a job with me, Bill.

GATES: The thing that was scary to me was when I started hiring my friends, and they expected to be paid. And then we had customers that went bankrupt--customers that I counted on to come through. And so I soon came up with this incredibly conservative approach that I wanted to have enough money in the bank to pay a year's worth of payroll, even if we didn't get any payments coming in. I've been almost true to that the whole time. We have about \$10 billion now, which is pretty much enough for the next year.

Anyway, if you're going to start a company, it takes so much energy that you'd better overcome your feeling of risk. Also, I don't think that you should necessarily start a company at the beginning of your career. There's a lot to be said for working for a company and learning how they do things first. In our case, Paul Allen and I were afraid somebody else might get there before us. It turned out we probably could've waited another year, in fact, because things were a little slow to start out, but being on the ground floor seemed very important to us.

How do you get people to support you?

GATES: At first you'll run into some skepticism. If you're young, it's hard to go lease premises. You couldn't rent a car when you were under 25, so I was always taking taxis to go see customers. When people would ask me to go have discussions in the bar, well, I couldn't go to the bar.

That's fun, because when people are first skeptical, they say, "Oh, this kid doesn't know anything." But when you show them you've really got a good product and you know something, they actually tend to go overboard. So, at least in this country, our youth was a huge asset for us once we reached a certain threshold.

2. The World Is Our Oyster Why Warren is sure everyone in China will want to drink Coke.

How do you as businessmen take your companies global?

BUFFETT: [At Berkshire Hathaway] we don't take our businesses global directly. Our two largest commitments are Coke and Gillette. Coke has 80% of its earnings coming from abroad, and Gillette has two-thirds of its earnings coming from abroad. So they are participating in a worldwide improvement in living standards, and we go global by piggybacking on them. I can sit in Omaha and let Doug Ivester [CEO of Coca-Cola] fly all over the world.

GATES: Our business is truly global. The PC standard is a global standard. What you need in a spreadsheet in Korea or Egypt is about the same as what you need in the U.S. We have to do some adaptation for the local languages, and that's a fun part of our business--understanding bi-directional languages and the large alphabets that you have in Chinese, Japanese, and Korean.

In fact, our market share is much higher outside the U.S. than it is inside, because it's relatively hard to set up local subsidiaries and to understand local conditions, local distribution and relationships. Since most of our competitors are from the U.S. and aren't as good at doing international business, we thrive even better in these other countries.

Most of our growth will come from outside the U.S. Here it will get to the point where it is largely a replacement market. Now, that doesn't mean U.S. customers don't want better software that can see, listen, and learn. But outside the U.S. we still have that early-growth-slope phenomenon.

What impelled you to make a trip together to China in 1995, and how has that trip affected your global business decisions since?

GATES: We went to China for a lot of reasons. Partly to relax and have fun. We found a few McDonald's there, so we didn't feel too far away from home. It was also exciting to go and see all the changes taking place, to see different parts of the country, and to meet some of the leaders.

China is a market that Microsoft had already been investing in. We've upped that a lot since then. As a percentage of our sales, though, it's tiny--well under 1%--and so even though it will double every year for the next five years, it's really only by taking a ten-year view that we can say it's worth the emphasis we're putting on it.

Although about three million computers get sold every year in China, people don't pay for the software. Someday they will, though. And as long as they're going to steal it, we want them to steal ours. They'll get sort of addicted, and then we'll somehow figure out how to collect sometime in the next decade.

BUFFETT: My family was amazed that I went. I never traveled beyond the outer reaches of the county in Nebraska. I had a terrific time and also confirmed my feeling that there's going to be a lot of Coca-Cola sold there in the future. I told everyone over there that it acts as an aphrodisiac.

3. Innovations "r" Us Warren ponders Internet chewing gum.

Both of you are innovators in your given industries. I was wondering what your definition of innovation is?

BUFFETT: I don't do a lot of innovating in my work. I really have just two functions: One is to allocate capital, which I enjoy doing. And the second one is to help 15 or 20 senior managers keep a group of people enthused about what they do when they have no financial need whatsoever to do it. At least three-quarters of the managers that we have are rich beyond any possible financial need, and therefore my job is to help my senior people keep them interested enough to want to jump out of bed at six o'clock in the morning and work with all of the enthusiasm they did when they were poor and starting. If I do those two things, they do the innovation.

GATES: The technology business has a lot of twists and turns. Probably the reason it's such a fun business is that no company gets to rest on its laurels. IBM was more dominant than any company will ever be in technology, and yet they missed a few turns in the road. That makes you wake up every day thinking, "Hmm, let's try to make sure today's not the day we miss the turn in the road. Let's find out what's going on in speech recognition, or in artificial intelligence. Let's make sure we're hiring the kinds of people who can pull those things together, and let's make sure we don't get surprised."

Sometimes we do get taken by surprise. For example, when the Internet came along, we had it as a fifth or sixth priority. It wasn't like somebody told me about it and I said, "I don't know how to spell that." I said, "Yeah, I've got that on my list, so I'm okay." But there came a point when we realized it was happening faster and was a much deeper phenomenon than had been recognized in our strategy. So as an act of leadership I had to create a sense of crisis, and we spent a couple of months throwing ideas and E-mail around, and we went on some retreats. Eventually a new strategy coalesced, and we said, "Okay, here's what we're going to do; here's how we're going to measure ourselves internally; and here's what the world should think about what we're going to do."

That kind of crisis is going to come up every three or four years. You have to listen carefully to all the smart people in the company. That's why a company like ours has to attract a lot of people who think in different ways, it has to allow a lot of dissent, and then it has to recognize the right ideas and put some real energy behind them.

Which countries and companies are best prepared to take advantage of the information age that is revolutionizing society?

BUFFETT: When you think about it, 15 years ago this country almost had an inferiority complex about its ability to compete in the world.

GATES: Everybody was talking about how the Japanese had taken over consumer electronics and that the computer industry was going to be next, and that their system of hard work somehow was superior, and that we had to completely rethink what we were doing. Now, if you look at what's happened in personal computers or in business in general, or at how we allocate capital, and how we let labor move around, the U.S. has emerged in a very strong position. And so the first beneficiary of all this information technology has been the U.S.

In places like Singapore, Hong Kong, and the Scandinavian countries, people are adopting the technology at basically the same rate that we are. And there are a few countries that, relative to their level of income, are going after the technology at an even higher rate than we are because they believe so much in education. In Korea and in many parts of China we see incredible penetration of personal computers even at very low income levels, because people there have decided it's a tool to help their kids get ahead.

The whole world is going to benefit in a big way. There will be this shift where, instead of your income level being determined by what country you are from, it will be determined by your education level. Today, a Ph.D. in India doesn't make nearly as much as a Ph.D. in the U.S. When we get the Internet allowing services and advice to be transported as efficiently as goods are transported via shipping, then you'll get essentially open-market bidding for that engineer in India vs. an engineer here in the U.S. And that benefits everyone, because you're taking better advantage of those resources. So the developed countries will get the early benefit of these things. But in the long run, the people in developing countries who are lucky enough to get a good education should get absolutely the biggest boost from all this.

BUFFETT: I didn't grasp it at first, but it's huge. The technological revolution will change the world in dramatic ways, and quickly. Ironically, however, our approach to dealing with that is just the opposite of Bill's. I look for businesses in which I think I can predict what they're going to look like in ten or 15 or 20 years. That means businesses that will look more or less as they do today, except that they'll be larger and doing more business internationally.

So I focus on an absence of change. When I look at the Internet, for example, I try and figure out how an industry or a company can be hurt or changed by it, and then I avoid it. That doesn't mean I don't think there's a lot of money to be made from that change, I just don't think I'm the one to make a lot of money out of it.

Take Wrigley's chewing gum. I don't think the Internet is going to change how people are going to chew gum. Bill probably does. I don't think it's going to change the fact that Coke will be the drink of preference and will gain in per capita consumption around the world; I don't think it will change whether people shave or how they shave. So we are looking for the very predictable, and you won't find the very predictable in what Bill does. As a member of society, I applaud what he is doing, but as an investor, I keep a wary eye on it.

GATES: This is an area where I agree strongly with Warren. I think the multiples of technology stocks should be quite a bit lower than the multiples of stocks like Coke and Gillette, because we are subject to complete changes in the rules. I know very well that in the next ten years, if Microsoft is still a leader, we will have had to weather at least three crises.

4. See You in Court! Bill and Warren talk about tangling with trustbusters.

What is the appropriate role for antitrust law in American business?

BUFFETT: We had one civil antitrust case at the Buffalo Evening News in 1977. And believe it or not, in the Salomon situation in 1991, in addition to having problems with the Federal Reserve in New York, and the SEC, and the U.S. Treasury, and the U.S. Attorney for the Southern District of New York, we also had the Department of Justice antitrust division after us. I don't know what happened to the Bureau of Indian Affairs. They missed us for some reason. Those are the only two experiences I had, and in neither case did I feel that we had done anything wrong. I might add that there was never any adjudication against us either time.

I am no antitrust scholar. I met Bill eight years ago, and he's a terrific teacher. He spent six or seven hours explaining Microsoft to me. Here I am the world's biggest dummy on technology, and he explained it to me pretty darn well. When he got through with it, I bought a hundred shares of stock so I could keep track of it. That shows two things: One is that I've got an IQ of about 50, and the second is that I didn't think he had any monopoly.

GATES: The key role of competition law is to protect consumers and to make sure that new products get created and that those products are very innovative. And you can look at different sectors of the economy and ask, "where is that happening very well?" No matter how you score it, there's no doubt that one sector of economy would stand out as absolutely the best, and that's the personal computer industry. I don't say the computer industry at large, because you have to remember that before personal computers came along, the structure was very different. People were stuck. Once you bought a computer from Digital or IBM or Hewlett-Packard or anyone else, the software that you created only ran on that computer.

The vision of Microsoft was that all of these computers would work the same. The reason for that is that if you want to get a lot of great software, you have to have a lot of

computers out there--millions and millions of them. So you've got to make them cheap, and make them so you don't have to test the software on all the different ones. The goal of the PC industry was to have every company competing to make the most portable one, or the fastest one, or the cheapest one. That would be great for consumers, and it would spark a big software market.

The price of computing before the PC came along was going down at a certain rate, and since the PC came along it's gone down at an incredible rate. The variety and quality of software has also increased at a phenomenal rate. We're absolutely at the peak of that today. The number of new software companies being started, the number of new jobs being created, the level of investment, the number of companies going public, you name it. It's way beyond even what it was three years ago. So consumers are doing very well.

Part of the PC dynamic is that instead of asking software developers to duplicate one another's work, we take anything that's typical in all those applications and put those features in Windows. So for things like connecting to the Internet, instead of everybody having to do that themselves, we put that in. That's been the evolution--graphical user interfaces came in, hard-disk support, networking support, now Internet support, including the browser.

I think antitrust laws as written are fine. There are people who will debate whether they should be weaker, but that's of academic interest. When I come in to do business, I'm very careful to check with our lawyers to be sure we're steering a hundred miles away from anything that would be questionable. So it is somewhat of a surprise to find ourselves in an antitrust controversy. Thank goodness for the judiciary, which is an environment in which facts are tested and people can see if competition worked in the way it should and has been beneficial to consumers. There's no doubt in our minds where that is going to come out.

In the meantime, we're going to be the focus of a lot of controversy because the filing of a lawsuit is a very big deal. You've got the government taking on that challenge and saying a lot of righteous things, and that's just something we'll have to be sure doesn't distract us from what we're really all about.

5. What's a Company Really Worth? Warren explains why Berkshire stock costs more than a Lexus.

Mr. Buffett, I was told that you have a policy against splitting stock, and I wondered if you might comment on Microsoft's history of splitting stock?

BUFFETT: I've never really felt that if I went into a restaurant and said, "I want two hatchecks instead of one for my hat," I'd really be a lot better off. But I also don't have any quarrel with companies that do split their stock, and I don't think Microsoft's been hurt by it.

I think that our policy fits us very well. There's nothing in my religious upbringing that causes me to recoil from stock splits. I'm on the boards of three companies, two of which have split their stock in the last couple of years. I happen to think that by not splitting Berkshire stock, we attract a slightly more long-term-oriented group of investors. What you want to do is attract shareholders that are very much like you, with the same time horizons and expectations. We don't talk about quarterly earnings, we don't have an investor relations department, and we don't have conference calls with Wall Street analysts, because we don't want people who are focusing on what's going to happen next quarter or even next year. We want people to join us because they want to be with us until they die.

If I were to split the stock dramatically, would I change that shareholder composition much? No, but I'd change it just a little. And remember, all the shareholder seats are filled, just like this auditorium. If I say something that offends all of you, and you all leave and another group comes in, am I better off or worse off? Well, that depends upon what they're like and what you're like. But I think I already have a very good group of shareholders who are attracted to these policies, and I think this policy reinforces it slightly.

GATES: Warren has done something admirable by signaling to people that it's a "different stock" and that they ought to think of Berkshire Hathaway as being a little different from your typical company. Having that unusual stock price is probably a good thing, as long as the newspaper doesn't screw it up. He's caused a lot of problems, you know, with the widths of those columns in the stock tables.

Mr. Buffett, what's your response to those who say that traditional methods for valuing companies are obsolete in this market?

BUFFETT: I think it's hard to find companies that meet our tests of being undervalued in this market, but I don't think that the methods of valuation have changed. It's just that in some markets, like in the mid-1970s, every security you looked at was really dramatically undervalued.

I once ran an investment partnership for about 13 years, ending in 1969, and closed it up because I couldn't find anything. I hadn't lost the ability to value companies; there just weren't any left that were cheap enough, and I wasn't in the business of shorting stocks.

But I think that there's no magic to evaluating any financial asset. A financial asset means, by definition, that you lay out money now to get money back in the future. If every financial asset were valued properly, they would all sell at a price that reflected all of the cash that would be received from them forever until Judgment Day, discounted back to the present at the same interest rate. There wouldn't be any risk premium, because you'd know what coupons were printed on this "bond" between now and eternity. That method of valuation is exactly what should be used whether you're in 1974 or you're in 1998. If I can't do that, then I don't buy. So I'll wait.

Would you look for a higher price-to-earnings ratio at this point than you did in 1969?

BUFFETT: That ratio would be affected by interest rates. The difference between now and 1969 or any other time, in terms of calculating a valuation, wouldn't be affected by anything else. Now, if you looked at the overall market, returns on equity are much higher than they were in 1969 or 1974, or any other time in history. So if you're going to say you're going to value the overall market, the question becomes: "Do you crank in the present 20% returns on equity for American business in aggregate, and say that's a realistic figure to stick on for this future that runs out until eternity?" I'd say that's a fairly reckless assumption and doesn't leave much margin of safety. And I would say that present market levels discount a lot of that, and so that makes me quite cautious.

Do you feel that technology has made businesses more efficient to the point that you can pay more for them?

GATES: There's definitely a one-time lift when you start using technology, and particularly if U.S. companies are using it better than their competitors outside the U.S. You get the ability to communicate better, and you get global scale in a lot of businesses that wouldn't have had it before.

When you look at the really big earners, the ones generating this 20% return on equity and going to that worldwide marketplace--companies like Coca-Cola or Microsoft or Boeing or GE--I know that every one of those has been helped by technology. But that cannot explain why ten years from now they'd be getting that kind of return on equity. Almost certainly there's something ephemeral about current conditions.

BUFFETT: I'm sure technology has made companies more efficient, and if I thought otherwise, I'd be afraid to say so with Bill sitting right here beside me. But the question you might ponder is this: Let's just say that I found a way to clone Jack Welch, and ran off 499 clones of him. Jack continued to run General Electric, and these other 499 ran the rest of the FORTUNE 500. Is the FORTUNE 500 going to have a higher return on equity five years from now or not?

I don't think the answer to that is easy. Because if you get 500 Jack Welches out there, they are going to be doing things in a competitive way that may well produce lower returns for American business than if you've got a bunch of clods out there and a guy like Jack competing with them. If you've got great variation in the quality of management, it improves the chances enormously of a relatively significant number getting terrific returns.

So I would say that a lot of things in business, including technology, really have the same effect as if you went to a parade and the band started coming down the street and all of a sudden you stood up on tiptoe. In another 30 seconds everybody else is on tiptoe, and it would be hell on your legs and you still wouldn't be seeing any better.

Capitalism tends to be self-neutralizing like that in terms of improvements. That's marvelous because it means we have better everything than otherwise. But the real trick is to stand up on tiptoe and not have anyone notice you.

The recent wave of mergers has been staggering. Could you comment on how any of these mergers will create value for shareholders?

BUFFETT: Actually, the two of us have a small announcement we would like to make... [laughter].

It won't stop. Mergers will be motivated by very good considerations. There truly are synergies in a great many mergers. But whether there are synergies or not, they are going to keep happening. You don't get to be the CEO of a big company by being a milquetoast. You are not devoid of animal spirits. And it gets contagious. I've been a director of 19 different public companies over the years, and I can tell you that the conversation turns to acquisitions and mergers much more when the competitors of the particular company are engaging in those. As long as our economy works the way it does--and I think it works very well--you're going to see a lot of it. A generally buoyant market tends to encourage mergers, because everybody's currency is more useful in those circumstances. [A few weeks later, Berkshire Hathaway agreed to pay \$23.5 billion in stock to acquire General Re, the world's third-largest reinsurance company.]

GATES: I think it's good to have a healthy skepticism. But General Motors was created out of a restructuring of the automobile industry from a specialized orientation to companies that did the whole job. And anybody who missed that was basically wiped out.

We've bought a lot of small companies, and I'd say that's been vital to us. These are companies that on their own probably wouldn't have made it, but when their abilities are combined with ours, both of us were able to create a much better set of products than we could've otherwise.

I think in banking today, if you're a medium-sized bank, you're probably going to need to participate in all this stuff that's going on. It doesn't make that much sense to have so many banks in this country, and so there will be certain ones going after scale. But there are a lot of silly mergers too.

At the end of the day, is the shareholder better off after a merger?

BUFFETT: In most acquisitions, it's better to be the target than the acquirer. The acquirer pays for the fact that he gets to haul back to his cave the carcass of the conquered animal.

I am suspicious of people who just keep acquiring almost by the week, though. If you look at the outstanding companies--say, a Microsoft or an Intel or a Wal-Mart--their growth overwhelmingly has been internal. Frequently, if some company is on a real acquisition binge, they feel they're using funny money, and it has certain aspects of a chain-letter game.

Beyond that, I'd like to see a period where merged companies just run by themselves after a deal, rather than moving around the accounting and putting up big restructuring charges. I get suspicious when there's too much activity. I like to see organic growth.

6. Aw, Shucks! Warren and Bill muse on their mistakes, their business partners, and managerial succession.

What was the best business decision you made?

BUFFETT: It was just jumping in the pool, basically. The nice thing about the investment business is that you don't need very many deals to succeed. In fact, if when you got out of business school here, you got a punch card with 20 punches on it, and every time you made an investment decision you used up one punch, and that's all you were going to get, you would make 20 very good investment decisions. And you could get very rich, incidentally. You don't need 50 good ideas at all.

I hope the one I made yesterday was a good one. But they've always been kind of simple and obvious to me. The truth is, you know them when you see them. They're so cheap. When I got out of Columbia University, I went through the Moody's manuals page by page--the industrial manual, the transportation manual, the banks and finance manual--just looking for things. And I found stocks at one times earnings. One was Genessee Valley Gas, a little tiny company up in upstate New York, a public utility selling at one times earnings. There were no brokerage reports on it, no nothing, but all you had to do was turn the page. It worked out so well I actually went through the book a second time. Bill was reading the World Book at that time. He's since put it out of business.

GATES: We were talking at breakfast this morning about which of all Warren's investment decisions was the worst one. They're tough to find because his track record is unbelievable. But we decided that, by some metric, buying the one that his company is named after--Berkshire Hathaway--was probably his worst investment decision.

BUFFETT: That's true. We went into a terrible business because it was cheap. It's what I refer to as the "used cigar butt" approach to investing. You see this cigar butt down there, it's soggy and terrible, but there's one puff left, and it's free. That's what Berkshire was when we bought it--it was selling below working capital--but it was a terrible, terrible mistake.

I've made all kinds of bad decisions that have cost us billions of dollars. They've been mistakes of omission rather than commission. I don't worry about not buying Microsoft, though, because I didn't understand that business. And I didn't understand Intel. But there are businesses that I did understand--Fannie Mae was one that was within my circle of competence. I made a decision to buy it, and I just didn't execute. We would've made many billions of dollars. But we didn't do it. Conventional accounting doesn't record that, but believe me, it happened.

GATES: In my case, I'd have to say my best business decisions have had to do with picking people. Deciding to go into business with Paul Allen is probably at the top of the list, and subsequently, hiring a friend--Steve Ballmer--who has been my primary business partner ever since. It's important to have someone who you totally trust, who is totally committed, who shares your vision, and yet who has a little bit different set of skills and who also acts as something of a check on you. Some of the ideas you run by him, you know he's going to say, "Hey, wait a minute, have you thought about this and that?" The benefit of sparking off somebody who's got that kind of brilliance is that it not only makes business more fun, but it really leads to a lot of success.

BUFFETT: I've had a partner like that--Charlie Munger--for a lot of years, and it does for me exactly what Bill is talking about. You have to calibrate with Charlie, though, because Charlie says everything I do is dumb. If he says it's really dumb, I know it is, but if he just says it's dumb, I take that as an affirmative vote.

It seems that in both of your companies, your success is driven by yourselves and your leadership skills. What will happen when you're gone?

BUFFETT: Your assumption is wrong. I will keep working until about five years after I die, and I've given the directors a Ouija board so they can keep in touch. But if the Ouija board doesn't work, we have outstanding people who can do what I do. People are not going to stop drinking Coca-Cola if I die tonight, they're not going to quit shaving tonight, they're not going to eat less See's candy, or fewer Dilly Bars, or anything of the sort. Those companies have terrific products, they've got outstanding managers, and all you'll need at the top of Berkshire is someone who can allocate capital and make sure you have the right managers down below. We've got the people identified to do that, and the board of directors of Berkshire knows who they are.

In fact, I've already sent out a letter that tells what should be done, and I've got another letter that's addressed that will go out at the time, and it starts out, "Yesterday I died," and then tells what the plans of the company are.

GATES: My attitude is a lot like Warren's. I want to keep doing what I'm doing for a long, long time. I think probably a decade from now or so, even though I'll still be totally involved with Microsoft because it's my career, I will pick somebody else to be CEO.

BUFFETT: I see some hands in the audience here.

GATES: That's a long time hence, and our top managers are always sitting down and talking about succession in general, because we want to make sure that we're giving people the opportunity to move up. We don't want to ever create a situation where they feel like it's clogged and they have to go off somewhere else to get big challenges. Our growth helps a lot. We're able to spawn off very, very big jobs for people. Picking that next person is something I give a lot of thought to, but it's probably five years before I have to do something very concrete about it. If there was a surprise, well, there's a contingency plan.

7. Charity Begins When I'm Ready Bill and Warren explain why they'll give away 99% of their wealth... someday.

As two of the world's most successful business people, what role do you see for yourselves in giving back to your communities? And how do you use your influence to get others to give back as well?

BUFFETT: We both have a similar philosophy on that. I know in my own case that 99%-plus will go back to society, just because we've been treated extraordinarily well by society.

I'm lucky. I don't run very fast, but I'm wired in a particular way that I thrive in a big capitalist economy with a lot of action. I'm not adapted for football, I'm not adapted for violin playing. I happen to be in something that pays off huge in this society. As Bill says, if I had been born some time ago I would've been some animal's lunch.

I do not believe in the divine right of the womb. Frankly, I don't think it's right that the quarterback of the Nebraska football team next year should be the eldest son of the quarterback of the Nebraska football team of 22 years ago. Nor do I think that our Olympic team in 2000 should be chosen from the same family that was on the Olympic team in the various respective sports in 1976.

We believe in a meritocracy when it comes to athletics and all sorts of things. Now, why not have a meritocracy in terms of what you go out into the world with in terms of the productive goods? Let the resources flow to those who use them best, and then I believe they should give them back to society when they get through.

GATES: That's a great philosophy, not to mention that passing along a lot of money can be bad for the people who receive it.

BUFFETT: You'd better not put it to a vote.

How do you use your role as successful businessmen in influencing others, even those who are not as successful, to give back?

BUFFETT: Let me suggest another way to think about this. Let's say that it was 24 hours before you were born, and a genie appeared and said, "You look like a winner. I have enormous confidence in you, and what I'm going to do is let you set the rules of the society into which you will be born. You can set the economic rules and the social rules, and whatever rules you set will apply during your lifetime and your children's lifetimes."

And you'll say, "Well, that's nice, but what's the catch?"

And the genie says, "Here's the catch. You don't know if you're going to be born rich or poor, white or black, male or female, able-bodied or infirm, intelligent or retarded." So all

you know is that you're going to get one ball out of a barrel with, say, 5.8 billion balls in it. You're going to participate in what I call the ovarian lottery. It's the most important thing that will happen to you in your life, but you have no control over it. It's going to determine far more than your grades at school or anything else that happens to you.

Now, what rules do you want to have? I'm not going to tell you the rules, and nobody will tell you; you have to make them up for yourself. But they will affect how you think about what you do in your will and things of that sort. That's because you're going to want to have a system that turns out more and more goods and services. You've got a great quantity of people out there, and you want them to live pretty well, and you want your kids to live better than you did, and you want your grandchildren to live better than your kids. You're going to want a system that keeps Bill Gates and Andy Grove and Jack Welch working long, long after they don't need to work. You're going to want the most able people working more than 12 hours a day. So you've got to have a system that gives them an incentive to turn out the goods and services.

But you're also going to want a system that takes care of the bad balls, the ones that aren't lucky. If you have a system that is turning out enough goods and services, you can take care of them. You don't want people worrying about being sick in their old age, or fearful about going home at night. You want a system where people are free of fear to some extent.

So you'll try to design something, assuming you have the goods and services to solve that sort of thing. You'll want equality of opportunity--namely a good public school system--to make you feel that every piece of talent out there will get the same shot at contributing. And your tax system will follow from your reasoning on that. And what you do with the money you make is another thing to think about. As you work through that, everybody comes up with something a little different. I just suggest you play that little game.

How do you see yourselves as leaders in facets of human experience other than business?

GATES: You have to be careful, if you're good at something, to make sure you don't think you're good at other things that you aren't necessarily so good at. I come in every day and work with a great team of people who are trying to figure out how to make great software, listening to the feedback and doing the research. And it's very typical that because I've been very successful at that, people come in and expect that I have wisdom about topics that I don't.

I do think there are some ways that we've run the company--the way we've hired people, and created an environment and used stock options--that would be good lessons for other businesses as well. But I always want to be careful not to suggest that we've found the solutions to all problems.

BUFFETT: You can learn a lot by studying Microsoft and Bill. And you can learn the most by studying what it is he does year after year. But if he devoted 5% or 10% to what

he's now doing, and then spread the remainder of his attention over a bunch of other things, well, society would be worse off, in my view.

Bill's right, occasionally there are things--like campaign finance reform--that he may want to take a position on. But you still don't want to say that the whole world ought to follow you on it. I'm very suspect of the person who is very good at one business--it also could be a good athlete or a good entertainer--who starts thinking they should tell the world how to behave on everything. For us to think that just because we made a lot of money, we're going to be better at giving advice on every subject--well, that's just crazy.

Having fielded their last question, the two billionaires briefly acknowledged the applause and bolted off the stage, leaving behind an audience that clearly would have relished another two hours of them. But no. Practically before the applause had died down, the two had jumped into Gates' Lexus and sped off. After all, they had a bridge game to play.

⋮ A Plain English
Handbook
⋮ *How to create clear
SEC disclosure documents*

By the Office of Investor Education and Assistance
U.S. Securities and Exchange Commission
450 5th Street, N.W.
Washington, DC 20549
August 1998

Preface

by Warren E. Buffett

This handbook, and Chairman Levitt’s whole drive to encourage “plain English” in disclosure documents, are good news for me. For more than forty years, I’ve studied the documents that public companies file. Too often, I’ve been unable to decipher just what is being said or, worse yet, had to conclude that nothing was being said. If corporate lawyers and their clients follow the advice in this handbook, my life is going to become much easier.

There are several possible explanations as to why I and others sometimes stumble over an accounting note or indenture description. Maybe we simply don’t have the technical knowledge to grasp what the writer wishes to convey. Or perhaps the writer doesn’t understand what he or she is talking about. In some cases, moreover, I suspect that a less-than-scrupulous issuer doesn’t want us to understand a subject it feels legally obligated to touch upon.

Perhaps the most common problem, however, is that a well-intentioned and informed writer simply fails to get the message across to an intelligent, interested reader. In that case, stilted jargon and complex constructions are usually the villains.

This handbook tells you how to free yourself of those impediments to effective communication. Write as this handbook instructs you and you will be amazed at how much smarter your readers will think you have become.

One unoriginal but useful tip: Write with a specific person in mind. When writing Berkshire Hathaway's annual report, I pretend that I'm talking to my sisters. I have no trouble picturing them: Though highly intelligent, they are not experts in accounting or finance. They will understand plain English, but jargon may puzzle them. My goal is simply to give them the information I would wish them to supply me if our positions were reversed. To succeed, I don't need to be Shakespeare; I must, though, have a sincere desire to inform.

No siblings to write to? Borrow mine: Just begin with "Dear Doris and Bertie." •

HIGHLY CONFIDENTIAL

September 23, 1998

Mr. John Meriwether
Chief Executive Officer
Long-Term Capital Management, L.P.
One East Weaver Street
Greenwich, CT 06331-5146

Dear Mr. Meriwether.

Subject to the following deal structure, the partnership described below proposes to purchase the assets of Long-Term Capital Management (and/or its affiliates and subsidiaries, collectively referred to as "Long-Term Capital") for \$250 million.

To purchaser will be a limited partnership whose investors will be Berkshire Hathaway for \$3 billion, American International Group for \$700 million and Goldman Sachs for \$300 million (or each of their respective affiliates). All management of the assets will be under the sole control of the partnership and will be transferred to the partnership in an orderly manner.

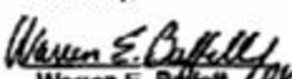

This bid is also subject to the following:

- 1) The limited partnership described herein will not assume any liabilities of Long-Term Capital arising from any activities prior to the purchase by the partnership
- 2) All current financing provided to Long-Term Capital will remain in place under current terms and conditions.

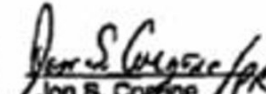

The names of the proposal participants may not be disclosed to anyone. If the names are disclosed, the bid will expire.

This bid will expire at 12:30 p.m. New York time on September 23, 1998.

Sincerely,

Warren E. Buffett /PK

Maurice R. Greenberg /PK

Jon S. Corzine /PK

Agreed and Accepted on behalf of Long-Term Capital

John Meriwether

Copy of the \$250 million offer for Long-Term Capital Management

Buffett Lecture at the University of Florida School of Business October 15, 1998

This speech was the first in a series sponsored by the Graham-Buffett Teaching Endowment, established in 1997 by a \$1 million gift from (1970 UF graduate) Mason Hawkins.

<http://Tinyurl.com/c85or>

Introduction:

The *Graham-Buffett* Course sequence is important to this college because it enables us to attract students who want this perspective on investing and managing corporations—a perspective that has been successfully employed by Mr. *Buffett*, Mr. Hawkins and before them, *Benjamin Graham*.

This perspective is quite simple but is sometimes lost in the complexity of our University analysis. The perspective is that you have to understand the underlying economics of the businesses that you invest in, work in. You have to be clear-eyed and not be swayed by the crowd or passing fancies of the moment. And you have to learn and stick to disciplined principles of business valuation.

In the long run this disciplined approach will more often than not bring success or more importantly avoid spectacular failures.

Hopefully at the *University of Florida* we can successfully convey those principles and create a program for the very best students and in time the very best employers as well.

We thank *Mr. Hawkins* for his gift (\$1 million) and share his thoughts today.

Mason Hawkins: He is someone I have admired tremendously for the last 30 years. In addition, he is someone each of us could pattern our lives after as a role model. It is my honor to introduce our lifetime's best long-term investor.....

Buffett: (holds mike) Testing: One million \$, two million \$...three million \$.

I would like to say a few words primarily and then the highlight for me will be getting your questions. I want to talk about what is on your mind.

Your Future

I would like to talk for just one minute to the students about your future when you leave here. Because you will learn a tremendous amount about investments, you all have the ability to do well; you all have the IQ to do well. You all have the energy and initiative to do well or you wouldn't be here. Most of you will succeed in meeting your aspirations.

But in determining whether you succeed there is more to it than intellect and energy. I would like to talk just a second about that. In fact, there was a guy, *Pete Kiewit* in Omaha, who used to say, he looked for three things in hiring people: integrity, intelligence and energy. And he said if the person did not have the first two, the later two would kill him, because if they don't have integrity, you want them dumb and lazy.

We want to talk about the first two because we know you have the last two. You are all second-year MBA students, so you have gotten to know your classmates. Think for a moment that I granted you the right--you can buy 10% of one of your classmate's earnings for the rest of their lifetime. You can't pick someone with a rich father; you have to pick someone who is going to do it on his or her own merit. And I gave you an hour to think about it.

Will you give them an IQ test and pick the one with the highest IQ? I doubt it. Will you pick the one with the best grades? The most energetic? You will start looking for qualitative factors, in addition to (the quantitative) because everyone has enough brains and energy. You would probably pick the one you responded the best to, the one who has the leadership qualities, the one who is able to get other people to carry out their interests. That would be the person who is generous, honest and who gave credit to other people for their own ideas. All types of qualities. Whomever you admire the most in the class. Then I would throw in a hooker. In addition to this person you had to go short one of your classmates.

That is more fun. Who do I want to go short? You wouldn't pick the person with the lowest IQ, you would think about the person who turned you off, the person who is egotistical, who is greedy, who cuts corners, who is slightly dishonest.

As you look at those qualities on the left and right hand side, there is one interesting thing about them, it is not the ability to throw a football 60 yards, it is not the ability to run the 100 yard dash in 9.3 seconds, it is not being the best looking person in the class, they are all qualities that if you really want to have the ones on the left hand side, you can have them.

They are qualities of behavior, temperament, character that are achievable, they are not forbidden to anybody in this group. And if you look at the qualities on the right hand side the ones that turn you off in other people, there is not a quality there that you have to have. You can get rid of it. You can get rid of it a lot easier at your age than at my age, because most behaviors are habitual. The chains of habit are too light to be felt until they are too heavy to be broken. There is no question about it. I see people with these self-destructive behavior patterns at my age or even twenty years younger and they really are entrapped by them.

They go around and do things that turn off other people right and left. They don't need to be that way but by a certain point they get so they can hardly change it. But at your age you can have any habits, any patterns of behavior that you wish. It is simply a question of which you decide.

If you did this... *Ben Graham* looked around at the people he admired and *Ben Franklin* did this before him. *Ben Graham* did this in his low teens and he looked around at the people he admired and he said, "I want to be admired, so why don't I behave like them?" And he found out that there was nothing impossible about behaving like them. Similarly he did the same thing on the reverse side in terms of getting rid of those qualities. I would suggest is that if you write those qualities down and think about them a while and make them habitual, you will be the one you want to buy 10% of when you are all through. And the beauty of it is that you already own 100% of yourself and you are stuck with it. So you might as well be that person, that somebody else.

Well that is a short little sermon. So let's get on with what you are interested in. Let's start with questions.....

Question: What about Japan? Your thoughts about Japan?

Buffett: My thoughts about Japan? I am not a macro guy. Now I say to myself *Berkshire Hathaway* can borrow money in Japan for 10 years at one percent. One percent! I say gee, I took *Graham's* class 45 years ago and I have been working hard at this all my life maybe I can earn more than 1% annually, it doesn't seem impossible. I wouldn't want to get involved in currency risk, so it would have to be Yen-denominated. I would have to be in Japanese Real Estate or Japanese companies or something of the sort and all I have to do is beat one percent. That is all the money is going to cost me and I can get it for 10 years. So far I haven't found anything. It is kind of interesting. The Japanese businesses earn very low returns on equity - 4% to 5% - 6% on equity and it is very hard to earn a lot as an investor when the business you are in doesn't earn very much money.

Now some people do it. In fact, I have a friend, Walter Schloss, who worked at *Graham* at the same time I did. And it was the first way I went at stocks to buy stocks selling way below working capital. A very cheap, quantitative approach to stocks. I call it the cigar butt approach to investing. You walk down the street and you look around for a cigar butt someplace. Finally you see one and it is soggy and kind of repulsive, but there is one puff left in it. So you pick it up and the puff is free--it is a cigar butt stock. You get one free puff on it and then you throw it away and try another one. It is not elegant. But it works. Those are low return businesses.

But time is the friend of the wonderful business; it is the enemy of the lousy business. If you are in a lousy business for a long time, you will get a lousy result even if you buy it cheap. If you are in a wonderful business for a long time, even if you pay a little bit too much going in you will get a wonderful result if you stay in a long time.

I find very few wonderful businesses in Japan at present. They may change the culture in some way so that management gets more share holder responsive over there and stock returns are higher. At the present time you will find a lot of low return businesses and that was true even when the Japanese economy was booming. It is amazing; they had an

incredible market without incredible companies. They were incredible in terms of doing a lot of business, but they were not incredible in terms of the return on equity that they achieved and that has finally caught up with them. So we have so far done nothing there. But as long as money is 1% there, we will keep looking.

Question: You were rumored to be one of the rescue buyers of *Long Term Capital*, what was the play there, what did you see?

Buffett: The *Fortune* Magazine that has *Rupert Murdoch* on the cover. It tells the whole story of our involvement; it is kind of an interesting story. I got the really serious call about *LTCM* on a Friday afternoon that things were getting serious. I know those people most of them pretty well--most of them at *Salomon* when I was there. And the place was imploding and the FED was sending people up that weekend. Between that Friday and the following Wed. when the NY Fed, in effect, orchestrated a rescue effort but without any Federal money involved. I was quite active but I was having a terrible time reaching anybody.

We put in a bid on Wednesday morning. I talked to *Bill McDonough* at the NY Fed. We made a bid for 250 million for the net assets but we would have put in 3 and 3/4 billion on top of that. \$3 billion from *Berkshire*, \$700 mil. from *AIG* and \$300 million. from *Goldman Sachs*. And we submitted that but we put a very short time limit on that because when you are bidding on 100 billion worth of securities that are moving around, you don't want to leave a fixed price bid out there for very long.

In the end the bankers made the deal, but it was an interesting period. The whole *LTCM* is really fascinating because if you take *Larry Hillenbrand*, *Eric Rosenfeld*, *John Meriwether* and the two Nobel prize winners. If you take the 16 of them, they have about as high an IQ as any 16 people working together in one business in the country, including *Microsoft*. An incredible amount of intellect in one room. Now you combine that with the fact that those people had extensive experience in the field they were operating in. These were not a bunch of guys who had made their money selling men's clothing and all of a sudden went into the securities business. They had in aggregate, the 16, had 300 or 400 years of experience doing exactly what they were doing and then you throw in the third factor that most of them had most of their very substantial net worth's in the businesses. Hundreds and hundreds of millions of their own money up (at risk), super high intellect and working in a field that they knew. Essentially they went broke. That to me is absolutely fascinating.

If I ever write a book it will be called, Why Smart People Do Dumb Things. My partner says it should be autobiographical. But this might be an interesting illustration. They are perfectly decent guys. I respect them and they helped me out when I had problems at *Salomon*. They are not bad people at all.

But to make money they didn't have and didn't need, they risked what they did have and what they did need. That is just plain foolish; it doesn't matter what your IQ is. If you risk something that is important to you for something that is unimportant to you it just

doesn't make sense. I don't care if the odds you succeed are 99 to 1 or 1000 to 1 that you succeed. If you hand me a gun with a million chambers with one bullet in a chamber and put it up to your temple and I am paid to pull the trigger, it doesn't matter how much I would be paid. I would not pull the trigger. You can name any sum you want, but it doesn't do anything for me on the upside and I think the downside is fairly clear. Yet people do it financially very much without thinking.

There was a lousy book with a great title written by Walter Gutman—You Only Have to Get Rich Once. Now that seems pretty fundamental. If you have \$100 million at the beginning of the year and you will make 10% if you are unleveraged and 20% if you are leveraged 99 times out of a 100, what difference if at the end of the year, you have \$110 million or \$120 million? It makes no difference. If you die at the end of the year, the guy who makes up the story may make a typo, he may have said 110 even though you had a 120. You have gained nothing at all. It makes absolutely no difference. It makes no difference to your family or anybody else.

The downside, especially if you are managing other people's money, is not only losing all your money, but it is disgrace, humiliation and facing friends whose money you have lost. Yet 16 guys with very high IQs entered into that game. I think it is madness. It is produced by an over reliance to some extent on things. Those guys would tell me back at Salomon; a six *Sigma* event wouldn't touch us. But they were wrong. History does not tell you of future things happening. They had a great reliance on mathematics. They thought that the Beta of the stock told you something about the risk of the stock. It doesn't tell you a damn thing about the risk of the stock in my view.

Sigma's do not tell you about the risk of going broke in my view and maybe now in their view too. But I don't like to use them as an example. The same thing in a different way could happen to any of us, where we really have a blind spot about something that is crucial, because we know a whole lot of something else. It is like *Henry Kauffman* said, "The ones who are going broke in this situation are of two types, the ones who know nothing and the ones who know everything." It is sad in a way.

I urge you. We basically never borrow money. I never borrowed money even when I had \$10,000 basically, what difference did it make. I was having fun as I went along it didn't matter whether I had \$10,000 or \$100,000 or \$1,000,000 unless I had a medical emergency come along.

I was going to do the same things when I had a little bit of money as when I had a lot of money. If you think of the difference between me and you, we wear the same clothes basically (SunTrust gives me mine), we eat similar food—we all go to *McDonald's* or better yet, *Dairy Queen*, and we live in a house that is warm in winter and cool in summer. We watch the Nebraska (football) game on big screen TV. You see it the same way I see it. We do everything the same—our lives are not that different. The only thing we do is we travel differently. What can I do that you can't do?

I get to work in a job that I love, but I have always worked at a job that I loved. I loved it just as much when I thought it was a big deal to make \$1,000. I urge you to work in jobs that you love. I think you are out of your mind if you keep taking jobs that you don't like because you think it will look good on your resume. I was with a fellow at Harvard the other day who was taking me over to talk. He was 28 and he was telling me all that he had done in life, which was terrific. And then I said, "What will you do next?" "Well," he said, "Maybe after I get my MBA I will go to work for a consulting firm because it will look good on my resume." I said, "Look, you are 28 and you have been doing all these things, you have a resume 10 times than anybody I have ever seen. Isn't that a little like saving up sex for your old age?"

There comes a time when you ought to start doing what you want. Take a job that you love. You will jump out of bed in the morning. When I first got out of *Columbia Business School*, I wanted to go to work for *Graham* immediately for nothing. He thought I was over-priced. But I kept pestering him. I sold securities for three years and I kept writing him and finally I went to work for him for a couple of years. It was a great experience. But I always worked in a job that I loved doing. You really should take a job that if you were independently wealthy that would be the job you would take. You will learn something, you will be excited about, and you will jump out of bed. You can't miss. You may try something else later on, but you will get way more out of it and I don't care what the starting salary is.

When you get out of here take a job you love, not a job you think will look good on your resume. You ought to find something you like.

If you think you will be happier getting 2x instead of 1x, you are probably making a mistake. You will get in trouble if you think making 10x or 20x will make you happier because then you will borrow money when you shouldn't or cut corners on things. It just doesn't make sense and you won't like it when you look back.

Question: What makes a company something that you like?

Buffett: I like businesses that I can understand. Let's start with that. That narrows it down by 90%. There are all types of things I don't understand, but fortunately, there is enough I do understand. You have this big wide world out there and almost every company is publicly owned. So you have all American business practically available to you. So it makes sense to go with things you can understand.

I can understand this, anyone can understand this (*Buffett* holds up a bottle of *Coca-Cola*). Since 1886, it is a simple business, but it is not an easy business—I don't want an easy business for competitors. I want a business with a moat around it. I want a very valuable castle in the middle and then I want the Duke who is in charge of that castle to be very honest and hard working and able. Then I want a moat around that castle. The moat can be various things: The moat around our auto insurance business, Geico, is low cost.

People have to buy auto insurance so everyone is going to have one auto insurance policy per car basically. I can't sell them 20, but they have to buy one. I can sell them 1. What are they going to buy it on? (based on what criteria?) They (customers) will buy based on service and cost. Most people will assume the service is identical among companies or close enough. So they will do it on cost. So I have to be a low cost producer--that is my moat. To the extent that my costs are further below the other guy, I have thrown a couple of sharks into the moat. All the time you have this wonderful castle, there are people out there who are going to attack it and try to take it away from you. I want a castle I can understand, but I want a castle with a moat around it.

Kodak

30 years ago, *Eastman Kodak's* moat was just as wide as *Coca-Cola's* moat. I mean if you were going to take a picture of your six-month old baby and you want to look at that picture 20 years from now or 50 years from now. And you are never going to get a chance—you are not a professional photographer—so you can evaluate what is going to look good 20 or 50 years ago. What is in your mind about that photography company (*Share of Mind*) is what counts. Because they are promising you that the picture you take today is going to be terrific 20 to 50 years from now about something that is very important to you. Well, *Kodak* had that in spades 30 years ago, they owned that. They had what I call share of mind. Forget about share of market, share of mind. They had something—that little yellow box—that said *Kodak* is the best. That is priceless. They have lost some of that. They haven't lost it all.

It is not due to *George Fisher*. *George* is doing a great job, but they let that moat narrow. They let *Fuji* come and start narrowing the moat in various ways. They let them get into the Olympics and take away that special aspect that only *Kodak* was fit to photograph the Olympics. So *Fuji* gets there and immediately in people's minds, *Fuji* becomes more into parity with *Kodak*.

You haven't seen that with *Coke*; *Coke's* moat is wider now than it was 30 years ago. You can't see the moat day by day but every time the infrastructure that gets built in some country that isn't yet profitable for *Coke* that will be 20 years from now. The moat is widening a little bit. Things are, all the time, changing a little in one direction or the other. Ten years from now, you will see the difference. Our managers of the businesses we run, I have one message to them, and we want to widen the moat. We want to throw crocs, sharks and gators—I guess—into the moat to keep away competitors. That comes about through service, through quality of product, it comes about through cost, some times through patents, and/or real estate location. So that is the business I am looking for.

Now what kind of businesses am I going to find like that? Well, I am going to find them in simple products because I am not going to be able to figure what the moat is going to look like for *Oracle*, *Lotus* or *Microsoft*, ten years from now. Gates is the best businessman I have ever run into and they have a hell of a position, but I really don't know what that business is going to look like ten years from now. I certainly don't know

what his competitors will look like ten years from now. I know what the chewing business will look like ten years from now. The Internet is not going to change how we chew gum and nothing much else is going to change how we chew gum. There will be lots of new products. Is *Spearmint* or *Juicy Fruit* going to evaporate? It isn't going to happen. You give me a billion dollars and tell me to go into the chewing gum business and try to make a real dent in *Wrigley's*. I can't do it. That is how I think about businesses. I say to myself, give me a billion dollars and how much can I hurt the guy? Give me \$10 billion dollars and how much can I hurt *Coca-Cola* around the world? I can't do it. Those are good businesses.

Now give me some money and tell me to hurt somebody in some other fields, and I can figure out how to do it.

So I want a simple business, easy to understand, great economics now, honest and able management, and then I can see about in a general way where they will be ten (10) years from now. If I can't see where they will be ten years from now, I don't want to buy it. Basically, I don't want to buy any stock where if they close the NYSE tomorrow for five years, I won't be happy owning it. I buy a farm and I don't get a quote on it for five years and I am happy if the farm does OK. I buy an apartment house and don't get a quote on it for five years, I am happy if the apartment house produces the returns that I expect. People buy a stock and they look at the price next morning and they decide to see if they are doing well or not doing well. It is crazy. They are buying a piece of the business. That is what *Graham*—the most fundamental part of what he taught me.

You are not buying a stock, you are buying part ownership in a business. You will do well if the business does well, if you didn't pay a totally silly price. That is what it is all about. You ought to buy businesses you understand. Just like if you buy farms, you ought to buy farms you understand. It is not complicated.

Incidentally, by the way, in calling this *Graham-Buffett*, this is pure *Graham*. I was very fortunate. I picked up his book (The Intelligent Investor) when I was nineteen; I got interested in stocks when I was 6 or 7. I bought my first stock when I was eleven. But I was playing around with all this stuff—I had charts and volume and I was making all types of technical calculations and everything. Then I picked up a little book that said you are not just buying some little ticker symbol, that bounces around every day, you are buying part of a business. Soon as I started thinking about it that way, everything else followed. It is very simple. So we buy businesses we think we can understand. There is no one here who can't understand *Coke*..... (end of first side.)

If I was teaching a class at business school, on the final exam I would pass out the information on an Internet company and ask each student to value it. Anybody that gave me an answer, I'd flunk (Laughter).

I don't know how to do it. But people do it all the time; it is more exciting. If you look at it like you are going to the races--that is a different thing--but if you are investing.... Investing is putting out money to be sure of getting more back later at an appropriate rate.

And to do that you have to understand what you are doing at any time. You have to understand the business. You can understand some businesses but not all businesses.

Question: You covered half of it which is trying to understand a business and buying a business. You also alluded to getting a return on the amount of capital invested in the business. How do you determine what is the proper price to pay for the business?

Buffett: It is a tough thing to decide but I don't want to buy into any business I am not terribly sure of. So if I am terribly sure of it, it probably won't offer incredible returns. Why should something that is essentially a cinch to do well, offer you 40% a year? We don't have huge returns in mind, but we do have in mind not losing anything. We bought *See's Candy* in 1972, *See's Candy* was then selling 16 m. pounds of candy at a \$1.95 a pound and it was making 2 bits a pound or \$4 million pre-tax. We paid \$25 million for it—6.25 x pretax or about 10x after tax. It took no capital to speak of. When we looked at that business—basically, my partner, Charlie, and I—we needed to decide if there was some untapped pricing power there. Where that \$1.95 box of candy could sell for \$2 to \$2.25. If it could sell for \$2.25 or another \$0.30 per pound that was \$4.8 on 16 million pounds. Which on a \$25 million purchase price was fine. We never hired a consultant in our lives; our idea of consulting was to go out and buy a box of candy and eat it.

What we did know was that they had share of mind in California. There was something special. Every person in Ca. has something in mind about *See's Candy* and overwhelmingly it was favorable. They had taken a box on Valentine's Day to some girl and she had kissed him. If she slapped him, we would have no business. As long as she kisses him, that is what we want in their minds. *See's Candy* means getting kissed. If we can get that in the minds of people, we can raise prices. I bought it in 1972, and every year I have raised prices on Dec. 26th, the day after Christmas, because we sell a lot on Christmas. In fact, we will make \$60 million this year. We will make \$2 per pound on 30 million pounds. Same business, same formulas, same everything--\$60 million bucks and it still doesn't take any capital.

And we make more money 10 years from now. But of that \$60 million, we make \$55 million in the three weeks before Christmas. And our company song is: "What a friend we have in Jesus." (Laughter). It is a good business. Think about it a little. Most people do not buy boxed chocolate to consume themselves, they buy them as gifts—somebody's birthday or more likely it is a holiday. Valentine's Day is the single biggest day of the year. Christmas is the biggest season by far. Women buy for Christmas and they plan ahead and buy over a two or three week period. Men buy on Valentine's Day. They are driving home; we run ads on the Radio. Guilt, guilt, guilt—guys are veering off the highway right and left. They won't dare go home without a box of Chocolates by the time we get through with them on our radio ads. So that Valentine's Day is the biggest day.

Can you imagine going home on Valentine's Day—our *See's Candy* is now \$11 a pound thanks to my brilliance. And let's say there is candy available at \$6 a pound. Do you

really want to walk in on Valentine's Day and hand—she has all these positive images of *See's Candy* over the years—and say, “Honey, this year I took the low bid.” And hand her a box of candy. It just isn't going to work. So in a sense, there is untapped pricing power—it is not price dependent.

Think of *Disney*. *Disney* is selling Home Videos for \$16.95 or \$18.95 or whatever. All over the world—people, and we will speak particularly about Mothers in this case, have something in their mind about *Disney*. Everyone in this room, when you say *Disney*, has something in their mind about *Disney*. When I say *Universal Pictures*, if I say *20th Century Fox*, you don't have anything special in your mind. Now if I say *Disney*, you have something special in your mind. That is true around the world.

Now picture yourself with a couple of young kids, whom you want to put away for a couple of hours every day and get some peace of mind. You know if you get one video, they will watch it twenty times. So you go to the video store or wherever to buy the video. Are you going to sit there and premier 10 different videos and watch them each for an hour and a half to decide which one your kid should watch? No. Let's say there is one there for \$16.95 and the *Disney* one for \$17.95—you know if you take the *Disney* video that you are going to be OK. So you buy it. You don't have to make a quality decision on something you don't want to spend the time to do. So you can get a little bit more money if you are *Disney* and you will sell a lot more videos. It makes it a wonderful business. It makes it very tough for the other guy.

How would you try to create a brand—*Dreamworks* is trying—that competes with *Disney* around the world and replaces the concept that people have in their minds about *Disney* with something that says, *Universal Pictures*? So a mother is going to walk in and pick out a *Universal Pictures* video in preference to a *Disney*. It is not going to happen.

Coca-Cola is associated with people being happy around the world. Everyplace – *Disneyland*, the *World Cup*, the *Olympics*—where people are happy. Happiness and *Coke* go together. Now you give me—I don't care how much money—and tell me that I am going to do that with *RC Cola* around the world and have five billion people have a favorable image in their mind about *RC Cola*. You can't get it done. You can fool around, you can do what you want to do. You can have price discounts on weekends. But you are not going to touch it. That is what you want to have in a business. That is the moat. You want that moat to widen.

If you are *See's Candy*, you want to do everything in the world to make sure that the experience basically of giving that gift leads to a favorable reaction. It means what is in the box, it means the person who sells it to you, because all of our business is done when we are terribly busy. People come in during these weeks before Christmas, Valentine's Day and there are long lines. So at five o'clock in the afternoon some woman is selling someone the last box candy and that person has been waiting in line for maybe 20 or 30 customers. And if the salesperson smiles at that last customer, our moat has widened and if she snarls at 'em, our moat has narrowed. We can't see it, but it is going on everyday. But it is the key to it. It is the total part of the product delivery. It is having everything

associated with it say, *See's Candy* and something pleasant happening. That is what business is all about.

Question: If I have every bought a company where the numbers told me not to. How much is quantitative and how much is qualitative?

Buffett: The best buys have been when the numbers almost tell you not to. Because then you feel so strongly about the product. And not just the fact you are getting a used cigar butt cheap. Then it is compelling. I owned a windmill company at one time. Windmills are cigar butts, believe me. I bought it very cheap, I bought it at a third of working capital. And we made money out of it, but there is no repetitive money to be made on it. There is a one-time profit in something like that. And it is just not the thing to be doing. I went through that phase. I bought streetcar companies and all kinds of things. In terms of the qualitative, I probably understand the qualitative the moment I get the phone call. Almost every business we have bought has taken five or ten minutes in terms of analysis. We bought two businesses this year.

General Re is a \$18 billion deal. I have never been to their home office. I hope it is there. (Laughter) "There could be a few guys there saying what numbers should we send *Buffett* this month?" I could see them going once a month and saying we have \$20 billion in the bank instead of \$18 billion. I have never been there.

Before I bought *Executive Jet*, which is fractional ownership of jets, before I bought it, I had never been there. I bought my family a quarter interest in the program three years earlier. And I have seen the service and it seems to develop well. And I got the numbers. But if you don't know enough to know about the business instantly, you won't know enough in a month or in two months. You have to have sort of the background of understanding and knowing what you do or don't understand. That is the key. It is defining your circle of competence.

Everybody has got a different circle of competence. The important thing is not how big the circle is, the important thing is the size of the circle; the important thing is staying inside the circle. And if that circle only has 30 companies in it out of 1000s on the big board, as long as you know which 30 they are, you will be OK. And you should know those businesses well enough so you don't need to read lots of work. Now I did a lot of work in the earlier years just getting familiar with businesses and the way I would do that is use what *Phil Fisher* would call, the "Scuttlebutt Approach." I would go out and talk to customers, suppliers, and maybe ex-employees in some cases. Everybody. Everytime I was interested in an industry, say it was coal, I would go around and see every coal company. I would ask every CEO, "If you could only buy stock in one coal company that was not your own, which one would it be and why? You piece those things together, you learn about the business after awhile.

Funny, you get very similar answers as long as you ask about competitors. If you had a silver bullet and you could put it through the head of one competitor, which competitor and why? You will find who the best guy is in the industry. So there are a lot of things

you can learn about a business. I have done that in the past on the business I felt I could understand so I don't have to do that anymore. The nice thing about investing is that you don't have to learn anything new. You can do it if you want to, but if you learn *Wrigley's* chewing gum forty years ago, you still understand *Wrigley's* chewing gum. There are not a lot of great insights to get of the sort as you go along. So you do get a database in your head.

I had a guy, *Frank Rooney*, who ran *Melville* for many years; his father-in-law died and had owned *H.H. Brown*, a shoe company. And he put it up with *Goldman Sachs*. But he was playing golf with a friend of mine here in Florida and he mentioned it to this friend, so my friend said "Why don't you call Warren?" He called me after the match and in five minutes I basically had a deal.

But I knew Frank, and I knew the business. I sort of knew the basic economics of the shoe business, so I could buy it. Quantitatively, I have to decide what the price is. But, you know, that is either yes or no. I don't fool a lot around with negotiations. If they name a price that makes sense to me, I buy it. If they don't, I was happy the day before, so I will be happy the day after without owning it.

Question: The Asian Crisis and how it affects a company like *Coke* that recently announced their earnings would be lower in the fourth quarter.

Buffett: Well, basically I love it, but because the market for *Coca-Cola* products will grow far faster over the next twenty years internationally than it will in the United States. It will grow in the U.S. on a per capita basis. The fact that it will be a tough period for who knows—three months or three years—but it won't be tough for twenty years. People will still be going to be working productively around the world and they are going to find this is a bargain product in terms of a portion of their working day that they have to give up in order to have one of these, better yet, five of them a day like I do.

This is a product that in 1936 when I first bought 6 of those for a quarter and sold them for a nickel each. It was in a 6.5 oz bottle and you paid a two cents deposit on the bottle. That was a 6.5 oz. bottle for a nickel at that time; it is now a 12 oz. can which if you buy it on Weekends or if you buy it in bigger quantities, so much money doesn't go to packaging—you essentially can buy the 12 ozs. for not much more than 20 cents. So you are paying not much more than twice the per oz. price of 1936. This is a product that has gotten cheaper and cheaper relative to people's earning power over the years. And which people love. And in 200 countries, you have the per capita consumption use going up every year for a product that is over 100 years old that dominates the market. That is unbelievable.

One thing that people don't understand is one thing that makes this product worth 10s and 10s of billions of dollars is one simple fact about really all colas, but we will call it *Coca-Cola* for the moment. It happens to be a name that I like. **Cola has no taste memory.** You can drink one of these at 9 O'clock, 10 O'clock, 1 O'clock and 5 O'clock. The one at 5 o'clock will taste as good to you as the one you drank early in the morning,

you can't do that with Cream Soda, Root Beer, Orange, Grape. All of those things accumulate on you. Most foods and beverages accumulate; you get sick of them after a while. And if you eat See's Candy—we get these people who go to work for us at See's Candy and the first day they go crazy, but after a week they are eating the same amount as if they were buying it, because chocolate accumulates on you. There is no taste memory to Cola and that means you get people around the world who will be heavy users—who will drink five a day, or for *Diet Coke*, 7 or even 8 a day. They will never do that with other products. So you get this incredible per capita consumption. The average person in this part of the world or maybe a little north of here drinks 64 ozs. of liquid a day. You can have 64 ozs. of that be *Coke* and you will not get fed up with *Coke* if you like it to start with in the least. But if you do that with anything else; if you eat just one product all day, you will get a little sick of it after a while.

It is a huge factor. So today over 1 billion of *Coca-Cola* product servings will be sold in the world and that will grow year by year. It will grow in every country virtually, and it will grow on a per capita basis. And twenty years from now it will grow a lot faster internationally than in the U.S., so I really like that market better, because there is more growth there over time. But it will hurt them in the short term right now, but that doesn't mean anything. *Coca-Cola* went public in 1919; the stock sold for \$40 per share. The Chandler family bought the whole business for \$2,000 back in the late 1880s. So now he goes public in 1919, \$40 per share. One year later it is selling for \$19 per share. It has gone down 50% in one year. You might think it is some kind of disaster and you might think sugar prices increased and the bottlers were rebellious. And a whole bunch of things. You can always find reasons that weren't the ideal moment to buy it. Years later you would have seen the Great Depression, WW II and sugar rationing and thermonuclear weapons and the whole thing—there is always a reason.

But in the end if you had bought one share at \$40 per share and reinvested the dividends, it would be worth \$5 million now (\$40 compounding at 14.63% for 86 years!). That factor so overrides anything else. If you are right about the business you will make a lot of money. The timing part of it is very tricky thing so I don't worry about any given event if I got a wonderful business what it does next year or something of the sort. Price controls have been in this country at various times and that has fouled up even the best of businesses. I wouldn't be able to raise prices Dec 31st on See's Candy. But that doesn't make it a lousy business if that happens to happen, because you are not going to have price controls forever. We had price controls in the early 70s.

The wonderful business—you can figure what will happen, you can't figure out when it will happen. You don't want to focus too much on when but you want to focus on what. If you are right about what, you don't have to worry about when very much.

Question: What about your business mistakes?

Buffett: How much time do you have? The interesting thing about investments for me and my partner, *Charlie Munger*, the biggest mistakes have not been mistakes of commission, but of omission. They are where we knew enough about the business to do

something and where, for one reason or another, sat they're sucking out thumbs instead of doing something. And so we have passed up things where we could have made billions and billions of dollars from things we understood, forget about things we don't understand. The fact I could have made billions of dollars from *Microsoft* doesn't mean anything because I never could understand *Microsoft*. But if I can make billions out of healthcare stocks, then I should make it. And I didn't when the Clinton health care program was proposed and they all went in the tank. We should have made a ton of money out of that because I could understand it. And didn't make it.

I should have made a ton of money out of *Fannie Mae* back the mid-1980s, but I didn't do it. Those are billion dollar mistakes or multi-billion dollar mistakes that generally accepted accounting principles don't pick up. The mistakes you see. I made a mistake when I bought *US Air Preferred* some years ago. I had a lot of money around. I make mistakes when I get cash. *Charlie* tells me to go to a bar instead. Don't hang around the office. But I hang around the office and I have money in my pocket, I do something dumb. It happens every time. So I bought this thing. Nobody made me buy it. I now have an 800 number I call every time I think about buying a stock in an airline. I say, "I am *Warren* and I am an air-aholic." They try to talk me down, "Keep talking don't do anything rash." Finally I got over it. But I bought it. And it looked like we would lose all our money in it. And we came very close to losing all our money in it. You can say we deserved to lose our money it.

We bought it because it was an attractive security. But it was not in an attractive industry. I did the same thing in *Salomon*. I bought an attractive security in a business I wouldn't have bought the equity in. So you could say that is one form of mistake. Buying something because you like the terms, but you don't like the business that well. I have done that in the past and will probably do that again. The bigger mistakes are the ones of omission. Back when I had \$10,000 I put \$2,000 of it into a *Sinclair Service Station* which I lost, so the opportunity cost on that money is about \$6 billion right now--fairly big mistakes. It makes me feel good when my *Berkshire* goes down, because the cost of my Sinclair Station goes down too. My 20% opportunity cost. I will say this, it is better to learn from other people's mistakes as much as possible. But we don't spend any time looking back at *Berkshire*. I have a partner, *Charlie Munger*; we have been pals for forty years—never had an argument. We disagree on things a lot but we don't have arguments about it.

We never look back. We just figure there is so much to look forward to that there is no sense thinking of what we might have done. It just doesn't make any difference. You can only live life forward. You can learn something perhaps from the mistakes, but the big thing to do is to stick with the businesses you understand. So if there is a generic mistake outside your circle of competence like buying something that somebody tips you on or something of the sort. In an area you know nothing about, you should learn something from that which is to stay with what you can figure out yourself. You really want your decision making to be by looking in the mirror. Saying to yourself, "I am buying 100 shares of General Motors at \$55 because....." It is your responsibility if you are buying it. There's gotta be a reason and if you can't state the reason, you

shouldn't buy it. If it is because someone told you about it at a cocktail party, not good enough. It can't be because of the volume or a reason like the chart looks good. It has to be a reason to buy the business. That we stick to pretty carefully. That is one of the things *Ben Graham* taught me.

Question: The current tenuous economic situation and interest rates? Where are we going?

Buffett: I don't think about the macro stuff. What you really want to in investments is figure out what is important and knowable. If it is unimportant and unknowable, you forget about it. What you talk about is important but, in my view, it is not knowable. Understanding *Coca-Cola* is knowable or *Wrigley's* or *Eastman Kodak*. You can understand those businesses that are knowable. Whether it turns out to be important depends where your valuation leads you and the firm's price and all that. But we have never not bought or bought a business because of any Macro feeling of any kind because it doesn't make any difference. Let's say in 1972 when we bought *See's Candy*, I think *Nixon* put on the price controls a little bit later, but so what! We would have missed a chance to buy something for \$25 million that is producing \$60 million pre-tax now. We don't want to pass up the chance to do something intelligent because of some prediction about something we are no good on anyway. So we don't read or listen to in relation to macro factors at all. The typical investment counselor organization goes out and they bring out their economist and they trot him out and he gives you this big macro picture. And they start working from there on down. In our view that is nonsense.

If *Alan Greenspan* was on the one side of me and *Robert Rubin* on the other side and they both were whispering in my ear exactly what they were going to do the next twelve months, it wouldn't make any difference to me what I would pay for *Executive Jet* or *General Re* or anything else I do.

Question: What is the benefit of being an out-of-towner as opposed to being on Wall Street?

Buffett: I worked on Wall Street for a couple of years and I have my best friends on both coasts. I like seeing them. I get ideas when I go there. **But the best way to think about investments is to be in a room with no one else and just think.** And if that doesn't work, nothing else is going to work. The disadvantage of being in any type of market environment like Wall Street in the extreme is that you get over-stimulated. You think you have to do something every day. The *Chandler* family paid \$2,000 for this company (*Coke*). You don't have to do much else if you pick one of those. And the trick then is not to do anything else. Even not to sell at 1919, which the family did later on. So what you are looking for is some way to get one good idea a year. And then ride it to its full potential and that is very hard to do in an environment where people are shouting prices back and forth every five minutes and shoving reports in front of your nose and all that. Wall Street makes its money on activity. You make your money on inactivity.

If everyone in this room trades their portfolio around every day with every other person, you will all end up broke. And the intermediary will end up with all the money. If you all own stock in a group of average businesses and just sit here for the next 50 years, you will end up with a fair amount of money and your broker will be broke. He is like the Doctor who gets paid on how often to get you to change pills. If he gave you one pill that cures you the rest of your life, he would make one sale, one transaction and that is it. But if he can convince you that changing pills every day is the way to great health, it will be great for him and the prescriptionists. You won't be any healthier and you will be a lot worse off financially. You want to stay away from any environment that stimulates activity. And Wall Street would have the effective of doing that.

When I went back to Omaha, I would go back with a whole list of companies I wanted to check out and I would get my money's worth out of those trips, but then I would go back to Omaha and think about it.

Question: How to evaluate *Berkshire* or *MSFT* if it does not pay dividends?

Buffett: It won't pay any dividends either. That is a promise I can keep. All you get with *Berkshire*, you stick it in your safe deposit box and then every year you go down and fondle it. You take it out and then you put it back. There is enormous psychic reward in that. Don't underestimate it.

The real question is if we can retain dollar bills and turn them into more than a dollar at a decent rate. That is what we try to do. And *Charlie Munger* and I have all our money in it to do that. That is all we will get paid for doing. We won't take any options or we won't take any salaries to speak of. But that is what we are trying to do. It gets harder all the time. The more money we manage the harder it is to do that. We would do way better percentage wise with *Berkshire* if it was 1/100th the present size. It is run for its owners, but it isn't run to give them dividends because so far every dollar that we earned or could have paid out, we have turned into more than a dollar. It is worth more than a dollar to keep it. Therefore, it would be silly to pay it out. Even if everyone was tax-free that owned it. It would have been a mistake to pay dividends at *Berkshire*. Because so far the dollar bills retained have turned into more than a dollar. But there is no guarantee that happens in the future. At some point the game runs out on that. That is what the business is about. Nothing else about the business do we judge ourselves by. We don't judge it by the size of its home office building or anything the like the number of people working there. We have 12 people working at headquarters and 45,000 employees at *Berkshire*, 12 people at HQ and 3,500 sq ft. and we won't change it.

But we will judge ourselves by the performance of the company and that is the only way we will get paid. But believe me, it is a lot harder than it used to be.

Question: What tells you when an investment has reached its full potential?

Buffett: I don't buy *Coke* with the idea it will be out of gas in 10 years or 50 years. There could be something that happens by I think the chances are almost nil. So what we

really want to do is buy businesses that we would be happy to own forever. It is the same way I fell about people who buy *Berkshire*. I want people who buy *Berkshire* to plan to hold it forever. They may not for one reason or the other but I want them at the time they buy it to think they are buying a business they are going to want to own forever.

And I don't say that is the only way to buy things. It is just the group to join me because I don't want to have a changing group all the time. I measure *Berkshire* by how little activity there is in it. If I had a church and I was the preacher and half the congregation left every Sunday. I wouldn't say, "It is marvelous to have all this liquidity among my members."

Terrific turnover... I would rather go to church where all the seats are filled every Sunday by the same people. Well that is the way we look at the businesses we buy. We want to buy something virtually forever. And we can't find a lot of those. And back when I started, I had way more ideas than money so I was just constantly having to sell what was the least attractive stock in order to buy something I just discovered that looked even cheaper. But that is not our problem really now. So we hope we are buying businesses that we are just as happy holding five years from now as now. And if we ever found a huge acquisition, then maybe we would have to sell something. Maybe to make that acquisition but that would be a very pleasant problem to have.

We never buy something with a price target in mind. We never buy something at 30 saying if it goes to 40 we'll sell it or 50 or 60 or 100. We just don't do it that way. Anymore than when we buy a private business like *See's Candy* for \$25 million. We don't ever say if we ever get an offer of \$50 million for this business we will sell it. That is not the way to look at a business.

The way to look at a business is this going to keep producing more and more money over time? And if the answer to that is yes, you don't need to ask any more questions.

Questions: How did you decide to invest in *Salomon*?

Buffett: *Salomon* like I said, I went into that because it was a 9% security in 1987 in September 1987 and the Dow was up 35% and we sold a lot of stuff. And I had a lot of money around and it looked to me like we would never get to do anything, so I took an attractive security form in a business I would never buy the common stock of. I went in because of that and I think generally it is a mistake. It worked out OK finally on that. But it is not what I should have been doing. I either should have waited in which case I could have bought more *Coca-Cola* a year later or thereabouts or I should have even bought *Coke* at the prices it was selling at even though it was selling at a pretty good price at the time. So that was a mistake.

On *Long-Term Capital* that is—we have owned other businesses associated with securities over the years—One of them is arbitrage. I've done arbitrage for 45 years and Graham did it for 30 years before that. That is a business unfortunately I have to be near a phone for. I have to really run it (arbitrage operations) out of the office myself, because

it requires being more market-attuned because I don't want to do that anymore. So unless a really big arbitrage situation came along that I understood, I won't be doing much of that. But I've probably participated in about 300 arbitrage situations at least in my life maybe more. It was a good business, a perfectly good business.

LTCM has a bunch of positions, they have tons of positions, but the top ten are probably 90% of the money that is at risk, and I know something about those ten positions. I don't know everything about them by a long shot, but I know enough that I would feel OK at a big discount going in and we had the staying power to hold it out. We might lose money on something on that, but the odds are with us. That is a game that I understand. There are few other positions we have that are not that big because they can't get that big. But they could involve yield curve relationships or on the run/off the run governments that are just things you learn over time being around securities markets. They are not the base of our business. Probably on average, they have accounted for $\frac{1}{2}$ - $\frac{3}{4}$ a percentage point of our return a year. They are little pluses you get for actually having been around a long time.

Arbitrage

One of the first arbitrages I did involved a company that offered cocoa beans in exchange for their stock. That was in 1955. I bought the stock, turned in the stock, got warehouse certificates for cocoa beans and they happen to be a different type but there was a basis differential and I sold them. That was something I was around at the time, so I learned about it. There hasn't been a cocoa deal since. 40 odd years, I have been waiting for a cocoa deal. I haven't seen it. It is there in my memory if it ever comes along. *LTCM* is that on a big scale.

Question: Diversification?

Buffett: The question is about diversification. I have a dual answer to that. If you are not a professional investor. If your goal is not to manage money to earn a significantly better return than the world, then I believe in extreme diversification. I believe 98% - 99% who invest should extensively diversify and not trade, so that leads them to an index fund type of decision with very low costs. All they are going to do is own part of America. And they have made a decision that owning a part of America is worthwhile. I don't quarrel with that at all. That is the way they should approach it unless they want to bring an intensity to the game to make a decision and start evaluating businesses. Once you are in the businesses of evaluating businesses and you decide that you are going to bring the effort and intensity and time involved to get that job done, then I think diversification is a terrible mistake to any degree. I got asked that question the other day at *SunTrust*. *If you really know businesses, you probably shouldn't own more than six of them.*

If you can identify six wonderful businesses, that is all the diversification you need. And you will make a lot of money. And I can guarantee that going into a seventh one instead of putting more money into your first one is gotta be a terrible mistake. Very few people have gotten rich on their seventh best idea. But a lot of people have gotten rich with their

best idea. So I would say for anyone working with normal capital who really knows the businesses they have gone into, six is plenty, and I probably have half of what I like best. I don't diversify personally. All the people I've known that have done well with the exception of *Walter Schloss*, *Walter* diversifies a lot. I call him Noah, he has two of everything.

Question: How do you distinguish the *Cokes* of the world from the *Proctor & Gambles* of this world?

Buffett: Well, *P&G* is a very, very good business with strong distribution capability and lots of brand names, but if you ask me and I am going to go away for twenty years and put all my family's net worth into one business, would I rather have *P&G* or *Coke*? Actually *P&G* is more diversified among product line, but I would feel more sure of *Coke* than *P&G*. I wouldn't be unhappy if someone told me I had to own *P&G* during the twenty-year period. I mean that would be in my top 5 percent. Because they are not going to get killed, but I would feel better about the unit growth and pricing power of a *Coke* over twenty or thirty years.

Right now the pricing power might be tough, but you think a billion servings a day for a penny each or \$10 million per day. We own 8% of that, so that is \$800,000 per day for *Berkshire Hathaway*. You could get another penny out of the stuff. It doesn't seem impossible. I think it is worth a penny more. Right now it would be a mistake to try and get it in most markets. But over time, *Coke* will make more per serving than it does now. Twenty years from now I guarantee they will make more per serving, and they will be selling a whole lot more servings. I don't know how many or how much more, but I know that.

P&G's main products--I don't think they have the kind of dominance, and they don't have the kind of unit growth, but they are good businesses. I would not be unhappy if you told me that I had to put my family's net worth into *P&G* and that was the only stock I would own. I might prefer some other name, but there are not 100 other names I would prefer.

Question: Would you buy *McDonald's* and go away for twenty years?

Buffett: *McDonald's* has a lot of things going for it, particularly abroad again. The position abroad in many countries is stronger than it is here. It is a tougher business over time. People don't want to be eating--exception to the kids when they are giving away beanie babies or something--at *McDonald's* every day. If people drink five *Cokes* a day, they probably will drink five of them tomorrow. The fast food business is tougher than that but if you had to pick one hand to have in the fast food business, which is going to be a huge business worldwide, you would pick *McDonald's*. I mean it has the strongest position.

It doesn't win taste test with adults. It does very well with children and it does fine with adults, but it is not like it is a clear winner. And it is gotten into the game in recent years of being more price promotional--you remember the experiment a year ago or so. It has

gotten more dependent on that rather than selling the product by itself. I like the product by itself. I feel better about *Gillette* if people buy the *Mach 3* because they like the *Mach 3* than if they get a *Beanie Baby* with it. So I think fundamentally it is a stronger product if that is the case. And that is probably the case.

We own a lot of *Gillette* and you can sleep pretty well at night if you think of a couple billion men with their hair growing on their faces. It is growing all night while you sleep. Women have two legs, it is even better. So it beats counting sheep. And those are the kinds of business...(you look for). But what type of promotion am I going to put out there against *Burger King* next month or what if they sign up *Disney* and I don't get *Disney*? I like the products that stand alone absent price promotion or appeals although you can build a very good business based on that. And *McDonald's* is a terrific business. It is not as good a business as *Coke*. There really hardly are any. It is a very good business and if you bet on one company in that field bet on (*garbled*) *McDonald's*. We bought *Dairy Queen* a while back that is why I am plugging it shamelessly here.

Question: What do I think about the utility industry?

Buffett: I have thought about that a lot because you can put big money in it. I have even thought of buying the entire businesses. There is a fellow in Omaha actually that has done a little of that through *Cal Energy*. But I don't quite understand the game in terms of how it is going to develop with deregulation. I can see how it destroys a lot of value through the high cost producer once they are not protected by a monopoly territory.

I don't for sure see who benefits and how much. Obviously the guy with very low cost power or some guy has hydro-power at two cents a Kwh has a huge advantage. But how much of that he gets to keep or how extensively he can send that outside his natural territory, I haven't been able to figure that out so I really know what the Industry will look like in ten years. But it is something I think about and if I ever develop any insights that call for action, I will act on them. Because I think I can understand the attractiveness of the product. All the aspects of certainty of users need and the fact it is a bargain and all of that. I understand. I don't understand who is going to make the money in ten years. And that keeps me away.

Question: Why do large caps outperform small caps (1998)?

Buffett: We don't care if a company is large cap, small cap, middle cap, micro cap. It doesn't make any difference. The only questions that matter to us:

- Do we understand the business?
- Do we like the people running it?
- And does it sell for a price that is attractive?

From my personal standpoint running *Berkshire* now because we got, pro forma for *Gen. Re*, \$75 to \$80 billion to invest in and I only want to invest in five things, so I am really limited to very big companies. But if I were investing \$100,000, I wouldn't care whether

something was large cap or small cap or anything. I would just look for businesses I understood.

Now, I think, on balance, large cap companies as businesses have done extraordinarily well the last ten years--way better than people anticipated they would do. You really have American businesses earning close to something 20% on equity. And that is something nobody dreamed of and that is being produced by very large companies in aggregate. So you have had this huge revaluation upwards because of lower interest rates and much higher returns on capital. If America business is really a disguised bond that earns 20%, a 20% coupon it is much better than a bond with a 13% coupon. And that has happened with big companies in recent years, whether it is permanent or not is another question. I am skeptical of that. I wouldn't even think about it--except for questions of how much money we run--I wouldn't even think about the size of the business. *See's Candy* was a \$25 million business when we bought it. If I can find one now, as big as we are, I would love to buy it. It is the certainty of it that counts.

Question: The securitization of real estate?

Buffett: There has been enormous securitization of the debt too of real estate and that is one of the items right now that is really clogging up the capital markets. The mortgage back securities are just not moving, commercial, not residential mortgage backs. But I think you are directing your question at equities probably. The equities, if you leave out the corporate form, have been a lousy way to own equities. You have interjected a corporate income tax into something that people individually have been able to own with a single tax, and to have the normal corporate form you have a double taxation in there. You really don't need it and it takes too much of the return.

REITS have, in effect, created a conduit so you don't get the double taxation, but they also generally have fairly high operating expenses. If you get real estate, let's just say you can buy fairly simple types of real estate at an 8% yield, or thereabouts, and you take away close to 1% to 1.5% by the time you count stock options and everything, it is not a terribly attractive way to own real estate. Maybe the only way a guy with a \$1,000 or \$5,000 can own it but if you have \$1 million or \$10 million, you are better off owning the real estate properties yourself instead of sticking some intermediary in between who will get a sizable piece of the return for himself. So we have found very little in that field.

You will see an announcement in the next couple of weeks that may belie what I am telling you today. I don't want you to think I am double crossing you up here. But generally speaking we have seen very little in that field that gets us excited. People sometimes get very confused about--they will look at some huge land company, like *Texas Pacific Land Trust*, which has been around over 100 years and has got a couple of million acres in Texas. And they will sell 1% of their land every year and they will take that (as income? Garbled) and come up with some huge value compared to the market value. But that is nonsense if you really own the property. You can't move. You can't move 50% of the properties or 20% of the properties, it is way worse than an illiquid stock. So you get these, I think, you get some very silly valuations placed on a lot of real

estate companies by people who really don't understand what it is like to own one and try to move large quantity of properties.

REITS have behaved horribly in this market as you know and it is not at all inconceivable that they become a class that would get so unpopular that they would sell at significant discounts from what you could sell the properties for. And they could get interesting as a class and then the question is whether management would fight you in that process because they would be giving up their income stream for managing things and their interests might run counter to the shareholders on that. I have always wondered about REITS that have managements they say their assets are so wonderful, and they are so cheap and then they (management) go out and sell stock. There is a contradiction in that. They say our stock is very cheap at \$28 and then they sell a lot of stock at \$28 less an underwriting commission. There is a disconnect there. But it is a field we look at.

Charlie and I can understand real estate, and we would be open for very big transactions periodically. If there was a *LTCM* situation translated to real estate, we would be open to that, the trouble is so many other people would be too that it would unlikely go at a price that would get us really get us excited.

Question: A down market is good for you?

Buffett: I have no idea where the market is going to go. I prefer it going down. But my preferences have nothing to do with it. The market knows nothing about my feelings. That is one of the first things you have to learn about a stock. You buy 100 shares of *General Motors (GM)*. Now all of a sudden you have this feeling about *GM*. It goes down, you may be mad at it. You may say, "Well, if it just goes up for what I paid for it, my life will be wonderful again." Or if it goes up, you may say how smart you were and how you and *GM* have this love affair. You have got all these feelings. The stock doesn't know you own it.

The stock just sits there; it doesn't care what you paid or the fact that you own it. Any feeling I have about the market is not reciprocated. I mean it is the ultimate cold shoulder we are talking about here. Practically anybody in this room is probably more likely to be a net buyer of stocks over the next ten years than they are a net seller, so everyone of you should prefer lower prices. If you are a net eater of hamburger over the next ten years, you want hamburger to go down unless you are a cattle producer. If you are going to be a buyer of *Coca-Cola* and you don't own *Coke* stock, you hope the price of *Coke* goes down. You are looking for it to be on sale this weekend at your Supermarket. You want it to be down on the weekends not up on the weekends when you tend the Supermarket.

The NYSE is one big supermarket of companies. And you are going to be buying stocks, what do you want to have happen? You want to have those stocks go down, way down; you will make better buys then. Later on twenty or thirty years from now when you are in a period when you are dis-saving, or when your heirs dis-save for you, then you may care about higher prices. There is Chapter 8 in *Graham's Intelligent Investor* about the attitude toward stock market fluctuations, that and Chapter 20 on the Margin of Safety

are the two most important essays ever written on investing as far as I am concerned. Because when I read Chapter 8 when I was 19, I figured out what I just said but it is obvious, but I didn't figure it out myself. It was explained to me. I probably would have gone another 100 years and still thought it was good when my stocks were going up. We want things to go down, but I have no idea what the stock market is going to do. I never do and I never will. It is not something I think about at all.

When it goes down, I look harder at what I might buy that day because I know there is more likely to be some merchandise there to use my money effectively in.

Moderator: Ok, Warren, we will let you take one more question from the audience....

Buffett: I will let you pick who get it. You can be the guy...(laughter).

Question: What would you do to live a happier life if you could live over again?

Buffett: This will sound disgusting. The question is how would I live my life over again to live a happier life? The only thing would be to select a gene pool where people lived to 120 or something where I came from.

I have been extraordinarily lucky. I mean, I use this example and I will take a minute or two because I think it is worth thinking about a little bit. Let's just assume it was 24 hours before you were born and a genie came to you and he said, "Herb, you look very promising and I have a big problem. I got to design the world in which you are going to live in. I have decided it is too tough; you design it. So you have twenty-four hours, you figure out what the social rules should be, the economic rules and the governmental rules and you and your kids and their kids will live under those rules.

You say, "I can design anything? There must be a catch?" The genie says there is a catch. You don't know if you are going to be born black or white, rich or poor, male or female, infirm or able-bodied, bright or retarded. All you know is you are going to take one ball out of a barrel with 5.8 billion (balls). You are going to participate in the ovarian lottery. And that is going to be the most important thing in your life, because that is going to control whether you are born here or in Afghanistan or whether you are born with an IQ of 130 or an IQ of 70. It is going to determine a whole lot. What type of world are you going to design?

I think it is a good way to look at social questions, because not knowing which ball you are going to get, you are going to want to design a system that is going to provide lots of goods and services because you want people on balance to live well. And you want it to produce more and more so your kids live better than you do and your grandchildren live better than their parents. But you also want a system that does produce lots of goods and services that does not leave behind a person who accidentally got the wrong ball and is not well wired for this particular system. I am ideally wired for the system I fell into here. I came out and got into something that enables me to allocate capital. Nothing so

wonderful about that. If all of us were stranded on a desert island somewhere and we were never going to get off of it, the most valuable person there would be the one who could raise the most rice over time. I can say, "I can allocate capital!" You wouldn't be very excited about that. So I have been born in the right place.

Gates says that if I had been born three million years ago, I would have been some animal's lunch. He says, "You can't run very fast, you can't climb trees, you can't do anything." You would just be chewed up the first day. You are lucky; you were born today. And I am. The question getting back, here is this barrel with 6.5 billion balls, everybody in the world, if you could put your ball back, and they took out at random a 100 balls and you had to pick one of those, would you put your ball back in?

Now those 100 balls you are going to get out, roughly 5 of them will be American, 95/5. So if you want to be in this country, you will only have 5 balls, half of them will be women and half men--I will let you decide how you will vote on that one. Half of them will be below average in intelligence and half above average in intelligence. Do you want to put your ball in there? Most of you will not want to put your ball back to get 100. So what you are saying is: I am in the luckiest one percent of the world right now sitting in this room--the top one percent of the world. Well, that is the way I feel. I am lucky to be born where I was because it was 50 to 1 in the United States when I was born. I have been lucky with parents, lucky with all kinds of things and lucky to be wired in a way that in a market economy, pays off like crazy for me. It doesn't pay off as well for someone who is absolutely as good a citizen as I am (by) leading Boy Scout troops, teaching Sunday School or whatever, raising fine families, but just doesn't happen to be wired in the same way that I am. So I have been extremely lucky so I would like to be lucky again.

Then the way to do it is to play out the game and do something you enjoy all your life and be associated with people you like. I only work with people I like. If I could make \$100 million dollars with a guy who causes my stomach to churn, I would say no because in way that is very much like marrying for money which is probably not a very good idea in any circumstances, but if you are already rich, it is crazy. I am not going to marry for money. I would really do almost exactly what I have done except I wouldn't have bought the *US Air*.

Thank you.

END.

WARREN E. BUFFETT, CHAIRMAN

March 29, 1999

Mr. Robert P. Miles
4532 W. Kennedy Blvd. #275
Tampa, FL 33609-2042

Dear Mr. Miles:

Thanks for your nice letter. By coincidence, just this weekend I saw your 101 reasons on the "Fool" bulletin board. You seem to be getting quite a bit of favorable comment from other viewers.

Anything you write about Berkshire Hathaway will be fine; you clearly understand the company well. I will be glad to sign your "101 Reasons," but I'm not sure if we'll be able to connect at the mall. It's likely to be a mob scene this year. I will be doing a lot of signing at the ballpark on Saturday night, but again the lines could be really long, and I won't be able to get to everybody during the game. Maybe the best bet is for you to send me a copy and I'll be delighted to sign it.

I wish you well — even *really* well! — with your project.

Best regards.

Sincerely,

Warren E. Buffett

WEB/db

Mr. Buffett on the Stock Market

Fortune, 11/22/99

The most celebrated of investors says stocks can't possibly meet the public's expectations. As for the Internet? He notes how few people got rich from two other transforming industries, auto and aviation.

Warren Buffett, chairman of Berkshire Hathaway, almost never talks publicly about the general level of stock prices--neither in his famed annual report nor at Berkshire's thronged annual meetings nor in the rare speeches he gives. But in the past few months, on four occasions, Buffett did step up to that subject, laying out his opinions, in ways both analytical and creative, about the long-term future for stocks. FORTUNE's Carol Loomis heard the last of those talks, given in September to a group of Buffett's friends (of whom she is one), and also watched a videotape of the first speech, given in July at Allen & Co.'s Sun Valley, Idaho, bash for business leaders. From those extemporaneous talks (the first made with the [Dow Jones](#) industrial average at 11,194), Loomis distilled the following account of what Buffett said. Buffett reviewed it and weighed in with some clarifications.

Investors in stocks these days are expecting far too much, and I'm going to explain why. That will inevitably set me to talking about the general stock market, a subject I'm usually unwilling to discuss. But I want to make one thing clear going in: Though I will be talking about the level of the market, I will not be predicting its next moves. At Berkshire we focus almost exclusively on the valuations of individual companies, looking only to a very limited extent at the valuation of the overall market. Even then, valuing the market has nothing to do with where it's going to go next week or next month or next year, a line of thought we never get into. The fact is that markets behave in ways, sometimes for a very long stretch, that are not linked to value. Sooner or later, though, value counts. So what I am going to be saying--assuming it's correct--will have implications for the long-term results to be realized by American stockholders.

Let's start by defining "investing." The definition is simple but often forgotten: Investing is laying out money now to get more money back in the future--more money in real terms, after taking inflation into account.

Now, to get some historical perspective, let's look back at the 34 years before this one--and here we are going to see an almost Biblical kind of symmetry, in the sense of lean years and fat years--to observe what happened in the stock market. Take, to begin with, the first 17 years of the period, from the end of 1964 through 1981. Here's what took place in that interval:

Dow Jones Industrial Average

Dec. 31, 1964: **874.12**

Dec. 31, 1981: **875.00**

Now I'm known as a long-term investor and a patient guy, but that is not my idea of a big move.

And here's a major and very opposite fact: During that same 17 years, the GDP of the U.S.--that is, the business being done in this country--almost quintupled, rising by 370%. Or, if we look at another measure, the sales of the FORTUNE 500 (a changing mix of companies, of course) more than sextupled. And yet the Dow went exactly nowhere.

To understand why that happened, we need first to look at one of the two important variables that affect investment results: interest rates. These act on financial valuations the way gravity acts on matter: The higher the rate, the greater the downward pull. That's because the rates of return that investors need from any kind of investment are directly tied to the risk-free rate that they can earn from government securities. So if the government rate rises, the prices of all other investments must adjust downward, to a level that brings their expected rates of return into line. Conversely, if government interest rates fall, the move pushes the prices of all other investments upward. The basic proposition is this: What an investor should pay today for a dollar to be received tomorrow can only be determined by first looking at the risk-free interest rate.

Consequently, every time the risk-free rate moves by one basis point--by 0.01%--the value of every investment in the country changes. People can see this easily in the case of bonds, whose value is normally affected only by

interest rates. In the case of equities or real estate or farms or whatever, other very important variables are almost always at work, and that means the effect of interest rate changes is usually obscured. Nonetheless, the effect--like the invisible pull of gravity--is constantly there.

In the 1964-81 period, there was a tremendous increase in the rates on long-term government bonds, which moved from just over 4% at year-end 1964 to more than 15% by late 1981. That rise in rates had a huge depressing effect on the value of all investments, but the one we noticed, of course, was the price of equities. So there--in that tripling of the gravitational pull of interest rates--lies the major explanation of why tremendous growth in the economy was accompanied by a stock market going nowhere.

Then, in the early 1980s, the situation reversed itself. You will remember Paul Volcker coming in as chairman of the Fed and remember also how unpopular he was. But the heroic things he did--his taking a two-by-four to the economy and breaking the back of inflation--caused the interest rate trend to reverse, with some rather spectacular results. Let's say you put \$1 million into the 14% 30-year U.S. bond issued Nov. 16, 1981, and reinvested the coupons. That is, every time you got an interest payment, you used it to buy more of that same bond. At the end of 1998, with long-term governments by then selling at 5%, you would have had \$8,181,219 and would have earned an annual return of more than 13%.

That 13% annual return is better than stocks have done in a great many 17-year periods in history--in most 17-year periods, in fact. It was a helluva result, and from none other than a stodgy bond.

The power of interest rates had the effect of pushing up equities as well, though other things that we will get to pushed additionally. And so here's what equities did in that same 17 years: If you'd invested \$1 million in the Dow on Nov. 16, 1981, and reinvested all dividends, you'd have had \$19,720,112 on Dec. 31, 1998. And your annual return would have been 19%.

The increase in equity values since 1981 beats anything you can find in history. This increase even surpasses what you would have realized if you'd bought stocks in 1932, at their Depression bottom--on its lowest day, July 8, 1932, the Dow closed at 41.22--and held them for 17 years.

The second thing bearing on stock prices during this 17 years was after-tax corporate profits, which the chart, [After-Tax Corporate Profits as a Percentage of GDP](#), displays as a percentage of GDP. In effect, what this chart tells you is what portion of the GDP ended up every year with the shareholders of American business.

The chart, as you will see, starts in 1929. I'm quite fond of 1929, since that's when it all began for me. My dad was a stock salesman at the time, and after the Crash came, in the fall, he was afraid to call anyone--all those people who'd been burned. So he just stayed home in the afternoons. And there wasn't television then. Soooo ... I was conceived on or about Nov. 30, 1929 (and born nine months later, on Aug. 30, 1930), and I've forever had a kind of warm feeling about the Crash.

As you can see, corporate profits as a percentage of GDP peaked in 1929, and then they tanked. The left-hand side of the chart, in fact, is filled with aberrations: not only the Depression but also a wartime profits boom--sedated by the excess-profits tax--and another boom after the war. But from 1951 on, the percentage settled down pretty much to a 4% to 6.5% range.

By 1981, though, the trend was headed toward the bottom of that band, and in 1982 profits tumbled to 3.5%. So at that point investors were looking at two strong negatives: Profits were sub-par and interest rates were sky-high.

And as is so typical, investors projected out into the future what they were seeing. That's their unshakable habit: looking into the rear-view mirror instead of through the windshield. What they were observing, looking backward, made them very discouraged about the country. They were projecting high interest rates, they were projecting low profits, and they were therefore valuing the Dow at a level that was the same as 17 years earlier, even though GDP had nearly quintupled.

Now, what happened in the 17 years beginning with 1982? One thing that didn't happen was comparable growth in GDP: In this second 17-year period, GDP less than tripled. But interest rates began their descent, and after the Volcker effect wore off, profits began to climb--not steadily, but nonetheless with real power. You can see the profit trend in the chart, which shows that by the late 1990s, after-tax profits as a percent of GDP were running close to

6%, which is on the upper part of the “normalcy” band. And at the end of 1998, long-term government interest rates had made their way down to that 5%.

These dramatic changes in the two fundamentals that matter most to investors explain much, though not all, of the more than tenfold rise in equity prices--the Dow went from 875 to 9,181--during this 17-year period. What was at work also, of course, was market psychology. Once a bull market gets under way, and once you reach the point where everybody has made money no matter what system he or she followed, a crowd is attracted into the game that is responding not to interest rates and profits but simply to the fact that it seems a mistake to be out of stocks. In effect, these people superimpose an I-can't-miss-the-party factor on top of the fundamental factors that drive the market. Like Pavlov's dog, these “investors” learn that when the bell rings--in this case, the one that opens the New York Stock Exchange at 9:30 a.m.--they get fed. Through this daily reinforcement, they become convinced that there is a God and that He wants them to get rich.

Today, staring fixedly back at the road they just traveled, most investors have rosy expectations. A Paine Webber and Gallup Organization survey released in July shows that the least experienced investors--those who have invested for less than five years--expect annual returns over the next ten years of 22.6%. Even those who have invested for more than 20 years are expecting 12.9%.

Now, I'd like to argue that we can't come even remotely close to that 12.9%, and make my case by examining the key value-determining factors. Today, if an investor is to achieve juicy profits in the market over ten years or 17 or 20, one or more of three things must happen. I'll delay talking about the last of them for a bit, but here are the first two:

(1) Interest rates must fall further. If government interest rates, now at a level of about 6%, were to fall to 3%, that factor alone would come close to doubling the value of common stocks. Incidentally, if you think interest rates are going to do that--or fall to the 1% that Japan has experienced--you should head for where you can really make a bundle: bond options.

(2) Corporate profitability in relation to GDP must rise. You know, someone once told me that New York has more lawyers than people. I think that's the same fellow who thinks profits will become larger than GDP. When you begin to expect the growth of a component factor to forever outpace that of the aggregate, you get into certain mathematical problems. In my opinion, you have to be wildly optimistic to believe that corporate profits as a percent of GDP can, for any sustained period, hold much above 6%. One thing keeping the percentage down will be competition, which is alive and well. In addition, there's a public-policy point: If corporate investors, in aggregate, are going to eat an ever-growing portion of the American economic pie, some other group will have to settle for a smaller portion. That would justifiably raise political problems--and in my view a major reslicing of the pie just isn't going to happen.

So where do some reasonable assumptions lead us? Let's say that GDP grows at an average 5% a year--3% real growth, which is pretty darn good, plus 2% inflation. If GDP grows at 5%, and you don't have some help from interest rates, the aggregate value of equities is not going to grow a whole lot more. Yes, you can add on a bit of return from dividends. But with stocks selling where they are today, the importance of dividends to total return is way down from what it used to be. Nor can investors expect to score because companies are busy boosting their per-share earnings by buying in their stock. The offset here is that the companies are just about as busy issuing new stock, both through primary offerings and those ever present stock options.

So I come back to my postulation of 5% growth in GDP and remind you that it is a limiting factor in the returns you're going to get: You cannot expect to forever realize a 12% annual increase--much less 22%--in the valuation of American business if its profitability is growing only at 5%. The inescapable fact is that the value of an asset, whatever its character, cannot over the long term grow faster than its earnings do.

Now, maybe you'd like to argue a different case. Fair enough. But give me your assumptions. If you think the American public is going to make 12% a year in stocks, I think you have to say, for example, “Well, that's because I expect GDP to grow at 10% a year, dividends to add two percentage points to returns, and interest rates to stay at a constant level.” Or you've got to rearrange these key variables in some other manner. The Tinker Bell approach--clap if you believe--just won't cut it.

Beyond that, you need to remember that future returns are always affected by current valuations and give some thought to what you're getting for your money in the stock market right now. Here are two 1998 figures for the FORTUNE 500. The companies in this universe account for about 75% of the value of all publicly owned American businesses, so when you look at the 500, you're really talking about America Inc.

FORTUNE 500

1998 profits: **\$334,335,000,000**

Market value on March 15, 1999: **\$9,907,233,000,000**

As we focus on those two numbers, we need to be aware that the profits figure has its quirks. Profits in 1998 included one very unusual item--a \$16 billion bookkeeping gain that Ford reported from its spinoff of Associates--and profits also included, as they always do in the 500, the earnings of a few mutual companies, such as State Farm, that do not have a market value. Additionally, one major corporate expense, stock-option compensation costs, is not deducted from profits. On the other hand, the profits figure has been reduced in some cases by write-offs that probably didn't reflect economic reality and could just as well be added back in. But leaving aside these qualifications, investors were saying on March 15 this year that they would pay a hefty \$10 trillion for the \$334 billion in profits.

Bear in mind--this is a critical fact often ignored--that investors as a whole cannot get anything out of their businesses except what the businesses earn. Sure, you and I can sell each other stocks at higher and higher prices. Let's say the FORTUNE 500 was just one business and that the people in this room each owned a piece of it. In that case, we could sit here and sell each other pieces at ever-ascending prices. You personally might outsmart the next fellow by buying low and selling high. But no money would leave the game when that happened: You'd simply take out what he put in. Meanwhile, the experience of the group wouldn't have been affected a whit, because its fate would still be tied to profits. The absolute most that the owners of a business, in aggregate, can get out of it in the end--between now and Judgment Day--is what that business earns over time.

And there's still another major qualification to be considered. If you and I were trading pieces of our business in this room, we could escape transactional costs because there would be no brokers around to take a bite out of every trade we made. But in the real world investors have a habit of wanting to change chairs, or of at least getting advice as to whether they should, and that costs money--big money. The expenses they bear--I call them frictional costs--are for a wide range of items. There's the market maker's spread, and commissions, and sales loads, and 12b-1 fees, and management fees, and custodial fees, and wrap fees, and even subscriptions to financial publications. And don't brush these expenses off as irrelevancies. If you were evaluating a piece of investment real estate, would you not deduct management costs in figuring your return? Yes, of course--and in exactly the same way, stock market investors who are figuring their returns must face up to the frictional costs they bear.

And what do they come to? My estimate is that investors in American stocks pay out well over \$100 billion a year--say, \$130 billion--to move around on those chairs or to buy advice as to whether they should! Perhaps \$100 billion of that relates to the FORTUNE 500. In other words, investors are dissipating almost a third of everything that the FORTUNE 500 is earning for them--that \$334 billion in 1998--by handing it over to various types of chair-changing and chair-advisory "helpers." And when that handoff is completed, the investors who own the 500 are reaping less than a \$250 billion return on their \$10 trillion investment. In my view, that's slim pickings.

Perhaps by now you're mentally quarreling with my estimate that \$100 billion flows to those "helpers." How do they charge thee? Let me count the ways. Start with transaction costs, including commissions, the market maker's take, and the spread on underwritten offerings: With double counting stripped out, there will this year be at least 350 billion shares of stock traded in the U.S., and I would estimate that the transaction cost per share for each side--that is, for both the buyer and the seller--will average 6 cents. That adds up to \$42 billion.

Move on to the additional costs: hefty charges for little guys who have wrap accounts; management fees for big guys; and, looming very large, a raft of expenses for the holders of domestic equity mutual funds. These funds now have assets of about \$3.5 trillion, and you have to conclude that the annual cost of these to their investors--counting management fees, sales loads, 12b-1 fees, general operating costs--runs to at least 1%, or \$35 billion.

And none of the damage I've so far described counts the commissions and spreads on options and futures, or the costs borne by holders of variable annuities, or the myriad other charges that the "helpers" manage to think up. In

short, \$100 billion of frictional costs for the owners of the FORTUNE 500--which is 1% of the 500's market value--looks to me not only highly defensible as an estimate, but quite possibly on the low side.

It also looks like a horrendous cost. I heard once about a cartoon in which a news commentator says, "There was no trading on the New York Stock Exchange today. Everyone was happy with what they owned." Well, if that were really the case, investors would every year keep around \$130 billion in their pockets.

Let me summarize what I've been saying about the stock market: I think it's very hard to come up with a persuasive case that equities will over the next 17 years perform anything like--anything like--they've performed in the past 17. If I had to pick the most probable return, from appreciation and dividends combined, that investors in aggregate--repeat, aggregate--would earn in a world of constant interest rates, 2% inflation, and those ever hurtful frictional costs, it would be 6%. If you strip out the inflation component from this nominal return (which you would need to do however inflation fluctuates), that's 4% in real terms. And if 4% is wrong, I believe that the percentage is just as likely to be less as more.

Let me come back to what I said earlier: that there are three things that might allow investors to realize significant profits in the market going forward. The first was that interest rates might fall, and the second was that corporate profits as a percent of GDP might rise dramatically. I get to the third point now: Perhaps you are an optimist who believes that though investors as a whole may slog along, you yourself will be a winner. That thought might be particularly seductive in these early days of the information revolution (which I wholeheartedly believe in). Just pick the obvious winners, your broker will tell you, and ride the wave.

Well, I thought it would be instructive to go back and look at a couple of industries that transformed this country much earlier in this century: automobiles and aviation. Take automobiles first: I have here one page, out of 70 in total, of car and truck manufacturers that have operated in this country. At one time, there was a Berkshire car and an Omaha car. Naturally I noticed those. But there was also a telephone book of others.

All told, there appear to have been at least 2,000 car makes, in an industry that had an incredible impact on people's lives. If you had foreseen in the early days of cars how this industry would develop, you would have said, "Here is the road to riches." So what did we progress to by the 1990s? After corporate carnage that never let up, we came down to three U.S. car companies--themselves no lollapaloozas for investors. So here is an industry that had an enormous impact on America--and also an enormous impact, though not the anticipated one, on investors.

Sometimes, incidentally, it's much easier in these transforming events to figure out the losers. You could have grasped the importance of the auto when it came along but still found it hard to pick companies that would make you money. But there was one obvious decision you could have made back then--it's better sometimes to turn these things upside down--and that was to short horses. Frankly, I'm disappointed that the Buffett family was not short horses through this entire period. And we really had no excuse: Living in Nebraska, we would have found it super-easy to borrow horses and avoid a "short squeeze."

U.S. Horse Population

1900: **21 million**

1998: **5 million**

The other truly transforming business invention of the first quarter of the century, besides the car, was the airplane--another industry whose plainly brilliant future would have caused investors to salivate. So I went back to check out aircraft manufacturers and found that in the 1919-39 period, there were about 300 companies, only a handful still breathing today. Among the planes made then--we must have been the Silicon Valley of that age--were both the Nebraska and the Omaha, two aircraft that even the most loyal Nebraskan no longer relies upon.

Move on to failures of airlines. Here's a list of 129 airlines that in the past 20 years filed for bankruptcy. Continental was smart enough to make that list twice. As of 1992, in fact--though the picture would have improved since then--the money that had been made since the dawn of aviation by all of this country's airline companies was zero. Absolutely zero.

Sizing all this up, I like to think that if I'd been at Kitty Hawk in 1903 when Orville Wright took off, I would have been farsighted enough, and public-spirited enough--I owed this to future capitalists--to shoot him down. I mean, Karl Marx couldn't have done as much damage to capitalists as Orville did.

I won't dwell on other glamorous businesses that dramatically changed our lives but concurrently failed to deliver rewards to U.S. investors: the manufacture of radios and televisions, for example. But I will draw a lesson from these businesses: The key to investing is not assessing how much an industry is going to affect society, or how much it will grow, but rather determining the competitive advantage of any given company and, above all, the durability of that advantage. The products or services that have wide, sustainable moats around them are the ones that deliver rewards to investors.

This talk of 17-year periods makes me think--incongruously, I admit--of 17-year locusts. What could a current brood of these critters, scheduled to take flight in 2016, expect to encounter? I see them entering a world in which the public is less euphoric about stocks than it is now. Naturally, investors will be feeling disappointment--but only because they started out expecting too much.

Grumpy or not, they will have by then grown considerably wealthier, simply because the American business establishment that they own will have been chugging along, increasing its profits by 3% annually in real terms. Best of all, the rewards from this creation of wealth will have flowed through to Americans in general, who will be enjoying a far higher standard of living than they do today. That wouldn't be a bad world at all--even if it doesn't measure up to what investors got used to in the 17 years just passed.

Bezos on Buffett

Skeptical of Internet mania, the founder and CEO of Amazon.com is spreading the gospel according to Buffett.

Patricia Sellers

Warren Buffett doesn't mention the Internet on these pages. But he does talk about two other transforming industries that failed to reward investors over time: autos and aviation. Only a fool would ignore his implicit warning: A lot of people will lose a lot of money betting on the Internet. Amazon.com founder and CEO Jeff Bezos was so intrigued by Buffett's talk at Herb Allen's gathering of business leaders in Sun Valley, Idaho, last July that he asked Buffett for his lists of the automakers and aircraft manufacturers that didn't make it. "When new industries become phenomenons, a lot of investors bet on the wrong companies," Bezos says. Referring to Buffett's 70-page catalog of mostly dead car and truck makes, he adds, "I noticed that decades ago, it was de rigueur to use 'Motors' in the name, just as everybody uses 'dot-com' today. I thought, Wow, the parallel is interesting."

Especially interesting to a billionaire like Bezos, who knows something about stock valuations from his previous career as a hedge fund manager. Interesting also to Bezos the history buff, who likes to talk about the Cambrian explosion about 550 million years ago, when multicelled life spawned unprecedented variation of species--and with it, a wave of extinctions. Given this perspective, Bezos says, Buffett's analogies about bankrupt businesses "resonate deeply." Now Bezos is spreading the gospel according to Buffett and urging Amazon employees to run scared every day. "We still have the opportunity to be a footnote in the e-commerce industry," he says.

Speaker: Well, good morning and welcome. You're a nice crowd, you certainly got quiet quickly. That surprised me. Can you hear me all right? There in the back? Well, for business school, you know it doesn't get much better than this. Having the world's greatest investor come to your campus is quite an honor.

Warren Buffett is Chairman of Berkshire Hathaway, a holding company whose investments range from GEICO Insurance, to American Express and Coca-Cola, to Borsheims jewelry store in his hometown of Omaha, Nebraska.

Mr. Buffett has been described as 'the god of value investors' and 'the Michael Jordon of the investing game.' He began his first investment partnership in the mid-1950s with \$100 of his own money. A few years later he began investing in a struggling Massachusetts textile mill called Berkshire Hathaway. Through Berkshire he started putting capital into other businesses, chiefly insurance, which generated cash streams for more investments which have done very well indeed as we all know.

From a share price of about \$18 in 1965, Berkshire today trades around \$69,100 a share. Think I'm going to go out and buy 500 shares. Over time the company has annualized performances more than double that of S&P 500, and Berkshire today is worth more than \$100 billion. But Mr. Buffett is known as much for his unpretentious style as for his lofty success. He has become a champion of investors and is legendary for his aversion to corporate doublespeak. He is rare among CEOs in that he cheerfully admits his mistakes. Three years ago he wrote in his annual report that Berkshire would have done better if he'd simply had gone to the movies. There weren't very many years like that since 1965, believe me.

Berkshire was proudly, even defiantly absent from the dot-com hysteria of the last few years, and now that the bubble has burst as we all know, it's Warren Buffett who's having the last laugh. In his most recent letter to shareholders he wrote, quote, "We've embraced the 21 st century by entering such cutting-edge industries as brick, carpet, insulation, and paint." Try to control your excitement. You know, and personally from reading his letters, I mean it's just a joy. It's a business lesson in itself. I would encourage you, whenever you get an opportunity, to take one aside and read it carefully. You'll learn a tremendous amount.

His wisdom and insights are so valued that some investors buy a share of Berkshire stock just so they can hear him at his legendary annual meeting, or as he calls it, 'Woodstock for capitalists.' He doesn't make speaking appearances often, and we are extremely fortunate to have him with us

today. Earl Leonard of Coca-Cola, and our distinguished executive in residence had a lot to with that, Earl, and we're deeply indebted to you for helping to arrange this. Thank you very much.

Our format today will be primarily questions and answers. Mr. Buffett will make some brief remarks at the beginning and then we'll move into your phase. We will have a microphone set up over here. We would like to come around- we're videotaping, so we'd like you to use the microphone, please. So go ahead and begin to line up over there to ask your questions. So would you please give a very warm welcome to the oracle of Omaha, Warren Buffett .

Warren Buffett : Testing. 1 million. 2 million. Great, okay. I came in from Nebraska today, and you're probably all familiar with us, mainly by our football team. We have those fellows with the big white helmets with those red 'N's on them. I asked one of our starters the other day, "What's the 'N' stand for?" And he said, "Knowledge." We make it tough on them though. I mean you don't coast through Nebraska just because you're a football player. They major in agricultural economics, and there's a two question final for all of the players. And the first question is, "What did old MacDonald have?" And they were giving that to one of our potential Heisman Trophy winners the other day. He started to sweat. Finally he brightened up, he said, "Farm!" The professor, delighted of course, you don't want to flunk a Heisman candidate. So he said, "Now," he said. "You're halfway home. Just one more question. How do you spell 'farm'?" Now the guy really starts to sweat, and he looks at the ceiling and he looks around. Finally his face brightens up and he says, "Ee-i-ee-i-oh!" So watch for that guy this year, he'll be dynamite.

I really want to talk about what's on your mind, so we're going to do a Q and A in a minute. There are a couple questions I always get asked. You know, people always say, "Well who should I go to work for when I get out then?" I've got a very simple answer, we may elaborate more on this as we go along, but, you know the real thing to do is to get going for some institution or individual that you admire. I mean it's crazy to take in-between jobs just because they look good on your resume, or because you get a little higher starting pay.

I was up at Harvard a while back, and a very nice young guy, he picked me up at the airport, a Harvard Business School attendee. And he said, "Look. I went to undergrad here, and then I worked for X and Y and Z, and now I've come here." And he said, "I thought it would really round out my resume perfectly if I went to work now for a big management consulting firm." And I said, "Well, is that what you want to do?" And he said, "No," but he said, "That's the perfect resume." And I said, "Well when are you going to start doing what you like?" And he said, "Well I'll get to that someday."

And I said, "Well you know, your plan sounds to me a lot like saving up sex for your old age. It just doesn't make a lot of sense."

I told that same group, I said, "Go to work for whomever you admire the most." I said, "You can't get a bad result. You'll jump out of bed in the morning and you'll be having fun." The Dean called me up a couple weeks later. He said, "What did you tell those kids? They're all becoming self-employed." So, you've got to temper that advice a little bit. Play one game a little bit with me for just a minute and then we'll get to your questions.

I'd like for the moment to have you pretend I've made you a great offer, and I've told you that you could pick any one of your classmates- and you now know each other probably pretty well after being here for a while. You have 24 hours to think it over and you can pick any one of your classmates, and you get 10 percent of their earnings for the rest of their lives. And I ask you, what goes through your mind in determining which one of those you would pick? You can't pick the one with the richest father, that doesn't count. I mean, you've got to do this on merit. But, you probably wouldn't pick the person that gets the highest grades in the class.

I mean, there's nothing wrong with getting the highest grades in the class, but that isn't going to be the quality that sets apart a big winner from the rest of the pack. Think about who you would pick and why. And I think you'll find when you get through, you'll pick some individual- you've all got the ability, you wouldn't be here otherwise. And you've all got the energy. I mean, the initiative is here, the intelligence is here throughout the class. But some of you are going to be bigger winners than others.

And it gets down to a bunch of qualities that, interestingly enough, are self-made. I mean it's not how tall you are. It's not whether you can kick a football 60 yards. It's not whether you can run the 100 yard dash in 10 seconds. It's not whether you're the best looking person in the room. It's a whole bunch of qualities that really come out of Ben Franklin, or the Boy Scout coders, or whatever it may be. I mean, it's integrity, it's honesty, it's generosity, it's being willing to do more than your share, it's just all those qualities that are self-selected.

And then if you look on the other side of the ledger, because there's always a catch to these free gifts and genie jokes, so. You also have to -and this is the fun part- you also have to sell short one of your classmates and pay 10 percent of what they do. So, who do you think is going to do the worst in the class? This is a way more. And think about it again. And again, it isn't the person with the lowest grades or anything of the sort. It's the person who just doesn't shape up in the character department.

We look for three things when we hire people. We look for intelligence, we look for initiative or energy, and we look for integrity. And if they don't have the latter, the first two will kill you, because if you're going to get someone without integrity, you want them lazy and dumb. I mean, you don't want a spark of energy out of them. So it's that third quality. But everything about that quality is your choice.

You know, you can't change the way you were wired much, but you can change a lot of what you do with that wiring. And it's the habits that you generate now on those qualities, or those negatives qualities. I mean the person who always claims credit for things they didn't do, that always cuts corners, that you can't count on. In the end those are habit patterns, and the time to form the right habits is when you're your age. I mean it doesn't do me much good to get golf lessons now. If I'd gotten golf lessons when I was your age I might be a decent golfer.

But, someone once said "the chains of habit are too light to be felt until they're too heavy to be broken." And I see that all the time. I see people with habit patterns that are self-destructive when they're 50 or 60 and they really can't change then, they're imprisoned by them. But you're not imprisoned by anything, so. When you write down the qualities of that person that you'd like to buy 10 percent of, look at that list and ask yourself, is there anything on that list I couldn't do?

And the answer is there won't be. And when you look at the person you sell short, and you look at those qualities that you don't like, if you see any of those in yourself -egotism, whatever it may be, selfishness- you can get rid of that. That is not ordained. And if you follow that, and Ben Franklin did this and my old boss Ben Graham did this at early ages in their young teens, Ben Graham looked around and he said, "Who do I admire?" And he wanted to be admired himself and he said, "Why do I admire these other people?" And he said, "If I admire them for these reasons, maybe other people would admire me if I behave in a similar manner." And he decided what kind of a person he wanted to be.

And if you follow that, at the end you'll be the person you want to buy 10 percent of. I mean that's the goal in the end, and it's something that's achievable by everybody in this room. So that's the end of the sermon. Now let's talk about what's on your mind, and you can ask anything. The only thing I won't tell you is what we're buying or selling. I don't even tell myself that. I mean I write it down and then it's like the Coca-Cola formula. There's only two people that can get into the trust department and find out what they are, and I don't know who the two are, so. We don't talk about what we're buying or selling, but anything else is fair game. Personal, business, anything you'd like to talk

about. And actually, the tougher the questions are, the more interesting it is for me. So don't spare my feelings, I mean just throw it at my head.

And with that, I guess we've got a microphone- is this the only microphone or is there one on this side?

Speaker: It's the only microphone right here. To ask a question you'll need to come down to this microphone.

Warren Buffett: Just stand in line, and I'll be Regis Philbin and you can- I have an old-fashioned belief that I can only should expect to make money in things that I understand. And when I say 'understand,' I don't mean understand what the product does or anything like that. I mean understand what the economics of the business are likely to look like 10 years from now or 20 years from now. I know in general what the economics of, say Wrigley chewing gum will look like 10 years from now. The internet isn't going to change the way people chew gum. It isn't going to change which gum they chew. If you own the chewing gum market in a big way, and you've got Doublemint, and Spearmint, and Juicy Fruit, those brands will be there 10 years from now. So I can pinpoint exactly what the numbers are going to look like on Wrigley, but I'm not going to be way off if I try to look forward on something like that.

Evaluating that company is within what I call 'my circle of competence.' I understand what they do, I understand the economics of it, I understand the competitive aspects of the business. There can be all kinds of companies that have wonderful futures but I don't know which ones they are. I've given talks in the past where I carry with me a 70-page tightly-printed list, and it shows 2000 auto companies. Now if at the start of the 20 th century you had seen what the auto was going to do to this country, the impact it would have on the lives of then your children and grandchildren and so on. It just, it transformed the American landscape. But of those 2000 companies, three basically survive. And they haven't done that well, many times.

So how do you pick three winners out of 2000? I mean it's not so easy to do. It's easy when you look back, but it's not so easy looking forward. So you could have been dead right on the fact that the auto industry- in fact, you probably couldn't have predicted how big of an impact it would have. But you wouldn't have- if you'd bought companies across the board you wouldn't have made any money, because the economic characteristics of that business were not easy to define.

I've always said the easier thing to do is figure out who loses. And what you really should have done in 1905 or so, when you saw what was going to happen with the auto is you should have gone short

horses. There were 20 million horses in 1900 and there's about 4 million horses now. So it's easy to figure out the losers, you know the loser is the horse. But the winner was the auto overall. But 2000 companies just about failed, a few merged out and so on.

There were three auto companies in the Dow Industrials in the 1920s and 30s: Studebaker, Nash-Kelvinator, and Hudson Motor. Now those names are all familiar to me, and maybe some of them are familiar to you, but they're not making any cars. They didn't make money. And yet at one time they were in the Dow 30, they were the aristocrats of American business. And they got creamed. So, figuring out the economic characteristics of the winners in a wonderful business is not easy.

In North Carolina, you know Orville and Wilbur took off- or I guess Orville took off and Wilbur watched. I'd have been Wilbur. But, if you could have seen the future of the airline business from that point forward and how that would transform things, it would have blown you away. And it's excited people incidentally ever since. But if there had been a capitalist in Kitty Hawk, he should have shot Orville down, because it's done nothing but cost investors money. There were over 400 airplane companies in the 1920s and 30s alone. There was in Omaha, there was in Nebraska, we were the Silicon Valley of apparently of aircraft, and they all disappeared. It's been a terrible business.

At the end of 1991 if you'd added up the aggregate earnings from all airline companies, with billions poured in since Wilbur and Orville were down there, they came to less than zero. The number of passengers went up every year. The importance of the industry was dramatically increased decade by decade, and nobody made any money. So, figuring out the economic consequences- T.V. I think there's, I don't know, 20-25 million sets a year sold in the United States. I don't think there's one of them made in the United States anymore. You'd say, T.V. set manufacturer, what a wonderful business. Nobody had a T.V. in 1950, thereabouts, '45-'50. Everybody has multiple sets now. Nobody in the United States has made any real money making the sets; they're all out of business. You know the Magnavoxs, the RCAs, all of those companies.

Radio was the equivalent in the 20s. Over 500 companies making radios in the 1920s. Again, I don't think there's a U.S. radio manufacturer at the present time. But Coca-Cola, you know. What was it, 1884 at Jacobs Pharmacy or whatever, a fellow comes up with something. A lot of copiers over the years, but now you've got a company that's selling roughly 1.1 billion 8 ounce servings of its product, not all Coke -Sprite and some others- daily throughout the world 117 years later.

So understanding the economic characteristics of a business is different than predicting the fact that an industry is going to do wonderfully. So when I look at the internet businesses or I look at tech

businesses, I say this is a marvelous thing and I love to play around on the computer, and I order my books from Amazon and all kinds of things. But I don't know who's going to win. Unless I know who's going to win, I'm not interested in investing; I'll just play around on the computer.

Defining your circle of competence is the most important aspect of investing. It's not how large your circle is, you don't have to be an expert on everything, but knowing where the perimeter of that circle of what you know and what you don't know is, and staying inside of it is all important. Tom Watson Senior who started IBM said in his book, he said, "I'm no genius. But I'm smart in spots, and I stay around those spots." And, you know that is the key. So if I understand a few things and stick in that arena, I'll do okay. And if I don't understand something but I get all excited about it because my neighbors are talking about, the stocks are going up, everything; I start fooling around someplace else, eventually I'll get creamed. And I should. So now let's go over here.

Audience: Hello, Mr. Buffett. I've got two short questions. One, is how do you find intrinsic value in a company?

Warren Buffett: Well intrinsic value is the number that if you were all-knowing about the future and could predict all the cash that a business would give you between now and judgement day, discounted at the proper discount rate that number is what the intrinsic value of a business is. In other words, the only reason for making an investment and laying out money now is to get more money later on, right? That's what investing is all about.

Now, when you look at a bond, so when you see a United States government bond it's very easy to tell what you're going to get back. It says it right on the bond. It says when you get the interest payments. It says when you get the principal. So, it's very easy to figure out the value of a bond. It can change tomorrow if interest rates change, but the cash flows are printed on the bond. The cash flows aren't printed on a stock certificate. That's the job of the analyst is to print out, change that stock certificate which represents an interest in the business, and change that into a bond and say this is what I think it's going to pay out in the future. When we buy some new machine for Shaw to make carpet, that's what we're thinking about obviously, and you'll learn that in business school.

But it's the same thing for a big business. If you buy Coca-Cola today, the company is selling for about \$110-15 billion in the market. The question is, if you had 110 or 15 billion- you wouldn't be listening to me, but I'd be listening to you incidentally. But the question is would you lay it out today to get what the Coca-Cola Company is going to deliver to you over the next 2 or 300 years? The discount rate doesn't make much difference as you get further out. And that is a question of how much cash they're going to give you. It isn't a question of how many analysts are going to

recommend it, or what the volume of the stock is, or what the chart looks like or anything, it's a question of how much cash it's going to give you.

It's true whether if you're buying a farm, it's true if you're buying an apartment house, any financial asset. Oil in the ground, you're laying out cash now to get more cash back later on. And the question is how much are you going to get, when are you going to get it, and how sure are you? And when I calculate intrinsic value of a business when we buy businesses, and whether we're buying all of a business or a little piece of a business, I always think we're buying the whole business because that's my approach to it. I look at it and I say, what will come out of this business and when?

And, what you'd really like of course is then to be able to use the money that you earned, and earn higher returns on it as you go along. I mean, Berkshire has never distributed anything to its shareholders, but its ability to distribute goes up as the value of the businesses we own increases. We can compound it internally, but the real question is, Berkshire's selling for, we'll say 105 or so billion now. What can we distribute from that- if you're going to buy the whole company for 105 billion now, can we distribute enough cash to you soon enough to make it sensible at present interest rates to lay out that cash now.

And that's what it gets down to. And if you can't answer that question, you can't buy the stock. You can gamble in the stock if you want to, or your neighbors can buy it. But if you don't answer that question, and I can't answer that for internet companies for example, and a lot of companies, there are all kinds of companies I can't answer it for. But I just stay away from those. Number two.

Audience: So you've got formulas involved in finding intrinsic values on certain companies? I mean, you got a mathematical system?

Warren Buffett: Just kind of present value, future cash, yeah.

Audience: Second short question is why haven't you written down your set of formulas or your strategies in written form so you can share it with everyone else?

Warren Buffett: Well I think I actually have written about that. If you read the annual reports over the recent years, in fact the most recent annual report I used what I've just been talking about, I used the illustration of Aesop. Because here Aesop was in 600 BC- smart man, wasn't smart enough to know it was 600 BC though. Would have taken a little foresight. But Aesop, in between tortoises and hares, and all these other things he found time to write about birds. And he said, "A bird in the hand is worth two in the bush." Now that isn't quite complete because the question is, how sure are you

that there are two in the bush, and how long do you have to wait to get them out? Now, he probably knew that but he just didn't have time because he had all these other parables to write and had to get on with it. But he was halfway there in 600 BC. That's all there is to investing is, how many birds are in the bush, when are you going to get them out, and how sure are you?

Now if interest rates are 15 percent, roughly, you've got to get two birds out of the bush in five years to equal the bird in the hand. But if interest rates are 3 percent, and you can get two birds out in 20 years, it still makes sense to give up the bird in the hand, because it all gets back to discounting against an interest rate. The problem is often you don't know not only how many birds are in the bush, but in the case of the internet companies there weren't any birds in the bush. But they still take the bird that you give them if they're in the hand.

But I actually have written about this sort of thing, and stealing heavily from Aesop who wrote it some 2600 years ago, but I've been behind on my reading. Yeah?

Audience: Good morning. I know you're famed for your success, but I was curious if there were any particular moments in your life, or mistakes or failures that you've made that were particularly memorable, what you may have learned from them, and if you had any particular advice for the students here in dealing with discouraging circumstances.

Warren Buffett: Yeah. Well I've made a lot of mistakes. The biggest mistake- well not necessarily the biggest, but buying Berkshire Hathaway itself was a mistake, because Berkshire was a lousy textile business. And I bought it very cheap. I'd been taught by Ben Graham to buy things on a quantitative basis, look around for things that are cheap. And I was taught that say in 1940 or 1950; it made a big impression on me.

So I went around looking for what I call used cigar butts of stocks. And the cigar butt approach to buying stocks is that you walk down the street and you're looking around for cigar butts, and you find on the street this terrible-looking, soggy, ugly-looking cigar- one puff left in it. But you pick it up and you get your one puff. Disgusting, you throw it away, but it's free. I mean it's cheap. And then you look around for another soggy one-puff cigarette.

Well that's what I did for years. It's a mistake. Although, you can make money doing it, but you can't make it with big money, it's so much easier just to buy wonderful businesses. So now I'd rather buy a wonderful business at a fair price than a fair business at a wonderful price. But in those days I was buying cheap stocks, and Berkshire was selling below its working capital per share. You got the plants for nothing, you got the machinery for nothing, you got the inventory and receivables at a

discount. It was cheap, so I bought it. And 20 years later I was still running a lousy business and that money did not compound.

You really want to be in a wonderful business because the time is the friend of the wonderful business. You keep compounding, it keeps doing more business, and you keep making more money. Time is the enemy of the lousy business. I could have sold Berkshire, perhaps liquidated it and made a quick little profit, you know one puff. But staying with those kind of businesses is a big mistake.

So you might say I learned something out of that mistake. And I would have been way better off taking- what I did with Berkshire is I kept buying better businesses. I started an insurance business, See's Candy, the Buffalo- all kinds of things. I would have been way better doing that with a brand new little entity that I'd set up rather than using Berkshire as the platform. Now I've had a lot of fun out of it. I mean everything in life seems to turn out for the better, so I don't have any complaints about that, but it was a dumb thing to do.

I went into US Air; I bought a preferred stock in 1989. As soon as my check cleared, the company went into the red and never got out. I mean it was really dumb. I've got an 800 number I call now whenever I think about buying an airline stock. I call them up any hour, fortunately I can call them at three in the morning, and I just dial and I say, "My name's Warren and I'm an aero-holic. And I'm thinking about buying this thing." Then they talk me down. It takes hours sometimes but it's worth it, believe me. If you ever think about buying an airline stock, call me and I'll give you the 800 number because you don't want to do it.

But, we got lucky in terms of how we eventually came out on it. But it was a dumb, dumb decision- all mine. And I've done- biggest in terms of opportunity costs, eventual costs, I bought half interest on a Sinclair filling station when I was about 20 with a guy who I was in the National Guard with. And I had about \$10,000 then and I put \$2,000 in, and I lost it all. So, that was 20%, and that means that the opportunity cost is now \$6 billion of that filling station which is a big price to pay for getting to wipe a few windows and a few windshields and things like that. So, actually I like it when Berkshire goes down because it reduces the cost of that mistake on an opportunity cost.

But, the biggest mistakes we've made by far- I've made, not we've made. The biggest mistakes I've made by far are mistakes of omission and not commission. I mean it's the things I knew enough to do, they were within my circle of competence, and I was sucking my thumb. And that is really, those are the ones that hurt. They don't show up any place. I probably cost

Berkshire at least \$5 billion, for example, by sucking my thumb 20 years ago, or close to it when Fannie Mae was having some troubles. We could have bought the whole company for practically nothing.

And I don't worry about that if it's Microsoft because I don't know. Microsoft isn't in my circle of competence. So I don't have any reason to think I'm entitled to make money out of Microsoft or out of cocoa beans or whatever. But I did know enough to understand Fannie Mae and I blew it. And that never shows up under conventional accounting. But I know the cost of it. I passed it up. And those are the big, big mistakes, and I've got plenty of them. And unless I tell you about them in the annual report -and I resist the temptation sometimes- unless I tell you about them in the annual report you're not going to know it because it doesn't show up under conventional accounting.

But omission is way bigger than commission. Big opportunities in life have to be seized. We don't do very many things, but when we get the chance to do something that's right and big, we've got to do it. And even to do it in a small scale is just as big a mistake almost as not doing it at all. You've really got to grab them when they come, because you're not going to get 500 great opportunities. You would be off if when you got out of school here you got a punch card with 20 punches on it, and every financial decision you made you used up a punch. You'd get very rich because you'd think through very hard each one.

I mean I went to a cocktail party and somebody talked about a company he didn't even understand what they did or couldn't pronounce the name. But they'd made some money last week and another one like it. You wouldn't buy it if you only had 20 punches on that card. There's a temptation to dabble, particularly during bull markets, and stocks are so easy. It's easier now than ever because you can do it online. You know just you click it in and maybe it goes up a point and you get excited about that and you buy another one the next day and so on. You can't much money over time doing that. But if you had a punch card with only 20 punches, you weren't going to get another one for the rest of your life, you would think a long time before every investment decision. And you would make good ones and you'd make big ones, and you probably wouldn't even use all 20 punches in your lifetime. But you wouldn't need to. Yep?

Audience: Mr. Buffett, good morning. In your comments about making mistakes and errors like that, could you talk a little bit about your sell discipline? When you're in a position and you feel like it's no longer good. What criteria do you use when you just finally abandon it?

Warren Buffett: Yeah when I started out- the sell situation has changed over the years because when I started out I had way more ideas than money. I mean I would go through Moody's Manual, I

went through it page by page, and then I went through it again page by page. And I found stocks in there that I could understand that were selling at like two times earnings, even one times earnings. Well, when you only have 10,000 bucks that can get a little frustrating, and if you don't like to borrow money, which I never liked to borrow money.

So, I was always coming up with more ideas than I had money, so I had to sell whatever I liked least to buy something new that just was compelling to me. And for a long time I was in that mode. And now our problem is we have more money than ideas. So, if you look at our annual report which is on the internet at our homepage berkshirehathaway.com. You'll see something in the back called the economic principles of Berkshire, which I believe in setting out for my partners. They are my partners; I don't look at them as shareholders I look at them as partners. They're going to be my partners for life. So I want to tell them how I think. And if they disagree with the way I think that's fine, but I don't want them to be disappointed in me.

So I lay out there and I say, in terms of our wholly-owned businesses, we're not going to sell no matter how much anybody offers us for them. I mean if somebody offers us three times what something is worth- See's Candy, The Buffalo News, Borsheims, whatever it may be, we're not going to sell it. I may be wrong in having that approach. I know I'm not wrong if I owned 100 percent of Berkshire because that's the way I want to live my life. I've got all the money I could possibly need, it just amounts to a change in the newspaper story on my obituary and the amount of money the foundation has. And to break-off relationships with people I like and people that have joined me because they think it's a permanent home, to do that simply because somebody waves a big check at me would be like selling one of my children because somebody waved a big check. So I won't do that, and I want to tell my partners I won't do it so that they're not disappointed in me.

More and more with certain stocks we've got that approach. Now, if we were chronically short of funds and had all kinds of opportunities coming, we might have a somewhat different approach.

But our inclination is not to sell things unless we get really discouraged, perhaps with the management, or we think the economic characteristics of the business change in a big way, and that happens. But we're not going to sell simply because it looks too high. In all likelihood, you can't make that 100 percent but that's the principle under which we're operating.

We're generating right now 5 billion of cash a year at least, so that's 100 million bucks every week. We've been talking here half an hour and I haven't done a damn thing. So, the real question is how do you put it out intelligently, and if we were selling things it'd be just that much more, so. There may come a time when that would change. But we want to- and I have partners, shareholders, partners,

who would say, "If you can get three times what See's Candy's worth, why don't you sell it?" And that's why I want to be sure before they come in, they know how I think on that. I mean they're entitled to know that.

But you really want- think for minute if you're going to get married and you want a marriage that's going to last, not necessarily the happiest marriage or one that Martha Stewart will talk about or anything, but you want a marriage that's going to last. What quality do you look for in a spouse? One quality- do you look for brains? Do you look for humor? Do you look for character? Do you look for beauty? No. You look for low expectations. That is the marriage that's going to last, if you both have low expectations. And I want my partners to be on the low side on expectations coming in because I want the marriage to last. It's a financial marriage when they join me at Berkshire and I don't want them to think I'm going to do things that I'm not going to do. So that's our guiding principle.

TO: Berkshire Hathaway Managers ("The All-Stars")

FROM: Warren E. Buffett

DATE: September 26, 2001

The last few weeks have been tough times for all of us in our personal lives and for many of us in our business activities.

At Berkshire we have estimated our September 11 insurance loss was \$2.2 billion. We've labeled this a "guess" because that's all it is. It will be many years before we can tell the world within a narrow range what the true figure was.

A very high percentage of the loss occurred in our U.S. insurance companies, with the balance in German and U.K. entities. Because we have regularly paid very large amounts of U.S. income taxes, we will bear 65% of the cost applicable to the U.S. operations; the government will bear 35%. Many insurers will not have their loss mitigated in this manner and some may not survive. Though much of our loss will be paid very soon, significant payments in the liability area will take a considerable time to settle.

Even with tax recoveries, our loss is huge. Nevertheless, it's one Berkshire can easily bear. We have long been in the super-cat business and we have been prepared, both financially and psychologically, to handle them when they occur. This won't be our last hit, though we fervently hope disasters in the future arise from natural causes, rather than be man-made. (We also would hope they would be of lesser magnitude.)

What should you be doing in running your business? Just what you always do: Widen the moat, build enduring competitive advantage, delight your customers, and relentlessly fight costs. With the exception of insurance pricing and coverages, almost all operating decisions that made sense a month ago make sense today.

For my part, I'll keep looking for sensible acquisitions and continue to manage our resources so that Berkshire remains a financial Rock of Gibraltar. I'm sure we are in a recession, probably a relatively deep and extended one, but they are part of business life and we are prepared.

In short, you do the managing and I'll do the worrying. That's a division of labor that's worked for us in the past, and it will continue to work well in the future.

Thanks, as always, for the great job all of you do that, in turn, makes my job so easy.

Warren

Warren

A Conversation

*Warren Buffett offering his wallet to
Dean Cynthia Milligan*

Arriving at Warren Buffett's office early on a Tuesday morning, Warren greeted me at the door. He was looking forward to the opportunity to discuss the College of Business Administration. As we toured his office, he chuckled when he recalled a puzzling income item of \$4.00 on his latest tax return. With his usual thorough research, discovered it was a royalty payment for his appearance on "All My Children". A framed collage on his office wall documents his appearance on the soap opera, along with the check stub, which records the payment for the appearance, \$55,000 plus a \$10.00 wardrobe allowance. His family tells him that is enough wardrobe allowance to last several years.

Other memorabilia that adorns his office are the original stock certificates signed by Wells and Fargo for American Express and the Wells Fargo Company. Along with those documents is a bank charter signed by Fargo. He also keeps two Coke machines and various other souvenirs, representing his businesses, such as a giant Dairy Queen ice cream sundae.

Cynthia: Talk about your Nebraska ties. Your parents were at the University, weren't they?

Warren: My great-grandfather started a grocery business in 1869 in Omaha. All of their children attended the University of Nebraska. When my father was at the University, he was the editor of The Daily Nebraskan. My mother was the granddaughter of the owner of the Cuming County Democrat in Westpoint, Nebraska. My mother could run a linotype when she was twelve; she used to interview people

Buffett

with Dean Cynthia H. Milligan

waiting for the train, just to have something to write about in the paper. When she went to the University, she naturally went to the Daily Nebraskan looking for a job, where she met my father.

Cynthia: What do you remember about your education at the University?

Warren: I had a great experience at Nebraska. Probably the best teacher I had was Ray Dein in accounting. I think everybody in business school should really know accounting; it is the language of business. If you are not comfortable with the language, you can't be comfortable in the country. You just have to get it into your spinal cord. It is so valuable in business.

Cynthia: You began your university education at another institution, what are your thoughts on the education you received at the University of Nebraska?

Warren: The best year of my undergraduate work was at Nebraska; I would call it my best overall experience except for the year at Columbia, where I studied with Ben Graham. The teachers at the University turned me on. There wasn't a class that disappointed me. I was close to my professors, who actually taught the classes. At my previous undergraduate college, graduate students taught the classes.

One of the best things that happened was the day the University was going to award the "Nathan Gold Scholarship," a \$500 scholarship to attend graduate school anywhere in the U.S. As it turned out, I was the only applicant that showed up for the interview. So I won the scholarship by default. My dad wanted me to apply to Harvard Business School. It was a 10-hour train ride to Chicago where I met with the person who was to interview me, and was told to come back another time when I was older. I was 19 at the time. So I rode 10 hours back, wondering what I was

"I had a great experience at the University of Nebraska. The teachers at the University turned me on. I was close to my professors. There wasn't a class I was disappointed in."

going to tell my Dad. In August of that year I was leafing through magazines and discovered that Ben Graham was teaching at Columbia, so I contacted the Dean at Columbia and even though it was very late to apply, was accepted.

Cynthia: Are you a goal oriented person? When you were in college did you set goals for yourself?

Warren: I have always liked business and wanted to be in business. This is my ledger from 1950, when I was at the University of Nebraska. It shows the investment in my golf ball business. I had \$44 cash and half interest in a car. I also had a brokerage account, but had to buy stocks in my sister's name because I was underage.

Cynthia: Your goals were financial then?

Warren: Business, I like the process of business. Money is a way to be in business, but the real fun is the activity itself.

Cynthia: When you are looking at a business in which to invest, what are your priorities?

Warren: You have to really understand the economics of a business and the kind of people you are getting into business with. They have to love their business. They have to feel that they have been creative, that it is their painting, I am not going to disturb it, just give them more canvas and more brushes, but its their painting, from our standpoint any way. The whole place will reflect the attitude of the person at the top, if you have someone at the top who doesn't care, the people down below won't care. On the other hand, if you have someone at the top who cares a great deal, that will be evident across the organization.

Cynthia: The type of people managing the business is a very important criteria, then?

Warren: Yes, contracts don't protect you; you have to have confidence in the people.

Cynthia: We are making a big investment in ethics and leadership. We just hired a nationally known scholar in leadership to head our Center for Advanced Leadership Studies. We are searching for a faculty member with a reputation in the field of ethical leadership to work with our Center of Ethics and our Center for Leadership. Obviously, we see a need for our graduates to develop leadership skills and be aware of ethical issues in business. What is your opinion on the need for those entering business careers to have leadership skills and developed ethical values?

Warren: The best ethical leadership people receive is from their parents. Every kid wants heroes, and they may pick the wrong ones. The natural heroes are the parents. Kids usually emulate their parents, and if the parents behave well, the kids are very, very likely to behave well.

I think that what you do at school by emphasizing ethical values is that you will keep those kids on track and pull in a few that aren't.

Nebraska's Most Illustrious Alumnus

"The younger you are when you start learning, the better. Anyone who understands compound interest can understand that."

“I like the process of business. Money is a way to be in business, but the real fun is the activity itself.”

Cynthia: What about the value of good leadership skills and ethics in business?

Warren: I have seen plenty of people succeed that don't have either one. And I have also seen an awful lot of people succeed that do; and those are the ones I admire and they are the ones I want to associate with. Honesty is a terrific policy. What do you look back on in terms of whether you have been a success? You have certain things you want to achieve, but if you don't have the love and respect of people, you are always a failure. That is the one thing you must earn, it can never be bought. No one that has the love and respect of others is ever a failure.

Cynthia: A donor gave us \$1 million to develop an ethics program, and every year he asks us if we really think this makes a difference. I agree with you, often the students come with high ethical standards, but what we are doing is exposing them to some ethical issues that might trip them up at some point in their career. We want them to understand the issues and understand they can influence those around them with their own standards. Do you agree with that approach?

Warren: The simple test of good ethics, is how would you feel about any act, if a reasonably intelligent, but unfriendly reporter were to write it up and put it in tomorrow's paper for everyone to see. If it passes that test, it's okay, and if you have to think about it, it probably isn't the right thing to do.

Cynthia: You talk often about heroes, who are your heroes?

Warren: I have been extraordinarily lucky with my heroes, starting with my Dad. I have never been let down by one of my heroes. When I was about 13 or 14, we moved to Washington. I was all mixed up for a while, I ran away from home, stole things, but I got through it because I had the right heroes. If you have the wrong ones you have a real problem, because you are going to emulate your heroes. You will gravitate toward the people you admire. If you don't choose those people carefully, you will very quickly develop situational ethics that can get you into trouble.

Cynthia: Let's talk technology. I know that you have said you are not interested in investing in technology companies. However, we have a strong technology and e-business focus in our business curriculum, believing that our graduates will be more valuable to their future employers if they understand the use of technology in management, marketing, accounting and finance. What is your opinion of the importance of technology in business education today?

Warren: I love what technology is doing for the world, including me. I don't think it is easy to pick who the technology winners will be in ten years, like it is with chewing gum or soft drinks. But, that is an investment decision. We are the world's leaders in technology and it is an engine that will do wonders for this country over time.

“ Economics should be part of everyone's background, because it is the way the world works.”

“I think everyone in business school should really know accounting. It is the language of business. It is the Rosetta Stone for Business.”

Cynthia: Our philosophy is that technology is a part of every element in our curriculum. We do not have an e-commerce or an e-business major. It should be infused into everything; it has changed accounting, it has changed all aspects of business.

Warren: It's a tool. For a student to leave business school and not know how technology affects business and a mind to keep up with the progress of technology would be insupportable. Technology is the future of business. It is transforming society. If I were starting out in business today, I would be very focused on technology.

Cynthia: Do you think an MBA is an important degree for students to have today?

Warren: If you are interested in business, or likely to be in business, an MBA is very useful. But, what is really important is what you bring to a class in terms of being interested in the subject. If you view a course like accounting as a drudge and a requirement, you are missing the whole game. Any course can be exciting. Mastering accounting is like mastering a new language, it can be so much fun. The attitude should be one of discovery, that you are coming there and discovering. Accounting is the Rosetta Stone of business.

Economics is fascinating, the first page of economics describes how mankind deals with insatiable wants and creates the systems to fulfill these wants. It's great stuff. Really how the world works. Business is a subsection, a fairly understandable subsection, not like black holes, which are fairly hard to visualize, but business is every day stuff and you are learning how the world works. You are 18-19 years old and learning about the world, understanding how this great world works. The GDP per capita in the 20th century increased 6 to 1. Think of that, six times. Why does that work here in the U.S., why doesn't it work other places? The U.S. is a small part of the universe, but a very important part and understanding that and seeing everything else against that backdrop for the rest of your life is fabulous.

Cynthia: What goals do you set for yourself today; do you have goals you still want to accomplish?

Warren: Berkshire is my canvas. The goal I have is to have Berkshire be generally admired for what it is. I am also proud that we do things at Berkshire that are different than other corporations. My partner, Charlie Munger, says that Berkshire is a didactic exercise, that it is a teaching platform. We do things differently at Berkshire than in other business which bring into question the generally accepted ways of doing business.

Cynthia: We have 3200 students in the Business College, just beginning their paths to a career. What advice would you give students who are preparing for a business career?

Warren: My advice generally is to sop up everything you can. You're not going to run out of storage room in your brain, so take advantage of everything that is of interest. You will never have another opportunity like this in your lifetime.

I ask students what they would do, if when they were sixteen, a genie came to them and told them that they could have the car of their dreams. The only catch is that it is the only car they will ever have. I know what I would do; I would study the owner's manual until I had it memorized, and do everything I could to keep the car in the best shape possible. When you are sixteen, you only have one brain and one body and that is all you are ever going to get.

Cynthia: What advice would you give students who are just starting out in a business career?

Warren: I would say, follow what you are passionate about. I think it is crazy to be someplace where you feel your ethics or whatever is out of sync with your work. You really want to be in a place where you jump out of bed in the morning and you are all fired up to get to work. I have always felt that way, basically,

Cynthia: Our students are always interested in knowing what you look for when you hire someone? What specific qualities do you seek?

Warren: You look for three things, you look for intelligence, you look for energy and you look for integrity. You don't need to be brilliant, just reasonably intelligent, Ray Kroc, for example, has good intelligence, which he combined with good business principles and passion for business and a passion for his particular business.

Every business student you have has the requisite intelligence and requisite energy. Integrity is not hard wired into your DNA. A student at that age can pretty much decide what kind of person they are going to be at sixty. If they don't have integrity, they never will. The chains of habit are sometimes too heavy to be broken. Students can forge their own chains. Just pick a person to admire and ask why you admire them, usually it is because they are generous, decent, kind people, and those are the kind of people to emulate.

Cynthia: Thank you for the generous amount of time you have given us today. I know that you are a great asset for the College and we appreciate your support.

Warren: Thank you for coming.

“Berkshire Hathaway is my canvas. I get to paint my own painting. The ultimate luxury.”

An FDIC for Insurers

By Warren Buffett

Monday, November 19, 2001; Page A21

I'm in the insurance business -- an expensive place to be in the past couple of months. It was made costly for Berkshire Hathaway, the company I run, because I did something very dumb: allowed Berkshire to provide insurance coverage for a huge catastrophe loss without its getting a premium for doing so. The risk we unthinkingly assumed was a loss from terrorism.

Given the degree of my error, I was lucky: We estimate our Sept. 11 loss at Berkshire to have been "only" about \$2.3 billion. That's more, by far, than we've ever lost from a single catastrophe, but the toll could have been far larger. Indeed, had a nuclear device been available to Osama bin Laden, the loss could have bankrupted most of the insurance industry, Berkshire very much included. Given that kind of horrendous, but not impossible, nuclear scenario, insured losses could have been \$1 trillion, an amount that exceeds the net worth of all property-casualty insurers worldwide.

A potential loss of almost infinite magnitude can be assumed only by an entity of almost-infinite resources. That economic species doesn't exist in the private sector. Only the U.S. government fits the bill.

Washington has accepted this proposition to a point. Congress is now agonizingly trying to create some sort of industry-government coalition that would insure losses from terrorism. The motives of all concerned are admirable, but I believe the actions now being considered have disturbing implications for our society.

Some proposals limit the government's liability but leave the risk for the industry open-ended. These proposals won't work: If unlimited liability is left with insurers, they will necessarily refuse to renew policies they see potentially leading them to bankruptcy.

Equally bad, all of the proposals now being considered will engender pricing based upon risk exposure. That is, if a business is located in a high-risk spot it will be asked to pay a staggering price for insurance. Risk-based pricing is normally equitable and desirable. At Berkshire, we employ it constantly. In this case, though, it would have antisocial consequences.

For example, the terrorism risk per dollar of insured value may be 10 or more times for iconic or critical properties in New York City what it is for properties in less-populated areas. But great cities are central to our society. We don't want them to wither under the burden of hugely disadvantageous insurance costs. Indeed, it's in America's interest for them to thrive. Citizens of our leading cities almost certainly bear above-normal physical risks in the war being waged upon us by terrorists. We should not impose crippling economic costs on them as well.

In my opinion, we would arrive at a solution for this societal problem if we were to adopt the Federal Deposit Insurance Corp. as a model for where we want to head in the insurance industry. The rationale for the FDIC, formed 68 years ago, was clear-cut: The United States sorely needed to eliminate bank runs and the financial panics they caused. Prior to the FDIC,

the risk from bank failures resided with depositors, who had no way to shed it. Neither they nor their banks could lay that risk off on private insurers for two reasons: First, the dollar amounts involved were simply too large; second, losses were correlated, in the sense that the failure of a few banks frequently caused a chain reaction, in which good banks toppled with bad, leaving a mountain of economic damage. Fortunately for the country, these punishing disruptions to our economy were ended by the advent of FDIC insurance.

At the moment, leaving aside insurance policies soon due to run out, millions of business owners, individuals, landlords and lenders bear the economic risk of terrorist attacks. Insurers won't step up to assume the risk -- we were previously dumb, but we've learned. It isn't right, though, that these risk-laden millions should have to shoulder this burden themselves: That would be self-insurance, and the economic distortions it would cause would stagger our society. Who would ever build a skyscraper in a major city or lend against it? Or how could a mom-and-pop deli, bare of insurance, locate next to an iconic office tower?

If we were to adopt an FDIC model for handling terrorism, the insurance industry would not be permitted to earn a dime from the coverage. Instead, a premium tax, payable to the U.S. Treasury, would be levied on all insurance. This would have the equitable effect of spreading the terrorism-related cost to the country in general, just as we spread defense expenditures.

Were a proposal such as I suggest to be enacted, the new law should sharply limit private lawsuits seeking to place blame on some party involved -- an airline, say. We should want the Treasury to make payments to victims solely to compensate them for loss of property, life or direct earnings, without worrying about fault. The law also should cover war losses. War and terrorism both have the capacity to impose losses that private insurers simply can't bear. Most existing policies already have a war exclusion -- but not all by far.

Some people will argue that an FDIC model for insurance would be a socialistic intrusion into the private sector. Most surely would have argued the same about the FDIC itself -- and yet that institution is today generally regarded as having been enormously beneficial. The problem was once bank runs and economic panics, and we found an innovative solution. Today, the problem is terrorism and its capricious effects on insurance costs, and we need a solution of comparable efficacy.

The writer is chairman of the board of Berkshire Hathaway Inc., a diversified company with insurance operations, and a director of the The Washington Post Co., which has an investment in Berkshire Hathaway.

Warren Buffett on the Stock Market

What's in the future for investors--another roaring bull market or more upset stomach? Amazingly, the answer may come down to three simple factors. Here, the world's most celebrated investor talks about what really makes the market tick--and whether that ticking should make you nervous.

FORTUNE

Monday, December 10, 2001

By Carol Loomis

<http://www.fortune.com/fortune/investing/articles/0,15114,372385,00.html>

Two years ago, following a July 1999 speech by Warren Buffett, chairman of Berkshire Hathaway, on the stock market--a rare subject for him to discuss publicly--FORTUNE ran what he had to say under the title Mr. Buffett on the Stock Market (Nov. 22, 1999). His main points then concerned two consecutive and amazing periods that American investors had experienced, and his belief that returns from stocks were due to fall dramatically. Since the Dow Jones Industrial Average was 11194 when he gave his speech and recently was about 9900, no one yet has the goods to argue with him.

So where do we stand now--with the stock market seeming to reflect a dismal profit outlook, an unfamiliar war, and rattled consumer confidence? Who better to supply perspective on that question than Buffett?

The thoughts that follow come from a second Buffett speech, given last July at the site of the first talk, Allen & Co.'s annual Sun Valley bash for corporate executives. There, the renowned stockpicker returned to the themes he'd discussed before, bringing new data and insights to the subject. Working with FORTUNE's Carol Loomis, Buffett distilled that speech into this essay, a fitting opening for this year's Investor's Guide. Here again is Mr. Buffett on the Stock Market.

The last time I tackled this subject, in 1999, I broke down the previous 34 years into two 17-year periods, which in the sense of lean years and fat were astonishingly symmetrical. Here's the first period. As you can see, over 17 years the Dow gained exactly one-tenth of one percent.

- Dow Jones Industrial Average

Dec. 31, 1964: 874.12

Dec. 31, 1981: 875.00

And here's the second, marked by an incredible bull market that, as I laid out my thoughts, was about to end (though I didn't know that).

- Dow Industrials

Dec. 31, 1981: 875.00

Dec. 31, 1998: 9181.43

Now, you couldn't explain this remarkable divergence in markets by, say, differences in the growth of gross national product. In the first period--that dismal time for the market--GNP actually grew more than twice as fast as it did in the second period.

- Gain in Gross National Product

1964-1981: 373%

1981-1988: 177%

So what was the explanation? I concluded that the market's contrasting moves were caused by extraordinary changes in two critical economic variables--and by a related psychological force that eventually came into play.

Here I need to remind you about the definition of "investing," which though simple is often forgotten. Investing is laying out money today to receive more money tomorrow.

That gets to the first of the economic variables that affected stock prices in the two periods--interest rates. In economics, interest rates act as gravity behaves in the physical world. At all times, in all markets, in all parts of the world, the tiniest change in rates changes the value of every financial asset. You see that clearly with the fluctuating prices of bonds. But the rule applies as well to farmland, oil reserves, stocks, and every other financial asset. And the effects can be huge on values. If interest rates are, say, 13%, the present value of a dollar that you're going to receive in the future from an investment is not nearly as high as the present value of a dollar if rates are 4%.

So here's the record on interest rates at key dates in our 34-year span. They moved dramatically up--that was bad for investors--in the first half of that period and dramatically down--a boon for investors--in the second half.

- Interest Rates, Long-Term Government Bonds

Dec. 31, 1964: 4.20%

Dec. 31, 1981: 13.65%

Dec. 31, 1998: 5.09%

The other critical variable here is how many dollars investors expected to get from the companies in which they invested. During the first period expectations fell significantly because corporate profits weren't looking good. By the early 1980s Fed Chairman Paul Volcker's economic sledgehammer had, in fact, driven corporate profitability to a level that people hadn't seen since the 1930s.

The upshot is that investors lost their confidence in the American economy: They were looking at a future they believed would be plagued by two negatives. First, they didn't see much good coming in the way of corporate profits. Second, the sky-high interest rates prevailing caused them to discount those meager profits further. These two factors, working together, caused stagnation in the stock market from 1964 to 1981, even though

those years featured huge improvements in GNP. The business of the country grew while investors' valuation of that business shrank!

And then the reversal of those factors created a period during which much lower GNP gains were accompanied by a bonanza for the market. First, you got a major increase in the rate of profitability. Second, you got an enormous drop in interest rates, which made a dollar of future profit that much more valuable. Both phenomena were real and powerful fuels for a major bull market. And in time the psychological factor I mentioned was added to the equation: Speculative trading exploded, simply because of the market action that people had seen. Later, we'll look at the pathology of this dangerous and oft-recurring malady.

Two years ago I believed the favorable fundamental trends had largely run their course. For the market to go dramatically up from where it was then would have required long-term interest rates to drop much further (which is always possible) or for there to be a major improvement in corporate profitability (which seemed, at the time, considerably less possible). If you take a look at a 50-year chart of after-tax profits as a percent of gross domestic product, you find that the rate normally falls between 4%--that was its neighborhood in the bad year of 1981, for example--and 6.5%. For the rate to go above 6.5% is rare. In the very good profit years of 1999 and 2000, the rate was under 6% and this year it may well fall below 5%.

So there you have my explanation of those two wildly different 17-year periods. The question is, How much do those periods of the past for the market say about its future?

To suggest an answer, I'd like to look back over the 20th century. As you know, this was really the American century. We had the advent of autos, we had aircraft, we had radio, TV, and computers. It was an incredible period. Indeed, the per capita growth in U.S. output, measured in real dollars (that is, with no impact from inflation), was a breathtaking 702%.

The century included some very tough years, of course--like the Depression years of 1929 to 1933. But a decade-by-decade look at per capita GNP shows something remarkable: As a nation, we made relatively consistent progress throughout the century. So you might think that the economic value of the U.S.--at least as measured by its securities markets--would have grown at a reasonably consistent pace as well.

The U.S. Never Stopped Growing

Per capita GNP gains crept in the 20th century's early years. But if you think of the U.S. as a stock, it was overall one helluva mover.

Year	20th-Century growth in per capita GNP (constant dollars)
1900-10	29%
1910-20	1%
1920-30	13%
1930-40	21%
1940-50	50%
1950-60	18%
1960-70	33%
1970-80	24%
1980-90	24%
1990-2000	24%

That's not what happened. We know from our earlier examination of the 1964-98 period that parallelism broke down completely in that era. But the whole century makes this point as well. At its beginning, for example, between 1900 and 1920, the country was chugging ahead, explosively expanding its use of electricity, autos, and the telephone. Yet the market barely moved, recording a 0.4% annual increase that was roughly analogous to the slim pickings between 1964 and 1981.

- Dow Industrials

Dec. 31, 1899: 66.08

Dec. 31, 1920: 71.95

In the next period, we had the market boom of the '20s, when the Dow jumped 430% to 381 in September 1929. Then we go 19 years--19 years--and there is the Dow at 177, half the level where it began. That's true even though the 1940s displayed by far the largest gain in per capita GDP (50%) of any 20th-century decade. Following that came a 17-year period when stocks finally took off--making a great five-to-one gain. And then the two periods discussed at the start: stagnation until 1981, and the roaring boom that wrapped up this amazing century.

To break things down another way, we had three huge, secular bull markets that covered about 44 years, during which the Dow gained more than 11,000 points. And we had three periods of stagnation, covering some 56 years. During those 56 years the country made major economic progress and yet the Dow actually lost 292 points.

How could this have happened? In a flourishing country in which people are focused on making money, how could you have had three extended and anguishing periods of stagnation that in aggregate--leaving aside dividends--would have lost you money? The answer lies in the mistake that investors repeatedly make--that psychological force I mentioned above: People are habitually guided by the rear-view mirror and, for the most part, by the vistas immediately behind them.

The first part of the century offers a vivid illustration of that myopia. In the century's first 20 years, stocks normally yielded more than high-grade bonds. That relationship now seems quaint, but it was then almost axiomatic. Stocks were known to be riskier, so why buy them unless you were paid a premium?

And then came along a 1924 book--slim and initially unheralded, but destined to move markets as never before--written by a man named Edgar Lawrence Smith. The book, called *Common Stocks as Long Term Investments*, chronicled a study Smith had done of security price movements in the 56 years ended in 1922. Smith had started off his study with a hypothesis: Stocks would do better in times of inflation, and bonds would do better in times of deflation. It was a perfectly reasonable hypothesis.

But consider the first words in the book: "These studies are the record of a failure--the failure of facts to sustain a preconceived theory." Smith went on: "The facts assembled, however, seemed worthy of further examination. If they would not prove what we had hoped to have them prove, it seemed desirable to turn them loose and to follow them to whatever end they might lead."

Now, there was a smart man, who did just about the hardest thing in the world to do. Charles Darwin used to say that whenever he ran into something that contradicted a conclusion he cherished, he was obliged to write the new finding down within 30 minutes. Otherwise his mind would work to reject the discordant information, much as the body rejects transplants. Man's natural inclination is to cling to his beliefs, particularly if they are reinforced by recent experience--a flaw in our makeup that bears on what happens during secular bull markets and extended periods of stagnation.

To report what Edgar Lawrence Smith discovered, I will quote a legendary thinker--John Maynard Keynes, who in 1925 reviewed the book, thereby putting it on the map. In his review, Keynes described "perhaps Mr. Smith's most important point ... and certainly his most novel point. Well-managed industrial companies do not, as a rule, distribute to the shareholders the whole of their earned profits. In good years, if not in all years, they retain a part of their profits and put them back in the business. Thus there is an element of compound interest (Keynes' italics) operating in favor of a sound industrial investment."

It was that simple. It wasn't even news. People certainly knew that companies were not paying out 100% of their earnings. But investors hadn't thought through the implications of the point. Here, though, was this guy Smith saying, "Why do stocks typically outperform bonds? A major reason is that businesses retain earnings, with these going on to generate still more earnings--and dividends, too."

That finding ignited an unprecedented bull market. Galvanized by Smith's insight, investors piled into stocks, anticipating a double dip: their higher initial yield over bonds, and growth to boot. For the American public, this new understanding was like the discovery of fire.

But before long that same public was burned. Stocks were driven to prices that first pushed down their yield to that on bonds and ultimately drove their yield far lower. What happened then should strike readers as eerily familiar: The mere fact that share prices were rising so quickly became the main impetus for people to rush into stocks. What the few bought for the right reason in 1925, the many bought for the wrong reason in 1929.

Astutely, Keynes anticipated a perversity of this kind in his 1925 review. He wrote: "It is dangerous ... to apply to the future inductive arguments based on past experience, unless one can distinguish the broad reasons why past experience was what it was." If you can't do that, he said, you may fall into the trap of expecting results in the future that will materialize only if conditions are exactly the same as they were in the past. The special conditions he had in mind, of course, stemmed from the fact that Smith's study covered a half century during which stocks generally yielded more than high-grade bonds.

The colossal miscalculation that investors made in the 1920s has recurred in one form or another several times since. The public's monumental hangover from its stock binge of the 1920s lasted, as we have seen, through 1948. The country was then intrinsically far more valuable than it had been 20 years before; dividend yields were more than double the yield on bonds; and yet stock prices were at less than half their 1929 peak. The conditions that had produced Smith's wondrous results had reappeared--in spades. But rather than seeing what was in plain sight in the late 1940s, investors were transfixed by the frightening market of the early 1930s and were avoiding re-exposure to pain.

Don't think for a moment that small investors are the only ones guilty of too much attention to the rear-view mirror. Let's look at the behavior of professionally managed pension funds in recent decades. In 1971--this was Nifty Fifty time--pension managers, feeling great about the market, put more than 90% of their net cash flow into stocks, a record commitment at the time. And then, in a couple of years, the roof fell in and stocks got way cheaper. So what did the pension fund managers do? They quit buying because stocks got cheaper!

- Private Pension Funds

% of cash flow put into equities

1971: 91% (record high)

1974: 13%

This is the one thing I can never understand. To refer to a personal taste of mine, I'm going to buy hamburgers the rest of my life. When hamburgers go down in price, we sing the "Hallelujah Chorus" in the Buffett household. When hamburgers go up, we weep. For most people, it's the same way with everything in life they will be buying--except stocks.

When stocks go down and you can get more for your money, people don't like them anymore.

That sort of behavior is especially puzzling when engaged in by pension fund managers, who by all rights should have the longest time horizon of any investors. These managers are not going to need the money in their funds tomorrow, not next year, nor even next decade. So they have total freedom to sit back and relax. Since they are not operating with their own funds, moreover, raw greed should not distort their decisions. They should simply think about what makes the most sense. Yet they behave just like rank amateurs (getting paid, though, as if they had special expertise).

In 1979, when I felt stocks were a screaming buy, I wrote in an article, "Pension fund managers continue to make investment decisions with their eyes firmly fixed on the rear-view mirror. This generals-fighting-the-last-war approach has proved costly in the past and will likely prove equally costly this time around." That's true, I said, because "stocks now sell at levels that should produce long-term returns far superior to bonds."

Consider the circumstances in 1972, when pension fund managers were still loading up on stocks: The Dow ended the year at 1020, had an average book value of 625, and earned 11% on book. Six years later, the Dow was 20% cheaper, its book value had gained nearly 40%, and it had earned 13% on book. Or as I wrote then, "Stocks were demonstrably cheaper in 1978 when pension fund managers wouldn't buy them than they were in 1972, when they bought them at record rates."

At the time of the article, long-term corporate bonds were yielding about 9.5%. So I asked this seemingly obvious question: "Can better results be obtained, over 20 years, from a group of 9.5% bonds of leading American companies maturing in 1999 than from a group of Dow-type equities purchased, in aggregate, around book value and likely to earn, in aggregate, about 13% on that book value?" The question answered itself.

Now, if you had read that article in 1979, you would have suffered--oh, how you would have suffered!--for about three years. I was no good then at forecasting the near-term movements of stock prices, and I'm no good now. I never have the faintest idea what the stock market is going to do in the next six months, or the next year, or the next two.

But I think it is very easy to see what is likely to happen over the long term. Ben Graham told us why: "Though the stock market functions as a voting machine in the short run, it acts as a weighing machine in the long run." Fear and greed play important roles when votes are being cast, but they don't register on the scale.

By my thinking, it was not hard to say that, over a 20-year period, a 9.5% bond wasn't going to do as well as this disguised bond called the Dow that you could buy below par--that's book value--and that was earning 13% on par.

Let me explain what I mean by that term I slipped in there, "disguised bond." A bond, as most of you know, comes with a certain maturity and with a string of little coupons. A 6% bond, for example, pays a 3% coupon every six months.

A stock, in contrast, is a financial instrument that has a claim on future distributions made by a given business, whether they are paid out as dividends or to repurchase stock or to settle up after sale or liquidation. These payments are in effect "coupons." The set of owners getting them will change as shareholders come and go. But the financial outcome for the business' owners as a whole will be determined by the size and timing of these coupons. Estimating those particulars is what investment analysis is all about.

Now, gauging the size of those "coupons" gets very difficult for individual stocks. It's easier, though, for groups of stocks. Back in 1978, as I mentioned, we had the Dow earning 13% on its average book value of \$850. The 13% could only be a benchmark, not a guarantee. Still, if you'd been willing then to invest for a period of time in stocks, you were in effect buying a bond--at prices that in 1979 seldom inched above par--with a principal value of \$891 and a quite possible 13% coupon on the principal.

How could that not be better than a 9.5% bond? From that starting point, stocks had to outperform bonds over the long term. That, incidentally, has been true during most of my business lifetime. But as Keynes would remind us, the superiority of stocks isn't inevitable. They own the advantage only when certain conditions prevail.

Let me show you another point about the herd mentality among pension funds--a point perhaps accentuated by a little self-interest on the part of those who oversee the funds. In the table below are four well-known companies--typical of many others I could have selected--and the expected returns on their pension fund assets that they used in calculating what charge (or credit) they should make annually for pensions.

Now, the higher the expectation rate that a company uses for pensions, the higher its reported earnings will be. That's just the way that pension accounting works--and I hope, for the sake of relative brevity, that you'll just take my word for it.

As the table below shows, expectations in 1975 were modest: 7% for Exxon, 6% for GE and GM, and under 5% for IBM. The oddity of these assumptions is that investors could then buy long-term government noncallable bonds that paid 8%. In other words, these companies could have loaded up their entire portfolio with 8% no-risk bonds, but they nevertheless used lower assumptions. By 1982, as you can see, they had moved up their assumptions a little bit, most to around 7%. But now you could buy long-term governments at 10.4%. You could in fact have locked in that yield for decades by buying so-called strips that guaranteed you a 10.4% reinvestment rate. In effect, your idiot nephew could have managed the fund and achieved returns far higher than the investment assumptions corporations were using.

Why in the world would a company be assuming 7.5% when it could get nearly 10.5% on government bonds? The answer is that rear-view mirror again: Investors who'd been

through the collapse of the Nifty Fifty in the early 1970s were still feeling the pain of the period and were out of date in their thinking about returns. They couldn't make the necessary mental adjustment.

Now fast-forward to 2000, when we had long-term governments at 5.4%. And what were the four companies saying in their 2000 annual reports about expectations for their pension funds? They were using assumptions of 9.5% and even 10%.

I'm a sporting type, and I would love to make a large bet with the chief financial officer of any one of those four companies, or with their actuaries or auditors, that over the next 15 years they will not average the rates they've postulated. Just look at the math, for one thing. A fund's portfolio is very likely to be one-third bonds, on which--assuming a conservative mix of issues with an appropriate range of maturities--the fund cannot today expect to earn much more than 5%. It's simple to see then that the fund will need to average more than 11% on the two-thirds that's in stocks to earn about 9.5% overall. That's a pretty heroic assumption, particularly given the substantial investment expenses that a typical fund incurs.

Heroic assumptions do wonders, however, for the bottom line. By embracing those expectation rates shown in the far right column, these companies report much higher earnings--much higher--than if they were using lower rates. And that's certainly not lost on the people who set the rates. The actuaries who have roles in this game know nothing special about future investment returns. What they do know, however, is that their clients desire rates that are high. And a happy client is a continuing client.

Are we talking big numbers here? Let's take a look at General Electric, the country's most valuable and most admired company. I'm a huge admirer myself. GE has run its pension fund extraordinarily well for decades, and its assumptions about returns are typical of the crowd. I use the company as an example simply because of its prominence.

If we may retreat to 1982 again, GE recorded a pension charge of \$570 million. That amount cost the company 20% of its pretax earnings. Last year GE recorded a \$1.74 billion pension credit. That was 9% of the company's pretax earnings. And it was 2 1/2 times the appliance division's profit of \$684 million. A \$1.74 billion credit is simply a lot of money. Reduce that pension assumption enough and you wipe out most of the credit.

GE's pension credit, and that of many another corporation, owes its existence to a rule of the Financial Accounting Standards Board that went into effect in 1987. From that point on, companies equipped with the right assumptions and getting the fund performance they needed could start crediting pension income to their income statements. Last year, according to Goldman Sachs, 35 companies in the S&P 500 got more than 10% of their earnings from pension credits, even as, in many cases, the value of their pension investments shrank.

Shifting Views

Expected pension fund returns

	1975	1982	2000
Exxon	7.0%	7.8%	9.5%
General Electric	6.0%	7.5%	9.5%
General Motors	6.0%	7.0%	10.0%
IBM	4.8%	5.5%	10.0%
<i>Yield on long-term government bonds</i>	8.0%	10.4%	5.5%

Unfortunately, the subject of pension assumptions, critically important though it is, almost never comes up in corporate board meetings. (I myself have been on 19 boards, and I've never heard a serious discussion of this subject.) And now, of course, the need for discussion is paramount because these assumptions that are being made, with all eyes looking backward at the glories of the 1990s, are so extreme. I invite you to ask the CFO of a company having a large defined-benefit pension fund what adjustment would need to be made to the company's earnings if its pension assumption was lowered to 6.5%. And then, if you want to be mean, ask what the company's assumptions were back in 1975 when both stocks and bonds had far higher prospective returns than they do now.

With 2001 annual reports soon to arrive, it will be interesting to see whether companies have reduced their assumptions about future pension returns. Considering how poor returns have been recently and the reprises that probably lie ahead, I think that anyone choosing not to lower assumptions--CEOs, auditors, and actuaries all--is risking litigation for misleading investors. And directors who don't question the optimism thus displayed simply won't be doing their job.

The tour we've taken through the last century proves that market irrationality of an extreme kind periodically erupts--and compellingly suggests that investors wanting to do well had better learn how to deal with the next outbreak. What's needed is an antidote, and in my opinion that's quantification. If you quantify, you won't necessarily rise to brilliance, but neither will you sink into craziness.

On a macro basis, quantification doesn't have to be complicated at all. Below is a chart, starting almost 80 years ago and really quite fundamental in what it says. The chart shows the market value of all publicly traded securities as a percentage of the country's business--that is, as a percentage of GNP. The ratio has certain limitations in telling you what you need to know. Still, it is probably the best single measure of where valuations stand at any given moment. And as you can see, nearly two years ago the ratio rose to an unprecedented level. That should have been a very strong warning signal.

For investors to gain wealth at a rate that exceeds the growth of U.S. business, the percentage relationship line on the chart must keep going up and up. If GNP is going to grow 5% a year and you want market values to go up 10%, then you need to have the line go straight off the top of the chart. That won't happen.

For me, the message of that chart is this: If the percentage relationship falls to the 70% or 80% area, buying stocks is likely to work very well for you. If the ratio approaches 200%--as it did in 1999 and a part of 2000--you are playing with fire. As you can see, the ratio was recently 133%.

Even so, that is a good-sized drop from when I was talking about the market in 1999. I ventured then that the American public should expect equity returns over the next decade or two (with dividends included and 2% inflation assumed) of perhaps 7%. That was a gross figure, not counting frictional costs, such as commissions and fees. Net, I thought returns might be 6%.

Today stock market "hamburgers," so to speak, are cheaper. The country's economy has grown and stocks are lower, which means that investors are getting more for their money. I would expect now to see long-term returns run somewhat higher, in the neighborhood of 7% after costs. Not bad at all--that is, unless you're still deriving your expectations from the 1990s.

Stock Options and Common Sense

By Warren E. Buffett, April 9, 2002

Opinion in The Washington Post

In 1994 seven slim accounting experts, all intelligent and experienced, unanimously decided that stock options granted to a company's employees were a corporate expense. Six fat CPAs, with similar credentials, unanimously declared these grants were no such thing.

Can it really be that girth, rather than intellect, determines one's accounting principles? Yes indeed, in this case. Obesity—of a monetary sort—almost certainly explained the split vote.

The seven proponents of expense recognition were the members of the Financial Accounting Standards Board, who earned \$313,000 annually. Their six adversaries were the managing partners of the (then) Big Six accounting firms, who were raking in multiples of the pay received by their public-interest brethren.

In this duel the Big Six were prodded by corporate CEOs, who fought ferociously to bury the huge and growing cost of options, in order to keep their reported earnings artificially high. And in the pre-Enron world of client-influenced accounting, their auditors were only too happy to lend their support.

The members of Congress decided to adjudicate the fight -- who, after all, could be better equipped to evaluate accounting standards? -- and then watched as corporate CEOs and their auditors stormed the Capitol. These forces simply blew away the opposition. By an 88-9 vote, U.S. senators made a number of their largest campaign contributors ecstatic by declaring option grants to be expense-free. Darwin could have foreseen this result: It was survival of the fattest.

The argument, it should be emphasized, was not about the use of options. Companies could then, as now, compensate employees in any manner they wished. They could use cash, cars, trips to Hawaii or options as rewards—whatever they felt would be most effective in motivating employees.

But those other forms of compensation had to be recorded as an expense, whereas options -- which were, and still are, awarded in wildly disproportionate amounts to the top dogs -- simply weren't counted.

The CEOs wanting to keep it that way put forth several arguments. One was that options are hard to value. That is nonsense: I've bought and sold options for 40 years and know their pricing to be highly sophisticated. It's far more problematic to calculate the useful life of machinery, a difficulty that makes the annual depreciation charge merely a guess. No one, however, argues that this imprecision does away with a company's need to record depreciation expense. Likewise, pension expense in corporate America is calculated under wildly varying assumptions, and CPAs regularly allow whatever assumption management picks.

Believe me, CEOs know what their option grants are worth. That's why they fight for them.

It's also argued that options should not lead to a corporate expense being recorded because they do not involve a cash outlay by the company. But neither do grants of restricted stock cause cash to be disbursed—and yet the value of such grants is routinely expensed.

Furthermore, there is a hidden, but very real, cash cost to a company when it issues options. If my company, Berkshire, were to give me a 10-year option on 1,000 shares of A stock at today's market price, it would be compensating me with an asset that has a cash value of at least \$20 million -- an amount the company could receive today if it sold a similar option in the marketplace. Giving an employee something that alternatively could be sold for hard cash has the same consequences for a company as giving him cash. Incidentally, the day an employee receives an option, he can engage in various market maneuvers that will deliver him immediate cash, even if the market price of his company's stock is below the option's exercise price.

Finally, those against expensing of options advance what I would call the "useful fairy-tale" argument. They say that because the country needs young, innovative companies, many of which are large issuers of options, it would harm the national interest to call option compensation an expense and thereby penalize the "earnings" of these budding enterprises.

Why, then, require cash compensation to be recorded as an expense given that it, too, penalizes earnings of young, promising companies? Indeed, why not have these companies issue options in place of cash for utility and rent payments—and then pretend that these expenses, as well, don't exist? Berkshire will be happy to receive options in lieu of cash for many of the goods and services that we sell corporate America.

At Berkshire we frequently buy companies that awarded options to their employees—and then we do away with the option program. When such a company is negotiating a sale to us, its management rightly expects us to proffer a new performance-based cash program to substitute for the option compensation being lost. These managers—and we—have no trouble calculating the cost to the company of the vanishing program. And in making the substitution, of course, we take on a substantial expense, even though the company that was acquired had never recorded a cost for its option program.

Companies tell their shareholders that options do more to attract, retain and motivate employees than does cash. I believe that's often true. These companies should keep issuing options. But they also should account for this expense just like any other.

A number of senators, led by Carl Levin and John McCain, are now revisiting the subject of properly accounting for options. They believe that American businesses, large or small, can stand honest reporting, and that after Enron-Andersen, no less will do.

I think it is normally unwise for Congress to meddle with accounting standards. In this case, though, Congress fathered an improper standard—and I cheer its return to the crime scene.

This time Congress should listen to the slim accountants. The logic behind their thinking is simple:

1. If options aren't a form of compensation, what are they?

2. If compensation isn't an expense, what is it?
3. And if expenses shouldn't go into the calculation of earnings, where in the world should they go?

Subject: Buffett speaks at Columbia Date: 5/10/02 2:00 AM
<http://boards.fool.com/Message.asp?mid=17197137>

On Thursday evening (5/9/02), Columbia Business School's Seminar on Value Investing welcomed Warren Buffett as the guest speaker. I was lucky enough to worm my way into it. Here are my notes. (I don't claim that everything is completely accurate, but I think I captured at least the proper meaning of everything).

5:55 pm – 5 minutes to go. The classroom looks like it was built to hold about 160 students and currently holds about 200 people – mainly students, with a few suit-and-tie types sprinkled in. There is some excitement, but not as much as the Berkshire annual meeting I went to 2 years ago. It was an interesting dynamic: In Omaha, everyone there made an effort to be there, which resulted in almost everyone knowing a good deal about Buffett and having some familiarity. In the classroom, there was a bit more curiosity, a “Do you think he'll have bodyguards?” kind of thing. I take my seat in the back and notice 3 cans of cherry coke lined up on the front table.

6:05 – Buffett walks in, picks up a can of cherry coke and holds it aloft. Everyone laughs. Bruce Greenwald (<http://www.amazon.com/exec/obidos/ASIN/0471381985/104-9675556-5361512>) acts as moderator. After a couple of class-related announcements, I get my first surprise – Walter Schloss is here, too. “If Warren Buffett can be thought of as the Babe Ruth of value investing, then Walter Schloss is the Ty Cobb and Satchel Paige combined.” He notes Schloss' longevity – 47 years of remarkable performance. [Prompted by Buffett later on, Schloss claims a 20.9% (pre-fees) annual return over that time period.]

Greenwald then notes how peculiar it feels to be responsible for introducing someone who clearly needs no introduction. He identifies Warren Buffett as “The Rose Blumkin of the investment world.” Buffett takes the microphone – “Testing, one billion, two billion”.

Some early remarks:

- Speaking on the longevity brought up with regard to Schloss, Buffett knows what he wants people to be saying at his funeral: “My God, he was old!”
- Notes that he has now been married for 50 years and 3 weeks and says that being married to Susie is “the only thing that's happened better than taking Graham's class.” He then points to Susie, who is sitting in the front row (surprise #2). [I think that Carol Loomis and Peter Buffett were also there, but I'm not positive.]

Next, the questions, which he leaves open to anything, whether business or personal related. As anyone who's ever seen Buffett speak can tell you, the questions were pretty standard. What makes the presentation interesting is the path that Buffett's answers take. Throughout this question and answer period, which lasts slightly over 2 hours, WEB is on his feet, leaning back onto a table, cherry coke at his side.

1. Options – We know you don't like them, but what about the companies you own?

WEB only knows of 2 companies that expense options (as is allowed under SFAS 123, but not practiced by many, for obvious reasons): Boeing and Winn-Dixie. He notes that a company (in Manhattan?) is currently voting on switching to an expensing convention. In most cases, options don't do a great job of providing the right incentives. Of all the employees in Berkshire Hathaway, Gen Re employees have made more, by far, from options in the last couple of years than anyone else in BRK. Looking at the dismal results of Gen Re indicates how capricious option rewards can be.

For BRK specifically, it doesn't make sense to give options to anyone. Anything that a division/subsidiary manager does to influence results is swamped by wiggles in the overall portfolio of businesses. Compensation arrangements at BRK are created and agreed upon in minutes – no consultants needed.

Across the spectrum, compensation plans are crazy.

WEB has an envelope with the name of his successor. (The first thing this note says is “Check my pulse again.”) It makes sense for him to have options – he would be responsible for the overall business. However, 2 critical features of these options would be:

- They would be granted with an exercise price equal to the greater of intrinsic value or market value.
- They would include a cost of capital effect so that the exercise price would be increasing each year.

As generally done, options are terrible. There's nothing inherently wrong with options. In the Buffett Limited Partnership, he had options: 25% of any returns in excess of 6%. However, he drew no salary and those options included a cost of capital.

2. Will the Wall Street Journal erode their moat with their recent cosmetic changes [moving a little towards USA Today]?

WSJ is an interesting case. 30 years ago, Dow Jones & Co. owned the world with regard to financial information. They had no competition to speak of. Most newspapers at that time defined their population by geography. The WSJ editor (name?) built the circulation from 50,000 to 1.5 million by defining population by interest. Their population had amazing demographics.

Over the past 30 years, financial information has been a growth industry. Dow Jones missed the boat. Their business was taken away by CNBC and Bloomberg. They got very self-satisfied. In 15 years, they went from #2 on Fortune's “Most Admired Companies” list to about #200.

He compared it to Classic Coke vs. New Coke. In the 1980's, Pepsi was conducting their “Pepsi Challenge” across America – and winning. People at Coke wouldn't admit it, but in 1985, Pepsi was driving them buggy. Americans will always go for a sweeter product in a taste test. Pepsi simply had [has] more calories than Coke and was [is] sweeter. So

Coke decided to add some sweetness/calories to compete. They tested New Coke across 300,000 people in every conceivable demographic slice before they brought it out. Pepsi capitalized on New Coke by calling the introduction of New Coke a product recall of Old Coke. Pepsi actually declared a holiday in their company on that day and took out ads the day before the formal New Coke release: “The other guy just blinked.”

As it turns out, the mystique of the Coke formula is great. Only 2 people know it, it's locked in a Sun Trust vault, blah blah blah. In reality, Coke can make Pepsi and Pepsi can make Coke. You can break down the formula. At one point, Pepsi was moving towards introducing a product called Savannah Cola, which was equal in formula to the Old Coke. The only problem they faced was that one of the ingredients from the formula was hard to obtain because almost the entire production was purchased by the Coca Cola company. Little by little, they were able to obtain this ingredient and were within 2 weeks of bringing it out when Coke relented and made Classic Coke.

[Talk about how important the “feelings” are with Coke. The associations one has when thinking about Coke. The fact that he could say RC Cola and no one would have much of a response, but he could say Coke and every single one of us would have some type of reaction. Pepsi consistently beat Coke in a blind challenge. New Coke consistently beat Old Coke in a blind challenge. Yet for some reason, people went ballistic when Coke changed the formula. That's how embedded the Coke idea is.]

It's like See's Candy. It's not that well known in the East, but 33 million people in California will all have a reaction to the See's name. When people in California put a piece of See's Candy in their mouth, they like it a lot. When you tell them that it's See's, they like it even more. It's the combination of all the thoughts that go into the experience.

The Coke CEO a couple of years ago got into trouble when he spoke of a vending machine that could vary prices depending on the weather, increasing prices in hot weather. [WEB: At least say it in a way like you're lowering prices in cold weather.] That brought a lot of bad feelings with it. When you're making \$0.01 per 8 oz. Serving and serving over 1 billion of those servings every single day, that's \$4 billion in earnings per year – all because of \$0.01 per serving. It's critical, huge to keep a favorable opinion in people's minds.

3. Concerning the comment about a nuclear attack made at the annual meeting – how is BRK insurance adapting?

BRK writing probably more terrorism insurance than anyone else. Amazingly it is almost all being sold with NCB (nuclear, chemical, and biological warfare) exclusion. A few policies have been sold without that exclusion, but not many. BRK can't sell very much insurance without NCB exclusion.

WTC is the largest workers' comp event in history – about \$1.8 billion in workers' compensation claims. The other day, BRK wrote time-sensitive earthquake insurance – it

only pays if the earthquake occurs between 6 am and 6 pm. The Northridge earthquake in 1994 would have been a huge workers comp event, but it occurred at 4:30 in the morning.

With regard to his prediction about a nuclear attack on a major American city: The chance of anything (NCB) occurring in the next year is very low. Over the next 10 years, that likelihood increases – there are more people in the world, more people hate us, and technology is improving. Over 50, that chance increases to a virtual certainty. In the early 1960's, only 2 countries had nuclear capabilities, and we damn near screwed it up. [Noted there was a good movie on the Cuban missile crisis a couple of years ago. I assume he means 13 Days, which I thought was good.] Now the chances are higher – there are way more people.

4. BRK has a history of striking quick deals and deals done over a handshake. Has there been a change based on the Enron-type financial deceptions?

No. Talked about how he closed the deal with Larson-Juhl, the custom frames maker. Got called up, talked on the phone for 20 minutes, heard the financials and heard the price, flew the guy to Omaha. “I've never seen the Company. I hope it's there.” [This was actually pretty funny as WEB did an impression of some scam artist: “Hey, what numbers should we report to Warren this month? Hahaha”] It's a great business – price is not a factor in custom frame purchasing. There are a ton of small framing businesses, dozens in Omaha alone. LJ supplies them all, usually delivering the product within a day. [Is this right? For a custom frame?]

“I could give you \$100 million (I'm not going to do that) to build a competing organization. You couldn't do it. It won't double in size, but it's a great business. I can see the durable advantage of that business. You can't mess it up.”

We just don't spend a lot of time researching deals. It's like teaching a class on the Efficient Markets Theory. You walk into class on the first day and say, “Everything's priced right.” Then what? What else do you need to say? You just don't need that much time. If it's not obvious right away, it won't be obvious with a year's worth of due diligence. (Used Chrysler and Ford as examples.)

Somehow moved into a Snickers and Wrigley's example. Snickers has been the top selling candy bar for 40 years and probably will be in 10 years. If you were chewing spearmint gum 10 years ago, you're still chewing it today. Those are great businesses. If you walked into a store for a Snickers bar and the guy behind the counter offered you a chocolate bar with the same taste and same gooeyness for 5 cents less, but it was “Joe's Chocolate Bar”, you wouldn't buy it. Due diligence – whether or not they have a bad lease or their bad debt reserve is too low – doesn't matter. It's about the durable advantage.

5. Do you see value in tech stocks today? Is there ever value? Where would BRK invest in tech?

If we could look out 5-10 years and see durable advantage and likelihood of high incremental ROE, that would be the place. We're not religious about not investing in tech stocks. ("In fact, I don't even know if there are religions against investing in tech stocks.") "There's no reason to look for a needle in a haystack if the haystack is made out of gold."

You could have bought the pharmaceutical industry in 1993 with a high degree of conviction. Maybe you couldn't identify the one or two winners, but the industry had marvelous economics and you know there wasn't going to be some new kid on the block to just completely up-end Merck or Schering Plough.

6. Can you speak about investments you made that didn't work out?

Errors tend to be of omission, not commission. Not necessarily Intel or Microsoft, but those situations where he knew the business and did nothing. "Thumb sucking". Often happens when he is buying a stock at \$x and it goes to \$x 1/8. He goes into paralysis. Fannie Mae is one example. Errors of omission have cost BRK billions and billions (20 – 30 billion).

BRK almost lost a lot on US Airways. "As the ink was drying on the check, they started losing and losing money." Salomon investment. 9/11 insurance – not the fact it was a catastrophe, but that the terrorism insurance wasn't built into the premiums.

The biggest mistake in management is not recognizing that very smart people will do dumb things – without trying to. [References Lowenstein book on LTCM.] Once an organization starts to gain momentum, it's impossible to stop them. Often happens with acquisitions. If the hurdle rate is 84.3%, the deal will be projected to return 84.4%. If the CEO wants it, it'll happen.

7. As you look at the entrepreneurs of the firms you've bought, what do you look for? What advice do you have for potential entrepreneurs?

We look for passion. WEB talked about Al Ueltschi for a while.

Sit down with them and find out if they love the business or love the money. We've never bought a business from a financial operative. We've never participated in an auction. If a guy auctions his business, we don't want him/it. There's nothing wrong with loving money, it's just not for us.

8. As the best professional in the industry, are you still getting better?

[At this point, Greenwald paraphrases the question as, "Do you still have the mental capacity to do the job?" I'm having flashbacks to Mycroft.]

Investing is great because you're always building a database. Every year you're adding a little bit more (new industries) and there's not that much leakage on the other end. GEICO purchase was a result of his existing database.

“I understand underwear”, so Fruit of the Loom wasn't a tough decision.

Everything is cumulative in investing. When he hears something today, it fits in some way into a model built by years of experience.

[Side note: This is an integral part of the whole “no due diligence” phenomenon. They don't necessarily perform due diligence prior to doing a deal precisely because they are performing an abstract version of due diligence on companies and industries every day by adding to their database.]

9. Asbestos payouts seem like they're being accelerated. Comments?

The claims acceleration has tended to be those companies that are in bankruptcy. For companies not in bankruptcy, claims rate hasn't really changed.

BRK has some asbestos claims out there (a lot from Gen Re) that arose under the normal course of business, and a lot of claims resulting from retro insurance. The deals rely upon timing of payments. BRK is conservative both in the premium demanded and the accounting for the deferred charges. Most asbestos claims are from policies where there is a finite limit.

Overall, payment rate is somewhat slower than anticipated. The results have been perfectly satisfactory so far. [The retro deals, I assume.]

10. What do you see in the underwear business that other people didn't and still don't in Sara Lee (owner of Hanes)? What EBITDA do you see for FoL? What stocks are cheap today?

[I'm cringing at the expected answer to the EBITDA and I expect a stonewall to the stock tips.]

Basically, EBITDA is worthless.

As far as underwear goes, Hanes and FoL own the market. There are higher-end makes (Calvin Klein, Jockey), but those two control the mass market. Sara Lee (Hanes) pursued an asset-light strategy. [Note: Enron pursued an asset-light strategy – a desire to take assets off balance sheet by removing ownership. Not that I'm really comparing the two.] We control the assets in place at FoL. You can't really buy another version of FoL because if you buy Hanes, you're buying the rest of Sara Lee's portfolio.

Wouldn't be surprised to see FoL earn \$130-140 million pre-tax.

Again, we hate EBITDA. Depreciation is the worst kind of expense. (May have even called it despicable.) It's reverse float.

As far as what stocks are cheap, that sounds like a very theoretical question. [Laughs] That's one question I won't answer. Talks about how they keep their activities private.

As far as what companies are in the picture, WEB will never buy a glamorous stock. Money doesn't know where it came from. There's no sense paying more money for a glamorous company if you're getting the same amount of money, but paying more for it. It's the same money that you could have gotten from a bland company for a lower cost.

11. General question about the attractiveness of distressed debt.

There's nothing intrinsically good or bad about distressed debt.

FoL was bought at about \$0.50 on the dollar. It was a very unusual kind of debt because it kept paying interest during the bankruptcy proceeding, so BRK got a lot of cash from it.

On the Finova transaction: They bought it before it was going to go bankrupt, but knew it was going to. The key there was to evaluate their receivables portfolio (about \$14 billion?). WEB estimated a worst-case scenario for the receivables and used that to determine the purchase price.

Comparing the two, Finova hinged on an evaluation of the receivables portfolio. Fruit of the Loom hinged on an evaluation of the brand.

Distressed debt requires more expertise than common stock. There is money to be made on some issues. [At this point, WEB and Schloss start rehashing an old railroad bankruptcy where apparently everyone got rich. Phenomenal level of detail remembered by both of these guys.]

We have never bought a junk bond when it was initially offered because Wall St. has a special sales push. We buy them later when they get in trouble.

12. What's your take on companies re-incorporating offshore for tax reasons?

I don't like it. I don't like individuals who made the money here living offshore [without paying taxes]. One guy tried to get himself declared an ambassador so he could live in the US full-time and still be a foreign citizen. [I think I got that right.] I'd like to think that we (BRK) wouldn't take that opportunity if presented, in the same way I'd like to think I wouldn't walk into a bank and take \$1 million if it was just sitting there. But you never know until it happens.

All of the big accounting firms have offered tax strategies, but we're not interested. We have a simple tax return.

On tax rates: Imagine that 24 hours before you're born, you and an effective twin (same DNA, etc.) will be born, one in the U.S. and one in Bangladesh. What percentage of your future income would you pledge to be born in the US? Most likely a pretty high amount. The US offers an extraordinary level of benefits.

13. Pro forma earnings are no good. But how can you look at a company like BRK with a 9/11 event without considering pro forma earnings?

You need to look at the long-term results, but you can't ignore the fact that management missed it (9/11 event). Look at the company's normalized earning power.

Look at this most recent quarter. One of the most benign quarters in insurance – nothing happened. No “cats” anywhere. You don't see insurance companies reporting good results and saying “Excluding the abnormally low level of claims, we actually would have reported a loss in this quarter”.

There are 2 keys to valuing BRK:

- How much cash will the current operating companies be kicking off over the next 10 years?

- What interesting things will be done with that cash in the next 10 years?

[I love it – WEB speaks of real options.]

14. On BRK investing abroad

We'd love to find businesses overseas similar to those we own. We have not had luck to date. 2 problems:

- Of the good businesses, most are in the US, so there's just not that many abroad.

- BRK is not as well-known overseas, so it's harder for them to get unsolicited calls.

Mentioned that 80% of Coke's earnings are from outside the US.

We own 15-20 stocks right now. 3 of those are entirely outside of the US. We'd be delighted to own any of those 3 in their entirety at the prices we paid for the piece we do own.

One issue is that reporting requirements are tough. In the US, you must disclose upon obtaining 5% of a firm. If you're an insurance company, you must disclose upon obtaining 10% of a firm – if you obtain between 5-10%, you can wait to disclose until year-end. In other countries, that threshold is lower. In the UK, 3% ownership requires disclosure, so our moves are limited.

15. In an investment partnership, how does lack of managerial control (over the firms you invest in) influence decisions)?

We have very little influence anyway, even as a director, so it is not a big deal. Very rarely can you change the course as a director and you can't attempt to very often. Someone invited to parties will find he is no longer invited if he is constantly belching at these parties. [<- Terrible paraphrase. More or less the same quote as he used at the annual meeting 2 years ago.]

Even with 100% owned companies, we accept decisions that we would not have made ourselves. In the long run, they probably balance out to be at least as good as what we would have done. More importantly, it allows the managers to treat the companies as "their" businesses. Do you think Al Ueltschi, who owns \$1 billion in BRK stock, is going to want to keep running his business if I'm over his shoulder making decisions?

16. Why don't you sell things when they hit extremely high prices?

We're not selling a See's Candy for any amount of money, even if someone offered us 3-4 times its value. Why? It's a quirk of ours. We don't get many opportunities to form associations with good people. When we forge an association, we don't like to ruin it by turning it over to someone else. Small equity pieces are a different matter.

With Buffett Limited Partnership, it was a different matter. It was WEB's job to make the most money possible. Now it's his job to run a business in an agreeable way that hopes to perform well. It's no longer the goal to wring every last dollar out of every situation.

Also talked of the benefits of having a reputation for not selling. [Same masterpiece discussion as recorded elsewhere.] When someone builds a business, they're building their own masterpiece. If we purchase that painting, we're offering to hang it, not buy it and quickly sell it to someone else. I tell the prospective seller they can choose to hand it over to BRK, where I will never tell them to add more blue paint or less red paint, but simply hang it. Consider BRK the Metropolitan Museum. Your alternative is to hang it in a porn shop. [I must be delirious. Did he really say this or am I just imagining this whole conversation?]

17. Interest rates are extremely low. What's the lowest benchmark you set?

Good question. I want 13% pre-tax. Over the last couple of years, we made about 8-10 acquisitions, and I think they'll work out to 13% pre-tax. There have been times where the interest rate was 20%, and 13% would be unacceptable. But the opposite doesn't hold. I can't go arbitrarily low with a required return. I'd rather have short-term returns of 1 ¾% than buy stocks or companies returning 8-9% because I'm going to be holding on to those forever. Those returns are fine now, but enough acquisitions like that and you end up with a very average business.

So, in this low-interest environment, we have a lot of money in bonds right now. Either we expect to get more good opportunities or the environment will change.

By the way, the environment will change.

The financial markets have a long history of doing crazy things. You are all young, you'll see those things repeated. [Tells a story about how he has a very old newspaper clipping of a brewer/investor who drowned himself in a vat of hot beer because of troubles arising from excessive margin use.] Those things will happen again. You'll have a lot of opportunities to get rich, even if the environment doesn't look like it right now.

18. Describe the H&R Block competitive advantage.

They had a disappointing quarter several years ago, but their franchise was not impaired. The market drove the price down.

Everyone knows H&R. You think of tax preparation, you think of H&R. How many people here can name the #2. Not many. [Apparently Cendant owns it.] How much would it take to topple them? The only thing to kill it would be a radical change in the tax laws (e.g., a move to a consumption tax).

We were willing to buy the entire firm at 75% more than what we paid for the piece we bought. [I think he said large insider ownership prevented it, but I'm not sure.]

19. Greenwald: Last question – We moved away from using the first edition of Security Analysis. What are we missing by not using that?

The historical perspective. People will continue to do dumb things.

“History may not repeat itself, but it rhymes.” (Twain?)

The first edition is good for a sense of history.

[At this point, he kind of wrapped up.] There are 3 things that are key:

1. Margin of safety (Finova deal) is absolutely essential.
2. Look at a stock as a business. “I spent 8 years buying stock without thinking of it that way.” [“I started at age 11 – I don't know why I started so late.”]
3. Develop the proper attitude towards the market. It is there to serve you, not instruct you. Too many people are instructed by the market.

Who Really Cooks the Books?

By Warren E. Buffett
Published: July 24, 2002

There is a crisis of confidence today about corporate earnings reports and the credibility of chief executives. And it's justified.

For many years, I've had little confidence in the earnings numbers reported by most corporations. I'm not talking about Enron and WorldCom -- examples of outright crookedness. Rather, I am referring to the legal, but improper, accounting methods used by chief executives to inflate reported earnings.

The most flagrant deceptions have occurred in stock-option accounting and in assumptions about pension-fund returns. The aggregate misrepresentation in these two areas dwarfs the lies of Enron and WorldCom.

In calculating the pension costs that directly affect their earnings, companies in the Standard & Poor's index of 500 stocks are today using assumptions about investment return rates that go as high as 11 percent. The rate chosen is important: in many cases, an upward change of a single percentage point will increase the annual earnings a company reports by more than \$100 million. It's no surprise, therefore, that many chief executives opt for assumptions that are wildly optimistic, even as their pension assets perform miserably. These C.E.O.'s simply ignore this unpleasant reality and their obliging actuaries and auditors bless whatever rate the company selects. How convenient: Client A, using a 6.5 percent rate, receives a clean audit opinion -- and so does client B, which opts for an 11 percent rate.

All that is bad, but the far greater sin has been option accounting. Options are a huge cost for many corporations and a huge benefit to executives. No wonder, then, that they have fought ferociously to avoid making a charge against their earnings. Without blushing, almost all C.E.O.'s have told their shareholders that options are cost-free.

For these C.E.O.'s I have a proposition: Berkshire Hathaway will sell you insurance, carpeting or any of our other products in exchange for options identical to those you grant yourselves. It'll all be cash-free. But do you really think your corporation will not have incurred a cost when you hand over the options in exchange for the carpeting? Or do you really think that placing a value on the option is just too difficult to do, one of your other excuses for not expensing them? If these are the opinions you honestly hold, call me collect. We can do business.

Chief executives frequently claim that options have no cost because their issuance is cashless. But when they do so, they ignore the fact that many C.E.O.'s regularly include pension income in their earnings, though this item doesn't deliver a dime to their companies. They also ignore another reality: When corporations grant restricted stock to their executives these grants are routinely, and properly, expensed, even though no cash changes hands.

When a company gives something of value to its employees in return for their services, it is clearly a compensation expense. And if expenses don't belong in the earnings statement, where in the world do they belong?

To clean up their act on these fronts, C.E.O.'s don't need "independent" directors, oversight committees or auditors absolutely free of conflicts of interest. They simply need to do what's right. As Alan Greenspan forcefully declared last week, the attitudes and actions of C.E.O.'s are what determine corporate conduct.

Indeed, actions by Congress and the Securities and Exchange Commission have the potential of creating a smoke screen that will prevent real accounting reform. The Senate itself is the major reason corporations have been able to duck option expensing. On May 3, 1994, the Senate, led by Senator Joseph Lieberman, pushed the Financial Accounting Standards Board and Arthur Levitt, then chairman of the S.E.C., into backing down from mandating that options be expensed. Mr. Levitt has said that he regrets this retreat more than any other move he made during his tenure as chairman. Unfortunately, current S.E.C. leadership seems uninterested in correcting this matter.

I don't believe in Congress setting accounting rules. But the Senate opened the floodgates in 1994 to an anything-goes reporting system, and it should close them now. Rather than holding hearings and fulminating, why doesn't the Senate just free the standards board by rescinding its 1994 action?

C.E.O.'s want to be respected and believed. They will be -- and should be -- only when they deserve to be. They should quit talking about some bad apples and reflect instead on their own behavior.

Recently, a few C.E.O.'s have stepped forward to adopt honest accounting. But most continue to spend their shareholders' money, directly or through trade associations, to lobby against real reform. They talk principle, but, for most, their motive is pocketbook.

For their shareholders' interest, and for the country's, C.E.O.'s should tell their accounting departments today to quit recording illusory pension-fund income and start recording all compensation costs. They don't need studies or new rules to do that. They just need to act.

Berkshire Hathaway and Junk Bonds

The company has been making 'sensible investments' in a few junk bonds and loans.

FORTUNE

Monday, March 3, 2003

By Warren Buffett

In a section of his upcoming annual letter to shareholders separate from the derivatives discussion, Buffett talks about stocks, cash, and the lure of junk bonds. A list of Berkshire's major common stock investments (those with a market value of more than \$500 million at the end of 2002) will be posted on March 8, on www.berkshirehathaway.com.

Last year we were ... able to make sensible investments in a few "junk" bonds and loans. Overall, our commitments in this sector sextupled, reaching \$8.3 billion by year-end.

Investing in junk bonds and investing in stocks are alike in certain ways: Both activities require us to make a price-value calculation and also to scan hundreds of securities to find the very few that have attractive reward/risk ratios. But there are important differences between the two disciplines as well. In stocks, we expect every commitment to work out well because we concentrate on conservatively financed businesses with strong competitive strengths, run by able and honest people. If we buy into these companies at sensible prices, losses should be rare. Indeed, during the 38 years we have run the company's affairs, gains from the equities we manage at Berkshire (that is, excluding those managed at General Re/Cologne and GEICO) have exceeded losses by a ratio of about 100 to one.

Purchasing junk bonds, we are dealing with enterprises that are far more marginal. These businesses are usually overloaded with debt and often operate in industries characterized by low returns on capital. Additionally, the quality of management is sometimes questionable. Management may even have interests that are directly counter to those of debtholders. Therefore, we expect that we will have occasional large losses in junk issues. So far, however, we have done reasonably well in this field.

Buffett on Investing in Stocks Today

'Unfortunately, the hangover from [the market bubble] may prove to be proportional to the binge.'

FORTUNE

Monday, March 3, 2003

By Warren Buffett

In a section of his upcoming annual letter to shareholders separate from the derivatives discussion, Buffett talks about stocks, cash, and the lure of junk bonds. A list of Berkshire's major common stock investments (those with a market value of more than \$500 million at the end of 2002) will be posted on March 8, on www.berkshirehathaway.com.

We continue to do little in equities. Charlie and I are increasingly comfortable with our holdings in Berkshire's major investees because most of them have increased their earnings while their valuations have decreased. But we are not inclined to add to them. Though these enterprises have good prospects, we don't yet believe their shares are undervalued.

In our view, the same conclusion fits stocks generally. Despite three years of falling prices, which have significantly improved the attractiveness of common stocks, we still find very few that even mildly interest us. That dismal fact is testimony to the insanity of valuations reached during The Great Bubble. Unfortunately, the hangover may prove to be proportional to the binge.

The aversion to equities that Charlie and I exhibit today is far from congenital. We love owning common stocks--if they can be purchased at attractive prices. In my 61 years of investing, 50 or so years have offered that kind of opportunity. There will be years like that again. Unless, however, we see a very high probability of at least 10% pretax returns (which translate to 6% to 7% after corporate tax), we will sit on the sidelines. With short-term money returning less than 1% after-tax, sitting it out is no fun. But occasionally successful investing requires inactivity.

WHAT WORRIES WARREN

Avoiding a 'Mega-Catastrophe'

Derivatives are financial weapons of mass destruction. The dangers are now latent--but they could be lethal.

FORTUNE

Monday, March 3, 2003

By Warren Buffett

Warren Buffett has been writing annual letters to Berkshire Hathaway shareholders since 1965. In the early years he followed a conventional format, but after serving on the SEC Advisory Board for Corporate Disclosure in 1976, he decided--as he puts it--to "get serious" about communicating with his shareholders.

He made another important decision in 1977: to recruit FORTUNE's Carol Loomis, a friend and long-term Berkshire shareholder, to be his editor. Buffett says she has been invaluable--"very friendly, very helpful, and very tough."

In this year's letter to shareholders Buffett tells of the difficulties of exiting the derivatives business he inherited in his 1998 purchase of General Re. He also concludes that the explosion in derivatives contracts may have created serious systemic risks. Loomis suggested to Buffett that he publish his section on derivatives in FORTUNE, and what follows is excerpted from the 2002 Berkshire Hathaway annual report, which will appear at berkshirehathaway.com on March 8.

Charlie [Munger, Buffett's partner in managing Berkshire Hathaway] and I are of one mind in how we feel about derivatives and the trading activities that go with them: We view them as time bombs, both for the parties that deal in them and the economic system.

Having delivered that thought, which I'll get back to, let me retreat to explaining derivatives, though the explanation must be general because the word covers an extraordinarily wide range of financial contracts. Essentially, these instruments call for money to change hands at some future date, with the amount to be determined by one or more reference items, such as interest rates, stock prices, or currency values. If, for example, you are either long or short an S&P 500 futures contract, you are a party to a very simple derivatives transaction--with your gain or loss derived from movements in the index. Derivatives contracts are of varying duration (running sometimes to 20 or more years), and their value is often tied to several variables.

Unless derivatives contracts are collateralized or guaranteed, their ultimate value also depends on the creditworthiness of the counterparties to them. In the meantime, though, before a contract is settled, the counterparties record profits and losses--often huge in amount--in their current earnings statements without so much as a penny changing hands.

The range of derivatives contracts is limited only by the imagination of man (or sometimes, so it seems, madmen). At Enron, for example, newsprint and broadband derivatives, due to be settled many years in the future, were put on the books. Or say you want to write a contract speculating on the number of twins to be born in Nebraska in 2020. No problem--at a price, you will easily find an obliging counterparty.

When we purchased Gen Re, it came with General Re Securities, a derivatives dealer that Charlie and I didn't want, judging it to be dangerous. We failed in our attempts to sell the operation, however, and are now terminating it.

But closing down a derivatives business is easier said than done. It will be a great many years before we are totally out of this operation (though we reduce our exposure daily). In fact, the reinsurance and derivatives businesses are similar: Like Hell, both are easy to enter and almost impossible to exit. In either industry, once you write a contract--which may require a large payment decades later--you are usually stuck with it. True, there are methods by which the risk can be laid off with others. But most strategies of that kind leave you with residual liability.

Another commonality of reinsurance and derivatives is that both generate reported earnings that are often wildly overstated. That's true because today's earnings are in a significant way based on estimates whose inaccuracy may not be exposed for many years.

Errors will usually be honest, reflecting only the human tendency to take an optimistic view of one's commitments. But the parties to derivatives also have enormous incentives to cheat in accounting for them. Those who trade derivatives are usually paid (in whole or part) on "earnings" calculated by mark-to-market accounting. But often there is no real market (think about our contract involving twins) and "mark-to-model" is utilized. This substitution can bring on large-scale mischief. As a general rule, contracts involving multiple reference items and distant settlement dates increase the opportunities for counterparties to use fanciful assumptions. In the twins scenario, for example, the two parties to the contract might well use differing models allowing both to show substantial profits for many years. In extreme cases, mark-to-model degenerates into what I would call mark-to-myth.

Of course, both internal and outside auditors review the numbers, but that's no easy job. For example, General Re Securities at year-end (after ten months of winding down its operation) had 14,384 contracts outstanding, involving 672 counterparties around the world. Each contract had a plus or minus value derived from one or more reference items, including some of mind-boggling complexity. Valuing a portfolio like that, expert auditors could easily and honestly have widely varying opinions.

The valuation problem is far from academic: In recent years some huge-scale frauds and near-fraud have been facilitated by derivatives trades. In the energy and electric utility sectors, for example, companies used derivatives and trading activities to report great "earnings"--until the roof fell in when they actually tried to convert the derivatives-related receivables on their balance sheets into cash. "Mark-to-market" then turned out to be truly "mark-to-myth."

I can assure you that the marking errors in the derivatives business have not been symmetrical. Almost invariably, they have favored either the trader who was eyeing a multimillion-dollar bonus or the CEO who wanted to report impressive "earnings" (or both). The bonuses were paid, and the CEO profited from his options. Only much later did shareholders learn that the reported earnings were a sham.

Another problem about derivatives is that they can exacerbate trouble that a corporation has run into for completely unrelated reasons. This pile-on effect occurs because many derivatives contracts

require that a company suffering a credit downgrade immediately supply collateral to counterparties. Imagine, then, that a company is downgraded because of general adversity and that its derivatives instantly kick in with their requirement, imposing an unexpected and enormous demand for cash collateral on the company. The need to meet this demand can then throw the company into a liquidity crisis that may, in some cases, trigger still more downgrades. It all becomes a spiral that can lead to a corporate meltdown.

Derivatives also create a daisy-chain risk that is akin to the risk run by insurers or reinsurers that lay off much of their business with others. In both cases, huge receivables from many counterparties tend to build up over time. (At Gen Re Securities, we still have \$6.5 billion of receivables, though we've been in a liquidation mode for nearly a year.) A participant may see himself as prudent, believing his large credit exposures to be diversified and therefore not dangerous. Under certain circumstances, though, an exogenous event that causes the receivable from Company A to go bad will also affect those from Companies B through Z. History teaches us that a crisis often causes problems to correlate in a manner undreamed of in more tranquil times.

In banking, the recognition of a "linkage" problem was one of the reasons for the formation of the Federal Reserve System. Before the Fed was established, the failure of weak banks would sometimes put sudden and unanticipated liquidity demands on previously strong banks, causing them to fail in turn. The Fed now insulates the strong from the troubles of the weak. But there is no central bank assigned to the job of preventing the dominoes toppling in insurance or derivatives. In these industries, firms that are fundamentally solid can become troubled simply because of the travails of other firms further down the chain. When a "chain reaction" threat exists within an industry, it pays to minimize links of any kind. That's how we conduct our reinsurance business, and it's one reason we are exiting derivatives.

Many people argue that derivatives reduce systemic problems, in that participants who can't bear certain risks are able to transfer them to stronger hands. These people believe that derivatives act to stabilize the economy, facilitate trade, and eliminate bumps for individual participants. And, on a micro level, what they say is often true. Indeed, at Berkshire, I sometimes engage in large-scale derivatives transactions in order to facilitate certain investment strategies.

Charlie and I believe, however, that the macro picture is dangerous and getting more so. Large amounts of risk, particularly credit risk, have become concentrated in the hands of relatively few derivatives dealers, who in addition trade extensively with one another. The troubles of one could quickly infect the others. On top of that, these dealers are owed huge amounts by nondealer counterparties. Some of these counterparties, as I've mentioned, are linked in ways that could cause them to contemporaneously run into a problem because of a single event (such as the implosion of the telecom industry or the precipitous decline in the value of merchant power projects). Linkage, when it suddenly surfaces, can trigger serious systemic problems.

Indeed, in 1998, the leveraged and derivatives-heavy activities of a single hedge fund, Long-Term Capital Management, caused the Federal Reserve anxieties so severe that it hastily orchestrated a rescue effort. In later congressional testimony, Fed officials acknowledged that, had they not intervened, the outstanding trades of LTCM--a firm unknown to the general public and employing only a few hundred people--could well have posed a serious threat to the stability of American markets. In other words, the Fed acted because its leaders were fearful of what might have

happened to other financial institutions had the LTCM domino toppled. And this affair, though it paralyzed many parts of the fixed-income market for weeks, was far from a worst-case scenario.

One of the derivatives instruments that LTCM used was total-return swaps, contracts that facilitate 100% leverage in various markets, including stocks. For example, Party A to a contract, usually a bank, puts up all of the money for the purchase of a stock, while Party B, without putting up any capital, agrees that at a future date it will receive any gain or pay any loss that the bank realizes.

Total-return swaps of this type make a joke of margin requirements. Beyond that, other types of derivatives severely curtail the ability of regulators to curb leverage and generally get their arms around the risk profiles of banks, insurers, and other financial institutions. Similarly, even experienced investors and analysts encounter major problems in analyzing the financial condition of firms that are heavily involved with derivatives contracts. When Charlie and I finish reading the long footnotes detailing the derivatives activities of major banks, the only thing we understand is that we don't understand how much risk the institution is running.

The derivatives genie is now well out of the bottle, and these instruments will almost certainly multiply in variety and number until some event makes their toxicity clear. Knowledge of how dangerous they are has already permeated the electricity and gas businesses, in which the eruption of major troubles caused the use of derivatives to diminish dramatically. Elsewhere, however, the derivatives business continues to expand unchecked. Central banks and governments have so far found no effective way to control, or even monitor, the risks posed by these contracts.

Charlie and I believe Berkshire should be a fortress of financial strength--for the sake of our owners, creditors, policyholders, and employees. We try to be alert to any sort of mega-catastrophe risk, and that posture may make us unduly apprehensive about the burgeoning quantities of long-term derivatives contracts and the massive amount of uncollateralized receivables that are growing alongside. In our view, however, derivatives are financial weapons of mass destruction, carrying dangers that, while now latent, are potentially lethal.

Dividend Voodoo

By Warren Buffett

Tuesday, May 20, 2003; Page A19

The annual Forbes 400 lists prove that -- with occasional blips -- the rich do indeed get richer. Nonetheless, the Senate voted last week to supply major aid to the rich in their pursuit of even greater wealth.

The Senate decided that the dividends an individual receives should be 50 percent free of tax in 2003, 100 percent tax-free in 2004 through 2006 and then again fully taxable in 2007. The mental flexibility the Senate demonstrated in crafting these zigzags is breathtaking. What it has put in motion, though, is clear: If enacted, these changes would further tilt the tax scales toward the rich.

Let me, as a member of that non-endangered species, give you an example of how the scales are currently balanced. The taxes I pay to the federal government, including the payroll tax that is paid for me by my employer, Berkshire Hathaway, are roughly the same proportion of my income -- about 30 percent -- as that paid by the receptionist in our office. My case is not atypical -- my earnings, like those of many rich people, are a mix of capital gains and ordinary income -- nor is it affected by tax shelters (I've never used any). As it works out, I pay a somewhat higher rate for my combination of salary, investment and capital gain income than our receptionist does. But she pays a far higher portion of her income in payroll taxes than I do.

She's not complaining: Both of us know we were lucky to be born in America. But I was luckier in that I came wired at birth with a talent for capital allocation -- a valuable ability to have had in this country during the past half-century. Credit America for most of this value, not me. If the receptionist and I had both been born in, say, Bangladesh, the story would have been far different. There, the market value of our respective talents would not have varied greatly.

Now the Senate says that dividends should be tax-free to recipients. Suppose this measure goes through and the directors of Berkshire Hathaway (which does not now pay a dividend) therefore decide to pay \$1 billion in dividends next year. Owning 31 percent of Berkshire, I would receive \$310 million in additional income, owe not another dime in federal tax, and see my tax rate plunge to 3 percent.

And our receptionist? She'd still be paying about 30 percent, which means she would be contributing about 10 times the proportion of her income that I would to such government pursuits as fighting terrorism, waging wars and supporting the elderly. Let me repeat the point: Her overall federal tax rate would be 10 times what my rate would be.

When I was young, President Kennedy asked Americans to "pay any price, bear any burden" for our country. Against that challenge, the 3 percent overall federal tax rate I would pay -- if a Berkshire dividend were to be tax-free -- seems a bit light.

Administration officials say that the \$310 million suddenly added to my wallet would stimulate the economy because I would invest it and thereby create jobs. But they conveniently forget that if Berkshire kept the money, it would invest that same amount, creating jobs as well.

The Senate's plan invites corporations -- indeed, virtually commands them -- to contort their behavior in a major way. Were the plan to be enacted, shareholders would logically respond by asking the corporations they own to pay no more dividends in 2003, when they would be partially taxed, but instead to pay the skipped amounts in 2004, when they'd be tax-free. Similarly, in 2006, the last year of the plan, companies should pay double their normal dividend and then avoid dividends altogether in 2007.

Overall, it's hard to conceive of anything sillier than the schedule the Senate has laid out. Indeed, the first President Bush had a name for such activities: "voodoo economics." The manipulation of enactment and sunset dates of tax changes is Enron-style accounting, and a Congress that has recently demanded honest corporate numbers should now look hard at its own practices.

Proponents of cutting tax rates on dividends argue that the move will stimulate the economy. A large amount of stimulus, of course, should already be on the way from the huge and growing deficit the government is now running. I have no strong views on whether more action on this front is warranted. But if it is, don't cut the taxes of people with huge portfolios of stocks held directly. (Small investors owning stock held through 401(k)s are already tax-favored.) Instead, give reductions to those who both need and will spend the money gained. Enact a Social Security tax "holiday" or give a flat-sum rebate to people with low incomes. Putting \$1,000 in the pockets of 310,000 families with urgent needs is going to provide far more stimulus to the economy than putting the same \$310 million in my pockets.

When you listen to tax-cut rhetoric, remember that giving one class of taxpayer a "break" requires -- now or down the line -- that an equivalent burden be imposed on other parties. In other words, if I get a break, someone else pays. Government can't deliver a free lunch to the country as a whole. It can, however, determine who pays for lunch. And last week the Senate handed the bill to the wrong party.

Supporters of making dividends tax-free like to paint critics as promoters of class warfare. The fact is, however, that their proposal promotes class welfare. For my class.

The writer is chief executive officer of Berkshire Hathaway Inc., a diversified holding company, and a director of The Washington Post Co., which has an investment in Berkshire Hathaway.

Notes on meeting with Warren Buffett on October 10, 2003

On living a successful life:

Look among your classmates/colleagues and ask yourself “If I could purchase 10% of anyone’s income, who would I choose?.....If I could short 10% of someone’s income, who would it be?”

Ben Graham used this exercise quite extensively.

Ask yourself the basis for your selection and write down on a piece of paper the qualities for each of these individuals – Understand that these are not God given qualities...they are based on determination and habit “Chains of habit are too light to be felt until they are too heavy to be broken”. You don’t want to wait until you’re 50 or 60.

Ask yourself, would you be uncomfortable with your decisions being written on the front page of the newspaper by an unfriendly but intelligent reporter.

On what changes/additions he would make to The Intelligent Investor:

He wouldn’t make many changes. The principles of the book are just as relevant today as they were when they were written. The important chapters are Chapters 8 and 20.

Key tenets of investing – think of stocks as businesses, don’t be influenced by Mr. Market and always have a margin of safety. If you follow these simple principles you HAVE to do well. The biggest obstacle in following these simple principles is detaching yourself from the feelings of others.

You only need a few good ideas in a lifetime

Business are generally sound over time but the difference between low price and high price in any year can be 3x (over 3000 companies are priced once a day)...this provides tremendous opportunities.

Understanding and following the principles set out in the intelligent investor is not a function of intellect, people either catch on or they do not.

On value investing and what is the hardest aspect of its implementation:

Berkshire Hathaway has too much money which has caused the universe of acceptable investments to shrink. Value investing is always difficult as it is hard to detach oneself from the emotional aspect of investing. Pascal said, “Most of man’s trouble rises from the inability to sit quietly in a room.” It is not the toughest game and opportunities come in clumps. There are very few mistakes a smart guy can make, one of which is leverage. When Genius Failed is a good book which clearly shows the trouble with leverage. It is a terrible mistake to assume that you can reduce human behavior to mathematical formulas. It is also difficult to detach yourself from the crowd. WEB worked in NY for 2 years but

he would not have done as well as if he had continued to live there. He would have been “overstimulated” by the many ideas and the emotional charge.

His life has not changed dramatically with the accumulation of wealth. Our lives should not change with money.

Despite the fact that he is worth billions, his life is very similar to ours – we still sleep 7 hours, eat the same, watch sports, wear similar clothes....the point is to keep perspective and don't let the money consume you. The key point is that you're having fun

Investing is simple, but it's not easy. One should not try to get rich too quick.

Stock market is liquid so it can also be highly volatile without the underlying fundamentals of a business changing.

Variance in price of farm land or other hard assets is generally low

Stock market opportunities come in clumps

On whether it's too late to get into the game:

Age is an advantage. From 8 to 19, I actually wasted years, a period during which I was not actively investing. Over time, you learn how to value businesses and how to realize when you can't value a business.

“It is not too late. There's plenty of time. You don't need many ideas.”

You probably only need to know 4 or 5 industries really well.

“If you love the field, you want to immerse in it. You want to learn about businesses.”

When he bought NFM, he knew the business. He knows which businesses are in his circle of competence.

On what books to read:

Outside of Ben Graham, read Phil Fisher's books from 1960's (Common Stocks and Uncommon Profits and Conservative Investors Sleep Well). You have to read a “zillion” annual reports.

Look for businesses that you think are very likely to succeed 10, 15 years from now. Do they have pricing power, exclusive franchise (“Maybe it's the only Cadillac distributor in Omaha.”)

“I like to go for cinches.”

“I like to shoot fish in a barrel. But I like to do it after the water has run out.”

Three things to look for:

1. The business
2. Management
3. Price

Every year he raises prices at See's Candies the day after Christmas. "That is my Christmas present to myself." "Mirror, mirror on the wall, how much should I charge for candy this fall? More. That's my kind of mirror."

In this country, people buy chocolates as gifts. You're not going to buy cheaper chocolate and tell your girlfriend that you took the low bid.

On Katherine Graham:

The most important Buffett did for her is helping her have confidence.

When he was teaching her about business and reading 10Ks, "at first she fell asleep."

She had two basic misconceptions:

1. Men were smarter than women ("After she met me, she got away from that.")
2. She was inferior because she didn't go to b-school.

Katherine Graham was looking at a fun house mirror and I just had to put in a real mirror. All of that was the result of years of being told she was inferior – by her mother and a very domineering husband.

Most important thing in the world is what you teach kids in those first couple of years. "Make sure you deserve to be their hero. Because you'll be their hero." As a parent you are in a teaching position all the time.

An important thing in life is whom do you have as your heroes.

On hedge funds:

WEB stumbled into the partnership form having worked for Newman and Graham and that is the form he would use to attract capital.

It is unethical to take a fee and a share of profits.

"It's open to significant abuse." Asset gathering is more important than performance. There are wrong incentives. "It's also unethical not to have your money in it."

If you were investing smaller sums of money, say \$10-20M, would you look for the fat pitches that are great, high ROE companies (like Coke), or ones that are statistically cheap, but possibly below average businesses? Which would you invest in--cigar butts, special situations of average businesses, or great but small-and-ignored companies?

“I would find more things looking at other things than Coke.” You want to work where there is little competition. If you look at the smaller cigar butt investments, you have just eliminated some pretty serious competition: Buffett (because he’s too big to dabble there), and all the people who listen only to sell-side research (because they don’t cover those little things).

One of the secrets in life is weak competition.

Forbes reported in 1993 that you spend 5-6 hours per day reading. What in the world could take that long? Annual reports? Periodicals? Books? All of the above? “I tend to read everything in sight. I used to read 5-6 hours a day.” Now he’s in the computer 12 hours a week playing bridge. That has to come out of something. “It’s not coming out of sleeping, or eating. It’s coming out of reading.” Nevertheless, he still reads a lot.

Excluding email, he spends more time in the computer than Bill Gates.

He’s willing to spend millions of dollars playing bridge on the Internet but they still haven’t found a way to do it.

“Meg Whitman’s got a very good business model.”

“We have no meetings at Berkshire. We don’t have a PowerPoint around here.”

What models do you have/use that enable you to make a bid for a company in 15 minutes?

“Models. That’s Charlie’s word.”

“If you know enough to do it, you know enough to do it immediately.”

Models:

- Do I understand the business?
- What are the competitive advantages of the business and will they endure?
- Is there going to be change? “I don’t like change.” It is good for humanity but not for investing

Nebraska Furniture Mart

- Short time frame to investment
- Asked about receivables and how much she owed
- Looked at unaudited income statement and no balance sheet

Clayton Homes

- Good business in a tough industry
- Made bid on second call over the phone – he never visited the company
- Prepare your life for making these quick decisions (learn to spot the opportunity and pounce on it)

Larson Juhl

- Never thought about the business
- 15 minute phone call
- 18,000 locations with sales force that called on all clients 6x a year – difficult to compete (investment in sales force, distribution, low price sensitivity – want it tomorrow – don't care if it's \$72 or \$84)
- no brainer

MiTek

- Connector plate business
- Small item of cost relative to cost of home
- Contractor wants reliability, not the lowest price
- Internet not going to change the business
- Never went to see the business

We all know about your famous sins of omission which you say have cost Berkshire shareholders billions and billions of dollars. Could you talk about some of your less successful investments (that is, sins of commission) you've made and what you've learned from them?

Sins of commission:

1. Buying Berkshire
2. Department store in the partnership years (Hochschild, Kohn) bought by Diversified Retailing
3. Blue Chip Stamps. It did \$120 million...this year \$50K (“The old Buffett touch”)

Oddly enough, these are the “three streams” out of which today's Berkshire flowed.

On China:

Too many variables in China that can translate into investment action.

You have to be right on 20 things for China to be profitable

There is nothing advantageous in looking for a silver needle in a golden haystack. Just take the haystack. The idea is to keep it simple.

Don't do triple dives. In investing, there is no score multiplier for making difficult investments. Just jump in the water at the low end of the pool – since there's no difficulty multiplier – the guy diving from the high platform gets the same amount of wet as you. He just worked more.

“We bought Petrochina because it was extremely cheap.”

What would you consider the greatest misconception that intelligent investors have about you as it regards your investing approach/style?

“Well, I first need to know what people’s perceptions are before knowing their misconceptions.”

On Berkshire, that it is a mutual fund, although that is happening less now. People may think that we get info from people, but we don’t. We don’t meet with managements. We used to. “I can figure it out by looking at the 10Ks.”

WEB buys 100 shares of many, many companies just to get the annual report.

This question is regarding inflation.....in your 1980 letter, you stated that "the great bulk ... of corporate capital is not even partially indexed [to inflation]," and consequently must reinvest a certain level of earnings just to maintain its current level of real earnings power. My question is, why isn't more corporate capital be indexed to inflation?

Inflation is the friend, or at least not the enemy, of the business that doesn’t take any capital, like See’s.

In your 2002 letter to shareholders, you wrote that you and Mr. Munger "view [derivatives] as time bombs, both for the parties that deal in them and the economic system." Does the rather non-committal and in some cases even dismissive reaction to your warning concern you? Are you personally disappointed that people haven't heeded your warning?

No, because it is a low probability event. Gen Re was one example of a time bomb although now we are down to 500 counterparties, which in my opinion is still a lot. I am in the insurance business where I have to recognize that while the odds of an event happening may be 1 in 40, it is still certain that at some point, it will happen.

If there were three people you could meet (deceased or not), who would they be and why?

“My baby doctor so I could start all over again.”

“The truth is everybody is pretty interesting.”

“I have the greatest collection of friends you can imagine.”

Charlie Munger is a very interesting person.

How will you handle the possibility of losing some of your mental edge? Ask Lou Simpson to slap you around when you start not making sense?

“How do I know I’m going ga-ga? That’s an important question.”

“I have assigned my family to do that.”

”They have to tell me as a group. If only one tells me, he’s out of the will.”

“Occasionally, I have to fire somebody. That’s the only thing I don’t like.”

Two things he enjoys:

1. "I come here every day. I get to paint the ceiling every day. I can do whatever I want." Nobody tells me how to paint it.
2. "The second thing I like is the applause. I like it that people like Berkshire."

On Arnold:

"I won the look-alike contest for Arnold."

Arnold has a very tough problem and is going to have to do some unpopular things.

Arnold is very smart; very financially smart.

Could you please talk about your view of the role of the firm in regards to corporate giving, especially in light of the recent Pampered Chef and Buffet Foundation developments?

The choice was simple because innocent people were losing their income because of us. Before that, we wanted to give people the choice of picking their own charities in a tax-effective way.

He mentioned specific donation such as Planned Parenthood. Women should have the right to make choices. "If I were a woman, I'd want to make my own choice."

How in business do you appraise people? What kind of due diligence, if any, do you conduct on people with whom you have business relationships, or are contemplating entering business relationships?

"I look at them in the eyes." He gets a sense of whether they like the money or the business. If they like the money they are going to leave. "I don't have any formulas, but you can feel it."

On what courses to take:

"Accounting is vital." It is the language of business. Accounting is substantially the most important.

Another asset: innate sense of probabilities. "I won't make a dumb bet. Not even for 50 cents."

"I'm wired to think in probabilistic way."

You must read Bob Rubin's upcoming book because he is a man who has excelled in probabilistic thinking.

Most CEOs are dumb about capital allocation. It is not their skill. As a CEO, he's buying businesses, but most of these guys won't even buy stock on their own. It is like

playing a violin your whole life and then getting to play at Carnegie Hall where they give you a piano.

On whether he follows other investors:

“Well, I read OID...but the answer is no.”

America's Growing Trade Deficit Is Selling the Nation Out From Under Us. Here's a Way to Fix the Problem—And We Need to Do It Now.

FORTUNE

Sunday, October 26, 2003

By Warren E. Buffett

I'm about to deliver a warning regarding the U.S. trade deficit and also suggest a remedy for the problem. But first I need to mention two reasons you might want to be skeptical about what I say. To begin, my forecasting record with respect to macroeconomics is far from inspiring. For example, over the past two decades I was excessively fearful of inflation. More to the point at hand, I started way back in 1987 to publicly worry about our mounting trade deficits—and, as you know, we've not only survived but also thrived. So on the trade front, score at least one "wolf" for me. Nevertheless, I am crying wolf again and this time backing it with Berkshire Hathaway's money. Through the spring of 2002, I had lived nearly 72 years without purchasing a foreign currency. Since then Berkshire has made significant investments in—and today holds—several currencies. I won't give you particulars; in fact, it is largely irrelevant which currencies they are. What does matter is the underlying point: To hold other currencies is to believe that the dollar will decline.

Both as an American and as an investor, I actually hope these commitments prove to be a mistake. Any profits Berkshire might make from currency trading would pale against the losses the company and our shareholders, in other aspects of their lives, would incur from a plunging dollar.

But as head of Berkshire Hathaway, I am in charge of investing its money in ways that make sense. And my reason for finally putting my money where my mouth has been so long is that our trade deficit has greatly worsened, to the point that our country's "net worth," so to speak, is now being transferred abroad at an alarming rate.

A perpetuation of this transfer will lead to major trouble. To understand why, take a wildly fanciful trip with me to two isolated, side-by-side islands of equal size, Squanderville and Thriftville. Land is the only capital asset on these islands, and their communities are primitive, needing only food and producing only food. Working eight hours a day, in fact, each inhabitant can produce enough food to sustain himself or herself. And for a long time that's how things go along. On each island everybody works the prescribed eight hours a day, which means that each society is self-sufficient.

Eventually, though, the industrious citizens of Thriftville decide to do some serious saving and investing, and they start to work 16 hours a day. In this mode they continue to live off the food they produce in eight hours of work but begin exporting an equal amount to their one and only trading outlet, Squanderville.

The citizens of Squanderville are ecstatic about this turn of events, since they can now live their lives free from toil but eat as well as ever. Oh, yes, there's a quid pro quo—but to the Squanders, it seems harmless: All that the Thrifts want in exchange for their food is Squanderbonds (which are denominated, naturally, in Squanderbucks).

Over time Thriftville accumulates an enormous amount of these bonds, which at their core represent claim checks on the future output of Squanderville. A few pundits in Squanderville smell trouble coming. They foresee that for the Squanders both to eat and to pay off—or simply service—the debt they're piling up will eventually require them to work more than eight hours a day. But the residents of Squanderville are in no mood to listen to such doomsaying.

Meanwhile, the citizens of Thriftville begin to get nervous. Just how good, they ask, are the IOUs of a shiftless island? So the Thrifts change strategy: Though they continue to hold some bonds, they sell most of them to Squanderville residents for Squanderbucks and use the proceeds to buy Squanderville land. And eventually the Thrifts own all of Squanderville.

At that point, the Squanders are forced to deal with an ugly equation: They must now not only return to working eight hours a day in order to eat—they have nothing left to trade—but must also work additional hours to service their debt and pay Thriftville rent on the land so imprudently sold. In effect, Squanderville has been colonized by purchase rather than conquest.

It can be argued, of course, that the present value of the future production that Squanderville must forever ship to Thriftville only equates to the production Thriftville initially gave up and that therefore both have received a fair deal. But since one generation of Squanders gets the free ride and future generations pay in perpetuity for it, there are—in economist talk—some pretty dramatic “intergenerational inequities.”

Let's think of it in terms of a family: Imagine that I, Warren Buffett, can get the suppliers of all that I consume in my lifetime to take Buffett family IOUs that are payable, in goods and services and with interest added, by my descendants. This scenario may be viewed as effecting an even trade between the Buffett family unit and its creditors. But the generations of Buffetts following me are not likely to applaud the deal (and, heaven forbid, may even attempt to welsh on it).

Think again about those islands: Sooner or later the Squanderville government, facing ever greater payments to service debt, would decide to embrace highly inflationary policies—that is, issue more Squanderbucks to dilute the value of each. After all, the government would reason, those irritating Squanderbonds are simply claims on specific numbers of Squanderbucks, not on bucks of specific value. In short, making Squanderbucks less valuable would ease the island's fiscal pain.

That prospect is why I, were I a resident of Thriftville, would opt for direct ownership of Squanderville land rather than bonds of the island's government. Most governments find

it much harder morally to seize foreign-owned property than they do to dilute the purchasing power of claim checks foreigners hold. Theft by stealth is preferred to theft by force.

So what does all this island hopping have to do with the U.S.? Simply put, after World War II and up until the early 1970s we operated in the industrious Thriftville style, regularly selling more abroad than we purchased. We concurrently invested our surplus abroad, with the result that our net investment—that is, our holdings of foreign assets less foreign holdings of U.S. assets—increased (under methodology, since revised, that the government was then using) from \$37 billion in 1950 to \$68 billion in 1970. In those days, to sum up, our country's "net worth," viewed in totality, consisted of all the wealth within our borders plus a modest portion of the wealth in the rest of the world.

Additionally, because the U.S. was in a net ownership position with respect to the rest of the world, we realized net investment income that, piled on top of our trade surplus, became a second source of investable funds. Our fiscal situation was thus similar to that of an individual who was both saving some of his salary and reinvesting the dividends from his existing nest egg.

In the late 1970s the trade situation reversed, producing deficits that initially ran about 1% of GDP. That was hardly serious, particularly because net investment income remained positive. Indeed, with the power of compound interest working for us, our net ownership balance hit its high in 1980 at \$360 billion.

Since then, however, it's been all downhill, with the pace of decline rapidly accelerating in the past five years. Our annual trade deficit now exceeds 4% of GDP. Equally ominous, the rest of the world owns a staggering \$2.5 trillion more of the U.S. than we own of other countries. Some of this \$2.5 trillion is invested in claim checks—U.S. bonds, both governmental and private—and some in such assets as property and equity securities.

In effect, our country has been behaving like an extraordinarily rich family that possesses an immense farm. In order to consume 4% more than we produce—that's the trade deficit—we have, day by day, been both selling pieces of the farm and increasing the mortgage on what we still own.

To put the \$2.5 trillion of net foreign ownership in perspective, contrast it with the \$12 trillion value of publicly owned U.S. stocks or the equal amount of U.S. residential real estate or what I would estimate as a grand total of \$50 trillion in national wealth. Those comparisons show that what's already been transferred abroad is meaningful—in the area, for example, of 5% of our national wealth.

More important, however, is that foreign ownership of our assets will grow at about \$500 billion per year at the present trade-deficit level, which means that the deficit will be adding about one percentage point annually to foreigners' net ownership of our national wealth. As that ownership grows, so will the annual net investment income flowing out of

this country. That will leave us paying ever-increasing dividends and interest to the world rather than being a net receiver of them, as in the past. We have entered the world of negative compounding—goodbye pleasure, hello pain.

We were taught in Economics 101 that countries could not for long sustain large, ever-growing trade deficits. At a point, so it was claimed, the spree of the consumption-happy nation would be braked by currency-rate adjustments and by the unwillingness of creditor countries to accept an endless flow of IOUs from the big spenders. And that's the way it has indeed worked for the rest of the world, as we can see by the abrupt shutoffs of credit that many profligate nations have suffered in recent decades.

The U.S., however, enjoys special status. In effect, we can behave today as we wish because our past financial behavior was so exemplary—and because we are so rich. Neither our capacity nor our intention to pay is questioned, and we continue to have a mountain of desirable assets to trade for consumables. In other words, our national credit card allows us to charge truly breathtaking amounts. But that card's credit line is not limitless.

The time to halt this trading of assets for consumables is now, and I have a plan to suggest for getting it done. My remedy may sound gimmicky, and in truth it is a tariff called by another name. But this is a tariff that retains most free-market virtues, neither protecting specific industries nor punishing specific countries nor encouraging trade wars. This plan would increase our exports and might well lead to increased overall world trade. And it would balance our books without there being a significant decline in the value of the dollar, which I believe is otherwise almost certain to occur.

We would achieve this balance by issuing what I will call Import Certificates (ICs) to all U.S. exporters in an amount equal to the dollar value of their exports. Each exporter would, in turn, sell the ICs to parties—either exporters abroad or importers here—wanting to get goods into the U.S. To import \$1 million of goods, for example, an importer would need ICs that were the byproduct of \$1 million of exports. The inevitable result: trade balance.

Because our exports total about \$80 billion a month, ICs would be issued in huge, equivalent quantities—that is, 80 billion certificates a month—and would surely trade in an exceptionally liquid market. Competition would then determine who among those parties wanting to sell to us would buy the certificates and how much they would pay. (I visualize that the certificates would be issued with a short life, possibly of six months, so that speculators would be discouraged from accumulating them.)

For illustrative purposes, let's postulate that each IC would sell for 10 cents—that is, 10 cents per dollar of exports behind them. Other things being equal, this amount would mean a U.S. producer could realize 10% more by selling his goods in the export market than by selling them domestically, with the extra 10% coming from his sales of ICs.

In my opinion, many exporters would view this as a reduction in cost, one that would let them cut the prices of their products in international markets. Commodity-type products would particularly encourage this kind of behavior. If aluminum, for example, was selling for 66 cents per pound domestically and ICs were worth 10%, domestic aluminum producers could sell for about 60 cents per pound (plus transportation costs) in foreign markets and still earn normal margins. In this scenario, the output of the U.S. would become significantly more competitive and exports would expand. Along the way, the number of jobs would grow.

Foreigners selling to us, of course, would face tougher economics. But that's a problem they're up against no matter what trade "solution" is adopted—and make no mistake, a solution must come. (As Herb Stein said, "If something cannot go on forever, it will stop.") In one way the IC approach would give countries selling to us great flexibility, since the plan does not penalize any specific industry or product. In the end, the free market would determine what would be sold in the U.S. and who would sell it. The ICs would determine only the aggregate dollar volume of what was sold.

To see what would happen to imports, let's look at a car now entering the U.S. at a cost to the importer of \$20,000. Under the new plan and the assumption that ICs sell for 10%, the importer's cost would rise to \$22,000. If demand for the car was exceptionally strong, the importer might manage to pass all of this on to the American consumer. In the usual case, however, competitive forces would take hold, requiring the foreign manufacturer to absorb some, if not all, of the \$2,000 IC cost.

There is no free lunch in the IC plan: It would have certain serious negative consequences for U.S. citizens. Prices of most imported products would increase, and so would the prices of certain competitive products manufactured domestically. The cost of the ICs, either in whole or in part, would therefore typically act as a tax on consumers.

That is a serious drawback. But there would be drawbacks also to the dollar continuing to lose value or to our increasing tariffs on specific products or instituting quotas on them—courses of action that in my opinion offer a smaller chance of success. Above all, the pain of higher prices on goods imported today dims beside the pain we will eventually suffer if we drift along and trade away ever larger portions of our country's net worth.

I believe that ICs would produce, rather promptly, a U.S. trade equilibrium well above present export levels but below present import levels. The certificates would moderately aid all our industries in world competition, even as the free market determined which of them ultimately met the test of "comparative advantage."

This plan would not be copied by nations that are net exporters, because their ICs would be valueless. Would major exporting countries retaliate in other ways? Would this start another Smoot-Hawley tariff war? Hardly. At the time of Smoot-Hawley we ran an unreasonable trade surplus that we wished to maintain. We now run a damaging deficit that the whole world knows we must correct.

For decades the world has struggled with a shifting maze of punitive tariffs, export subsidies, quotas, dollar-locked currencies, and the like. Many of these import-inhibiting and export-encouraging devices have long been employed by major exporting countries trying to amass ever larger surpluses—yet significant trade wars have not erupted. Surely one will not be precipitated by a proposal that simply aims at balancing the books of the world's largest trade debtor. Major exporting countries have behaved quite rationally in the past and they will continue to do so—though, as always, it may be in their interest to attempt to convince us that they will behave otherwise.

The likely outcome of an IC plan is that the exporting nations—after some initial posturing—will turn their ingenuity to encouraging imports from us. Take the position of China, which today sells us about \$140 billion of goods and services annually while purchasing only \$25 billion. Were ICs to exist, one course for China would be simply to fill the gap by buying 115 billion certificates annually. But it could alternatively reduce its need for ICs by cutting its exports to the U.S. or by increasing its purchases from us. This last choice would probably be the most palatable for China, and we should wish it to be so.

If our exports were to increase and the supply of ICs were therefore to be enlarged, their market price would be driven down. Indeed, if our exports expanded sufficiently, ICs would be rendered valueless and the entire plan made moot. Presented with the power to make this happen, important exporting countries might quickly eliminate the mechanisms they now use to inhibit exports from us.

Were we to install an IC plan, we might opt for some transition years in which we deliberately ran a relatively small deficit, a step that would enable the world to adjust as we gradually got where we need to be. Carrying this plan out, our government could either auction “bonus” ICs every month or simply give them, say, to less-developed countries needing to increase their exports. The latter course would deliver a form of foreign aid likely to be particularly effective and appreciated.

I will close by reminding you again that I cried wolf once before. In general, the batting average of doomsayers in the U.S. is terrible. Our country has consistently made fools of those who were skeptical about either our economic potential or our resiliency. Many pessimistic seers simply underestimated the dynamism that has allowed us to overcome problems that once seemed ominous. We still have a truly remarkable country and economy.

But I believe that in the trade deficit we also have a problem that is going to test all of our abilities to find a solution. A gently declining dollar will not provide the answer. True, it would reduce our trade deficit to a degree, but not by enough to halt the outflow of our country's net worth and the resulting growth in our investment-income deficit.

Perhaps there are other solutions that make more sense than mine. However, wishful thinking—and its usual companion, thumb sucking—is not among them. From what I now see, action to halt the rapid outflow of our national wealth is called for, and ICs

seem the least painful and most certain way to get the job done. Just keep remembering that this is not a small problem: For example, at the rate at which the rest of the world is now making net investments in the U.S., it could annually buy and sock away nearly 4% of our publicly traded stocks.

In evaluating business options at Berkshire, my partner, Charles Munger, suggests that we pay close attention to his jocular wish: “All I want to know is where I’m going to die, so I’ll never go there.” Framers of our trade policy should heed this caution—and steer clear of Squanderville.

FORTUNE editor at large Carol Loomis, who is a Berkshire Hathaway shareholder, worked with Warren Buffett on this article.

Why Foreigners Can’t Ditch Their Dollars

FORTUNE

Sunday, October 26, 2003

How often have you seen a comment like this in articles about the U.S. dollar? “Analysts say that what really worries them is that foreigners will start moving out of the dollar.”

Next time you see something like that, dismiss it. The fact is that foreigners—as a whole—cannot ditch their dollars. Indeed, because our trade deficit is constantly putting new dollars into the hands of foreigners, they have to just as constantly increase their U.S. investments.

It’s true, of course, that the rest of the world can choose which U.S. assets to hold. They can decide, for example, to sell U.S. bonds to buy U.S. stocks. Or they can make a move into real estate, as the Japanese did in the 1980s. Moreover, any of those moves, particularly if they are carried out by anxious sellers or buyers, can influence the price of the dollar.

But imagine that the Japanese both want to get out of their U.S. real estate and entirely away from dollar assets. They can’t accomplish that by selling their real estate to Americans, because they will get paid in dollars. And if they sell their real estate to non-Americans—say, the French, for euros—the property will remain in the hands of foreigners. With either kind of sale, the dollar assets held by the rest of the world will not (except for any concurrent shift in the price of the dollar) have changed.

The bottom line is that other nations simply can’t disinvest in the U.S. unless they, as a universe, buy more goods and services from us than we buy from them. That state of affairs would be called an American trade surplus, and we don’t have one.

You can dream up some radical plots for changing the situation. For example, the rest of the world could send the U.S. massive foreign aid that would serve to offset our trade deficit. But under any realistic view of things, our huge trade deficit guarantees that the rest of the world must not only hold the American assets it owns but consistently add to

them. And that's why, of course, our national net worth is gradually shifting away from our shores.

Why Foreigners Can't Ditch Their (US) Dollars

November 10, 2003

HOW OFTEN HAVE YOU SEEN A COMMENT LIKE THIS IN ARTICLES ABOUT the U.S. dollar? “Analysts say that what really worries them is that foreigners will start moving out of the dollar.”

Next time you see something like that, dismiss it. The fact is that foreigners— as a whole—cannot ditch their dollars. Indeed, because our trade deficit is constantly putting new dollars into the hands of foreigners, they have to just as constantly increase their U.S. investments.

It's true, of course, that the rest of the world can choose which U.S. assets to hold. They can decide, for example, to sell U.S. bonds to buy U.S. stocks. Or they can make a move into real estate, as the Japanese did in the 1980s. Moreover, any of those moves, particularly if they are carried out by anxious sellers or buyers, can influence the price of the dollar.

But imagine that the Japanese both want to get out of their U.S. real estate and entirely away from dollar assets. They can't accomplish that by selling their real estate to Americans, because they will get paid in dollars. And if they sell their real estate to non-Americans—say, the French, for euros—the property will remain in the hands of foreigners. With either kind of sale, the dollar assets held by the rest of the world will not (except for any concurrent shift in the price of the dollar) have changed.

The bottom line is that other nations simply can't disinvest in the U.S. unless they, as a universe, buy more goods and services from us than we buy from them. That state of affairs would be called an American trade surplus, and we don't have one.

You can dream up some radical plots for changing the situation. For example, the rest of the world could send the U.S. massive foreign aid that would serve to offset our trade deficit. But under any realistic view of things, our huge trade deficit guarantees that the rest of the world must not only hold the American assets it owns but consistently add to them. And that's why, of course, our national net worth is gradually shifting away from our shores.

Fuzzy Math And Stock Options*

By Warren Buffett

Tuesday, July 6, 2004

Until now the record for mathematical lunacy by a legislative body has been held by the Indiana House of Representatives, which in 1897 decreed by a vote of 67 to 0 that pi—the ratio of the circumference of a circle to its diameter—would no longer be 3.14159 but instead be 3.2. Indiana schoolchildren momentarily rejoiced over this simplification of their lives. But the Indiana Senate, composed of cooler heads, referred the bill to the Committee for Temperance, and it eventually died.

What brings this episode to mind is that the U.S. House of Representatives is about to consider a bill that, if passed, could cause the mathematical lunacy record to move east from Indiana. First, the bill decrees that a coveted form of corporate pay—stock options—be counted as an expense when these go to the chief executive and the other four highest-paid officers in a company, but be disregarded as an expense when they are issued to other employees in the company. Second, the bill says that when a company is calculating the expense of the options issued to the mighty five, it shall assume that stock prices never fluctuate.

Give the bill's proponents an A for imagination—and for courting contributors—and a flat-out F for logic.

All seven members of the Financial Accounting Standards Board, all four of the big accounting firms and legions of investment professionals say the two proposals are nonsense. Nevertheless, many House members wish to ignore these informed voices and make Congress the Supreme Accounting Authority. Indeed, the House bill directs the Securities and Exchange Commission to “not recognize as ‘generally accepted’ any accounting principle established by a standard

setting body” that disagrees with the House about the treatment of options.

The House's anointment of itself as the ultimate scorekeeper for investors, it should be noted, comes from an institution that in its own affairs favors Enronesque accounting. Witness the fanciful “sunset” provisions that are used to meet legislative “scoring” requirements. Or regard the unified budget protocol, which applies a portion of annual Social Security receipts to reducing the stated budget deficit while ignoring the concomitant annual costs for benefit accruals.

I have no objection to the granting of options. Companies should use whatever form of compensation best motivates employees—whether this be cash bonuses, trips to Hawaii, restricted stock grants or stock options. But aside from options, every other item of value given to employees is recorded as an expense. Can you imagine the derision that would be directed at a bill mandating that only five bonuses out of all those given to employees be expensed? Yet that is a true analogy to what the option bill is proposing.

Equally nonsensical is a section in the bill requiring companies to assume, when they are valuing the options granted to the mighty five, that their stocks have zero volatility. I've been investing for 62 years and have yet to meet a stock that doesn't fluctuate. The only reason for making such an Alice-in-Wonderland assumption is to significantly understate the value of the few options that the House wants counted. This undervaluation, in turn, enables chief executives to lie about what they are truly being paid and to overstate the earnings of the companies they run.

Some people contend that options cannot be precisely valued. So what? Estimates pervade accounting. Who

knows with precision what the useful life of software, a corporate jet or a machine tool will be? Pension costs, moreover, are even fuzzier, because they require estimates of future mortality rates, pay increases and investment earnings. These guesses are almost invariably wrong, often substantially so. But the inherent uncertainties involved do not excuse companies from making their best estimate of these, or any other, expenses. Legislators should remember that it is better to be approximately right than precisely wrong.

If the House should ignore this logic and legislate that what is an expense for five is not an expense for thousands, there is reason to believe that the Senate—like the Indiana Senate 107 years ago—will prevent this folly from becoming law. Senator Richard Shelby (R-Ala.), chairman of the Senate Banking Committee, has firmly declared that accounting rules should be set by accountants, not by legislators.

Even so, House members who wish to escape the scorn of historians should render the Senate's task moot by killing the bill themselves. Or if they are absolutely determined to meddle with reality, they could attack the obesity problem by declaring that henceforth it will take 24 ounces to make a pound. If even that friendly standard seems unbearable to their constituents, they could exempt all but the fattest five in each congressional district from any measurement of weight.

In the late 1990s, too many managers found it easier to increase “profits” by accounting maneuvers than by operational excellence. But just as the schoolchildren of Indiana learned to work with honest math, so can option-issuing chief executives learn to live with honest accounting. It's high time they step up to that job.

The writer is chief executive officer of Berkshire Hathaway Inc., a diversified holding company, and a director of The Washington Post Co., which has an investment in Berkshire Hathaway.

WARREN BUFFETT RESPONDS TO QUESTIONS FROM 85 WHARTON STUDENTS ON NOVEMBER 12, 2004

1) Is it more difficult to find predictable businesses today than it has been historically because the rate of change has increased within most industries? Has the accelerating rate of change within most industries caused you to reassess your buy and hold investment thesis, particularly given the inability for many consumer brands like Coke and Gillette to grow?

There are basically two ways to look at change. We see change as the enemy of investments, if it wasn't the richest people would be librarians. Some businesses will change very quickly. We are looking for ones that don't. If you can predict the change then you can become very rich, but the net investment (e.g. from what went on at Kitty Hawk – air flight) to equity investors is a huge negative. For example, I have a list of over 2000 companies that made automobiles, now the last two, GM and Ford, are in trouble. Hundreds are out of business – many people didn't know that Maytag and Du Pont made automobiles. The net investment for investors has not been a great deal. We look for certainty of what won't change. You mentioned Gillette. After 100 years, Gillette still has 70% market share, and yet the distribution, product and raw materials are not mysterious. It has survived within our capitalist system and you know its products will be used regularly.

Coke sells 50% of the carbonated beverages worldwide: about 1.3 billion 8 ounce servings, higher than last year and the year before. I guarantee Coke, Wrigleys and Gillette will dominate. The internet won't change what brands people like.

We are looking for the absence of change. Fruit of the Loom and Haynes together have 80% of boys underwear in the US. I guess we will keep wearing underwear. Bill Gates welcomes the absence of change, he just doesn't get it in his business. Microsoft and E-Bay have some moat. If you can identify change, that is great, but it is a lot riskier and so is the chance of our strategy not working. So we look for absence of change. We don't like to lose money. Capitalism is pretty brutal. We look for mundane products that everyone needs. Patents are the worst way to ensure demand. There is still plenty of opportunity to find predictable demand. The problem isn't the lack of opportunities, it's the prices.

2) You wound up the Buffett Partnership in 1969 due in part to the virtual disappearance of investment opportunities for the analyst who stresses quantitative factors. In your view, is today a better investing environment than 1969? How is it better and worse?

1969 was tough. It wasn't pleasant to do. I had grown from \$105,000 to \$100,000,000. I had a lot of propositions to take over the partnership. If I had a similar partnership I would have closed it around 2000 in the height of the internet boom.

We were all in REITS in March 2000 when NASDAQ was hitting its high. If I had had a large partnership I would have folded it, but not if it was small. It has to do both with how I feel and how the partners feel. I feel like a jerk (losing on a relative basis) and the jerks are making money. I won't persist in trying to make money when I don't

WARREN BUFFETT RESPONDS TO QUESTIONS FROM 85 WHARTON STUDENTS ON NOVEMBER 12, 2004

understand what is going on. It is harder to invest and risk other people's money than to invest your own money.

We still get opportunities: for example, we got \$8 billion into the Junk Bond thing in 2002 and would have gone up to \$22 billion if we had more time. We were buying as fast as we could.

Investing is the world's best game. I was in the department store business – you have to match you competitors – it's a business that throws defensive decisions at you all the time. We want a business with not defensive decisions. Investing is a perfect example. Just watch ball after ball come through and wait for your fat pitch. You can sit and wait for just the right pitch. Harder when you invest in public and the fans are screaming "swing you bum."

But at your age, you can fool around with small money and I see things to do there.

3) You made an argument for 7% returns over the next decade in Fortune. Given that (1) profit margins are at least 30% above historical averages, (2) the ratio of prices/GDP is at least 25% above historical averages, and (3) interest rates are ~25% below historical averages, assuming mean reversion, wouldn't one conclude that while economic earnings growth plus dividends may be 7%, that we are at an unsustainable valuation plateau?

We are near the high-end of the valuation band, but not really at an extreme. I have commented on the market 4 or 5 times in *Forbes* interviews previously (1969, 1974, 1981, and 1977 in *Fortune*). Most of you can say if something is overvalued or undervalued, you can spot the occasional extreme cases.

There is a big band of valuation and the idea is to calibrate extremes. When I look at a business, I look for people with passion. I can recognize a 98 or a 6, not a 63. This rule is good enough in life and investment. You refer to my 2001 article, but returns have not exceeded 7%, so I guess that this is not that precise of a band.

I suspect that stocks are too high now. Nothing is cheap and I am not finding a lot of now but there will be a day when you will be shooting fish in a barrel. The important thing is to be prepared to play heavily when the time comes and that means that you cannot play with everybody.

4) You have said in the past that you would rather buy a great business at a fair price than a fair business at a great price. If the price is fair to both the buyer and the seller and the buyer does not substantially improve the business, then it would be hard to see how the buyer would obtain superior returns from such an investment if the price already discounts the quality of the business. Since you clearly look for superior returns can you explain how you buy at a price that is both fair to the seller and still leaves you room for abnormal returns?

WARREN BUFFETT RESPONDS TO QUESTIONS FROM 85 WHARTON STUDENTS ON NOVEMBER 12, 2004

Periodically the stock market does not price rationally. Great businesses have been sold for ridiculously low prices in the past. Unlike negotiated sale of businesses, the market is like an auction and stocks traded on it are not perceived as ownership shares in business. While the price of farmland or apartments in Nebraska does not vary a great deal around the mean, and have little chance of having wild aberrations, stock prices on the other hand may sometimes vary by as much as 50% to 100%. Accordingly, there are opportunities to buy stocks in businesses at low value.

So we really try to buy wonderful businesses at ridiculous prices. In the case of Washington Post, in 1973 the whole of the company was only selling for \$80M (5M shares at \$16 each). This is a business that owns a number of newspapers, four TV stations and several magazines (like Newsweek). Most analysts would have agreed that the intrinsic value of the assets was around \$400 to \$500 million. But you could buy little pieces of the business for much less. Seizing this opportunity, Mr. Buffett purchased around 9% of the shares for \$10 million in 20-30 tickets from institutional investors who couldn't sell fast enough because they thought the share prices would keep falling. They wouldn't have argued that the business was not worth \$400 million, just that the stock was going down. Subsequently, Mr. Buffett has steadily increased Berkshire's holding in the company (to around 22%) and today the company is worth about \$10 billion dollars.

Making purchases through a negotiated markets for entire businesses is different. You may get a decent result. These transactions are to a mild degree effected by the auction market. As Peter Lynch often says, companies will cut the flowers and water the weeds – when a company is in trouble it often sells the crown jewels.

5) What value would you personally attach to \$1 received 1 year from today with 100% certainty?

It depends on how much purchasing power \$1 dollar has in one year. You need to find the present value of that \$1 dollar, using the discount rate (i.e., Treasuries of equivalent maturity). It is very similar to analyzing the stream of a company's earning flow. How much long term earnings flow you would like to have using the discount rate? Also, you need to be aware of whether the interest rates over the medium-to-long term will change quite big or not. Your expectation of the "normal" interest rate will drive what discount rate you apply to the streams of a Japanese company in the mid-1990s, for example. If you think the interest rate will rise sharply, and do not want to buy long-term bonds, you need to think about whether you like to buy the company's long-term earnings yield. If you do like long term bonds, STRIPS are a good investment.

6) This week Eric Rosenfeld recounted the last days of LTCM and your participation in a potential bailout. He believes that if they could have gotten you back on your cell phone in Alaska the bailout would have been consummated: "to this day I think it would've gotten done if he [Mr. Buffett] was in town....however, nobody was willing to put in \$4 billion without consulting [Mr. Buffett]". Could you share your version of the story?

WARREN BUFFETT RESPONDS TO QUESTIONS FROM 85 WHARTON STUDENTS ON NOVEMBER 12, 2004

Eric called me on Sunday while I was playing bridge. I could tell from the sound of his voice that something grave was transpiring. On Monday he was on vacation with Bill Gates in Alaska, so he was negotiating on a satellite phone, while Bill was looking on. Meanwhile the captain kept moving the boat closer to shore so they could see the bears or something. Gates thought the whole situation was very amusing.

On Tuesday, he was at Yellowstone, and negotiating using an intermediary at Goldman Sachs, and finally gave Goldman his terms on Wed morning. He told Peter (GS Banker) to put in the bid - \$3bn from Mr. Buffett, \$750mm from AIG, and \$250mm from GS. He told Peter to sign his name on the (in)famous letter. Peter asked if he was crazy, but Mr. Buffett told him to just do it. So Peter signs my name, John Corzine's and Hank Greenberg's. He figured if he was on the hook, so he might as well sign Hank Greenberg's name. I don't think anybody's signed Hank's name before. I then went on the bus through Yellowstone (out of range for the satellite phone).

John (Merriwether) got \$150mm (\$250?). But it left a lot to work out between Wednesday and Monday. "If I'd been in NY, we'd have made the deal....that's [description of Eric Rosenfeld's version] a very accurate rendition of what happened."

They [LTCM] and [NY Fed Governor] McDonnough played the hand the way they should have....but I got to see Old Faithful. I've told Bill Gates lots of times he's cost us a lot of money.

I knew the stuff they were doing...these are the kind of positions I would've put on...I think we would have made multiple billions...I've made a lot of money on weekends.

I don't blame him [Merriwether] – he got an extra \$150 million

7) You and Charlie Munger believe that the easiest person in the world to fool is yourself. Have you been fooling yourself by remaining committed to certain buy and hold doctrines, especially considering they are alluring because you have to work less since good investments work for you.

People believe what they want to believe. Everyone rationalizes their actions. A partner like Charlie can point it out to me. If we have a strength, it is that we think things through and we have the advantage of having each other. We are not influenced by other people. Charlie would say we are successful because we are rational and do our own work.

Paraphrasing Keynes', "The difficulty lies not in the new ideas but in escaping from the old ones," Mr. Buffett remarked: The problem is not holding onto the new [ideas]. The problem is escaping from the old. Darwin claimed he had to write down new ideas constantly. His mind would race to find new ideas. But if he did not write down his new findings within 30 minutes his subconscious would wipe them out and revert to old beliefs.

WARREN BUFFETT RESPONDS TO QUESTIONS FROM 85 WHARTON STUDENTS ON NOVEMBER 12, 2004

8) What do you believe is the top thing that will affect our great country's competitiveness in the future and what would you advise be done to address it? (can follow up with health care and social security/pension gap)

One of the biggest problems facing the country is weapons of mass destruction. But there isn't much that can be done about the problem (there will always be terrorists).

The trade deficit, of which current account deficit accounts for 90%, is the biggest economic problem facing the U.S. It is very complicated and not covered sufficiently in the debate. Social security and Healthcare are two issues tied in with the issue of the trade deficit. When there is no trade deficit, there is no net holding by foreigners. Currently government redistributes 22% of the US output to social security and healthcare. And these issues are eternal intra-family political squabbles over the redistribution between those who are producing and those who are not producing? Trade Deficit is a transfer of ownership or IOU on converted ownership, representing \$1.8BN of outflow to foreign countries. It can't be easily addressed. If the trade deficit continues at the current rate for the next 6-10 years, foreigners will have a permanent call on 3% of the output.

Can we afford this? Potentially yes. Foreign aid administered after the Marshall Plan post-WWII can be appropriate. However this is an accumulated burden to be paid by future generations because their "parents" didn't want to pay for it. This could play a significant factor in future financial market disruption. "When someone fires in the theater on the stage" with significant amount of assets held by foreigners, along with other things happening at the same time, the trade deficit could be the #1 problem in the next financial event.

On healthcare, you have to rationalize healthcare demand when healthcare costs become higher and higher. The demand structure under the current system is not sustainable. We need to reframe some of the expectations of people and reframe what is the appropriate level of healthcare provisions. For example: Should we keep everyone alive for their last 3-6 months? Should people get the maximum amount of care to keep healthy? Government needs to ration it through government policy and people's willingness to wait.

9) Is there a significant portion of the value you generate from the portfolio derived through active investment (e.g., influence on management decision, etc.) If so, what do you think of the role and probability of long-term success of an investment manager with little influence over management decisions, i.e., a passive investor? Has passive investing lost some of its appeal for you because you have been personally disappointed with the management of major American corporations? If so, what implications does that have for America?

In short, Charlie and I do not and should not have a significant impact on the management of our companies. You would be surprised how little impact we have on management. They [CEOs] all have different batting stances and know what style works for them. There would be no point for us to tell them to alter their stance as you can still

WARREN BUFFETT RESPONDS TO QUESTIONS FROM 85 WHARTON STUDENTS ON NOVEMBER 12, 2004

be a good hitter even if you stand different to the next man - we hire them as they are good hitters.

In terms of our influence on the CEO's of our public holdings - we are "toothless tigers". We do not control the company and do never threaten to sell our stakes if our advice is not taken, therefore we are very much toothless tigers. We are holders of the stock for the long-term and therefore do not gain from short-term increases in the price. Moreover, we actually prefer for the price to go down in the near term so we can buy more stock and increase our stake in the company. However, the disclosure rules make it increasingly difficult for us to build up stakes in companies. For instance, we rarely invest in the UK as there is a 3% disclosure rule so we can not build a meaningful stake before it becomes public. So historically, we performed much better when the disclosure requirements were less stringent and they have been increased steadily over time. Our investment in PetroChina was another example of disclosure rules costing us hundreds of millions of dollars. We had to announce our ownership at a 1% level, after which the price shot up.

Stockholders should be able to think and behave like owners. The three things that a shareholder in a public company should focus on are: do you have the right CEO? does she/he overreach? are they too focused on acquisitions or empire building and stop thinking on a per share basis? Institutional owners need to focus on these three aspects.

Both Charlie and I say we would make a lot more money if we were anonymous. You'd be surprised how little impact we have on management. They're all different individuals with their own egos, money, and even control. You'd be surprised how much we don't steer them. We have very little influence on their investments, but it doesn't matter because we don't buy and sell. We don't gain anything from the stock price going up. Piggybacking doesn't do much.

It's a big minus to operate in a public arena where people are not likely to follow. I still have 99% of my net worth in Berkshire, but I try to buy some on my own anonymously -- I do much better that way.

We ask for confidential treatment in some areas, but the SEC doesn't allow that often.

Passive investor role: big institutional owners should act and behave like owners. The big thing to worry about is whether the company has the right CEO and if it does, does the CEO overreach even if he's a good manager? The only people who can stop that are the directors and owners...and the directors will only stop it if the owners make a case. CEOs will sometimes do things uneconomic to satisfy primal urges. My instinct is that the institutional investors behave better than they did 10 years ago.

10) I am also from Omaha. When I tell people at school about your frugal financial approach, they are stunned. What is your specific philosophy about wealth? And how do you think this discipline has contributed to your success running Berkshire?

WARREN BUFFETT RESPONDS TO QUESTIONS FROM 85 WHARTON STUDENTS ON NOVEMBER 12, 2004

Mr. Buffett feels he was lucky to be born in the US (he won the ovarian lottery). He believes that he's wired in a way that works well in a capitalistic society: he has the innate ability to allocate money. He believes that society has enabled him to earn this money and so he believes that the money should go back to society eventually. He believes in a graduated income tax. Society has contributed to his wealth so they should benefit.

He discussed the effect wealth has on an individual and the effect it has had on his life: It means that he can do whatever he wants to do. He has the luxury to make choices. But, he has no desire to be a greenskeeper- to own a 20 acre property which requires him to devote time to organizing and maintaining it. Further, spending the next 4yrs building a house doesn't appeal to him. He won't find a house where he'd be happier than the one he's live in since '58-59. He has no interest in owning a large yacht- he views this as more of a hassle than anything else. He prefers to use his wealth to do what he wants to do with the people he wants to do it with.

He likes his life. He likes the people he works with- nobody has left Berkshire voluntarily in 15 yrs. He won't buy a business owned by someone he doesn't like.

If one were to ask Charlie why they were successful, he would respond that it was due to “rational decision making” and being able to not depend and focus on what someone else thinks is important. Also stressed that he was very lucky to be born in the country that he was. Likened it to a lottery with a 1 in 50 chance. This is because he is “wired in a way to be very effective” in a large economy where capital allocation skills are needed and highly rewarded. He illustrated the counter example with a quote from Gates saying that if he were born a few thousand years earlier he “would be an animal’s lunch”.

As for the trappings of wealth, he believes he already lives the life he wants to live. He cautioned against backing into certain behaviors simply because that was what other rich people do. For example, he does not want to own a large boat as he simply does not derive enough utility out of it to justify the bother that would entail from owning and maintaining one. As it stands, he does benefit from his wealth in that he has the “ultimate luxury”, that is to do what he wants to do everyday and he’s having more fun than most 74 year olds. He doesn’t want to build a bigger house and he gets to work with people he likes. Apparently, they like him too as none of the 18 people who work with him at Berk HQ has left in 15 years. He also will not do a deal simply for the money as it would be as perverse as someone already very wealthy marrying for the money. What money has ultimately given him is the power to choose because the luxury to choose is what being wealthy is all about.

Mr. Buffett continued and discussed the middleweight boxing match he watched on PPV at \$54.95. He didn’t think twice about the cost of it. He talked about how in the not too distant past the fight would have been limited to people at Madison Square Garden whereas the boxers there stood to gain the benefit from an audience of millions because of what society as a whole has enabled. Therefore he is, and he believes so should the boxers, be in favor of progressive taxes. That is they are able to make extraordinary

WARREN BUFFETT RESPONDS TO QUESTIONS FROM 85 WHARTON STUDENTS ON NOVEMBER 12, 2004

incomes because of society and should be willing to contribute a greater share to maintaining it.

11) It is clear that you would never resort to earnings smoothing etc for Berkshire. But you do sell insurance products that have helped other companies smooth their earnings, or at least make their problems look less severe. Is there a contradiction in this?

The whole idea of insurance is that you pay a premium each year to protect for a disaster every 20 years. The nature of the product is smoothing earnings. You personally do this with your auto insurance. You pay \$400 (or \$350 if you call Geico!) to protect yourself. Sometimes companies have used it incorrectly, but this is not inherent in the insurance product. If you get into "no risk transfer" deals with insurance you can get called on it. Berkshire Hathaway has written the two biggest retroactive insurance deals. One when White Mountain bought One Beacon and the other when ACE bought Cigna. Each paid ~\$1.5 billion to reduce charges for old bad cases. Berkshire Hathaway was much better equipped to handle the risk than ACE or White Mountain (who were both stretching to pay for the deals). All of our policies are finite. There have been some cases of policies with zero risk transfer in the U.S., but they were very limited in the last five years because auditors must now sign off that there is adequate risk transfer and it is not just for accounting purposes. Generally, there is an understanding and a long relationship between the primary insurer and the reinsurer. If the reinsurer gets killed, the primary does not take the business elsewhere. They just build that experience into next year's quote. This is less prevalent now because it is less client orientated and more transaction oriented because of the introduction of brokers. There is no more relationship development, just a focus on the lowest price.

12) At our investment management conference a few weeks ago, one panel featured the CIOs from Barclays Global Investors, State Street and Vanguard, and we collectively discussed the use of derivatives in modern portfolio management. We understand you dealt with unknown exposures in a past acquisition, but wonder if you think in this environment certain institutions have the risk control and discipline to use derivatives to effectively mitigate their risks.

Berkshire uses derivatives. There is nothing evil about them per se. It is very hard to control risks without derivatives. But all mismarks on contracts are in the trader's favor, never our favor. These days, there is no money in plain vanilla stuff - the margins are too squeezed - so you get people writing very sophisticated derivatives.

Berkshire is still unwinding many of its positions. General Re had 23,000 contracts 3 yrs ago and 3000 are left. Derivatives are very tough for management. In situations like 9/11, with losses of unknown magnitude, anyone with big equity and big derivatives portfolio (when you don't know what's behind the derivatives) is in trouble. A big downgrade on the company would have followed with margin postings, etc. - trouble...

Another issue with derivatives is that the incentives of the guy writing the derivatives are not aligned with the company. For example. one of the highest paid guys at Gen Re was

WARREN BUFFETT RESPONDS TO QUESTIONS FROM 85 WHARTON STUDENTS ON NOVEMBER 12, 2004

the guy that wrote complicated contracts - and those contracts were not necessarily good for the company.

Finally, the problem with large derivatives portfolios is that they tend to be directly related to equity positions that company has. This interdependence means that billions of dollars on your balance sheet are dependent on others performance (other equity performance) - not on your own company performance.

"Derivatives are like AIDS - its not who you slept with, but who they slept with"

13) You often talk about the importance of investing only with people you like, trust and admire. However, you've bought companies only days after you became aware of them. How do you evaluate the owners and managers of a company before investing?

After mentioning that he's actually bought companies after only brief telephone conversations, Mr. Buffett admitted that "every now and then you miss", but added that "it's better than the odds of marriage". He went on to say that "sometimes you size up people better with more time", but he didn't sound like he needed much time to recognize the type of character he looks for.

The key question for him when evaluating the management of a potential acquisition target is "do they love the money or the business". His concern is that he monetizes the owner/manager's wealth and that may cause the latter, if he doesn't truly love the business, not to work as hard after he's sold out to Berkshire. He said he looks for the "obvious cases" of owners who truly love their businesses and added that he's mostly been successful (has had "a good batting average") in identifying them.

For those owners, their businesses are their life's work, which Mr. Buffett compared to a painting: "You spent all your life painting this painting. You can sell it to us and see it hanging in a place of honor in a museum. Or you can sell it to an LBO operator and see it hanging in a porn shop.

"I once bought a jewelry business over the phone. I could tell that the current owner was the 'right' type of person. The owner's great grandfather had started the company and I could tell that the owner really loved the business."

Mr. Buffett said that he can usually "size someone up in less than a day". The most important question he poses in buying a business and looking at management is, "do they love the business?" He phrased it in this way: "If you spend your whole life painting a picture would you rather have that painting on exhibit at the Metropolitan Museum of Art, or would you rather earn 5% more on the sale of the painting and have it hanging in a porn shop?"

He has had a great batting average in picking companies and people. But he says that "we can't tell with everyone and once in a while we make a mistake."

WARREN BUFFETT RESPONDS TO QUESTIONS FROM 85 WHARTON STUDENTS ON NOVEMBER 12, 2004

14) The profits of financial companies as a % of total US corporate profits is at an all-time high (~40%) -- is this just the result of the carry trade, which will end, or perhaps bogus use of derivatives, or is there something more structural changing?

15) On his fears about US dollar weakness:

The dollar is not overvalued on a purchasing power basis. Macroeconomics is not our usual game, however if some economic facts are screaming at us, we jump on them. We don't usually do junk bonds, however if you cast your eye about, you can always find deals. I don't feel like doing macro bets as much with other people's money as my own. We work with big currencies-- eight of them. I don't have a view about which will move most against the dollar. My view is that the dollar will weaken. Countries support their own currency-- Japan wanted to keep their currency down which kept the US currency up. I don't know if China or HK will decouple their currency from the US. I like to have earnings in other currencies because they convert into more dollars, however I keep most of our cash in dollars.

16) On probabilistic thinking: while we would all love to do it, how does one distinguish between true subjective probabilistic thinking and bias induced guesswork?

Of course we try to make decisions based on probability and not guesswork. I agree strongly with the thoughts in Robert Rubin's book (In An Uncertain World). It's all probabilities. The one time when Charlie and I have trouble doing this is when it comes to firing people. I hate doing that and I avoid it as much as possible. We had one manager at one of our companies who developed Alzheimer's disease. It took us a long time to see it, and after we saw it, it took us a long time to act on it. Fortunately, the company still did well even while he had Alzheimer's, so we've developed a new rule around here: Only buy businesses that are so good that someone with Alzheimer's can manage them!

We all think we're doing the former – probabilistic thinking.

Mr. Buffett said he tries to always use probabilistic thinking. That's what he likes about the insurance business and investments. We try to think through every decision that comes to us. Some decisions are simple probabilities.

However, Mr. Buffett added that we're human and probabilistic thinking is not always possible. Mr. Buffett said that when dealing with other people, such as firing someone, is a time in his case that he may stray from probabilistic thinking. An example was when

WARREN BUFFETT RESPONDS TO QUESTIONS FROM 85 WHARTON STUDENTS ON NOVEMBER 12, 2004

Mr. Buffett denied that one employee who ran one of his businesses had Alzheimer's for one year beyond when anyone else would have picked up on it. He said how hard it was for him to fire him, especially since he loved the person but he was just no longer good at the job. He, therefore, unintentionally postponed the decision. Mr. Buffett said he looked for countering evidence because he hates to fire a CEO he likes. He said he will tolerate a lot from someone who has been an associate. Mr. Buffett then joked that now he buys business that even a person with Alzheimer's can run!

One thinks they know when they're getting way from probabilistic thinking, but you can not always detect it.

Mr. Buffett recommended Bob Rubin's book in which he recommends ways to think in the economic world

He concluded that business is all probabilistic thinking but some thinking is better not being calculated, for example in relation to people you love and humans in general.

17) You said a year or two ago that the ratio of US corporate profits as a % of GDP was historically high, at 6%, and would likely fall. Since then, the ratio has gone up (nearing 8%). Has something structurally changed, or are you confident that the ratio will still fall back?

Mr. Buffett responded that he doesn't believe the 8% rate will be sustainable, and he views 6% as a more reasonable figure in the long-run. Moreover, he has trouble reconciling high corporate profits % (even at 6% level) with the corresponding figure of federal taxes paid by corporations, which is currently also at a very high level – 1.5% of GDP.

After a brief discussion of corporate profits and corporate taxes as a percentage of GDP, Mr. Buffett shared an interesting view on federal taxation. In a way, federal government owns a special class of stock (let's call it Class AA stock) in every corporation. For example, last year Berkshire Hathaway paid ~ \$3.4 bil. to federal government in relation to this "stock." The more the company reinvests in its business, the higher next year's earnings and tax payments are – i.e. the higher the dividends and the value of the AA stock are). Moreover, at any point in time, the federal government can change the % of earnings to be distributed to it (i.e. change the tax rate). If the government would ever decide to "go public" with a security of future Berkshire Hathaway tax payments, that stock would be very attractive. Wall Street would love it. In fact, at 35% tax rate, that stock could be worth as much as the entire Berkshire Hathaway.

Tuesday, January 25, 2005

The Wisdom of Warren Buffett

I spent 6 hours last week in Omaha with Warren Buffett. As I walked into the meeting I was pleasantly surprised to find Mr. Buffett dressed more like a scroungy sophomore chemistry student than the greatest investor of all time. It was an open Q&A session with some of my colleagues and me for about 3 hours.

Going into the meeting, I was thinking that I would receive a great deal of advice about investing and how to quantify intrinsic value. I figured he'd tell us all about "Mr. Market" and how his favorite holding period is forever. Then I figured we'd get around to his bet on the Euro or his belief that the market is irrational and inefficient. Or perhaps the second richest man in the world would, I don't know, talk about money?

Total time spent talking about any of the above: Zero. Zilch. Nada.

Let's get to what he DID talk about. As a big fan of "Top" lists, I've compiled the "Top 5" things (prioritized) I learned from Warren Buffett that day:

1. Be Grateful -

There are roughly 6 Billion people in the world. Imagine the worlds biggest lottery where every one of those 6 Billion people was required to draw a ticket. Printed on each ticket were the circumstances in which they would be required to live for the rest of their lives.

Printed on each ticket were the following items:

- Sex
- Race
- Place of Birth (Country, State, City, etc.)
- Type of Government
- Parents names, income levels & occupations
- IQ (a normal distribution, with a 66% chance of your IQ being 100 & a standard deviation of 20)
- Weight, height, eye color, hair color, etc.
- Personality traits, temperament, wit, sense of humor
- Health risks

If you are reading this blog right now, I'm guessing the ticket you drew when you were born wasn't too bad. The probability of you drawing a ticket that has the favorable circumstances you are in right now is incredibly small (say, 1 in 6 billion). The probability of you being born as your preferable sex, in the United States, with an average IQ, good health and supportive parents is miniscule.

Warren spent about an hour talking about how grateful we should all be for the circumstances we were born into and for the generous ticket we've been offered in life. He said that we should not take it for granted or think that it is the product of something we did - we just drew a lucky ticket. (He also pointed out that his skill of "allocating capital" would be useless if he would have been born in poverty in Bangladesh.)

2. Be Ethical & Fair

Continuing on the analogy above, consider this scenario:

Imagine that you were selected as the one person (out of 6 Billion) to create the systems of the world. This includes the type of government, social programs, tax systems, military systems, job markets, laws, regulations, etc.

The only catch was this: You had to come up with systems that you believed were fair and that you wanted to live with, before you were allowed to look at your ticket.

When Warren talked about this it made me reconsider the definition of ethical behavior - what type of system would you create if you didn't know what ticket you had drawn? Would you take a different position on some of the programs you are for or against if you were surrounded by a different set of circumstances?

3. Be Trustworthy

This may be a minor point that Mr. Buffett was trying to make, but he told a simple story that affected me greatly. He told of the Founder of the Nebraska Furniture Mart, one of his companies, and how she came from a poor Jewish family and couldn't read, write or speak English. She had survived the Holocaust, spent 16 years bringing her family to the U.S. (at \$50 per person), and grew the Nebraska Furniture Mart from a \$500 initial investment to do \$350 Million annually from a single location in Omaha.

She told Warren at one point that the way she evaluated people was simple: She simply asked herself, "Would they hide me?" What a great way to judge your instincts about whether to trust someone or not.

4. Invest in Your Circle of Competence

Warren talked at length about investing within your circle of competence. This applies as much to entrepreneurship as it does to investing in public securities. One thing that continually amazes me is how much discipline Warren has in never letting himself get excited about a deal that he doesn't understand. He understands his weaknesses, limitations, and the types of businesses that he gets.

He said that it is crucial that people clearly recognize what they don't understand, and place their effort and energy on businesses or career paths that allow them to bet big on

themselves doing something that they do understand. He said that it's "not so important how big the circle is, but it's important that you know where the perimeter is, and when you're outside of it."

5. Do What You Love

Perhaps the reason that we've heard this a million times is that it's true. Warren talked at length about how excited he is to wake up in the morning and to do what he loves. He talked about how important it is to have the freedom in your life to paint your own canvas any way that you like. He said that many people talk about how they are going to just work at a high-paying job "for a little while" and then go do what they love - he equated that to "saving up sex for old age." He said to "never do something that doesn't excite you or that you dislike."

Not the advice you'd expect from somebody worth over \$40 Billion?

I only hope that as I gain success throughout my career that I can mirror the image of humility, charity, intelligence, optimism and justice that Warren Buffett represents.

Meeting with Warren Buffett 28Jan05 – synthesized notes by topic

On investing...

How Warren spends his day:

- Wakes up at 6:45, reads paper at home, often doesn't make it into the office until after the market opens
- No set schedule, WB hates having a full calendar
- Always takes reading material home
- Spends 80% of the day reading, 20% talking on the phone (he then said it might be more like 90/10)
- Phone conversations are generally short

Investment process:

- In the past some things were cheap enough WB could decide in a day (this was somewhat a function of a time period where companies would sell at 2-3x earnings)
- Decisions should be obvious to onlookers. You should be able to explain why you bought something in a paragraph.
- "I don't do DCF" (WB says he does a rough approximation in his mind)
- Finding ideas is a function of cumulative knowledge over time. Something just comes along – usually an event takes place, like a good management team screwing up – that creates the opportunity (WB seems to imply here that his reading isn't specifically targeted at finding ideas, but rather that ideas jump out at him as a natural consequence of voracious reading)
- You must be patient...good ideas tend to be clustered together, and may not come at even time intervals...when you don't find anything for a while it can be irritating
- WB isn't bothered by missing something outside his circle of competence
- Missing things inside the circle is nerve racking...examples include WMT, FNM

Advice for new investors:

- Don't worry too much about your mistakes
- Don't learn too much from your mistakes
 - o Don't become Mark Twain's frog that never sat again on a stove after being burned
 - o BUT...never be willing to play a "fatal" game
- Don't confuse social progress with the chance to make money – look at airlines and autos for examples
- Law degree is not essential, but good if you think it will help in your specific career
- Learning to think like a lawyer is a valuable trait
- Allocate even more of your day to reading than he does
- Read lots of K's and Q's – there are no good substitutes for these
- Read every page
- Ask business managers the following question: "If you could buy the stock of one of your competitors, which one would you buy? If you could short, which one would you short?"
- Always read source (primary) data rather than secondary data
- If you are interested in one company, get reports for competitors. "You must act like you are actually going into that business, and if you were, you'd want to know what your competitors were doing."

Why more people don't follow his advice:

- The advice doesn't promise enough...it's not a "get rich quick" scheme, which is what a lot of other philosophies promise
- WB mentioned that when he was really young he started investing using technical analysis, but found that he never could make any money with it
- "I realized that technical analysis didn't work when I turned the chart upside down and didn't get a different answer."
- After seeing that charting didn't work, he switched to Graham...it made sense and it worked

What Warren reads:

- Most of reading includes K's, Q's and 5 newspapers daily
- Hasn't found much worthwhile book reading outside of Graham and Fisher

Advice to non-professional investors:

- If you like spending 6-8 hours per week working on investments, do it
- If you don't, then dollar cost average into index funds. This accomplishes diversification across assets and time, two very important things.
- "There is nothing wrong with a 'know nothing' investor who realizes it. The problem is when you are a 'know nothing' investor but you think you know something."
 - o NOTE: this is analogous to the concept of 'metaknowledge' that Mauboussin talked about...there's also a Confucius quote on this

Avoiding human misjudgment:

- WB said repeatedly that it doesn't take above a 125 IQ to do this...in fact, IQ over this amount is pretty much wasted. It's not really about IQ.
- Staying within circle of competence is paramount
- When you are within the circle, keep these things in mind:
 - o Don't get in a hurry
 - o You are better off not talking to others
 - o Just keep looking until you find something (don't give up)
 - o Good ideas come in clumps – by time, by sector, by asset class

Discount rates used for valuation:

- Use a long term normalized interest rate for Treasuries...e.g. 6%
- Don't use different discount rates for different businesses...it doesn't really matter what rate you use as long as you are being intellectually honest and conservative about future cash flows.
- Only want one variable to compare in order to assess the viability of an investment – price versus value. If we allowed discount rates to change it would lead to more than one variable.
- WB's assessment of the risk of a company is baked into the probabilities for future cash flow scenarios of the company
- "I don't know what the true cost of capital is for a business unless we own it"

Starting a fund from scratch today:

- Probably would do the same thing he did before

On Berkshire...

Managing Berkshire:

- Focused hard on creating a company over time that he would like today...built the company around the way he likes to work
- Hates meetings, managing people, and company rituals
- BRK has no general counsel or IR
- Directors meet in person only once per year
- 17 people employed at HQ
- "I don't call managers of my businesses, they call me"

Buying businesses:

- The first question I ask is: "Does the owner love the business or does he/she love the money?" It's very easy to tell the difference.
- I am proud to be able to provide a good home for many businesses. It is like finding a home for a painting. Business owners who are looking to sell can either sell their businesses to Berkshire (like putting painting in the Metropolitan Museum of Art) or sell to an LBO and let them tear it up, dress up the accounting, and resell it (like selling a painting to a porn shop).

Why he has a large cash position:

- Can't find things to buy
- In the past there were times it was like shooting fish in a barrel...sometimes even like shooting idle fish in a barrel...it's not like that now, but there will be times in the future when it will be like that again
- Berkshire is currently putting a few billion to work buying a stock, but it wouldn't trouble him deeply if they were not able to take the position

On specific industries or companies...

Subprime mortgage industry:

- There are similarities between subprime and manufactured housing financing
- The most important factor for the subprime industry is the health of the economy, which has been good of late
- Securitization moves the ultimate lender farther away from borrower, which is what causes problems
- A shock will probably not occur unless we see materially higher long interest rates...200-300bps
- As long as participants in that industry are charging a high enough interest rate to account for the inherent credit risk, it should be okay.
- As far as housing prices go, there won't be a problem until the collateral value falls below the value of the loan
- "We haven't played in that [the subprime industry] yet, but we do own H&R Block, which does some of those loans, although they don't keep the paper."
- REIT structures in the subprime industry aren't necessarily a bad thing
- The economy is going to be far more important than the structure used

Competitive advantage and business model in banking:

- Banking is a good business - many banks earn high returns on tangible equity
- “Charlie and I have been surprised at how much profitability banks have, given that it seems like a commodity business.”
- Underestimated how sticky customers are and how unaware they are of fees banks charge them
- WFC - \$4.00 per share after full taxes on \$15 of tangible equity
- If you have a well run bank, you don't need to be the #1 bank in an area
- Bank ROA is not highly correlated to size
- You may have to pay 3x tangible equity to buy a bank
- Only problem with banks is that sometimes they get crazy and do dumb things... '91 was a good example
- If a bank doesn't do dumb things on the asset side, it will make good money

Auto industry outlook (especially GM):

- GM bonds are currently selling at B spreads
- Auto industry is a very tough business
- In the '60's GM had over 50% of the US car market...people thought they were impenetrable
- GM did dumb labor deals when the accounting didn't require accruals for costs
- GM is now a terrible life/health benefits company with an auto business attached
 - o Auto business is well managed, but labor issues are just killer
- 2000 auto companies were started after Henry Ford – there are now 3 left in the US – no money has been really made over time

Musings on Coke:

- The chance that Coke is not the leader in the carbonated beverage business in the future is very small
- Candy bars become very entrenched in their markets and are hard to unseat...they don't travel well into new markets
- Coke travels well into new markets
- One of the most important thing about Coke as a consumer product is that Coke does not have a “taste memory.” In other words, the taste of Coke doesn't accumulate in your mouth. This is what makes it easy for some people to have 3,4,5+ Cokes each day. They never tire of it because there is no taste residue. Orange or grape soda accumulates and you get sick of it. Same thing with chocolate. There is no diminishing marginal utility of taste for Coke. WB doesn't believe there has ever been a word written about this phenomenon.

On currencies...

Bet against the dollar / currency hedging:

- Currently owns over \$20B in foreign currency
- No strong feeling on which currencies will do best against the dollar
- Increasing interest rates will also add to debt service burden to foreigners

- Every day US consumes 5% more than we produce...US is like an enormously wealthy family with a very large farm, and we keep mortgaging larger and larger pieces of it to foreigners
- Foreigners own net \$3T of US securities...goes up \$2B per day
- This is no a “doom and gloom” bet on the US – still a great country with great infrastructure
- Formulated thesis after reading Bureau of Economic Analysis data
- In November trade imbalance with China was \$16B (\$190B annualized)
- This is not a short term bet...don’t know where the dollar is going over the next year...this is a five year bet
- Typical investor should not make the same bet unless one found a foreign stock that was attractive...could buy the stock and leave the currency risk unhedged
- WB never hedges currency risk when he buys a foreign security because he likes the extra diversification it provides

Impacts of the potential revaluation of the Yuan:

- If it revalues 10-20% it probably won’t have a material impact because the discrepancy between labor costs in China and US is so large
- It is unlikely that China will remove the peg
- Wal-Mart is opening up big in China

The future of the Euro:

- There will be strains, but it should be fine over the long term
- WB believes it has been a good thing for Europe and the world

On inflation...

Inflation and the CPI:

- CPI is flawed as a measure of inflation
- Average person’s CPI has a very different composition than the weighted CPI used to calculate inflation
- CPI understates human consumption
- Businesses often have contracts that range from 90 to 360 days, therefore inflation lags substantially
- Eventually higher raw material costs will get passed through to the consumer
- Health care is 6% of CPI, but 14% of GDP
- Home ownership was taken out of the CPI 20 years ago and replaced by an imputed rent amount
 - o Rental rates have not risen since then but home prices have...the increased burden of higher home prices has been fortunately offset for a while by lower interest rates

On commodities...

Oil and natural gas:

- Everyone thinks oil has moved a lot...you have to consider the weakening of the dollar...if you look at oil priced in Euros it has not moved a lot...same situation with gold

- We have seen a real increase in many raw materials...coal is a good example; very scarce right now
- WB doesn't play the game of betting on the price of oil or commodities often
- Natty – MidAmerican is looking at an Alaskan pipeline
- Alaska has 80T-90T cubic feet of natural gas (a lot)
- Trouble with Alaska opportunity:
 - o \$2/mcf transport costs
 - o Takes 6-7 years to build pipeline – hard to make 6-7 year commitment with uncertain future price outlook
 - o Same issue with LNG terminal build-out
- Most commodity companies don't trust current prices because they've been burned too many times on price
- Oil exploration in the US is tough
- Today our onshore production is 6MM barrels/day
- We used to be self-sufficient in oil production, to the point where we had to periodically shut down because we were producing too much
- US is the most explored oil province in the world – haven't found a real elephant in the lower 48 states in 30-40 years
- BRK is not tempted to bet in the oil exploration business in any material way

Aluminum:

- No real opinion on it
- The problem with raw materials businesses is that there's no brand identity...no one ever says, "I want a Coke only if it comes in an Alcoa aluminum can"
- Aluminum, to a large degree, is just stored up electricity, because power is such a huge component of its production cost

On public policy...

Privatizing social security:

- We must remember that social security is not for you or me
- 10-20 million people will not be able to support themselves when they are old
- A rich society like the US should provide that support for its citizens (before one is productive a society should provide good schools, and after one is productive, a society should provide financial support).
- Don't think it's good to let less competent investors do it on their own...they need help, they are not "wired" to be good investors, and it's our responsibility to help provide them with the highest SS base possible
- Privatization plan would lower the base and require you to invest to make up the difference

Miscellaneous...

Impact of emerging economies on US:

- Don't think it will be anything dramatic

Social activities:

- Spends 1-2 hours 4-5 times per week playing bridge

Charity:

- Doing charity work is the opposite of investing – with charity, we look for the most difficult problem to solve and the ones that have the lowest probability of success
- WB is giving guidelines to trustees (see above), but he's not dictating exactly where he wants to give. WB realizes that he will have no idea what the big problems will be in the distant future after he's gone

Warren's success:

- "I was born wired to allocate capital well." If I was born in Bangladesh and I walked down the street explaining that "I allocate capital well", the townspeople would say "get a job".
- Bill Gates says that if I was born 1000 years ago, I wouldn't survive because I am not fast or strong. I would find myself running from a lion screaming "I allocate capital well!!"

Warren Buffett

Chairman and CEO of Berkshire Hathaway

I had two mentors: my dad, Howard Buffett, and Ben Graham. Here were these two guys who I revered and who over the years gave me tons of good advice. But when I think about what they said to me, the truth is, the first thing that comes to mind is bad advice.

I was not quite 21 when this happened, in 1951, and just getting out of business school at Columbia. I had just taken Ben's class there -- and I was the most interested student you ever saw. I wanted to work for Ben at Graham-Newman Corp., and I had famously gone to him and offered to work for nothing. He said no.

But I still was determined to go into the securities business, and that's where Ben and my dad gave me the bad advice. They both thought it was a bad time to start. One thing on their minds was that the Dow Jones industrials had been above 200 all year, and yet there had never been a year when it didn't sell below 200. So they both said, "You'll do fine, but this is not a good time to start."

Now there's one thing that may have influenced my dad, and maybe Ben too. I was so immature. I was not only young-looking, I was young-acting. I was skinny. My hair looked awful. Maybe their advice was their polite way of saying that before I started selling stocks, I needed to mature a little, or I wasn't going to be successful. But they didn't say that to me; they said the other. Anyway, I didn't pay any attention. I went back to Omaha and started selling securities at my dad's firm, Buffett Falk.

My dad was a totally independent thinker. I suppose the fact that he was has influenced my own thinking some when it comes to buying stocks. Ben instructed me some there too. He said, "You're neither right nor wrong because others agree with you. You're right because your facts and reasoning are right."

Now, Ben -- I started learning from him when I read his books on investing at the University of Nebraska. I had tried all kinds of investing up to then, but what he said, particularly in *The Intelligent Investor*, just lifted the scales from my eyes -- things like "margin of safety" and how to use "Mr. Market" rather than letting him use you. I then went to Columbia just to take his class and later got that turndown when I asked him for a job. But I kept thinking about that idea when I went back to Omaha. I kept trying to sell Ben stocks and pestering him, sort of. And finally one day in 1954 I got a letter from him saying something to the effect of the next time you're in New York, I'd like to talk to you about something. I was elated! And I made a point of getting to New York immediately.

I went to work for Ben in August 1954, without ever having asked what my salary would be. It turned out to be \$12,000, plus the next year I got a \$2,000 bonus. I worked for both parts of the business: Graham-Newman was a regulated investment company, and Newman & Graham Ltd. was what we'd today call a hedge fund. But together they ran only \$12 million!

Walter Schloss and I -- though he left before long to start a hedge fund -- worked together in a little room. We had a lot of fun with each other, plus we kept poring through the manuals, looking for

cheap stocks. We never went out to visit any companies. Ben thought that would be cheating. And when we found something terrific, Ben would put 50,000 bucks into it.

By early 1956, Ben was planning to leave the firm to go to California. And I had already decided by then to go back to Omaha. I had a terrible time telling Ben about that: I'd go into his office and come back, and then go in and not do it, for a really long time. But his reaction was kind of the same as my dad would have had: whatever's best for you.

I had \$9,800 at the end of 1950, and by 1956 I had \$150,000. I figured with that I could live like a king. And I didn't know what I was going to do in Omaha. Maybe go to law school. I did not have a plan. I certainly didn't know I was going to start an investing partnership. But then a couple of months later, seven people wanted me to invest their money for them, and a partnership was the way to do it. And that began it all.

--2005

Buffett: Cut your gains!

In his 2006 letter to Berkshire Hathaway shareholders, Warren Buffett explains how costly it can be to let advisors come between you and your money.

By Warren Buffett

March 6, 2006: 5:54 AM EST

(FORTUNE Magazine) - *Warren Buffett often uses his annual report to comment on subjects he believes of importance to today's markets. Here, from the report published Saturday, is an allegory about "How to Minimize Investment Returns."*

It's been an easy matter for Berkshire and other owners of American equities to prosper over the years.

Between Dec. 31, 1899, and Dec. 31, 1999, to give a really long-term example, the Dow rose from 66 to 11,497. (Guess what annual growth rate is required to produce this result; the surprising answer is at the end of this piece.)

This huge rise came about for a simple reason: Over the century, American businesses did extraordinarily well and investors rode the wave of their prosperity. Businesses continue to do well. But now shareholders, through a series of self-inflicted wounds, are in a major way cutting the returns they will realize from their investments.

The explanation of how this is happening begins with a fundamental truth: With unimportant exceptions, such as bankruptcies in which some of a company's losses are borne by creditors, the most that owners in aggregate can earn between now and Judgment Day is what their businesses in aggregate earn. True, by buying and selling that is clever or lucky, investor A may take more than his share of the pie at the expense of investor B.

And, yes, all investors feel richer when stocks soar. But an owner can exit only by having someone take his place. If one investor sells high, another must buy high. For owners as a whole, there is simply no magic -- no shower of money from outer space -- that will enable them to extract wealth from their companies beyond that created by the companies themselves.

Indeed, owners must earn less than their businesses earn because of "frictional" costs. And that's my point: These costs are now being incurred in amounts that will cause shareholders to earn far less than they historically have.

To understand how this toll has ballooned, imagine for a moment that all American corporations are, and always will be, owned by a single family. We'll call them the Gotrocks. After paying taxes on dividends, this family -- generation after generation -- becomes richer by the aggregate amount earned by its companies.

Today that amount is about \$700 billion annually. Naturally, the family spends some of these dollars. But the portion it saves steadily compounds for its benefit. In the Gotrocks household everyone grows wealthier at the same pace, and all is harmonious.

But let's now assume that a few fast-talking Helpers approach the family and persuade each of its members to try to outsmart his relatives by buying certain of their holdings and selling them certain

others. The Helpers -- for a fee, of course -- obligingly agree to handle these transactions. The Gotrocks still own all of corporate America; the trades just rearrange who owns what.

So the family's annual gain in wealth diminishes, equaling the earnings of American business minus commissions paid. The more that family members trade, the smaller their share of the pie and the larger the slice received by the Helpers. This fact is not lost upon these broker-Helpers: Activity is their friend, and in a wide variety of ways, they urge it on.

After a while, most of the family members realize that they are not doing so well at this new "beat my brother" game. Enter another set of Helpers. These newcomers explain to each member of the Gotrocks clan that by himself he'll never outsmart the rest of the family. The suggested cure: "Hire a manager -- yes, us -- and get the job done professionally."

These manager-Helpers continue to use the broker-Helpers to execute trades; the managers may even increase their activity so as to permit the brokers to prosper still more. Overall, a bigger slice of the pie now goes to the two classes of Helpers.

The family's disappointment grows. Each of its members is now employing professionals. Yet overall, the group's finances have taken a turn for the worse. The solution? More help, of course.

It arrives in the form of financial planners and institutional consultants, who weigh in to advise the Gotrocks on selecting manager-Helpers. The befuddled family welcomes this assistance. By now its members know they can pick neither the right stocks nor the right stock pickers. Why, one might ask, should they expect success in picking the right consultant? But this question does not occur to the Gotrocks, and the consultant-Helpers certainly don't suggest it to them.

The Gotrocks, now supporting three classes of expensive Helpers, find that their results get worse, and they sink into despair. But just as hope seems lost, a fourth group -- we'll call them the hyper-Helpers -- appears. These friendly folk explain to the Gotrocks that their unsatisfactory results are occurring because the existing Helpers -- brokers, managers, consultants -- are not sufficiently motivated and are simply going through the motions. "What," the new Helpers ask, "can you expect from such a bunch of zombies?"

The new arrivals offer a breathtakingly simple solution: Pay more money. Brimming with self-confidence, the hyper-Helpers assert that huge contingent payments -- in addition to stiff fixed fees -- are what each family member must fork over in order to really outmaneuver his relatives.

The more observant members of the family see that some of the hyper-Helpers are really just manager Helpers wearing new uniforms, bearing sewn-on sexy names like HEDGE FUND or PRIVATE EQUITY. The new Helpers, however, assure the Gotrocks that this change of clothing is all-important, bestowing on its wearers magical powers similar to those acquired by mild-mannered Clark Kent when he changed into his Superman costume. Calmed by this explanation, the family decides to pay up.

And that's where we are today: A record portion of the earnings that would go in their entirety to owners -- if they all just stayed in their rocking chairs -- is now going to a swelling army of Helpers. Particularly expensive is the recent pandemic of profit arrangements under which Helpers receive large portions of the winnings when they are smart or lucky, and leave family members with all the losses -- and large fixed fees to boot -- when the Helpers are dumb or unlucky (or occasionally crooked).

A sufficient number of arrangements like this -- heads, the Helper takes much of the winnings; tails, the Gotrocks lose and pay dearly for the privilege of doing so -- may make it more accurate to call the family the Hadrocks. Today, in fact, the family's frictional costs of all sorts may well amount to 20 percent of the earnings of American business. In other words, the burden of paying Helpers may cause American equity investors, overall, to earn only 80 percent or so of what they would earn if they just sat still and listened to no one.

Long ago, Sir Isaac Newton gave us three laws of motion, which were the work of genius. But Sir Isaac's talents didn't extend to investing: He lost a bundle in the South Sea Bubble, explaining later, "I can calculate the movement of the stars, but not the madness of men." If he had not been traumatized by this loss, Sir Isaac might well have gone on to discover the fourth law of motion: *For investors as a whole, returns decrease as motion increases.*

Here's the answer to the question posed at the beginning of this piece: To get very specific, the Dow increased from 65.73 to 11,497.12 in the 20th century, and that amounts to a gain of 5.3 percent compounded annually. (Investors would also have received dividends, of course.) To achieve an equal rate of gain in the 21st century, the Dow will have to rise by Dec. 31, 2099, to -- brace yourself -- precisely 2,011,011.23. But I'm willing to settle for 2,000,000; six years into this century, the Dow has gained not at all.

To: Berkshire Hathaway Managers (“The All-Stars”)

From: Warren E. Buffett

Date: September 27, 2006

The five most dangerous words in business may be “Everybody else is doing it.” A lot of banks and insurance companies have suffered earnings disasters after relying on that rationale.

Even worse have been the consequences from using that phrase to justify the morality of proposed actions. More than 100 companies so far have been drawn into the stock option backdating scandal and the number is sure to go higher. My guess is that a great many of the people involved would not have behaved in the manner they did except for the fact that they felt others were doing so as well. The same goes for all of the accounting gimmicks to manipulate earnings – and deceive investors – that has taken place in recent years.

You would have been happy to have as an executor of your will or your son-in-law most of the people who engaged in these ill-conceived activities. But somewhere along the line they picked up the notion – perhaps suggested to them by their auditor or consultant – that a number of well-respected managers were engaging in such practices and therefore it must be OK to do so. It’s a seductive argument.

But it couldn’t be more wrong. In fact, every time you hear the phrase “Everybody else is doing it” it should raise a huge red flag. Why would somebody offer such a rationale for an act if there were a good reason available? Clearly the advocate harbors at least a small doubt about the act if he utilizes this verbal crutch.

So, at Berkshire, let’s start with what is legal, but always go on to what we would feel comfortable about being printed on the front page of our local paper, and never proceed forward simply on the basis of the fact that other people are doing it.

A final note: Somebody is doing something today at Berkshire that you and I would be unhappy about if we knew of it. That’s inevitable: We now employ well over 200,000 people and the chances of that number getting through the day without any bad behavior occurring is nil. But we can have a huge effect in minimizing such activities by jumping on anything immediately when there is the slightest odor of impropriety. Your attitude on such matters, expressed by behavior as well as words, will be the most important factor in how the culture of your business develops. And culture, more than rule books, determines how an organization behaves.

Thanks for your help on this. Berkshire’s reputation is in your hands.

Warren Buffett on Walter Schloss

Let me end this section by telling you about one of the good guys of Wall Street, my long-time friend Walter Schloss, who last year turned 90. From 1956 to 2002, Walter managed a remarkably successful investment partnership, from which he took not a dime unless his investors made money. My admiration for Walter, it should be noted, is not based on hindsight. A full fifty years ago, Walter was my sole recommendation to a St. Louis family who wanted an honest and able investment manager.

Walter did not go to business school, or for that matter, college. His office contained one file cabinet in 1956; the number mushroomed to four by 2002. Walter worked without a secretary, clerk or bookkeeper, his only associate being his son, Edwin, a graduate of the North Carolina School of the Arts. Walter and Edwin never came within a mile of inside information. Indeed, they used “outside” information only sparingly, generally selecting securities by certain simple statistical methods Walter learned while working for Ben Graham. When Walter and Edwin were asked in 1989 by *Outstanding Investors Digest*, “How would you summarize your approach?” Edwin replied, “We try to buy stocks cheap.” So much for Modern Portfolio Theory, technical analysis, macroeconomic thoughts and complex algorithms.

Following a strategy that involved no real risk – defined as permanent loss of capital – Walter produced results over his 47 partnership years that dramatically surpassed those of the S&P 500. It’s particularly noteworthy that he built this record by investing in about 1,000 securities, mostly of a lackluster type. A few big winners did not account for his success. It’s safe to say that had millions of investment managers made trades by a) drawing stock names from a hat; b) purchasing these stocks in comparable amounts when Walter made a purchase; and then c) selling when Walter sold his pick, the luckiest of them would not have come close to equaling his record. There is simply no possibility that what Walter achieved over 47 years was due to chance. I first publicly discussed Walter’s remarkable record in 1984. At that time “efficient market theory” (EMT) was the centerpiece of investment instruction at most major business schools. This theory, as then most commonly taught, held that the price of any stock at any moment is not demonstrably mispriced, which means that no investor can be expected to overperform the stock market averages using only publicly-available information (though some will do so by luck). When I talked about Walter 23 years ago, his record forcefully contradicted this dogma.

And what did members of the academic community do when they were exposed to this new and important evidence? Unfortunately, they reacted in all-too-human fashion: Rather than opening their minds, they closed their eyes. To my knowledge no business school teaching EMT made any attempt to study Walter’s performance and what it meant for the school’s cherished theory. Instead, the faculties of the schools went merrily on their way presenting EMT as having the certainty of scripture. Typically, a finance instructor who had the nerve to question EMT had about as much chance of major promotion as Galileo had of being named Pope. Tens of thousands of students were therefore sent out into life believing that on every day the price of every stock was

“right” (or, more accurately, not demonstrably wrong) and that attempts to evaluate businesses – that is, stocks – were useless. Walter meanwhile went on over performing, his job made easier by the misguided instructions that had been given to those young minds. After all, if you are in the shipping business, it’s helpful to have all of your potential competitors be taught that the earth is flat.

Maybe it was a good thing for his investors that Walter didn’t go to college.

Study Visit to Berkshire Hathaway by MBA Students from Terry College of Business at the University of Georgia

January, 2007

This document is a transcript of some questions asked by the students and Warren Buffett's answers.

Compiled by Sham Gad

<http://shamgad.blogspot.com>

Opening Remarks by Warren Buffett

Everyone has the potential to achieve their dreams. The point is to get out of each of us what we are capable of producing. I will invite you to play a game. Suppose that when this class ends, you have one hour to pick a classmate that you will own 10% of his or her earnings for the rest of their life. Besides picking the one with the richest father (laughter) you would choose the person who is most effective. I would predict that you would not necessarily pick the student with the best grades or highest IQ. Instead, you would look for someone with the most integrity and intelligence. Think about the person that has a 300 horsepower motor and operates at 300hp and compare that person to someone who has a 400hp motor but operates at 150hp. You would pick the 300hp everyday.

My point is to suggest that you should become an effective human being...the chains of habit are too light to feel until they are too heavy to break!

Highlights of the Q&A

Given the steady decline in the textile industry in the Northeast and the economically depressed nature of New Bedford and other companies in the industry what made you purchase Berkshire Hathaway at the time that you did?

Buffett: Well in 1962 I learned from Ben Graham how to assess businesses. He also had the cigar butt analogy for buying businesses...you can usually get one good puff out of it and it's free. Berkshire made a lot of money after WWII (more than Pfizer and Merck) and then it steadily went downhill. Between 1955 and 1965 Berkshire went from 12 mills to 2 mills and they bought their own stock as mills closed. We bought 100,000 shares out of 1 million in 1962 at \$7 3/8 and the company had \$10-11/share in working capital. I knew I wouldn't lose money because of the working capital. It was losing money but it was also liquefying assets by closing mills.

Seabury Stanton was running Berkshire at the time and I went to go visit him. We had an agreement that Berkshire would tender \$11-1/2 for my shares of the company. At this point, I could not buy any stock as I had inside information. A few weeks later I received a letter from Old Colony Trust containing a tender offer of \$11-3/8. Early the following week, Seabury tendered the stock at 11 3/8. As result, I began buying more Berkshire. Other family members of Seabury Stanton sold their shares to me and I gained controlling interest in the company. The family members weren't very happy with Seabury either really. We ran the mills until 1985. .

See's Candy is an example of low rate of return on capital expenditures individually yet the company as a whole makes loads of money because of the great brand of See's. We bought See's in 1972 and every year since then we have raised the prices the day after Christmas and it never hurt the business. When we invest we ask one question, how long do you have to wait to raise the prices? If you are an airline today and you try to raise your prices, an

hour later, you will be lowering them because of competition. Not the case with a good brand like See's. If I were to give you a \$100 million, I'm not going to, but if I did, you could not damage the See's brand in the minds of 30 or so million Californians. Only See's can do that. Their brand is their promise to provide the quality and service that people have grown to expect.

Mr. Buffett, you have described Berkshire Hathaway as your masterpiece painting, a masterful business entity that has compounded shareholders equity at 21.5% per year since you have taken over. You have described your work as being a capital allocator and that it has been a joy for you to do that work all your life. In July 2006 you allocated all the Berkshire Hathaway shares you accumulated to the Bill and Melinda Gates Foundation and four other foundations. This act was enormous in its scope, brilliant in execution, and magnanimous in its goal. It now becomes the Bill and Melinda Gates Foundations' job to allocate \$15,000,000 each and every business day because of your donations. In your mind which part of this incredible act was most important or most concerning to you and why?

Buffett: I actually gave the stock away 15 years ago in my mind, created a trust mentally. When my wife died, I was forced to do something. Soon after I discussed my plans with Bill and Melinda they gave me an original copy of Adam Smith's Wealth of Nations. In the first chapter Adam Smith talks about "Specialization of Labor", which talks about markets and allowing countries to specialize and work on what they are good at. Mike Tyson doesn't try to run Berkshire, and I don't try to get in the ring with Mike Tyson. This is how I look at philanthropy. I started looking for people that were younger, smarter, more experienced, and doing it with their own money. I looked for people that had similar goals, who would do the best with the money. In effect, I outsourced the handling of my philanthropy. It was a no brainer.

In the Fortune article, I stated that business is a game that I love because I get to hit the easy pitches. Ted Williams had written a book about hitting and he said to succeed in baseball, you had to wait for the best pitch. See's Candies to me was an easy pitch. It is not like Olympic diving, where one could do a simple dive perfectly, but score lower than someone who might have made a big splash attempting a more difficult dive. In diving you are judged on the degree of difficulty.

Philanthropy is the opposite of investing with degree of difficulty. Philanthropy deals with trying to solve the toughest problems in society, so you expect to fail very often. I personally don't like failing, so I'd rather let someone else do it. I wouldn't personally enjoy working on something where I couldn't get any feedback on how I was doing and in fact, expected the project to fail. My lifespan is 12 years now and I should be able to add tens of billions of dollars to my "donation" in that time. I am going to stick with what I love doing and I am glad others will work on giving the money away.

I'm just lucky to have been in the right place at the right time. Another place, another time, I wouldn't have been as successful. Society enabled me to make my money and my money

should go to society.

You have said that the last 50 or so years were a unique time for investing in American securities markets—numerous mis-pricings. Do you believe that something like this will happen again? And if you were 26 today and you had only a \$1,000,000 how would you generate the 50% returns that you said you might do with smaller amounts of capital?

Buffett: Attractive opportunities come from observing human behavior. In 1998, people behaved like frightened cavemen (referring to the Long Term Capital Management meltdown). People make their own opportunities. They will be frozen by fear, excited by greed and it doesn't matter what their IQ, degrees etc is. Growth of 50% per year is with small capitalization, not large cap. The point is I got rich looking for stock with strong earnings.

The last 50 years weren't unique. It's just capitalizing on human behavior. It's people that make opportunities when others are frozen by fear or excited by greed. Human behavior allows for success if you are able to detach yourself emotionally.

In 1951, I got out of school at 20 years old. At the time there were two publishers of stock information, Moody's and Standards and Poor's. I used Moody's and went through every manual. I recently bought a copy of the 1951 Moody off of Amazon. On page 1433, there's a stock you could have made some money on. The EPS was \$29 and the Price Range was from \$3-\$21/share. On another page, there is a company that had an EPS of \$29.5 and the price range was \$27-28, 1x earnings. You can get rich finding things like this, things that aren't written about.

A couple of years ago I got this investment guide on Korean stocks. I began looking through it. It felt like 1974 all over again. Look here at this company...Dae Han, I don't know how you pronounce it, it's a flour company. It earned 12,879 won previously. It currently had a book value of 200,000 won and was earning 18,000 won. It had traded as high as 43,000 and as low as 35,000 won. At the time, the current price was 40,000 or 2 times earnings. In 4 hours I had found 20 companies like this.

The point is nobody is going to tell you about these companies. There are no broker reports on Dae Han Flour Company. When you invest like this, you will make money. Sure 1 or 2 companies may turn out to be poor choices, but the others will more than make up for any losses. Not all of them will be good, but some will and those will make you rich. And this didn't happen in 1932, this was in 2004! These opportunities will be there in the next 30 years. You'll have streaks where you'll find some bad companies and a few times where you'll make money with everything that you do.

The Wall Street analysts are brilliant people; they are better at math, but we know more about human nature.

In your investing life you will have several opportunities and one or two that can't go

wrong. For example, in 1998 the NY fed offered a 30-year treasury bonds yielding less than the 29-½ year treasury bonds by 30 basis points. What happened was LTCM put a trade on at 10 basis points and it was a crowded trade, they were 100% certain to make money but they could not afford any hiccups. I know more about human nature; these were MIT grads, really smart guys, and they almost toppled the system with their highly leveraged trading.

This was definitely a good time to act.

When looking at other countries Mr. Buffett, do you look at the country's overall financial status or do you look at the financials of that specific company in a foreign country? You mentioned investing in Korean companies – do you ever look at the state of the country you are investing in?

Buffett: We care about the country where the company is run. There is a disadvantage being outside of the US. A few years ago we were looking to invest in either PetroChina or Yukos in Russia. We ended up picking PetroChina because the political situation was more stable. It turned out to be a good decision. I care about the country and the geopolitical environment I am investing in.

The whole company was selling for \$35 billion. It was selling for one-fourth of the price of Exxon, but was making profits equal to 80% of Exxon. I was reading the annual report one day and in it I saw a message from the Chairman saying that the company would pay out 45% of its profits as dividends. This was much more than any company like this, and I liked the reserves. If it were a US company, it would sell for \$85 billion; it's a good, solid company. I don't understand the Chinese culture like I understand the US culture. However it said right in their annual report that they will payout 45% of their earnings as dividends, basically they say if they make money they will pay it out. I invested \$450 million and its now worth \$3.5 billion. I decided I'd rather be in China than Russia. I liked the investment climate better in China.

In July, the owner of Yukos, Mikhail Khodorkovsky (at that time, the richest man in Russia) had breakfast with me and was asking for my consultation if they should expand into New York and if this was too onerous considering the SEC regulations. Four months later, Mikhail Khodorkovsky was in prison. Putin put him in. He took on Putin and lost. His decision on geopolitical thinking was wrong and now the company is finished. PetroChina was the superior investment choice. 45% was a crazy amount of dividends to offer but China kept its word. I am never quite as happy as I am in the US, because the laws are more uncertain elsewhere, but the point is to buy things cheap. Russia is just a bad geopolitical environment. On the other hand, China has kept their word on paying the dividends. In fact, when the dividends check comes in, it is calculated out 10 or so decimals, these guys keep their word. I don't know the tax laws in China, but you can buy a good business cheap. At Berkshire Hathaway, you have to spend hundreds of millions of dollars to move the needle. We have a problem of finding things worth investing in.

In respect to Africa how would you find above average stocks given the information costs and limitations in Africa? What is your best advice about obtaining acceptable information?

Buffett: There aren't too many companies in Africa that are big enough for Berkshire to look at, except for maybe DeBeers, Anglo-American, or SAB Miller. Also, there isn't a lot of information on these companies. I know South Africa has stock information available. The key is to get good information.

In comparison, Korea has plenty of information available. There is Kissline online. Within seconds I can get Korean Stock Exchange Information, Annual and even quarterly information. I'm not sure if the same is available online for South Africa. This is OK because I don't need to win every game, just the ones I play.

I have three mailboxes in my office – IN, OUT, and TOO HARD. I was joking with the MIT students that I should have a TOO HARD bin and they made me one, so now I have it and I use it. I will only swing at pitches that I really like. If you do it 10 times in your life, you'll be rich. You should approach investing like you have a punch card with 20 punch-outs, one for each trade in your life. I think people would be better off if they only had 10 opportunities to buy stocks throughout their lifetime. You know what would happen? They would make sure that each buy was a good one. They would do lots and lots of research before they made the buy. You don't have to have many 4X growth opportunities to get rich. You don't need to do too much, but the environment makes you feel like you need to do something all the time.

How would you define your character? And what portion of your character do you believe contributed the most to your success?

Buffett: The important qualities you need are intelligence, patience, and interest, but the biggest thing is to be rational. In '97-8, people weren't rational. People got caught up with what other people were doing. Don't get caught up with what other people are doing. Being a contrarian isn't the key, but being a crowd follower isn't either. You need to detach yourself emotionally. You need to think about what is going on around you. Being in Omaha helps me in that regard. When I was in NYC, I had 50 people whispering in my ear before noon. It's hard sometimes, like when the Internet craze hit. Nobody likes to see their neighbor doing stupid things and getting rich. It was like Cinderella's ball, I think I'll just have one more dance, it's not midnight yet. Sounds simple – but it is hard to leave the party. The problem with stocks is they don't have clocks. You don't know when it will be midnight so you can leave the party. My partner Charlie Munger and Tony Nicely at Geico are always rational. 160 IQs can say stupid things that sound good. People do silly things, whether they have 120 IQ or 160. You can always improve your rational thought. Rationality is the only thing that helps you. One thing that could help would be to write down the reason you are buying a stock before your purchase. Write down "I am buying Microsoft @ \$300B because..." Force yourself to write this down. It clarifies your mind and discipline. This exercise makes you more rational.

What is your opinion on exchange-traded funds and how to do you accurately judge them?

Buffett: ETF's are a fairly low cost way to get into a market or industry. We don't hold any and never will. I recommend index funds for people who don't want to spend time studying the market. They are good for 95% of the population. If you don't bring anything to the game, you shouldn't expect to win.

How do you hope to tackle administrative costs when it comes to Aids treatment in Africa?

Buffett: Bill and Melinda Gates can tackle these issues better than I can. I work on giving them more money so they can have more to work with. I am better suited to raise the capital, let others do the work they are good at. We can do a lot more with private charities than the government can. We judge our success on how intelligent we attack a problem rather than success or failure. Bill Gates regards every human life as valuable; we in the US need the help much less than other countries do.

The inheritance or estate tax has continued to be debated on Capital Hill, yet your position has not changed in the fact that you feel this tax should be maintained. Could you please share your views on why legislators should not change this tax law?

Buffett: Well it's not a death tax. 2.2 million people die in the US and out of that only 4,000 estates will be taxed. The federal government collects \$30 billion in tax revenue per year from estate taxes and a high percentage of the heirs of these estates will receive \$50 million or more.

We have to ask ourselves what is the proper tax policy for our society. Let me illustrate with a game. Imagine 24 hours before your birth a genie comes to you and lets you design the world into which you will come. You define all of the political, economic, and societal facets of the world. But there is one catch. You have to draw a ticket from a pool of 6 billion. On this ticket will be your characteristics in this world, i.e. if you are born in the US or Bangladesh, if you are male or female, black or white, retarded or normal, etc. What would you do? You would design a world with rules that would initially foster abundance.

A world that produces lots of output where everyone is productive. You would create an abundant society. Secondly, you would want justice. You would want the output to be spread out. You would design a world where there was freedom from fear, freedom from fear of old age. You would want equality of opportunity, a market system, and that the best people were in the right places. You would want a world that would take care of the people who got the bad tickets. This has nothing to do with religion, I'm agnostic. At the time that I was born, the odds were about 50 to 1 that I was born in the United States. I won the ovarian lottery.

You would make sure all of the lucky tickets are incentivized to keep working. Also you

would want others to have equality of opportunity, not equality of outcome though. One bigger thing would be a good system of the rule of law. You would also want to make sure you have people in the right places according to their talents. You would also want to help others that have no opportunity. I could set it up so that my descendants would not have to work for ten generations. So I would end up effectively taking my descendants out of the pool of proactive people. The descendants of wealthy people could potentially become welfare recipients. Lots of families (I won't name names) create dynasties where society contributes to them just because they are part of the "lucky sperm club". Instead of using food stamps, they would have stocks and bonds. The estate tax modifies the ability to create a family dynasty that takes the descendants out of the work pool, the group of productive citizens.

We all participated in the ovarian lottery, it's probably the most important thing we have ever done. In fact, you all are in business school, you are pretty smart and you have a bright future ahead of you; if you had the chance to trade in your lottery ticket for the chance to pick 100 tickets of which you would have to take one. Would you do it? I would argue you should not. Out of the 100, only 4 or 5 would be born in the US. Out of that only not many would be headed on the path you are headed down. So we are part of the top 1% in society, we are pretty lucky. My descendants are part of the top 1 tenth of one percent of society. This means that you are in the luckiest 1% of the world.

Early on in your career you bought some land and then rented this out to some local farmers? Why didn't you pursue this type of investment in real estate?

Buffett: I made an initial investment farm real estate when I was 14. Someone else handled the whole transaction; I just bought 40 acres. A guy would farm the land and harvest X number bushels of soybean and sell it for \$X per bushel at the market and say here is your check. I did virtually nothing for this investment. I had no idea if he actually harvested what he said he did, or if he sold the bushels he said he sold, or for that matter what price he sold it at. It's kind of like the guys who kept all his cows in with a big herd. As they are taking them to market, the owner of the big herd says, sorry but all of your cows died. How would you know which cows were yours?

In 1980 with the S&L crisis, land was selling for \$2,000 an acre. Well, an acre produced 120 bushels of corn or 45 bushels of soybeans. At a couple dollars a bushel, this was basically \$80 an acre in revenue. At the time with the interest rates, you would pay \$150 per acre in interest. So you were taking in \$80 and paying out \$150, it just did not make sense. The bankers went crazy lending money at \$2,000 an acre prices for farms at 10% interest rates to produce \$80 an acre in crops. Well after a bunch of people lost big time, the FDIC took control of the farms and ended up selling them at \$600 an acre, which at the time was a good deal. The FDIC took over hundreds of farms because people went crazy and lost their shirts.

The S&L's lost their fundamentals and the Government owned \$100 million worth of properties they needed to dump at a low cost. This was an opportunity to make some

money, however I still don't like farms because they are too passive. I still don't like farming. My son likes farming, I don't.

Mr. Buffett it has been well documented that you don't manage your managers. Do you possess a strong intuition about people or do you have a process when you evaluate the management of companies that you are looking to possible purchase?

Buffett: Good question. The question I ask is will they still work after they have sold their business? Do they love the money or the business? If it's the business, then we have a deal. If it's the money, and that's ok, it's just not what we are looking for. I don't have to identify all of the ten's out there; I just have to make sure the ones I make deals with are tens. I can't look at the class and say, "You're a 6.5. You're an 8." I just need to find a few 10s. Do I have an intuition when judging a business owner? Sometimes. People give themselves away; I don't know what it is. We don't have any contracts at Berkshire; people stay because they have a passion for their business and I don't want to screw that up. Not much changes at 65 years old. I have 40 CEO's working for companies owned by Berkshire. Since 1965, not one of them has left Berkshire Hathaway. If I told Lou Simpson of Geico to be at the office at 9am and he could only get one hour for lunch, he would leave. I don't need to identify every ten out there, just the ones we invest in.

Machiavelli said that a man could be feared and loved. But one might want to be more feared than loved. Do you agree with this? Has there ever been a situation where you had to be more feared than loved?

Buffett: I don't believe in fear as a manager. Ben Graham, Don Keough, and my dad are the people I have worked for and they never tried to get people to respond by fear. Certain industries may be conducive – platoon operators maybe – but even then, if you turn back and desert your buddies...I don't operate like that. I don't like this life. Probably certain circumstances call for it: operate this way for a policeman. I believe the most powerful force is love and that is the most effective way of dealing with people. I would not want to live a life where people are afraid of me. People don't operate well under fear. Some circumstances where mutually assured destruction is the end result, fear is good. But not at Berkshire Hathaway, love is way better to operate. By the way, how did Machiavelli do? There is no religion of Machiavelli 500 years later, is there?

Sometimes we learn more from our failures than our successes. What do you consider your greatest mistake or failure?

Buffett: I have made lots of failures of omission more than failures of commission. Things that I understand, there have been a few, a couple that cost \$10B. If a business was selling cheap and I did not buy, I consider that a failure. As Charlie would say, I was sucking my thumb on that one. I made a terrible deal buying Dexter Shoe. I did not learn much from it either. I bought it for \$400M, but the biggest mistake is that I gave up stock that is now

worth \$3B.

You're going to make mistakes. You can't play in the game without making any mistakes. I don't think about it, I just move on. Most business mistakes are irreversible setbacks, but you get another chance. There are two things in life that you don't get another chance at – marrying the wrong person and what you do with your children. Business, you just go on. It's a mistake to dwell on mistakes, it's unproductive. It's like Mark Twain's story about the cat that sat on a hot stove – he never sat on a hot stove again, but he never sat on a cold one again either.

Talking about values and morality, is there a moral connection to whom you give your money to and why?

Buffett: Charlie and I went to Memphis to look at a chewing tobacco company. In the end, we decided we didn't want to own it. We would buy stock in a tobacco company, but we didn't want to own it.

A good example is Charlie's favorite company, Costco. They are the #3 distributor in the US of cigarettes, but you wouldn't avoid buying it because of that. You'll drive yourself crazy trying to keep track of these things. Our philosophy is that it's impossible to grade marketable securities, but we'll buy the stocks without any problems, but we just won't be in certain businesses.

My view is that energy production should move to nuclear. It's clean, cheap and safe. Coal emissions are bad for the environment; however it's still a good company. It's impossible to grade marketable securities on moral activity. Berkshire Hathaway has and will buy what trades, but will not buy companies that engage in certain behaviors. PetroChina owns 40% of the oil in the Sudan that is government owned. If they did not own it, someone else would. Also, you have to keep in mind, if PetroChina did not buy it its possible the Sudan would own 100% of the oil rights and that's not so good either.

I find it funny that people find time to protest PetroChina for ownership of the Sudanese oil, but with the \$300 billion or so of imported goods from China, these same people don't protest Chinese goods. They protest investment in Chinese companies though.

Besides the type of management that you look for, when you look at financials you make decisions rather quickly. In regards to the financial information and the business overall what factors do you look at?

Buffett: We make quick decisions because we have filters before we get to the point of making a decision.

Filter #1 – Can we understand the business? What will it look like in 10-20 years? Take Intel vs. chewing gum or toilet paper. We invest within our circle of competence. Jacob's

Pharmacy created Coke in 1886. Coke has increased per capita consumption every year it has been in existence. It's because there is no taste memory with soda. You don't get sick of it. It's just as good the 5th time of the day as it was the 1st time of the day.

Filter #2 – Does the business have a durable competitive advantage? This is why I won't buy into a hula-hoop, pet rock, or a Rubik's cube company. I will buy soft drinks and chewing gum. This is why I bought Gillette and Coke.

Filter #3 – Does it have management I can trust?

Filter #4 – Does the price make sense?

Since 1972 we have made no change in the marketing, process etc. Take See's candy. You cannot destroy the brand of See's candy. Only See's can do that. You have to look at the brand as a promise to the customer that we are going to offer the quality and service that is expected. We link the product with happiness. You don't see See's candy sponsoring the local funeral home. We are at the Thanksgiving Day Parades though.

The End

On January 19, 2007 I flew to Omaha, Nebraska to hand deliver a written question to Warren Buffett. A copy of the letter included as Appendix I.

The letter essentially addressed Mr. Buffett's early investments and asked:

If you were today 20-something years old, again looking to allocate less than \$10 million, and free to allocate capital into well over 8,000 opportunities (before even considering anything overseas), would your Latticework of Mental Models primarily be searching for:

- a) Situations reminiscent of 1957 – akin to Daehan Flour Mills,
or*
- b) Situations reminiscent of 1987 – akin to Moody's Corporation?*

In response to my 1,091 word question, Mr. Buffett handwrote a response of eight words. See Appendix II.

Respectfully,

Shai Dardashti

Appendix I: Text of Letter to Warren Buffett

January 19, 2007

Warren Buffett
1440 Kiewit Plaza
Omaha, Nebraska 68131

Dear Warren:

Like the thousands of other young people who try to contact you, I've always been the kid in school who used to read the business section of the paper rather than the sports section while in high school and would check "yahoo finance" rather than "yahoo sports" while in college.

I first read The Warren Buffett Way when I was 13 and I walked into the local library looking for a book about investing. I first wrote to you when I was 17 when I figured I actually had a reason to make a plea for your attention. I first had the privilege to shake your hand at age 21 when I organized a student trip from University of Maryland.

I just traveled 1,000 miles on 48 hours of notice to shake your hand for a second time. And to hand deliver this letter to you.

My father escaped from Iran in 1967 – as a 12 year old, leaving his parents behind and surviving on his own in Philadelphia with an aunt. My mother is from a small town in Pennsylvania – many in her family were victims of the Holocaust. If you are actually reading this message, I am indeed one of the luckier people in the world.

I consider the luck to be able to deliver this communication to you on par with that of a philosophy student conversing with Plato; the odds for "time, technology, and temperament" to all align is a statistical anomaly. I could not have been handed a better ticket in the Ovarian Lottery.

I've read your Partnership Letters, the Letters to Berkshire Shareholders, and my fair share of articles that you have written and books that have been written about you - *yet still have a single looming question.*

Any guidance would be deeply appreciated.

My sincerest thanks,

Shai Dardashti (signed)

Mr. Buffett, on June 23, 1999 you shared with Business Week:

*If I was running \$1 million today, or \$10 million for that matter, I'd be fully invested. Anyone who says that size does not hurt investment performance is selling. **The highest rates of return I've ever achieved were in the 1950s.** I killed the Dow. You ought to see the numbers. But I was investing peanuts then. It's a huge structural advantage not to have a lot of money. I think I could make you 50% a year on \$1 million. No, I know I could. I guarantee that.*

More recently, Morningstar reported:

*Munger also recalled a comment made by Buffett at the Berkshire annual meeting concerning how cheap Korean stocks had become during that country's financial meltdown in 2002: "There were flour mills trading at two times earnings. **Warren thought he was young again.**"*

As I understand things, I recognize two “mental models” from your investment patterns over the years:

The “1957” Graham Approach

At a talk to Columbia students in 1993 you shared:

When I got out of Columbia the first place I went to work was a five-person brokerage firm with operations in Omaha. It subscribed to Moody's industrial manual, banks and finance manual and public utilities manual. I went through all those page by page.

*I found a little company called **Genesee Valley Gas** near Rochester . It had 22,000 shares out. It was a public utility that was earning about \$5 per share, and the nice thing about it was you could buy it at \$5 per share.¹*

*I found **Western Insurance** in Fort Scott, Kansas. The price range in Moody's financial manual...was \$12-\$20. Earnings were \$16 a share. I ran an ad in the Fort Scott paper to buy that stock.*

*I found **the Union Street Railway**, in New Bedford, a bus company. At that time it was selling at about \$45 and, as I remember, had \$120 a share in cash and no liabilities.*

¹ Even adjusting for inflation, 22K shares at \$5 each implies a market cap well below \$1 million.

Along similar lines, in late 2005 I understand you explained to a group of Harvard students the following:

Citicorp sent a manual on Korean stocks. Within 5 or 6 hours, twenty stocks selling at 2 or 3x earnings with strong balance sheets were identified. Korea rebuilt itself in a big way post 1998. Companies overbuilt their balance sheets – including Daehan Flour Mill with 15,000 won/year earning power and selling at “2 and change” times earnings. The strategy was to buy the securities of twenty companies thereby spreading the risk that some of the companies will be run by crooks. \$100 million was quickly put to work.

The “1987” Fisher Approach

The following excerpts from an article written by Carol Loomis published on April 11, 1988 in Fortune provide interesting clarity on the modus-operandi of Berkshire circa 1987:

Unusual Profitability (High ROE with Low Debt; i.e. high ROIC)

...But in his 1987 annual report, Buffett the businessman comes out of the closet to point out just how good these enterprises and their managers are. Had the Sainted Seven operated as a single business in 1987, he says, they would have employed \$175 million in equity capital, paid only a net \$2 million in interest, and earned, after taxes, \$100 million. That's a return on equity of 57%, and it is exceptional. As Buffett says, "You'll seldom see such a percentage anywhere, let alone at large, diversified companies with nominal leverage."

Unusual Growth (Opportunities for Reinvestment of Retained Earnings)

...Some folks of the right sort, by the name of Heldman, read that ad and brought him their uniform business, Fechheimer, in 1986. The business had only about \$6 million in profits, which is an operation smaller than Buffett thinks ideal.

...A few hundred miles away at Fechheimer (...1987 sales: \$75 million)

Paying for Quality

...By 1972, Blue Chip Stamps, a Berkshire affiliate that has since been merged into the parent, was paying three times book value to buy See's Candies, and the good-business era was launched. "I have been shaped tremendously by Charlie," says Buffett. "Boy, if I had listened only to Ben, would I ever be a lot poorer.

Appendix II: Warren Buffett's Eight Word Response
(Handwritten on final page of original letter)

At the Q&A I arranged you told me that today (May 23, 2005) you were "85% Graham and 15% Fisher."

If you were today 20-something years old, again looking to allocate less than \$10 million, and free to allocate capital into well over 8,000 opportunities (before even considering anything overseas), would your Latticework of Mental Models primarily be searching for:

- a) Situations reminiscent of 1957 - akin to Daehan Flour Mills, or
- b) Situations reminiscent of 1987 - akin to Moody's Corporation?

Either is fine

*Better for small sums
" " large "*
WB

*Better for small sums.
" " large "*

Either is fine.

Marking to myth

Warren Buffett

Chairman and CEO, Berkshire Hathaway

Many institutions that publicly report precise market values for their holdings of CDOs and CMOs are in truth reporting fiction. They are marking to model rather than marking to market. The recent meltdown in much of the debt market, moreover, has transformed this process into marking to myth.

Because many of these institutions are highly leveraged, the difference between "model" and "market" could deliver a huge whack to shareholders' equity. Indeed, for a few institutions, the difference in valuations is the difference between what purports to be robust health and insolvency. For these institutions, pinning down market values would not be difficult: They should simply sell 5% of all the large positions they hold. That kind of sale would establish a true value, though one still higher, no doubt, than would be realized for 100% of an oversized and illiquid holding.

In one way, I'm sympathetic to the institutional reluctance to face the music. I'd give a lot to mark my weight to "model" rather than to "market."

What Warren thinks...

With Wall Street in chaos, Fortune naturally went to Omaha looking for wisdom. Warren Buffett talks about the economy, the credit crisis, Bear Stearns, and more.

By [Nicholas Varchaver](#),

(Fortune Magazine) -- *If Berkshire Hathaway's annual meeting, scheduled for May 3 this year, is known as the Woodstock of Capitalism, then perhaps this is the equivalent of Bob Dylan playing a private show in his own house: Some 15 times a year Berkshire CEO Warren Buffett invites a group of business students for an intensive day of learning. The students tour one or two of the company's businesses and then proceed to Berkshire (BRKA, Fortune 500) headquarters in downtown Omaha, where Buffett opens the floor to two hours of questions and answers. Later everyone repairs to one of his favorite restaurants, where he treats them to lunch and root beer floats. Finally, each student gets the chance to pose for a photo with Buffett.*

In early April the megabillionaire hosted 150 students from the University of Pennsylvania's Wharton School (which Buffett attended) and offered Fortune the rare opportunity to sit in as he expounded on everything from the Bear Stearns (BSC, Fortune 500) bailout to the prognosis for the economy to whether he'd rather be CEO of GE (GE, Fortune 500) - or a paperboy. What follows are edited excerpts from his question-and-answer session with the students, his lunchtime chat with the Whartons over chicken parmigiana at Piccolo Pete's, and an interview with Fortune in his office.

Buffett began by welcoming the students with an array of Coca-Cola products. ("Berkshire owns a little over 8% of Coke, so we get the profit on one out of 12 cans. I don't care whether you drink it, but just open the cans, if you will.") He then plunged into weightier matters:

Before we start in on questions, I would like to tell you about one thing going on recently. It may have some meaning to you if you're still being taught efficient-market theory, which was standard procedure 25 years ago. But we've had a recent illustration of why the theory is misguided. In the past seven or eight or nine weeks, Berkshire has built up a position in auction-rate securities [bonds whose interest rates are periodically reset at auction; for more, see box on page 74] of about \$4 billion. And what we have seen there is really quite phenomenal. Every day we get bid lists. The fascinating thing is that on these bid lists, frequently the same credit will appear more than once.

Here's one from yesterday. We bid on this particular issue - this happens to be Citizens Insurance, which is a creature of the state of Florida. It was set up to take care of hurricane insurance, and it's backed by premium taxes, and if they have a big hurricane and the fund becomes inadequate, they raise the premium taxes. There's nothing wrong with the credit. So we bid on three different Citizens securities that day. We got one bid at an 11.33% interest rate. One that we didn't buy went for 9.87%, and one went for 6.0%. It's the same bond, the same time, the same dealer. And a big issue. This is not some little anomaly, as they like to say in academic circles every time they find something that disagrees with their theory.

So wild things happen in the markets. And the markets have not gotten more rational over the years. They've become more followed. But when people panic, when fear takes over, or when greed takes over, people react just as irrationally as they have in the past.

Do you think the U.S. financial markets are losing their competitive edge? And what's the right balance between confidence-inspiring standards and ...

... between regulation and the Wild West? Well, I don't think we're losing our edge. I mean, there are costs to Sarbanes-Oxley, some of which are wasted. But they're not huge relative to the \$20 trillion in total market value. I think we've got fabulous capital markets in this country, and they get screwed up often enough to make them even more fabulous. I mean, you don't want a capital market that functions perfectly if you're in my business. People continue to do foolish things no matter what the regulation is, and they always will. There are significant limits to what regulation can accomplish. As a dramatic illustration, take two of the biggest accounting disasters in the past ten years: Freddie Mac and Fannie Mae. We're talking billions and billions of dollars of misstatements at both places.

Now, these are two incredibly important institutions. I mean, they accounted for over 40% of the mortgage flow a few years back. Right now I think they're up to 70%. They're quasi-governmental in nature. So the government set up an organization called OFHEO. I'm not sure what all the letters stand for. [Note to Warren: They stand for Office of Federal Housing Enterprise Oversight.] But if you go to OFHEO's website, you'll find that its purpose was to just watch over these two companies. OFHEO had 200 employees. Their job was simply to look at two companies and say, "Are these guys behaving like they're supposed to?" And of course what happened were two of the greatest accounting misstatements in history while these 200 people had their jobs. It's incredible. I mean, two for two!

It's very, very, very hard to regulate people. If I were appointed a new regulator - if you gave me 100 of the smartest people you can imagine to work for me, and every day I got the positions from the biggest institutions, all their derivative positions, all their stock positions and currency positions, I wouldn't be able to tell you how they were doing. It's very, very hard to regulate when you get into very complex instruments where you've got hundreds of counterparties. The counterparty behavior and risk was a big part of why the Treasury and the Fed felt that they had to move in over a weekend at Bear Stearns. And I think they were right to do it, incidentally. Nobody knew what would be unleashed when you had thousands of counterparties with, I read someplace, contracts with a \$14 trillion notional value. Those people would have tried to unwind all those contracts if there had been a bankruptcy. What that would have done to the markets, what that would have done to other counterparties in turn - it gets very, very complicated. So regulating is an important part of the system. The efficacy of it is really tough.

At Piccolo Pete's, where he has dined with everyone from Microsoft's Bill Gates to the New York Yankees'

Alex Rodriguez, Buffett sat at a table with 12 Whartonites and bantered over many topics.

How do you feel about the election?

Way before they both filed, I told Hillary that I would support her if she ran, and I told Barack I would support him if he ran. So I am now a political bigamist. But I feel either would be great. And actually, I feel that if a Republican wins, John McCain would be the one I would prefer. I think we've got three unusually good candidates this time.

They're all moderate in their approach.

Well, the one we don't know for sure about is Barack. On the other hand, he has the chance to be the most transformational too.

I know you had a paper route. Was that your first job?

Well, I worked for my grandfather, which was really tough, in the [family] grocery store. But if you gave me the choice of being CEO of General Electric or IBM or General Motors, you name it, or delivering papers, I would deliver papers. I would. I enjoyed doing that. I can think about what I want to think. I don't have to do anything I don't want to do. It might be wonderful to be head of GE, and Jeff Immelt is a friend of mine. And he's a great guy. But think of all the things he has to do whether he wants to do them or not.

How do you get your ideas?

I just read. I read all day. I mean, we put \$500 million in PetroChina. All I did was read the annual report. [Editor's note: Berkshire purchased the shares five years ago and sold them in 2007 for \$4 billion.]

What advice would you give to someone who is not a professional investor? Where should they put their money?

Well, if they're not going to be an active investor - and very few should try to do that - then they should just stay with index funds. Any low-cost index fund. And they should buy it over time. They're not going to be able to pick the right price and the right time. What they want to do is avoid the wrong price and wrong stock. You just make sure you own a piece of American business, and you don't buy all at one time.

When Buffett said he was ready to pose for photographs, all 150 students stampeded out of the room within seconds and formed a massive line. For the next half hour, each one took his or her turn with Buffett, often in hammy poses (wrestling for his wallet was a favorite). Then, as he started to leave, a 77-year-old's version of A Hard Day's Night ensued, with a pack of 30 students trailing him to his gold Cadillac. Once free, he drove this Fortune writer back to his office and continued fielding questions.

How does the current turmoil stack up against past crises?

Well, that's hard to say. Every one has so many variables in it. But there's no question that this time there's extreme leveraging and in some cases the extreme prices of residential housing or buyouts. You've got \$20 trillion of residential real estate and you've got \$11 trillion of mortgages, and a lot of that does not have a

problem, but a lot of it does. In 2006 you had \$330 billion of cash taken out in mortgage refinancings in the United States. That's a hell of a lot - I mean, we talk about having \$150 billion of stimulus now, but that was \$330 billion of stimulus. And that's just from prime mortgages. That's not from subprime mortgages. So leveraging up was one hell of a stimulus for the economy.

If that was one hell of a stimulus, do you think the \$150 billion government stimulus plan will make an impact?

Well, it's \$150 billion more than we'd have otherwise. But it's not like we haven't had stimulus. And then the simultaneous, more or less, LBO boom, which was called private equity this time. The abuses keep coming back - and the terms got terrible and all that. You've got a banking system that's hung up with lots of that. You've got a mortgage industry that's deleveraging, and it's going to be painful.

The scenario you're describing suggests we're a long way from turning a corner.

I think so. I mean, it seems everybody says it'll be short and shallow, but it looks like it's just the opposite. You know, deleveraging by its nature takes a lot of time, a lot of pain. And the consequences kind of roll through in different ways. Now, I don't invest a dime based on macro forecasts, so I don't think people should sell stocks because of that. I also don't think they should buy stocks because of that.

Your OFHEO example implies you're not too optimistic about regulation.

Finance has gotten so complex, with so much interdependency. I argued with Alan Greenspan some about this at [Washington Post chairman] Don Graham's dinner. He would say that you've spread risk throughout the world by all these instruments, and now you didn't have it all concentrated in your banks. But what you've done is you've interconnected the solvency of institutions to a degree that probably nobody anticipated. And it's very hard to evaluate. If Bear Stearns had not had a derivatives book, my guess is the Fed wouldn't have had to do what it did.

Do you find it striking that banks keep looking into their investments and not knowing what they have?

I read a few prospectuses for residential-mortgage-backed securities - mortgages, thousands of mortgages backing them, and then those all tranching into maybe 30 slices. You create a CDO by taking one of the lower tranches of that one and 50 others like it. Now if you're going to understand that CDO, you've got 50-times-300 pages to read, it's 15,000. If you take one of the lower tranches of the CDO and take 50 of those and create a CDO squared, you're now up to 750,000 pages to read to understand one security. I mean, it can't be done. When you start buying tranches of other instruments, nobody knows what the hell they're doing. It's ridiculous. And of course, you took a lower tranche of a mortgage-backed security and did 100 of those and thought you were diversifying risk. Hell, they're all subject to the same thing. I mean, it may be a little different whether they're in California or Nebraska, but the idea that this is uncorrelated risk and therefore you can take the CDO and call the top 50% of it super-senior - it isn't super-senior or anything. It's a bunch of juniors all put together. And the juniors all correlate.

If big financial institutions don't seem to know what's in their portfolios, how will investors ever know when it's safe?

They can't, they can't. They've got to, in effect, try to read the DNA of the people running the companies. But I say that in any large financial organization, the CEO has to be the chief risk officer. I'm the chief risk officer at Berkshire. I think I know my limits in terms of how much I can sort of process. And the worst thing you can have is models and spreadsheets. I mean, at Salomon, they had all these models, and you know, they fell apart.

What should we say to investors now?

The answer is you don't want investors to think that what they read today is important in terms of their investment strategy. Their investment strategy should factor in that (a) if you knew what was going to happen in the economy, you still wouldn't necessarily know what was going to happen in the stock market. And (b) they can't pick stocks that are better than average. Stocks are a good thing to own over time. There's only two things you can do wrong: You can buy the wrong ones, and you can buy or sell them at the wrong time. And the truth is you never need to sell them, basically. But they could buy a cross section of American industry, and if a cross section of American industry doesn't work, certainly trying to pick the little beauties here and there isn't going to work either. Then they just have to worry about getting greedy. You know, I always say you should get greedy when others are fearful and fearful when others are greedy. But that's too much to expect. Of course, you shouldn't get greedy when others get greedy and fearful when others get fearful. At a minimum, try to stay away from that.

By your rule, now seems like a good time to be greedy. People are pretty fearful.

You're right. They are going in that direction. That's why stocks are cheaper. Stocks are a better buy today than they were a year ago. Or three years ago.

But you're still bullish about the U.S. for the long term?

The American economy is going to do fine. But it won't do fine every year and every week and every month. I mean, if you don't believe that, forget about buying stocks anyway. But it stands to reason. I mean, we get more productive every year, you know. It's a positive-sum game, long term. And the only way an investor can get killed is by high fees or by trying to outsmart the market.

WARREN E. BUFFETT, CHAIRMAN

October 6, 2008

The Honorable Henry M. Paulson, Jr.
Secretary of the Treasury
1500 Pennsylvania Avenue, NW
Washington, DC 20220

Dear Hank:

I have previously mentioned to you my thought that an investment fund could be formed that would address some of the public's concerns about Treasury's plans to purchase illiquid mortgages. In this letter, I will spell out my thinking in greater detail.

Some critics have worried that Treasury won't buy mortgages at prices close to the market but will instead buy at higher "theoretical" prices that would please selling institutions. Critics have also questioned how Treasury would manage the mortgages purchased: Would Treasury act as a true investor or would it be overly influenced by pressures from Congress or the media? For example, would Treasury be slow to foreclose on properties or too bureaucratic in judging requests for loan forbearance? Additionally, many who are comfortable with a Department of the Treasury headed by someone with your market knowledge are worried about how the investment program would be administered by a future Treasury Secretary who had to rely on a bureaucracy to make important market decisions.

What I would like to suggest is a program that allows Treasury to buy more than the \$700 billion of assets presently anticipated and allows it to do so in a way that dramatically reduces the risk – to almost zero – that Treasury will lose money on its purchases. Indeed, the program I recommend is highly likely to produce profits. Let's call my proposed entity the Public-Private Partnership Fund (PPPF).

The Honorable Henry M. Paulson, Jr.
October 6, 2008
Page 2

This entity would initially be capitalized with \$10 billion of common stock held by the private sector and \$40 billion of notes owned by Treasury. The notes would be due in ten years and carry an interest rate equal to the rate being paid by Treasury on its ten-year bond at the time PPPF was created. These notes would have absolute seniority. That is, they would be paid in full before the common stock would receive a nickel.

PPPF would operate as a REIT, LLC or in some other form that would receive flow-through tax treatment.

With the funds it had raised, PPPF would buy \$50 billion of mortgages (with a far greater principal amount of course). It would focus on whole loans and residential mortgage-backed securities (RMBS) and stay away from second mortgages and exotic instruments such as CDOs squared. Going by today's prices, much of what PPPF would buy would likely be priced at 50-80% of par.

In time, the mortgages and securities in the portfolio would produce cash, through paydowns or later sales, that could be paid to Treasury and the private investors. The cash would first go to pay off Treasury, until it had recovered its entire investment along with interest. That having been accomplished, the private shareholders would be entitled to recoup both their \$10 billion and a rate of interest equal to that received by Treasury. Finally, any profits would be split with three-fourths going to the shareholders and one-fourth going to Treasury.

Let me sum up the effects of this plan: PPPF's capitalization would turn \$40 billion of Treasury money into \$50 billion of mortgage purchases. More important, Treasury would operate with a \$10 billion "cushion" from loss, because the private money in PPPF would be on the front line, eating that amount of net loss if losses were sustained.

Given this structure, PPPF's shareholders would have every incentive to make intelligent purchases. It should be clear to the American public that purchases are not being made at "bail-out" prices for imprudent institutions, but rather at "intelligent investor" prices for Treasury and PPPF shareholders.

The Honorable Henry M. Paulson, Jr.
October 6, 2008
Page 3

Exploring the merits of this plan, I have talked with Bill Gross and Mohamed El-Erian of PIMCO, and they have told me they would manage this operation on a pro-bono basis. The managing entity would need a small staff, of course. But overall costs would be minimal and, in any event, would be borne by the common stock, since all expenses and losses would go against their \$10 billion.

I've also talked with Lloyd Blankfein at Goldman, Sachs, who says that firm would work on a pro-bono basis to secure the \$10 billion of equity capital. The company I head, Berkshire Hathaway, would be pleased to invest \$500 million, and I think the remainder of the funds needed would be quickly committed by major institutional investors – perhaps especially pension funds.

The reason why I expect the funds to be readily available is simple: If mortgages are purchased at current levels by an entity employing significant leverage and working with dependable, low-cost funds supplied by the U. S. Treasury, profits are very likely to be good—and perhaps even exceptional. That is true because prices have fallen to a level that reflects the inability of other buyers to obtain leverage. Thus returns for an investment operation that has access to long-term Treasury-type funding should be particularly interesting. Unlevered returns of 10% -- and present buyers are seeking more than this – can turn into 25% returns with the leverage I propose.

Once this program is off the ground, I would suggest that the capitalization of PPPF – both equity and debt – be doubled. In this instance, however, Wall Street firms – again on a pro-bono basis – would offer \$10 billion of PPPF's common stock to the American public on exactly the same terms as those granted the initial institutional investors. If PPPF is going to be a good deal for equity holders – and I believe it will be – I would want to be sure that the average American has a chance to share in such an investment on a basis equal to that secured by Berkshire Hathaway and other institutional investors. If this offer is fully subscribed, Treasury would purchase an additional \$40 billion of notes, giving PPPF total buying power of \$100 billion.

I would be willing to personally buy \$100 million of stock in this public offering. (This constitutes about 20% of my net worth outside of my Berkshire holdings, which as you know are promised to charity.)

The Honorable Henry M. Paulson, Jr.
October 6, 2008
Page 4

Another detail: In the initial offering to institutions, I would bar hedge funds or other vehicles in which the manager receives an override of profits from investing. I think that in a government-connected enterprise such as this, you would want to have investors receive all of the profits available instead of splitting them with managers taking fat overrides.

* * * * *

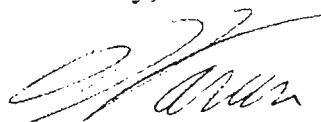

The most likely scenario under which PPPF would prove disappointing is one in which market prices make it impossible for it to buy the contemplated \$100 billion of mortgages at risk-adjusted prices that promise good returns. To cover this possibility, the plan could stipulate that money be proportionately returned to Treasury and to common shareholders if after two years PPPF had been unsuccessful in reaching its goal for purchases.

Alternatively, PPPF could become a purchaser of new “non-conforming” mortgages – those whose size exceeds Freddie and Fannie limits. This move would stimulate the housing market and reduce the high interest rates that non-conforming mortgages now carry (compared to Treasury yields). Any move that PPPF made in this direction would need to be approved by both Treasury and the majority of the common stock. Were this plan to be put into effect, moreover, PPPF should only deal with borrowers putting up downpayments of size, earning comfortable incomes relative to debt service requirements, and supplying documentation of their creditworthiness.

Hank, these are all tentative ideas. But I think it’s enormously important that the public have confidence that Treasury’s activities in the mortgage field are sound and potentially profitable. The public is skeptical – indeed, disbelieving – about this point now, but I believe PPPF could go a long way toward correcting this misconception.

If this plan, or some variation, appears to be feasible, Bill, Mohamed, Lloyd and I – and I’m sure a myriad of others – are ready to help.

Sincerely,

Warren E. Buffett

Buy American. I Am.

By WARREN E. BUFFETT
Published: October 16, 2008

Omaha

THE financial world is a mess, both in the United States and abroad. Its problems, moreover, have been leaking into the general economy, and the leaks are now turning into a gusher. In the near term, unemployment will rise, business activity will falter and headlines will continue to be scary.

So ... I've been buying American stocks. This is my personal account I'm talking about, in which I previously owned nothing but United States government bonds. (This description leaves aside my Berkshire Hathaway holdings, which are all committed to philanthropy.) If prices keep looking attractive, my non-Berkshire net worth will soon be 100 percent in United States equities.

Why?

A simple rule dictates my buying: Be fearful when others are greedy, and be greedy when others are fearful. And most certainly, fear is now widespread, gripping even seasoned investors. To be sure, investors are right to be wary of highly leveraged entities or businesses in weak competitive positions. But fears regarding the long-term prosperity of the nation's many sound companies make no sense. These businesses will indeed suffer earnings hiccups, as they always have. But most major companies will be setting new profit records 5, 10 and 20 years from now.

Let me be clear on one point: I can't predict the short-term movements of the stock market. I haven't the faintest idea as to whether stocks will be higher or lower a month — or a year — from now. What is likely, however, is that the market will move higher, perhaps substantially so, well before either sentiment or the economy turns up. So if you wait for the robins, spring will be over.

A little history here: During the Depression, the Dow hit its low, 41, on July 8, 1932. Economic conditions, though, kept deteriorating until Franklin D. Roosevelt took office in March 1933. By that time, the market had already advanced 30 percent. Or think back to the early days of World War II, when things were going badly for the United States in Europe and the Pacific. The market hit bottom in April 1942, well before Allied fortunes turned. Again, in the early 1980s, the time to buy stocks was when inflation raged and the economy

was in the tank. In short, bad news is an investor's best friend. It lets you buy a slice of America's future at a marked-down price.

Over the long term, the stock market news will be good. In the 20th century, the United States endured two world wars and other traumatic and expensive military conflicts; the Depression; a dozen or so recessions and financial panics; oil shocks; a flu epidemic; and the resignation of a disgraced president. Yet the Dow rose from 66 to 11,497.

You might think it would have been impossible for an investor to lose money during a century marked by such an extraordinary gain. But some investors did. The hapless ones bought stocks only when they felt comfort in doing so and then proceeded to sell when the headlines made them queasy.

Today people who hold cash equivalents feel comfortable. They shouldn't. They have opted for a terrible long-term asset, one that pays virtually nothing and is certain to depreciate in value. Indeed, the policies that government will follow in its efforts to alleviate the current crisis will probably prove inflationary and therefore accelerate declines in the real value of cash accounts.

Equities will almost certainly outperform cash over the next decade, probably by a substantial degree. Those investors who cling now to cash are betting they can efficiently time their move away from it later. In waiting for the comfort of good news, they are ignoring Wayne Gretzky's advice: "I skate to where the puck is going to be, not to where it has been."

I don't like to opine on the stock market, and again I emphasize that I have no idea what the market will do in the short term. Nevertheless, I'll follow the lead of a restaurant that opened in an empty bank building and then advertised: "Put your mouth where your money was." Today my money and my mouth both say equities.

Warren E. Buffett is the chief executive of Berkshire Hathaway, a diversified holding company.

Buffett Speaks at Emory University's Goizueta Business School

The following are notes from Dang Le an MBA student at Emory University's Goizueta Business School on 2/26/09

Students from Emory and 5 other business schools were invited to come visit Mr. Buffett for a Q&A session. These notes were reproduced to the best of my ability as I heard and as I could recall them from a collection of mine and other students' notes. There is no guarantee that this was exactly what was said, but the intent was to preserve the spirit of the message. Enjoy.

Buffett:

Did you hear they called off the Wall Street Christmas Pageant this year? They had trouble finding three wise men...and a virgin. There are many opportunities right now. The markets are very inefficient at times, and this is one of those times.

Kansas:

Berkshire has invested in several insurance companies, would you go into the health insurance business?

Buffett:

No. Health insurance is so ingrained into national policy that it is a tough business. It's pretty adversarial. I'm not really that excited about it from a business perspective. I don't want to write policies with high loan loss ratios. That being said, I would buy the stock of an undervalued healthcare insurer.

Insurance is an interesting business. You know, we underwrote a two year life insurance policy on Mike Tyson. I wanted an exclusion against women shooting him, but they wouldn't let me.

South Dakota:

You've recently invested in Goldman Sachs and GE. Is the financial sector a good buy right now?

Buffett:

No sector is a good buy unless you understand the business. However, I do believe that there is good value and great opportunity now in the financial sector because it is extremely unpopular. Sector's themselves don't make good buys, companies that are undervalued make good buys. You know how to value a business, you project the future cash flows discounted to present and buy with a margin of safety. The earnings prospects need to be greater than the current value. Anything that is unpopular is always great to look at. If I was getting out of school right now, I would take a look.

Creighton:

How much and how does risk factor into your investment decisions? Would you invest in emerging markets?

Buffett:

In general, emerging markets are not great for me because I need to put a lot of money to work. Risk does not equal beta. Risk comes around because you don't understand things, not because of beta. There are normally 10 filters or so that I go through when I hear an idea. The first is can I understand the business and understand the downside not just today but five to ten years from now. There have

been very few times that I've lost 1% of my net worth. I might be risk averse but I am not action adverse. Mrs. B saved \$500 over the course of 16 years to start and build Nebraska Furniture Mart. Tom Watson Sr of IBM said, "I'm smart in spots and I stay in those spots." I just stay within my circle of confidence. When I bought Nebraska Furniture Mart in 1983, Mrs. B took cash and not Berkshire stock. Why? She didn't understand the value of stock. She understood cash and that is what she took. I need only need to be right a few times and can let thousands of ideas go by.

Ted Williams, who wrote the "Science of Hitting," broke the strike zone into 92 ball shaped sections. He knew, if hit in his sweet spot, he'd hit 430, a little further out, and he'd hit 350. You have to know your sweet spot. The beautiful thing about investing is that it's a "No called strike game" where unlike baseball the only strikes in investing are when you swing. I don't have to swing.

When I do invest, I don't care if the stock price goes from \$10 to \$2 but I do care about if the value went from \$10 to \$2. Avoid debt. I decided early on that I never wanted to owe more than 25% of my net worth, and I haven't... except for in the very beginning. I like to play from a position of strength. I always try to have the odds in my favor. When I go to Vegas, I don't go around putting \$5 dollars on the blackjack tables. If someone wants to come to my room and put \$5 on my bed, well that's fine. I like those odds better.

Emory:
How do you think about value?

Buffett:
The formula for value was handed down from 600 BC by a guy named Aesop. A bird in the hand is worth two in the bush. Investing is about laying out a bird now to get two or more out of the bush. The keys are to only look at the bushes you like and identify how long it will take to get them out. When interest rates are 20%, you need to get it out right now. When rates are 1%, you have 10 years. Think about what the asset will produce. Look at the asset, not the beta. I don't really care about volatility. Stock price is not that important to me, it just gives you the opportunity to buy at a great price. I don't care if they close the NYSE for 5 years. I care more about the business than I do about events. I care about if there's price flexibility and whether the company can gain more market share. I care about people drinking more Coke.

I bought a farm from the FDIC 20 years ago for \$600 per acre. Now I don't know anything about farming but my son does. I asked him, how much it cost to buy corn, plow the field, harvest, how much an acre will yield, what price to expect. I haven't gotten a quote on that farm in 20 years.

If I were running a business school I would only have 2 courses. The first would obviously be an investing class about how to value a business. The second would be how to think about the stock market and how to deal with the volatility. The stock market is funny. You have no compulsion to act and a bunch of silly people setting prices all the time, it is great odds. I want the market to be like a manic depressive drunk. Graham's Ch. 8, in the book Intelligent Investor, on Mr. Market is the most important thing I have ever read. Now think about the NYSE. You have thousands of companies to choose from. For me, that universe has shrunk because I need to put large dollar amounts to work. Attitude is much more important than IQ. You can really get into trouble with a high IQ, i.e. Long-Term Capital. You need to have the right philosophical temperament.

Penn State:
Why did you invest in Harley-Davidson?

Buffett:
I like the 15%. I measured that 15% against other credits and it looked attractive on both a relative

basis and an absolute basis. Also, we have to have a certain amount of the portfolio go to debt. Lately, the government has become the guarantor for some companies but not for others and the “haves” and “have-nots” determined by certainty of government assistance rather than the credit quality. These finance companies have a problem getting funded, not with their customers. Any company where you can get your customers to tattoo your name on their body has quite a strong brand. For this investment I had to think what is the probability that they will not pay me back and would I want to own the company if they did not, basically that the equity isn't worth zero. Risk premiums in the corporate bond market went from real low to real high. Right now, they're out of whack. The flip side is that governments are overpriced. We have a bubble in governments. T-bills actually had a negative interest rate. I never thought I'd see that. A mattress is a better investment than the US 10 Year. Buying corporates and shorting the 10-year is a great idea and smart guys went broke doing it because even if you're right, you need to be able to play out your hand. I always think about what I would do if a nuclear bomb went off or if Bernanke ran off with Paris Hilton to South America.

Texas:

Do you feel that the might of America has changed?

Buffett:

You can bet against the dollar, but I would never bet against America. The system in the U.S. has allowed the country to unleash more for the world than any other country. Since 1776, the U.S. had a different system than the rest of the world and that system unleashed the human potential. We were not the smartest nor did we have the best resources. This is the same system we have in place today with people of similar intelligence. I have and would bet against the U.S. currency, stocks, etc. but the United States prevails over time. There are all kinds of rocky roads but we have rule of law, equality of opportunity, and a meritocracy. We have a market system and people apply energies and imagination to come up with things someone would want. Everyone in this room is working far below his/her potential.

Kansas:

We know that you are a big bridge player. Do you think that bridge correlates to investing? Are there any traits or characteristics that might carry over from one to the other?

Buffett:

Bridge is the best game there is. You're drawing inferences from every bid and play of a card, and every card that is or isn't played. It teaches you about partnership and other human skills. In bridge, you draw inferences from everything and that carries over well into investing. In bridge, similar to in life, you'll never get the same hand twice but the past does have a meaning. The past does not make the future definitive but you can draw from those experiences. I think the partnership aspect of bridge is a great lesson for life. If I'm going into battle, I want to partner with the best. I was playing with a world champion and we were playing against my sister and her husband. We lost, so I took the scorepad and I ate it.

South Dakota:

What are your views on derivatives and how do you think they have affected the global market?

Buffett:

In my 2002 letter to shareholders I referred to them as “weapons of mass destruction.” Derivatives are really just a way to create a product with a very long fuse, for example, 100 years, as opposed to stocks which settle in 3 days. That kind of system allows claims to be built up. AIG called me in September and told me they were about to get downgraded which would have required higher posting requirements. Now this is an enterprise that has been built up over decades and was

effectively destroyed in 48 hours by these products. With derivatives, you're exposed to counterparties and thus reliant on others. These claims built up over time to the tune of billions of dollars and when one falls, the whole system falls. Derivatives are not evil by themselves but rather everyone needs to be able to handle them. System wide, they're rat poison. Berkshire holds many derivatives but we always hold the money at Berkshire.

Creighton:

What do you think about the stimulus package? Would you rather see tax cuts or government spending?

Buffett:

We obviously have a problem, but we'll come out of this just fine. The idea of a stimulus is to do things that will have an impact quickly and the current proposal won't do that. When dealing with situations like this, you can't do just one thing but always need to ask yourself what is the next question. We have utilized monetary policy and guaranteed everything in sight. It's a standard Keynesian prescription. Tax cuts benefit people differently in the short term. We are basically saying, we're not going to pay for what we're doing in terms of government spending and that we'll just mail you some money but it's better than doing nothing. In the end, you should buy stock in a business that any idiot could run because someday, one will. You know, our country is similar.

Emory:

How do you think differently today than you did twenty years ago? Where do you expect to see the greatest differences in 2030?

Buffett:

The fundamental things about investing that I learned when I was younger haven't changed. I am lucky to have picked up a book at 19, *The Intelligent Investor*, that gave structure to investing and investment decisions. Over time, I learned different ways to apply it. I have learned what it is outside my circle of confidence. I bought See's in 1972 and I think understanding the value of brand helped drive the decision to buy Coca-Cola in 1988. Through experience, I have gotten smarter on predicting and evaluating human behavior. My wife put me together in terms of human behavior. I really enjoy doing what I do and I get to do what I want. I enjoy talking to groups like these. Irv and Ron Blumkin are some of my best friends and I continue to add friends by buying businesses. I don't want a boat or 12 houses. I'm almost fully depreciated, down to my residual value. Age doesn't affect my ability to my job though, as opposed to Arnold Palmer, he can't play his game.

Penn State:

What advice would you give the average person in the U.S.?

Buffett:

It's hard to give advice to someone who might lose their job. My Dad went to work on August 13, 1931 to find out the bank where he worked and held all our money had closed. He had no job and no money and two kids. You want to be as prepared as you can and you just don't want to have debt. Medical problems cause a lot of the grief and lots of credit card debt. Credit cards are poison. If you make a dollar, only spend 95 cents, not \$1.05. You should be ahead of the game all the time rather than behind as it is harder to work your way out of a hole. You want to play the game from strength, and you have to think ahead. People don't always want to hear advice when things are going well. People risked everything they had and needed for something they didn't have or need. Charlie once said, "The problem isn't getting rich, it's staying sane."

Texas:

What are the biggest challenges that this country faces?

Buffett:

The biggest problem is probably weapons of mass destruction. We have always had people who were ill-fitted to society and wished harm on others. In 1945 we unlocked the atom, and that changed everything. The human animal hasn't changed, you still have the same percentage that are maladjusted. The problem is knowledge, materials, and deliverability. What you could do with the wrong kind of infectious disease is incredible. You can transmit things much faster today. Governments, individuals and organizations can't control security. It's what I would spend all of my money on if I could fix it. Everyone here in this room won what I call the ovarian lottery. You were born at the right time and we were all very, very lucky. We are in the luckiest 1% of humanity.

Kansas:

What are some of the mistakes that Secretary Paulson made during the sub-prime crisis?

Buffett:

Hank is a great guy and great friend. He's extremely smart about markets but not so smart about politics. I sympathize with Hank. Hank Paulson was not the supreme commander. He had to work through at least 535 people with different incentives. The whole situation has developed faster and at an extreme pace, more than anyone thought. The first TARP program got voted down, which changed the dynamic. All variables affect other variables. Congress did not appreciate how severe the problem was. I call it an "Economic Pearl Harbor" in September. FDR essentially had a blank check and that what people think is important and believing it makes it so. He restored confidence in the banking system. Paulson's job may have been almost impossible given the circumstances. He was used to operating in a sphere that did not require consensus (Goldman Sachs). People that take that on [public service jobs] are laying themselves open to be unfairly attacked, criticized and scrutinized. In hindsight, letting Lehman fail was probably not the right thing but it was difficult to tell at the time. It created trust problems as money market funds fell apart soon thereafter. When people start to worry about the money in money markets, it's a problem. People want to be led at this point, but fall back into old habits very easily. When you think that Citi or Lehman is just a house of cards... I mean who would have even believed you. It's like Noah before the flood, building his ark. Can you imagine the reaction he got?

South Dakota:

What do you think about the U.S. trade deficit?

Buffett:

I talked to Barack back in August, and said: "I have good news and bad news. The good news is that the economy will be terrible, so you'll definitely get elected. The bad news is that the economy will be even worse at inauguration." He asked, "Do you think it's too late to throw the election?" The trade situation is there and it causes problem and could exacerbate the situation. However, all issues go on the back burner until we solve the big problem.

We create sovereign wealth funds, buying more goods and services than everyone else in the world. The decline in the oil price has helped the trade deficit but nothing will get better until everyone feels better. Every day, we buy \$2 billion of goods and service more than we produce and export. We give the exporting nations USD. The trade deficit creates claims on the United States. Sometimes we're a little hypocritical. For example, three years ago, the Chinese wanted to buy Unocal (a small oil company in California) and Congress wanted to condemn China for wanting to buy the oil company with the money we gave them (through U.S. imports). That's a little disingenuous. The trade deficit creates a situation because we give people claim checks, then we get upset when they want to use them. The Japanese bought Rockefeller Center in the 80's. Did we think they were going to move it? It's not useful to fan those flames in a nuclear world, and that's what's wrong with "Buy America." The trade deficit will come up big time when we get past the current problems.

Creighton:

Why do you live the way that you do?

Buffett:

Do you mean, why am I frugal? You can't buy health and you can't buy love. I'm a member of every golf club that I want to be a member of. I'm the highest handicap member of Augusta National. I'd rather play golf here with people I like than at the fanciest golf course in the world. I can do anything that I want, and I do. I buy everything I want to have. I'm not interested in cars and my goal is not to make people envious. Don't confuse the cost of living with the standard of living. Bella Eidenberg was a Polish Jew who was at Auschwitz and some of her family didn't make it. Twenty years ago she said she was slow to make friends, and that the real question in her mind was always, "Would they hide me?" If you have a lot of people that would hide you, you've had a very successful life. That can't be bought. I know people that have billions of dollars and their children would say, "he's in the attic."

I estimate that I live on \$100,000 per year, except for my plane which costs me about \$1 to \$1.5 million. I like the plane, it improves my life. My computer and my airplane changed my life in a big way and I'm not sure, if I had to choose, which one I'd give up. Anything beyond \$50 Million doesn't improve my life. If I took out \$3 billion of Berkshire stock, I could have paid 30,000 people \$100,000 per year to paint my portrait every day. I could have paid 50,000 people \$60,000 per year to dress in loin cloths and haul rocks to create the Buffett tomb. That's not me. I believe in giving my kids enough so they can do anything, but not so much that they can do nothing.

Penn State:

What do you think of the good bank, bad bank idea?

Buffett:

It is tough to do but if it were done well, it could do a lot. Call the bad bank an "Aggregator Bank." There is a lot to be said in cleaning out past problems. There are 7,000 banks in the U.S. with such varying degrees of conditions so it is tough to provide a sweeping overhaul. The biggest thing they're wrestling with is pricing what goes into the aggregator bank. These are smart, well-intentioned people working enormously hard on this.

Emory:

You take great pride in keeping your schedule wide open. Do you believe that corporate America is overscheduled and overstretched?

Buffett:

[Showed his blank schedule book]. Bill Gates is overscheduled. I am extremely lucky and I can say no to anything because there isn't an entity that can use economic pressure to make me do something. A lot of CEOs get into a lot of the rituals that are part of the job. I would rather deliver papers than be the CEO of GE. They have too much stuff to do that is a big pain. Don't get me wrong, CEOs have it pretty good. I'd imagine that every CEO in the Fortune 500 would be willing to take the job for half of the money. The 76 or so CEOs that run companies at Berkshire don't have to deal with bankers or lawyers. At Berkshire, we've never had a meeting for all of them anywhere. There are no presentations and no committees. They can be more productive, and it makes it attractive when they can do what they like to do best.

Kansas:

What are three traits of successful managers?

Buffett:

Passion is the number one thing that I look for in a manager. IQ is not really that important. They need to be able to work well with others and the ability to get people to do what you want them to do. I'd say intelligence, energy, integrity. If you don't have the last one, the first two will kill you. All you have is a crook who works hard. If a person doesn't have integrity, you want them dumb and lazy.

If you could put 10% of your future earnings on one of your classmates, you would pick the one that's most effective at working with people. These are qualities that are elective. If you could pick one to sell short, it would be the person that no one wants to work with. You can elect to be the kind of person you want to be. Look at those qualities of the two people you've selected (one long and one short). They're all qualities that you possess. It's like marriage. If you want a marriage that's going to last, look for someone with low expectations. Don't keep score. Keeping score doesn't build organizations, homes, etc. I have never had one fight with Charlie. When I took over Solomon I had to pick the best person to run it. I interviewed 12 people for 15 minutes each and I asked myself, "Who would I go into a foxhole with?" I never look at grades or where you went to school. When I picked Deryck Maughan, he never asked me about pay or options or indemnity. He went to work.

Chains of habit are too light to be felt until they're too heavy to be broken. In terms of picking people how do you lead your life in a way that I'd pick you?

The Greenback Effect

By WARREN E. BUFFETT
Published: August 18, 2009

Omaha

IN nature, every action has consequences, a phenomenon called the butterfly effect. These consequences, moreover, are not necessarily proportional. For example, doubling the carbon dioxide we belch into the atmosphere may far more than double the subsequent problems for society. Realizing this, the world properly worries about greenhouse emissions.

The butterfly effect reaches into the financial world as well. Here, the United States is spewing a potentially damaging substance into our economy — greenback emissions.

To be sure, we've been doing this for a reason I resoundingly applaud. Last fall, our financial system stood on the brink of a collapse that threatened a depression. The crisis required our government to display wisdom, courage and decisiveness. Fortunately, the Federal Reserve and key economic officials in both the Bush and Obama administrations responded more than ably to the need.

They made mistakes, of course. How could it have been otherwise when supposedly indestructible pillars of our economic structure were tumbling all around them? A meltdown, though, was avoided, with a gusher of federal money playing an essential role in the rescue.

The United States economy is now out of the emergency room and appears to be on a slow path to recovery. But enormous dosages of monetary medicine continue to be administered and, before long, we will need to deal with their side effects. For now, most of those effects are invisible and could indeed remain latent for a long time. Still, their threat may be as ominous as that posed by the financial crisis itself.

To understand this threat, we need to look at where we stand historically. If we leave aside the war-impacted years of 1942 to 1946, the largest annual deficit the United States has incurred since 1920 was 6 percent of gross domestic product. This fiscal year, though, the deficit will rise to about 13 percent of G.D.P., more than twice the non-wartime record. In dollars, that equates to a staggering \$1.8 trillion. Fiscally, we are in uncharted territory.

Because of this gigantic deficit, our country's "net debt" (that is, the amount held publicly) is mushrooming. During this fiscal year, it will increase more than one percentage point per month, climbing to about 56 percent of G.D.P. from 41 percent. Admittedly, other countries, like Japan and Italy, have far higher ratios and no one can know the precise level of net debt to G.D.P. at which the United States will lose its reputation for financial integrity. But a few more years like this one and we will find out.

An increase in federal debt can be financed in three ways: borrowing from foreigners, borrowing from our own citizens or, through a roundabout process, printing money. Let's look at the prospects for each individually — and in combination.

The current account deficit — dollars that we force-feed to the rest of the world and that must then be invested — will be \$400 billion or so this year. Assume, in a relatively benign scenario, that all of this is directed by the recipients — China leads the list — to purchases of United States debt. Never mind that this all-Treasuries allocation is no sure thing: some countries may decide that purchasing American stocks, real estate or entire companies makes more sense than soaking up dollar-denominated bonds. Rumbblings to that effect have recently increased.

Then take the second element of the scenario — borrowing from our own citizens. Assume that Americans save \$500 billion, far above what they've saved recently but perhaps consistent with the changing national mood. Finally, assume that these citizens opt to put all their savings into United States Treasuries (partly through intermediaries like banks).

Even with these heroic assumptions, the Treasury will be obliged to find another \$900 billion to finance the remainder of the \$1.8 trillion of debt it is issuing. Washington's printing presses will need to work overtime.

Slowing them down will require extraordinary political will. With government expenditures now running 185 percent of receipts, truly major changes in both taxes and outlays will be required. A revived economy can't come close to bridging that sort of gap.

Legislators will correctly perceive that either raising taxes or cutting expenditures will threaten their re-election. To avoid this fate, they can opt for high rates of inflation, which never require a recorded vote and cannot be attributed to a specific action that any elected official takes. In fact, John Maynard Keynes long ago laid out a road map for political survival amid an economic disaster of just this sort: "By a continuing process of inflation, governments can confiscate, secretly and unobserved, an important part of the wealth of

their citizens.... The process engages all the hidden forces of economic law on the side of destruction, and does it in a manner which not one man in a million is able to diagnose.”

I want to emphasize that there is nothing evil or destructive in an increase in debt that is proportional to an increase in income or assets. As the resources of individuals, corporations and countries grow, each can handle more debt. The United States remains by far the most prosperous country on earth, and its debt-carrying capacity will grow in the future just as it has in the past.

But it was a wise man who said, “All I want to know is where I’m going to die so I’ll never go there.” We don’t want our country to evolve into the banana-republic economy described by Keynes.

Our immediate problem is to get our country back on its feet and flourishing — “whatever it takes” still makes sense. Once recovery is gained, however, Congress must end the rise in the debt-to-G.D.P. ratio and keep our growth in obligations in line with our growth in resources.

Unchecked carbon emissions will likely cause icebergs to melt. Unchecked greenback emissions will certainly cause the purchasing power of currency to melt. The dollar’s destiny lies with Congress.

Warren E. Buffett is the chief executive of Berkshire Hathaway, a diversified holding company.

Financial Crisis Inquiry Commission Staff Audiotape of Interview with Warren Buffett, Berkshire Hathaway

May 26, 2010

INTERVIEWER:

Thank you. Mr. Buffett we're with the staff of the Financial Crisis Inquiry Commission. We were formed by Congress in 2009 to investigate the causes of the financial crisis both globally and domestically. And to do a report, due at the end of this year, December 15, 2010 to the President and to Congress which we also plan to release to the American public. We're tasked not only with investigating the causes of the financial crisis but looking at specific issues that Congress has enumerated in the Fraud Enforcement Recovery Act which formed the Commission. The Commission is a bipartisan Commission, six Democrats and four Republican Commissioners and we are with the staff of the Commission. We wanted to ask you a few questions today and get your views and your insights so that we may better understand the causes of the financial crisis. In addition, we would like to ask you a few questions about Moody's

as well since you are a significant shareholder in Moody's. And if you don't mind, let's ask first about Moody's specifically.

INTERVIEWER:

I understand sir, that in 1999 and in February of 2000 you invested in Dun and Bradstreet.

WARREN BUFFETT:

That's correct. I don't have the dates, but that sounds right.

INTERVIEWER:

Yes sir. And am I correct, sir, in saying that you made no purchases after Moody's spun off from Dun and Bradstreet?

WARREN BUFFETT:

I believe that's correct.

INTERVIEWER:

What kind of due diligence did you and your staff do when you first purchased Dun and Bradstreet in 1999 and then again in 2000?

WARREN BUFFETT:

There is no staff. I make all the investment decisions and I do all my own analysis. And basically it was an evaluation both of Dun and Bradstreet and Moody's but of the economics of their business. And I never met with anybody. Dun and Bradstreet had a very good business and Moody's had an even better business. And basically the single most important decision in evaluating a business is pricing power. You've got the power to raise prices without losing business to a competitor, and you've got a very good business. And if you have to have a prayer session before raising the price by a tenth of a cent (laughs), then you got a terrible business. And I've been in both and I know the difference.

INTERVIEWER:

Now, you've described the importance of quality management in your investing decisions and I know your mentor Benjamin Graham, I happen to have read his book as

well, has described the importance of management. What attracted you to the management of Moody's when you made your initial investments?

WARREN BUFFETT:

I knew nothing about the management of Moody's. I've also said many times in annual reports and elsewhere that one of the many, but with reputation of for brilliance in him gets hooked up with a business with a reputation of bad economics, it's the reputation of the business that remains intact. If you've got a good enough business, if you have a monopoly newspaper, if you have a network television station, I'm talking in the past, you know, your idiot nephew could run it. And if you've got a really good business, it doesn't make any difference. It makes some difference maybe in capital allocation or something of the sort, but the extraordinary business does not require good management.

WARREN BUFFETT:

I'm not making any reference to Moody's management, I didn't know them, but it really, you know, if you own the only newspaper in town up till the last five years or so, you have pricing power and you didn't have to go to the office.

INTERVIEWER:

And do you have any opinion, sir, of how well management of Moody's has performed?

WARREN BUFFETT:

It's hard to evaluate when you have a business that has that much pricing power. I mean, they have done very well in terms of huge returns on tangible assets, almost infinite. And they have, they have grown along with a business that generally capital markets became more active and all that. So in the end--and they've raised prices--we're a customer of Moody's too so I see this from both sides and an unwilling customer, but we're a

customer nevertheless. And what I see as a customer is reflected in what's happened in their financial record.

INTERVIEWER:

And I've seen in many places where you've been referred to as a passive investor of Moody's. Is that a fair characterization and what sort of interactions and communications have you had with the Board and with management of Moody's?

WARREN BUFFETT:

At the very start there was a fellow named Cliff Alexander who was the Chairman of Dun and Bradstreet while they were breaking it up. He met me, I met him in connection with something else years earlier. So we had a lunch at one time, but he wasn't really an operating manager, he was there sort to oversee the breakup of the situation. Since we really owned stock in both Dun and Bradstreet and Moody's when they got split up, I'd never been in Moody's offices. I don't think I've ever initiated a call to them. I would say that three or four times as part of a general road show their CEO and the investor relations person would stop by and they think they have to do that. I have no interest in it basically and I never requested a meeting. It just, it was part of what they thought investor relations were all about. And we don't believe much in that.

INTERVIEWER:

What about any Board members? Have you pressed for the election of any Board members to Moody's Board?

WARREN BUFFETT:

No, I have no interest in it.

INTERVIEWER:

And, we've talked about just verbal communications. Have you sent any letters or submitted any memos or ideas for strategy decisions to Moody's?

WARREN BUFFETT:

No, no.

WARREN BUFFETT:

If I thought they needed me I wouldn't have bought the stock. (laughs)

INTERVIEWER:

In 2006 Moody's began to re-purchase its shares, buying back its shares that were outstanding and they did so from 2006 to 2008 according to our records. Why didn't you sell back your shares to Moody's at that time? I know subsequent in 2009 you've sold some shares but from '06 to '09 during the buy-back did you consider selling your shares back and if so, why didn't you?

WARREN BUFFETT:

Oh, I thought they had an extraordinary business and, you know, they still have an extraordinary business now subject to a different threat which we'll get into later, I'm sure. But I made a mistake in that it got to very lofty heights and we didn't sell. It wouldn't have made any difference whether we were selling to them or selling in the market. But there are very few businesses that had the competitive position that Moody's and Standard and Poor's had, they both had the same position essentially. Very few businesses like that in the world. It's a natural duopoly to some extent, now that may get changed, but it has historically been a natural duopoly where anybody coming in and offering to cut their price in half had no chance of success. And there are not many businesses where somebody could come in to cut the price in half. And if somebody doesn't think about shifting, but that's the nature of the ratings business and it's a naturally obtained one. I mean, it's assisted by the fact that the two of them became the standard for regulators and all of that. So it's been assisted by the governmental actions over time. But it's a natural duopoly.

INTERVIEWER:

Now, Mr. Buffett, you've been reported as saying that you don't use ratings.

WARREN BUFFETT:

That's right.

INTERVIEWER:

But the world does.

WARREN BUFFETT:

That's right.

WARREN BUFFETT:

But we pay for ratings which I don't like. (laughs)

INTERVIEWER:

My question is one of more policy and philosophy and that is, would the American economy be better off in the long run if credit ratings were not so embedded in our regulations and if market participants relied less on credit ratings?

WARREN BUFFETT:

Well, I think it might be better off if everybody that invested significant sums of money did their own analysis but that is not the way the world works. And regulators have a terrible problem in setting capital requirements all of that sort of thing without some kind of standards that they look to even if those are far from perfect standards. I can't really judge it perfectly from the regulators' standpoint. From the investors' standpoint, I think that investors should do their own analysis and we always do.

INTERVIEWER:

Would you support the removal of references to credit ratings from regulations?

WARREN BUFFETT:

That's a tough question. I mean, you get into, you get into, you know, how you regulate insurance companies and banks. And we are very significantly in the insurance business and we are told that we can only own triple B and above and different--there are all kinds of different rules in different states and even different countries. And those may serve as a crude tool to

determine proper capital or to prevent buccaneers of one sort from going out and speculating in the case of banks with money that's obtained through a government guarantee. So that is not an easy question.

INTERVIEWER:

As I mentioned at the outset we're investigating the causes of the financial crisis and I would like to get your opinion as to whether credit ratings and their apparent failure to predict accurately credit quality of structured finance products like residential mortgage backed securities and collateralized debt obligations. Did that failure or apparent failure cause or contribute to the financial crisis?

WARREN BUFFETT:

It didn't cause it but there were a vast number of things that contributed to it. The basic cause was, you know, embedded in, partly in psychology, partly in reality in a growing and finally pervasive belief that house prices couldn't go down. And everybody succumbed, virtually everybody succumbed to that. But that's, the only way you get a bubble is when basically a very high percentage of the population buys into some originally sound premise--and it's quite interesting how that develops--originally sound premise that becomes distorted as time passes and people forget the original sound premise and start focusing solely on the price action. So the media, investors, mortgage bankers, the American public, me, you know, my neighbor, rating agencies, Congress, you name it. People overwhelmingly came to believe that house prices could not fall significantly. And since it was the biggest asset class in the country and it was the easiest class to borrow against it created, you know, probably the biggest bubble in our history. It'll be a bubble that will be remembered along with South Sea bubble and [unintelligible] bubble.

INTERVIEWER:

I do want to ask you some questions about the formation of that bubble, if I may ask a couple more on the rating agency side and then shift to that. And that is, do I take it, though, that you believe that at least the failure of the ratings contributed in some part to the financial crisis?

WARREN BUFFETT:

But I do think it was, I think every aspect of society contributed to it virtually. But they fell prey to the same delusion that existed throughout the country eventually. And it meant that the models they had were no good. They didn't contemplate, but neither did the models in the minds of 300 million Americans contemplate what was going to happen.

INTERVIEWER:

And similarly, sir, the ratings agencies, both Moody's and S&P downgraded securities en masse in July of 2007, July, roughly starting around July 10, 2007. And then again in mid October of 2007. Many have pointed to these downgrades as contributing to the crisis. Do you believe that these downgrades, the sudden downgrades contributed to uncertainty in the market or the looming crisis?

WARREN BUFFETT:

Well, I think that the realization by people that a bubble was starting to pop and, you know, everybody doesn't wake up a six a.m. on some morning and find it out. But Freddie Mac, Fannie Mae they all felt different in the middle of 2007 than they did in the middle of 2006 or 2005. So people were watching a movie and they thought the movie had a happy ending and all of a sudden the events on the screen started telling them something different. And different people in the audience picked it up maybe different hours, different days, different weeks. But at some point the bubble popped.

WARREN BUFFETT:

And for differently people it was, they were seeing it at slightly different times. But you can say the media's caused it too, if they say the bubble's popping, you know. The recognition of it by the rating agencies I would say, you know, may have pulled a whole bunch of people that previously hadn't been paying much attention that it was happening. The report's coming out of Freddie and Fannie may have told people what was happening country-wide and I think that was the summer of 2007 certainly was telling people that. So it was dawning on people in a way sort of that what they believed wasn't true.

INTERVIEWER:

Now, I read in one of your shareholder letters I thought you appropriately said, "A pin lies in wait for every bubble."

WARREN BUFFETT:

And this was the biggest one.

INTERVIEWER:

When did you realize that there was a mortgage melt down coming and if so, what steps did you take to prepare for it? And if not, why were you unable, as one of the purportedly wisest investors in the United States, why were you unable to spot this massive bubble growing?

WARREN BUFFETT:

The answer is to the first part was not soon enough. (laughs) And it was something we talked about at our annual meetings. And I think one point I referred to it as a bubblette, I don't remember what year that was. But, and I talked my home in Laguna where the implicit value of the land had gotten up to \$30 million an acre or something like that, on that order. But the nature of bubbles is that, you know, with the internet bubble I was aware of it too, but I didn't go and shorten stocks. I never shorted internet stocks and I didn't short housing stocks.

Looking back, you know, a) we don't short around here but, you know, if I'd seen what was coming, I might have behaved differently (laughs) including selling Moody's. Something's wrong.

INTERVIEWER:

And we've obviously had bubbles in the past. As you pointed with the internet bubble and others. But at least in recent times we've never had a financial crisis as severe as the one we're living through now. When did it dawn on you that this bubble bursting and this financial crisis was going to be different than none others in recent time?

WARREN BUFFETT:

Well, unfortunately, it's a gradual process and, you know, you get wise too late. When it really became apparent that, you know, that this was something like we'd never seen was in September 2008 that's when I said on CNBC, this is an economic Pearl Harbor. Well, it was an economic Pearl Harbor by definition I meant that I hadn't seen it three months earlier because I didn't see a Pearl Harbor three months earlier. There were all kinds of developments, but the degree to which it would stop the financial system, you know. And then with the consequent overflow into the economy, you know. Until September 2008, I didn't fully realize.

INTERVIEWER:

What do you think it was, if you were to point to one of the single driving causes behind this bubble? What would you say?

WARREN BUFFETT:

There's a really interesting aspect of this which will take a minute or two to explain, but my former boss Ben Graham in an observation 50 or so years ago to me that really stuck in my mind and now I've seen elements of it. He said you can get in a whole lot more trouble in investing with a sound

premise than with a false premise. If you have some premise that the moon is made of green cheese or something, you know, it's ridiculous on its face. If you come up with a premise that common stocks have done better than bonds and I wrote about this in a Fortune article in 2001. Because it was, there was a famous little book in 2001 by Edgar Lawrence Smith, in 1924, I think, by Edgar Lawrence Smith that made a study of common stocks vs. bonds. And it showed, he started out with the idea that bonds would over-perform during deflation and common stocks would over-perform during inflation. He went back and studied a whole bunch of periods and lo and behold, his original hypothesis was wrong. He found that common stocks always over-performed. And he started to think about it and why was that. Well it was because there was a retained earnings factor. They sold, the dividend you got on stocks was the same as the yield on bonds and on top of that you had retained earnings. So they over-performed. That became the underlying bulwark for the '29 bubble. People thought stocks were starting to be wonderful and they forgot the limitations of the original premise which was that if stocks were yielding the same as bonds that they had this going for them.

So after a while the original premise which becomes sort of the impetus for what later turns out to be a bubble is forgotten and the price action takes over. Now we saw the same thing in housing. It's a totally sound premise that houses will become, worth more over time because the dollar becomes worth less. It isn't because, you know, construction costs go up. And it isn't because houses are so wonderful it's because the dollar becomes worth less that a house that was bought 40 years ago is worth more today than it was then. And since 66% or 67% of the people want to own their home and because you can borrow money

on it and you're dreaming of buying a home, if you really believe that houses are going to go up in value you buy one as soon as you can. And that's a very sound premise. It's related of course, though, to houses selling at something like replacement price and not [unintelligible] of stripping inflation. So the sound premise it's a good idea to buy a house this year because it will probably cost more next year and you're going to want a home and the fact that you can finance it gets distorted over time if housing prices are going up 10% a year and inflation is a couple of percent a year. Soon the price action, or at some point the price action takes over and you want to buy three houses and five houses and you want to buy with nothing down and you want to agree to payments that you can't make and all of that sort of thing because it doesn't make any difference, it's going to be worth more next year. And the lender feels the same way. Doesn't really make difference if it's a liar's loan or you don't have the income or something because even if they have to take it over, it'll be worth more next year. Once that gathers momentum and it gets reinforced by price action and the original premise is forgotten which it was in 1929. The internet, it's the same thing. The internet was going to change our lives, but it didn't mean that every company was worth \$50 billion that could dream up a prospectus and the price action becomes so important to people that it takes over their minds. And because housing was the largest single asset around 22 trillion or something like on about, you know, a household wealth of 50 or 60 trillion or something like that in the United States, such a huge asset, so understandable to the public. They might not understand stocks or the internet, you know, they might not understand tulip bulbs, but they understood houses. And they wanted to buy one anyway and the financing, and you could leverage up to the sky, it

created a bubble like we've never seen. I wish I'd figured that out in 2005.

INTERVIEWER:

This bubble, though, has been described as different from prior housing bubbles. And certainly the forces that you've described about prices and certainly the types of loans that you've described have been around for a while. What do you think, though, made this particular housing bubble different and what would you point to to the growth of this particular housing bubble? Some have pointed to cheap money, in essence, some have pointed to lack of regulation in the origination business, some have pointed to the drive from Wall Street for securitized mortgages and RMBS and then as collateral for CEOs. Others have pointed to government policy that created the housing bubble. What do you think created and caused this housing bubble?

WARREN BUFFETT:

It's a great question to which I don't have a great answer. Why did the, I don't know whether the tulip bulb bubble was in 1610 or 20 but tulips had been around before and they'd always looked beautiful and people had wanted them in their tables and all that. And for some reason it gets to a critical mass, this critical point where price action alone starts dominating people's minds. And when your neighbor has made a lot of money by buying internet stocks, you know, and your wife says that you're smarter than he is and he's richer than you are, you know, so why aren't you doing it. When that gets to a point, when day trading gets going, all of that sort of thing, very hard to point to what does it. I mean, it, you know, we've had hula hoops in this country, we've had pet rocks, I mean, you know, and this is the financial manifestation of, you know, a craze of sorts. And I, it's very hard to tell what got the--all the, you can name a lot of factors that contribute to it but to say what is the

one that this time was different that made, why it didn't catch fire earlier, I can't give you the answer.

INTERVIEWER:

You don't make our job any easier. (laughs)

WARREN BUFFETT:

(laughs) No, well, no, listen, I don't have a great answer, I'd probably have written an essay or something on it by this point. I mean, you know, I think it's going to defy an answer to be perfectly honest. That doesn't mean that your time is wasted or anything. Understanding, you know, the pathology of bubbles is not an unimportant--we had one that was more severe, in fact there was an article in the Omaha World Herald about three months ago that described how it was more severe, we had a bubble in the Midwest in the early '80s in farmland that created much more financial dislocation, but it was limited to the farm belt than this particular bubble has which has not hit as hard in terms of housing in the Midwest. So Nebraska was much harder hit in the farmland bubble. And the farmland bubble had the same logic to it. Inflation was out of control, Volcker hadn't really come in with his, with his meat axe to the economy and people said, you know, you're not making more farmland, there are going to be more people eating, farmland gets more productive by the years, we learn more about it, fertilizers and all that sort of thing. And cash is trash so you should go to, and own something real which was a farm. And I bought a farm from the FDIC and well, no, it was the FDIC I think. They took over a bank 30 miles from here, I bought up a farm for \$600 an acre that the bank had lent \$2,000 an acre against. And the farm didn't know what I'd paid for it or the other guy had paid, or lent on it. And that farm had a productive capacity of probably \$60 an acre in terms of what corn soybeans were selling for. To lend

\$2,000 against it when interest rates were 10% was madness. And both the banks in [unintelligible] and Nebraska went broke because they went insane. They got through the '30s alright, but the psychology that farms could do nothing but go up took over. And that was a significant, but very miniature version of what could happen with houses country-wide.

INTERVIEWER:

Now earlier you referenced the GSEs and it's been reported that in 2000 you sold nearly all of your Freddie Mac and Fannie Mae shares. What persuaded you in 2000 to think that those were no longer good investments?

WARREN BUFFETT:

Well, I didn't know that they were not going to be good investments. But I was concerned about the management at both Freddie Mac and Fannie Mae although our holdings were concentrated in Freddie Mac. They were trying to and proclaiming that they could increase earnings per share in some low double digit range or something of the sort. And any time a large financial institution starts promising regular earnings increases you're going to have trouble. It isn't given to man to be able to run a financial institution where different interest rates scenarios will prevail and all of that comes to produce smooth regular earnings from a very large base to start with. So if people are thinking that way they're going to do things maybe in accounting it's turned out to be the case in both Freddie and Fannie but also in operations that I would regard as unsound. I don't know when it'll happen, I don't even know for sure if it'll happen. It will happen eventually if they keep up that policy and so, we, or I just decided to get out.

INTERVIEWER:

The Washington Post reported on October 31, 2007 that you had provided some testimony the day

before in a case against Freddie Mac's CEO where you had indicated that you became troubled when Freddie Mac made an investment unrelated to its mission. And you were quoted in that article as saying that you didn't think that it made any sense at all and you were concerned about what they might be doing that I didn't know about. What was that investment unrelated to its mission?

WARREN BUFFETT:

As I remember it was Philip Morris bonds, I think, I could be wrong, it might be R.J. Reynolds or something. But they'd made a large investment in that. Now they're dealing essentially with government guaranteed credit. We knew that then, we've had it ratified subsequently by what's happened. So here was an institution that was trying to serve two masters, Wall Street and her investors, and Congress. And they were using this power to do something that was totally unrelated to the mission and then they gave me some half-baked explanation about how it increased liquidity which was just nonsense. And the truth was they were arbitraging the government's credit. And for something the government really didn't intend for them to do. And, you know, there's seldom just one cockroach in the kitchen, you know. You turn on the light and all those others all start scurrying around. And I wasn't, I couldn't find the light switch but I'd seen one.

INTERVIEWER:

Shifting to more recent times. You've made investments in Goldman Sachs in September of 2008 and in General Electric. What were your considerations when you made those investments and were you persuaded by any government official to make those investments?

WARREN BUFFETT:

I wasn't persuaded by, I was, in my own mind, there was only one way the, both

the financial world and the economy was going to come out of this situation that, of paralysis in September of 2008 and I made the fundamental decision that we had really the right people in Bernanke and Paulson and in there with the President would back them up. That we had a government that would take the action and only the government could. It would take the action to get an economic machine that had become stalled basically back into action. And I didn't know what they would do, I didn't know what Congress would go. It didn't really make much difference. The important thing was the American public would come to believe that our government would do whatever it took. And I felt it would, it would have been suicide not to. But it hadn't been done in the early '30s and therefore those companies like General Electric or Goldman Sachs were going to be fine over time. But it was a bet, essentially, on the fact that the government would not really shirk its responsibility at a time like that to leverage up when the rest of the world was trying to de-leverage and panicked.

INTERVIEWER:

Around that same time on October 17, 2008 you wrote an op-ed piece in the New York Times on why you were buying American stocks. And did anyone from the federal government or Federal Reserve ask you to write that?

WARREN BUFFETT:

No, no.

INTERVIEWER:

And similarly, I know you weren't persuaded by anything the government asked you to do but did anyone ask you to make any investments in financial companies such as Goldman?

WARREN BUFFETT:

No. Well, Goldman asked me to and GE asked me to and a number of other

companies asked me to but nobody from government.

INTERVIEWER:

No one from government?

WARREN BUFFETT:

No.

WARREN BUFFETT:

I have, I have, actually, testified that in the connection with Lehman was trying to raise some money in the spring of 2008 and Dick Fuld was calling me and he did get Hank Paulson to call but Hank did not urge me to buy. He was responding to the entreaties of Fuld that he make a call but I was not asked to buy anything. Wouldn't have done any good if they'd asked. (laughs)

INTERVIEWER:

Do you believe that your prominence as an investor and your stock purchases could alleviate the financial crisis, was that--?

WARREN BUFFETT:

That was not a motivation.

INTERVIEWER:

Was that a consideration?

WARREN BUFFETT:

No, no, not a bit. (laughs) My public spirit has stopped short of \$8 billion.

INTERVIEWER:

Would the American economy have been better off in the long run if there'd had been no exceptional government assistance to financial institutions? In other words do you think that we've increased the likelihood of moral hazard in the long run?

WARREN BUFFETT:

I think the moral hazard thing is misunderstood in a big way. There is no moral hazard existing with shareholders of Citigroup with Freddie Mac, with Fannie Mae, with WaMu, with Wachovia, you just go up and down the line. I mean, those people lost anywhere from 90% to 100% of their

money. And the idea that they would walk away and think, ah, I've been saved by the federal government when I think just the companies I named there's a least a half a trillion dollars of loss that the common shareholders now--there's another question with managements which we might get into later. But in terms of moral hazard I don't even understand why people talk about that in terms of equity holdings.

INTERVIEWER:

Do you think we would have been better off though, if we had not the infusion of government assistance?

WARREN BUFFETT:

I think it would be a disaster, you know. It would have. It would have been the disaster of all time.

INTERVIEWER:

I'd like for you to try to help me square something you've been quoted as saying about credit default swaps and I'm sure my colleague Chris Seifer has been focusing in on these areas, he'll ask you additional questions. But you've been quoted as saying credit default swaps were financial weapons of mass destruction.

WARREN BUFFETT:

Well, I, I, no, I said derivatives.

INTERVIEWER:

Derivatives, excuse me.

WARREN BUFFETT:

Yeah, were financial--systemically they represented potential financial weapons of mass destruction. And I think, I don't think there's any question about that.

INTERVIEWER:

And in 2008 you began to invest in credit default swaps and I understand that--

WARREN BUFFETT:

Yeah, we've sold insurance for a lot of years and sometimes that's credit

insurance. And, you know, I don't think the way--I don't see a connection between selling insurance and thinking something can be systemically dangerous if again carried to extremes in terms of the leverage produced and the scope of contracts entered in but I don't see anything improper about credit insurance.

WARREN BUFFETT:

Banks are doing that for decades with letters of credit and that sort of thing.

INTERVIEWER:

And in terms of though your concern with derivatives, is it a question of the type of product or is it a question of the use or both?

WARREN BUFFETT:

It's a question of being, it's the ability to inject enormous amounts of leverage into a system where leverage is dangerous. And without people fully appreciating the amount of leverage and as a handmaiden of leverage, a risk of counterparties running up huge amounts of receivables and payables. And one of the reasons stock markets work well is that you've got a three day settlement period. But if you have a one year settlement period--in fact, I think over in Kuwait they did some years ago, and they had a total debacle--you would have far more problems. Well, derivatives and bonds are very, very long settlement period and things can happen between when you write a contract and if you have a settlement period, there was one at Gen Re that was 100 years, very hard to predict the behavior of somebody else 100 years from now. (laughs) And derivatives present big problems. Now, if there's only a small amount in use it doesn't make that much difference to the system. But if they become more and more pervasive, more and more imaginative and less, and in effect very little attention being paid to them which is why I sounded a warning. I don't think they're evil per se, it's just,

they, I mean there's nothing wrong with having a futures contract or something of the sort but they do let people engage in massive mischief. And the thing I found really extraordinary--and Tracy, you might give them that letter-- I mean I wrote this letter in 1982, about the date--the, here, you've got a Commission that's doing what before I did, you know, many years ago. And when we had those hearings after '29 we decided leverage was dangerous for people and it could cause systemic problems when used in the stock market. And we had the Federal Reserve power to determine margin requirements. We said that was important and that if people got over leveraged in the stocks they could cause a problem not only for themselves but for others if it was done on a wide scale. And then we came along in 1982 and we in a sense opened up leverage to anybody in extreme measures and since that time, 28 years since then, I and perhaps others, but I know I pointed out at least 20 times the, really nonsense of saying somebody at the Federal Reserves telling people they can only borrow 50% against stocks or whatever the margin requirements have been at various times. And then at the same time telling them that you can go gamble, you know, in S&P futures or something, the 2% or 3% margin or whatever it might be and to this day, and I've talked to Congress about it and to this day we sit there with a system where the Federal Reserve is telling you how much you can borrow against stocks and we've got this parallel system where people can gamble anything they want virtually in terms of the most obvious one being the S& P futures. And I've seen no attempt by anybody to address that total contradiction. Might be a suggestion for your Commission.

INTERVIEWER:

On that vein we've been charged with talking about excess risk and excess speculation and I know you've

commented on what you view as speculation in one of your letters. But we've had some internal conversations within the Commission itself about the use of the term speculation whether it's a--

WARREN BUFFETT:

It's an interesting--defining investment, speculation and gambling is an interesting question.

INTERVIEWER:

I'd be interested in, you know, what you think speculation is as opposed to investing which you've written about and also what you think excess speculation or excess risk is in that context.

WARREN BUFFETT:

It's a tricky definition, you know, it's like pornography (laughs) the famous quote and all that, but I look at it in terms of the intent of the person engaging in the transaction. And an investment operation and that's not the way Graham defines it in his book, but an investment operation in my view is one where you look to the asset itself to determine your decision to lay out some money now to get some more money back later on. So you look to the apartment house, you look to the stock, you look to the farm in terms of what that will produce. And you don't really care whether there's a quote under it all. You are basically committing some funds now to get more funds later on through the operation of the asset. Speculation, I would define, as much more focused on the price action of the stock, particularly that you buy or the indexed future or something of the sort. Because you are not really, you are counting on, for whatever factors, could be quarterly earnings, could be up or it's going to split or whatever it may be or increase the dividend, but you are not looking to the asset itself. And I say the real test of how you, what you're doing is whether you care whether the markets are open. When I

buy a stock, I don't care whether they close the stock market tomorrow for a couple of years because I'm looking to the business, Coca-Cola or whatever it may be to produce returns for me in the future from the business. Now if I care whether the stock market is open tomorrow then I say to some extent I'm speculating because I'm thinking about whether the price is going to up tomorrow or not. I don't know where the price is going to go. And then gambling I would define as engaging in a transaction which doesn't need to be part of the system. I mean, if I want to bet on a football game, you know, the football game's operation is not dependent on whether I bet or not. Now, if I want to bet on October wheat or something of the sort people have to raise wheat and when they plant it they don't know what the price is going to be later on. So you need activity on the other side of that and who may be speculating on it but it is not an artificial transaction that has no necessity for existing in an economic framework. And the gambling propensity with people is huge. I mean, you took a, you know, some terrible sand out in the west about 100 years ago and you created, you know, huge industry with people flying thousands of miles to do things which are mathematically unintelligent, you know. Now that is, shows something in mankind that has a strong, strong behavioral, has a strong behavioral aspect to it and think how much easier it is, you know, to sit there in front of a computer and have the same amount of fun without, you know, getting on a plane and going a 1,000 miles and having to make reservations and do all that sort of thing. So with this propensity to gamble encouraged incidentally by the state with lotteries, you know, with terrible odds attached to them, people don't have to be trained to want to gamble in this country but they, they have this instinct, a great many people. They're encouraged when they see some successes around, that's why

the bells and whistles go off in the casino when somebody hits a jackpot, you know. So, you know, you have all these things pushing to that including governmental urging to buy lottery tickets and all that sort of thing. And now you've got a vehicle like, you know, S&P futures or something where you can go in and out and where Congress has granted particularly favorable tax treatment to you if you win. I mean, you can be in for ten seconds and have 60% long term gain which I regard as, you know, extraordinary. But it exists.

WARREN BUFFETT:

That's all I know about gambling, actually speculation (laughs) but I do know it when I see it.

INTERVIEWER:

My last question before I turn things over is, you've mentioned management and people have observed that there has been failures of management at Wall Street banks. Similarly people have described there to be failures of regulators during this crisis.

WARREN BUFFETT:

Failures of the media, failures of, you know, Congress failures, you know. Commentators, you know.

INTERVIEWER:

How did management fail and what do you view as the essential failures in management of the Wall Street firms and similarly what would you view as the failures of the regulators leading up to and during the crisis?

WARREN BUFFETT:

Well, they didn't anticipate, you know, how extraordinary a bubble could be created, you know. And very difficult to fault them because so few people have a difficult time doing that when a crowd is rushing in one direction knowing the other direction is very hard. And usually the people that do that become discredited by the price action, you know. If you were a Cassandra in 2005 or 2006 and

houses kept going up, you know, after a while people quit listening and it [unintelligible] because they're nuts anyway, you know, anything that's going on so you, you have a fringe element to Cassandras too. Conceivably, you know, if the President of the United States, you know, or the Chairman of the Fed or somebody made a strong statement, Greenspan made a strong statement I remember in 1996 you know about irrational consumers, you know, that didn't stop the stock market. When people think there's easy money available they're not inclined to change. Particularly if somebody said a month or two ago watch out for this easy money and then their neighbors made some more money in the ensuing month or two, it's just, it's overwhelming. And we've seen it.

INTERVIEWER:

And the failures of regulators? Were there any?

WARREN BUFFETT:

Well, oh, I mean they are failures of everybody in one sense. But the biggest failure is that were unable to act contrary to the way humans act in these situations. I mean, it would have, you can say regulators should have been out there screaming about the fact you people are doing foolish things and sure, regulators could have stopped it. If a regulator said, or Congress could have stopped--Freddie and Fannie, if Freddie and Fannie had said, you know, we will only accept mortgages with 30% down payments, verified income and the payments can't be more than 30% of your income, you know, that would have stopped it. But who, you know, who could do that.

INTERVIEWER:

Do you think if Fannie--

WARREN BUFFETT:

In fact, if I think you recommend that (laughs), of course for future mortgage actions you better get an unlisted phone number.

INTERVIEWER:

(laughs) Do you think if Fannie had tighter standards and tighter controls that we could have averted a financial crisis?

WARREN BUFFETT:

Well, Freddie and Fannie were in a position--whether they were practically in that position, whether Congress, you know, would have tolerated them coming out with really much stricter standards, I don't think it probably could have happened. I'm not sure they wanted it to happen either. I mean, they were enjoying the party too. And they didn't think the party was going to end like this. I mean, it wasn't like somebody was thinking this is going to end in a paralysis of the American economy, you know. They just, they started believing what other people believed. It's very tough to fight that. We will have other bubbles in the future, I mean, there's no question about that. I don't think the President of the United States, you know, could have stopped it by rhetoric. And I think if any President of the United States had said, you know, I'm campaigning on a program of 30% down payments, verified income and not more than 30, you know, they might not have impeached him but they sure as hell wouldn't have re-elected him. (laughs)

INTERVIEWER:

Thanks. I'm going to primarily ask you about derivatives generally but I want to ask you about a couple of things different first. In your most recent shareholder letter you talked about how Berkshire Hathaway--

INTERVIEWER:

That Berkshire Hathaway would never become dependent on the kindness of strangers.

WARREN BUFFETT:

Absolutely.

INTERVIEWER:

And too big to fail was not a fallback

position and that the company would always have sufficient cash apparently in the magnitude of \$20 billion these days so that would not be a problem. Generally when you look at the issue of too big to fail, is it just a liquidity issue? Do you have enough cash? No one's too big to fail because the issue will never come up?

WARREN BUFFETT:

You'll have the institutions too big to fail. We still have them now, I mean, we'll have them after. Your Commission reports, certainly I mean Freddie and Fannie we've totally acknowledged we got--and incidentally are too big to fail. I'm not quarrelling with the policy on it and they aren't too big to wipe out the shareholders though, I mean. So it isn't, you know, society has done the right thing with Freddie and Fannie in my view. They've wiped out the shareholders, nobody's got any illusion that the government is protecting them as an equity holder. They do have the belief that they will be protected as debt holders but we were sending that message well before the bubble. I mean, you know, Congress would say technically we aren't backing them and they've only got this two and quarter million or whatever it was line of. But Freddie and Fannie paper was held all over the world and, you know, in a world where the other guy's got nuclear bombs (laughs) you're sort of implying to them that the government was standing behind this. I don't think you would have wanted to default on Freddie and Fannie, so I think we've done the right thing. But there will be institutions that are too big to fail but they're not too big to wipe out the shareholders--and I would argue that they're not too big to, I think there should be different incentives with institutions like that with the top, the top management. They're not too big to send away to the CEO that caused the problem, away without a dime.

INTERVIEWER:

And I understand that is, I'm just asking if, your opinion, is the answer to the too big to fail problem make them hold more cash?

WARREN BUFFETT:

The answer, and it isn't a perfect answer, you will always institutions too big to fail and sometimes they will fail in the next 100 years. But you will have fewer failures if the person on top and the Board of Directors who select that person and who set the terms of his or her employment if they have a lot to lose. And in this particular incident the shareholders have got probably it's well over half a trillion, maybe approaching a trillion, they've suffered the losses, society has suffered the losses from all the disruption in the second place. Directors and CEOs, CEOs, you know they only have 80% of what they had before, but they're all wealthy beyond the dream of most Americans. The Directors, you know, have collected their \$200,000 or \$300,000 a year and they're protected by insurance. And so the people that are in a position to make decisions day by day as to trading off the safety of the institution vs. the chance for improving quarterly earnings or something of the sort, you need different incentives in my view. And so far nothing's been done on that.

INTERVIEWER:

So let me ask you because another area we look at is a potential contributing cost of financial crisis are compensation structures and incentive structures within firms. And you have seen a lot of firms, you know, come out since the crisis and say, oh well, now we're doing things differently. Now we pay more of our executives in stock. Now the stock or cash bonuses are subject to claw back provisions and vesting periods or whatever. Do you have any thoughts on, you know, how you do make them have accountability for when things go wrong?

WARREN BUFFETT:

Well, all of that is good. I mean, that's better than what existed before. But I think it has to be far more Draconian than that, to really change behavior big time. And the difference is between a guy making \$100 million and \$50 million, you know, that, I don't think, or clawing back \$25 million of it, sure, you know, it registers but it doesn't, I don't think it changes behavior that much compared to at least what I would have in mind.

INTERVIEWER:

Do you and the next I was going to ask you, what are the more Draconian--

WARREN BUFFETT:

I think it's enormously important when you get very big financial institutions and maybe in other cases too, well, we're in a building run by the Keywood Company. It's the most successful construction company in the world and it has been for decades. Nobody's ever heard of it but it's huge and it's got a set of management principles and basically it started with Pete Keywood saying that arranging a compensation system so that the company got in trouble not only he went broke but all the people that got him in trouble went broke. And you, when you have the ability to do things with government guaranteed money as the banks or something, or Freddie and Fannie whatever it may be, you need a person at the top who has all of the downside that somebody has that loses their job, you know, working in an auto factory or something of the sort. And that will change behavior. Now, you can argue it may make them too cautious, I mean that, so you want some upside for them, too, I mean, you want them to balance somehow their interest in a way that society might balance its interest. And as part of that with the CEO I think you need important but far less Draconian arrangements in terms of Directors. Because they can't evaluate risk in a large institution

or have risk committees telling them what's going on. But they can set the terms of employment for the CEO in a way that will make him terribly risk conscious and if they don't do that, if they haven't done it effectively, I think there should be significant downside to them. I've suggested to them that maybe they give back five times the highest compensation they received in the previous five years or something. It has to be meaningful but it can't be so Draconian that you don't get Directors. You'll get CEOs, you don't have to worry about that, if you've got a lot of upside for CEOs you can give them the downside of, you know, sack cloth and ashes and you'll still get CEOs that--

INTERVIEWER:

The downside of course is just zero because they file bankruptcy and that's it. I had a question for you though related to that, in the 50 years plus that you've been investing have you seen changes in compensation approaches, policies, attitudes with respect to senior management at these various--

WARREN BUFFETT:

Well, it's gradually, maybe not, yeah, it's changed over the years and you've seen it just in the relationship of top management compensation to the average employee. So it has gotten considerably more generous-- if you want to use that term - from 50 years ago. There used to be a few outstanding--Bethlehem Steel was famous for paying a lot of money and you go way, way back and all that, but in general it wasn't expected. And there's some ironic aspects to that because in a sense the SEC has required more exposure in pay packages and everything like that so you've got this envy factor, I mean, you know, the same thing that happens in baseball. I mean, if you bat .320 you expect to get more than .310 and nobody knows in business whether you're batting .320 or not so everybody says they're a .320 hitter. And the Board of Directors

has to say, well, we've got a .320 hitter because they couldn't be responsible for picking a guy that bats .250. So you have this racheting effect which I've talked about a lot of times. And the more information that's published about compensation in a way, the worse it's gotten in terms of what people do. Because they look at the other guy and he's got personal use of the plane or whatever it may be (laughs) and that gets built into the next contract. So, it's changed over the years and the downside is not parallel, the upside in terms of innovation.

INTERVIEWER:

Well, let me ask you other than looking at perhaps more Draconian measures for money and compensation that is received, do you have any opinions on just the amounts that are paid in whatever form in the first place. And for example, one of things we see, and frankly I saw this before I came to the FCIC is you always read in a proxy statement that all these companies go out and hire somebody to do a survey and see, you know, to come up with executive compensation and they're looking at a bunch of companies that pay their executives a lot of money. And they say, okay, you should get a whole lot of money too.

WARREN BUFFETT:

Ratchet, ratchet, ratchet, that's the name of the comp board.

INTERVIEWER:

I mean, is, do you have any opinions on just the level of executive compensation?

WARREN BUFFETT:

Well, it's perfectly understandable, I mean, you've got a CEO that cares enormously about his compensation. You've got a compensation committee that meets, you know, for a few hours maybe every meeting. You've got a human relations vice president who is working for the CEO that probably

suggests a compensation consultant. But a compensation consultant who is Draconian is not going to get hired, generally around, or even too innovative on the downside, there's just--so it is, you know, it's the agency problem that the economist would call it. But it's very, it's very hard, over time--and then you've got this comparison factor which embodies all the other things I just mentioned and then they get into the system and people say, well, we didn't hire a guy in the bottom quartile to be our CEO so we're not going to compare to the bottom quartile, we're not getting compared to the next to bottom quartile. So it just ratchets up and we've seen it. And I am the comp committee for 70-some companies which Berkshire owns. It's not rocket science. And we pay a lot of money to some of our CEOs but it's all performance. When they make a lot of money it's performance related. And we have different arrangements for different people. But we've never hired a compensation consultant, ever. And we never will. I mean, if I don't know enough to figure out the compensation for these people, you know, somebody else should be in my job. And the test is how do they perform and do they leave for other places and, you know, we've got the record on that. The problem, you know, I'm in a position of control, I am the stockholder of these subsidiary companies and when you get people in between who are getting paid, you know, \$200,000 to \$300,000 a year being on a Board which is important to some of them and where they're hoping that they get put on some other Board so they've got another \$200,000-\$300,000 a year, they are not exactly going to be doberman pinschers, you know, in policing things.

INTERVIEWER:

In terms of, we've seen Bear fail, Lehman fail, Merrill essentially fail and get acquired by BofA and Morgan Stanley and Goldman both received

government assistance and Goldman received the benefit of your investment too. All of those investment banking franchises, I believe the compensation structure was essentially minimum 45% of net revenues was getting paid out in comp, some years even higher. Any opinion on that structure?

WARREN BUFFETT:

I can tell you it's very hard to change. I was at Solomon (laughs) and it, the nature of Wall Street is that overall it makes a lot of money relative to the number of people involved, relative to the IQ of the people involved and relative to the energy expended. They work hard, they're bright, but they aren't, they don't work that much harder or that much brighter than somebody that, you know, is building a dam someplace, you know, or a whole lot of other jobs. But in a market system it pays off very, very big, you know. And it, in effect, you know, boxing pays off very big now compared to what it did when the only auditorium we had was 25,000 seats at Madison Square Garden and now you've cable television so you can put a couple of, you know, lightweights who you'll never see again, you know, on pay per view and they'll get millions for it now. Market systems produce strange results and Wall Street, in general, the capital markets are so big, there's so much money, taking a small percentage results in a huge amount of money per capita in terms of the people that work in it. And they're not inclined to give it up.

INTERVIEWER:

When you see the general compensation structure in terms of percentage payout and the types of structures they have with ever different levels of Draconian claw backs or whatever and the risks that were taken that resulted in failures and bailouts, I mean, do you see in the big, you know, the compensation picture in general as

a contributing cause or part of the story of what happened on the street?

WARREN BUFFETT:

Comp, most of the comp, you're talking about individual trader or something, you know, and they have, you know, they call it trader's option. That they've got the upside, they have a good year and they have a bad year, you know. They might not have a good year again next year, they might go to a different firm but they really, their interests are not totally aligned with shareholders. And I would say this, I think most managements of Wall Street firms and I was around Solomon and I know what happens at [unintelligible], they're trying, they want to align them, I mean, it isn't, you know, it isn't like the top management is oblivious to this problem. But I can just tell you, being at Solomon personally, it's just, it's a real problem because the fellow can go next door or he can set up a hedge fund or whatever it may be. You don't, you don't have a good way of having some guy that produces x dollars of revenues to give him 10% of x because he'll figure out, he'll find some other place that will give him 20% of x or whatever it may be. It is a tough managerial problem, but I think the best thing again, if you're worrying about the Bear Stearnses of the world or anything is to have an arrangement in place that if they ever have to go to the federal government for help that the CEO and his spouse come away with nothing. And I think that can be done. And I think if society is required to step in and, you know, come up with all kinds of things, disrupt, you know, the lives of millions of Americans in various ways, I think there ought to be a lot of downside. And I think that would change behavior more than any, trying to write some terribly complicated thing, you know, that only 38% of us can (laughs). I just don't know how to write rules otherwise. This would get their attention and I wouldn't try

to, I wouldn't know how to get more specific than that.

INTERVIEWER:

Well, then, let me ask you this then. If the CEOs and their spouse--unlucky marriage there--you know, have to give back everything--

WARREN BUFFETT:

You'd think the spouse would be a better police than the regulator (laughs)

INTERVIEWER:

You know, that they need to give everything back or be shown the door, if the company needs government assistance, there are CEOs at some firms that got government assistance that are still there including for example Mr. Blankfein that I've at least read you said, boy, if they're going to replace Blankfein I'd like to replace them with his brother.

WARREN BUFFETT:

Yeah, I don't think they needed assistance. The system needed assistance then but if, when they had that famous meeting at the treasury on Monday if they hadn't called on Goldman Sachs and they called on the others, Goldman would have been fine. The system needed to be supported, just, you know, it wasn't important the precise action. It was that the world had to see that the federal government was going to do whatever it took. And nobody knew whatever it took meant. But they did need to see conviction, action and all of that. And Bernanke and Paulson they could have called on nine different other institutions, these were particularly good names to have there, but had gone through the same mechanism and Goldman Sachs would have been fine, Wells Fargo would have been fine. They didn't need the money, the system needed the reassurance that the government was going to act.

INTERVIEWER:

It's, we've been reported when you made the investment in Goldman in September of '08 that you were, you know, somewhat betting on the government taking some type of action.

WARREN BUFFETT:

Not in relation to Goldman though, but in the, no, I was betting on the fact the federal government would show the will to the American people that they would, in effect, do whatever it took to re-start the engine.

INTERVIEWER:

So, I don't know if you can answer this question because it's somewhat of a hypothetical but if you knew then that the government was not going to put any money into Goldman would you have still made the investment?

WARREN BUFFETT:

Oh, yeah, it wouldn't bother me whether I'm going to put it in Goldman but if I thought the government was not going to reassure the American public through acts, speeches whatever it might be that they were going to do whatever it took to save the system, I would have, you know, got my mattress out. But, Goldman did not need the money, the system needed the reassurance. But Goldman would have been, if they'd ever been called down there they would have been fine. I wouldn't have put the money in if I thought Goldman needed specific government action. But I also would not have put the money in if I thought the government was going to stand by and watch things unfold.

INTERVIEWER:

Okay. So now let's actually turn to derivatives, I didn't think we'd spend that much time--the statute amongst other things tells us to look at the role of derivatives that it played in the financial crisis and we have been talking to "many" experts in the field that, whether they're academicians

or market participants that work with derivatives. And, of course, we've read, you know, what you've written in the shareholder letters, the weapons of mass destruction, they can lead to excess risk and leverage and there's counterparty risk. At the same time if they're managed effectively they can be fine although I think in your shareholder letters you're primarily talking about credit derivatives there but I may be mistaken.

WARREN BUFFETT:

Well, when we buy the Burlington Northern, they're hedging diesel fuel. Now what I tell them is I wouldn't do it if I were them but it's entirely up to them. I mean, diesel fuel's a big cost for them and they've got pass-through costs to some of the people that use the railroad and they don't have pass-throughs so they're exposed partly. The only, I tell them if they really don't want diesel fuel on the market we'll just close up the railroad and then all trade diesel fuel all day, you know. And if they don't know it, they're going to be out the frictional costs over time. The reason many of them do it is that they want, the public companies, they want to smooth earnings. And I'm not saying there's anything wrong with that but that is the motivation. They're not going to, they're going to lose as much on the diesel fuel contracts over time as they make but they can protect themselves just like Coca-Cola does on foreign exchange and they make a big thing of this. I wouldn't do it, they do, but all kinds, most companies what to do that. Anheuser-Busch was just talking about it in Business Week a few weeks ago how they do it. It's a common practice. It's overdone in my view, but it is the response to the fact that the market doesn't like the fact that diesel fuel could affect the earnings of Burlington or Union Pacific up and down in some quarter when really over time they're not going to make any, you know, they're not going to save any money by doing it in my view.

INTERVIEWER:

And just broadly, whether it's interest rate, foreign exchange commodity equities or credit derivatives, do you have a view on whether they contributed or caused the financial crisis, what role they played whether it was a cause, a contributing cause, a propagating mechanism or anything?

WARREN BUFFETT:

Anything that increased leverage significantly tends to make, it can't even create a crisis, but it would tend to accentuate any crisis that occurs. So I think that if Lehman had been less leveraged there would have been less problems in the way of problems. And part of that leverage arose from the use of derivatives. And part of the dislocation that took place afterwards arose from that. And there's some interesting material if you look at, I don't exactly what Lehman material I was looking at, but they had a netting arrangement with the Bank of America as I remember and, you know, the day before they went broke and these are very, very, very rough figures from memory, but as I remember the day before they went broke Bank of America was in a minus position of \$600 million or something like that they had deposited which I think J.P. Morgan in relation to Lehman and I think that the day they went broke it reversed to a billion and a half in the other direction and those are big numbers. And I think the numbers are, I think I'm right on just order of magnitude. So when things like that exist in the system, you know, that's under stress for other reasons, it becomes a magnifying factor. How big of one you don't know. But Lehman would have had less impact on the system if they had not had the derivative book they had. Now they had plenty of bad real estate investments and a whole bunch of other things as well.

INTERVIEWER:

And when you talk about the leverage and the counterparty risk from derivatives are you talking about certain types or derivatives, you know, there's the five categories we see. Do you have any opinion on--?

WARREN BUFFETT:

Unfortunately, yeah, unfortunately people were not really imaginative about derivatives. I mean it started out with the simple ones, you know, interest rates, swaps and that sort of thing, foreign currency. And then the profit got driven away from those. When I was at Solomon they talked about in the plain vanilla contracts there wasn't any money in it anymore because they were on the screens and everybody knew--but what they call sometimes the toxic waste, there was a lot of money in and, you know, the more complicated the derivative, well, you remember the situation with Proctor and Gamble thing from the Banker's Trust and American Greetings and all of that, if you read the nature of those contracts where they had these exploding factors, you know, when you got beyond a certain point, the CFO of a place like Proctor and Gamble or American Greetings was probably not understanding those things very well. And there's just more money in contracts that people don't understand. And so they get this proliferation of these things and who knows what's in the mind of the end user of the things that, you know, they're protecting themselves against the sort of Jefferson County in Alabama and all kinds of things. So, you know, it's, it's an instrument that's prone to lots of mischief because long settlement periods, complicated formulas for sometimes deriving the variables that are entering into the eventual payout, it's got a lot of possibilities for mischief. And a lot's been caused. And mischief doesn't make much difference if it's, you know, one guy, you know, rolling dice against another and one guy's

loaded a dice they're doing for \$5 a throw but it makes a lot of difference when you get into big numbers.

INTERVIEWER:

So let me ask you on the issue of transparency you wrote in your shareholder letter, not the recent one, but the one from the year before that it's simply impossible for investors to understand and analyze these. It was impossible or at least very difficult for auditors to audit them and for regulators to regulate them and after spending time with financial institutions 10K or whatever else you reached for a bottle of aspirin which I can very much appreciate.

(laughter)

But, and you also wrote, you know, that policymakers talk about transparency as being a great cure-all for--

WARREN BUFFETT:

It's a great word (laughs).

WARREN BUFFETT:

Nobody can be against transparency.

INTERVIEWER:

But, you said, you know, look, I don't know of any reporting system, you know, that can fix this. So, I mean, obviously, you know, we're not just looking at causes of the financial crisis but this whole lack of transparency particularly in the area of derivatives as you know from taking aspirin for your headaches after looking at 10Ks, is a problem. So I'm just wondering what, you know, your opinions are and how do we address that problem?

WARREN BUFFETT:

I think it's a terribly difficult problem, well, it was so difficult a problem I didn't think I could solve it. We bought Gen Re which had 23,000 derivative contracts. I could have hired 15 of the smartest people that, you know, math majors, PhDs and I could have given them carte blanche

to devise any reporting system to me that would enable me to get my mind around what exposure that I had and it wouldn't have worked. I mean, it just, the only answer was to get out of it. Can you imagine 23,000 contracts with 900 institutions all over the world with probably 200 of them names I can't pronounce. And all of these contracts extending years into the future, multiple variables, you know, and all of these, you can't manage it. In my view, I wouldn't be able to manage something like that. And if I read a 10K that's 300 pages long and it describes notional values of all this, not to impugn anybody because probably one of the best managed really large institutions around, but if I look at J.P. Morgan I see two trillion in receivables, two trillion in payables, a trillion and seven netted off on each side of the 300 billion remaining maybe 200 billion collateralized. But that's all fine but I don't know what dis-continuities are going to do to those numbers overnight if there's a, if there's a major nuclear, chemical or biological terrorist action that really is disruptive to the whole financial system here, who the hell knows what happens to those numbers on both sides or thousands of counterparties around. So I don't think it's -- I think it's virtually unmanageable.

WARREN BUFFETT:

Certainly it is, would be for me.

INTERVIEWER:

And let me ask, well, Goldman's the K, I looked at recently and there I see over a million contracts.

WARREN BUFFETT:

Over a million contracts

INTERVIEWER:

They don't disclose notional values in the K, at least not that I found yet, but, you know, they do disclose when you take out the netting, it's about one and a half trillion dollars both assets and

liabilities go to BIS and get information from Goldman, it's not in their 10K, it's like 45 trillion when you add up all the numbers.

WARREN BUFFETT:

Its bigger at J.P. Morgan. (laughs)

INTERVIEWER:

And I don't see anything in the Ks and there is a question coming, I promise, (laughs) on who the counterparties are. So, I mean, does, would that help in transparency, some more disclosure on who the counterparties are?

WARREN BUFFETT:

You can't design the system, I don't believe, I mean, I couldn't design the system and I've got a smart partner, Charlie Munger and we, the two of us couldn't design a system or come close to designing a system that would have told us what we were doing. So we got out. And we do know what we're doing with the 250 contracts we've got. And frankly I think we do a better job of disclosure of our derivatives position than any company in the United States, you know. We just tell people what we've done but, that's easy to do with 250 contracts or thereabouts and they only fall into a couple of categories. But I want to know, I want to know every contract and I can do that with the way we've done it. But I can't do it with 23,000 that a bunch of traders are putting on. I'm putting these on myself and I really only about two or three decisions that go through my mind in doing that. But to have a group of traders putting on thousands of them and counting on the behavior of party A over here to be the offset to what might happen with party C and I'm in between, I just, I don't know how to do that. And I don't think really anybody knows how to do that. And I probably shouldn't talk about names on this but I've had discussions with very important people about this in the past before the crisis hit and those people were confident that risk committees

could come in with spreadsheets and explain it all and I always thought that was total nonsense.

INTERVIEWER:

There's at least been some recent reports in the press that you've been lobbying against the retroactive, adjustment of the retroactive effect or at least some provisions in legislation that would require collateral to be--

WARREN BUFFETT:

Yeah, we're not against collateral being required at all as far as--we do say if you're changing contracts retroactively that if a change in any part of the contract is made that the party benefiting from that change should pay the appropriate amount to the party that's suffering from it. Now when we put on our contracts because we didn't want to get ourselves in a position where we were a problem to the country, we negotiated for non-collateral type contracts. Now the price of collateralized contracts we would have received considerably more in the way of premiums if we had agreed to collateral. Right now we're looking at one contract where we can get paid \$11 million if we agree to put up collateral and we can get paid \$7.5 million if we don't agree to put up collateral. Every other term of the contract is the same. So all we say is if these things are changed retroactively, we want to be paid for the difference in value between a collateralized contract and a non-collateralized contract. And otherwise, incidentally it isn't just us, Coca-Cola, Anheuser-Busch, you name it, will have to send money to Wall Street as part of the deal that will be changed from before. And there's nothing wrong with that, if it's a matter of public policy that they want all contracts collateralized including changing them retroactively. There may be a constitutional problem, I'm not sure about that. But if the difference was paid for the difference between a value of the collateralized contract we were over \$150 million

on, during the height of the crisis on just a relatively small piece of it. If we would accept, if we would change from non-collateralized contract to a collateralized contract, my Wall Street, big Wall Street firm and we just say if that's forced upon us to do that we want \$150 million or whatever the appropriate number is. We sold a house in effect that was unfurnished and if we sold it furnished we would have gotten more money and if the government says now later on, two years after we made the deal, you've got to give the furniture too we want to get paid. And I think that would probably stand up in court incidentally, I mean, if it wasn't even addressed in the bill. But we'll see what happens on--

INTERVIEWER:

Sure. Other things we've heard from other folks that I'll ask your opinion on, a lot of people seem to think a lot of over the counter derivatives are really pretty standardized contracts that should be triggered on an exchange. Any opinions on that?

WARREN BUFFETT:

Well, I think it's very hard to do. I mean, you've got right now certain foreign exchange contracts that are traded on exchanges. The volume is practically nothing. Because there, let's just take a Swiss Franc contract. There's a September contract and a December contract and a March contract. But if we want to hedge some instrument we've got and we've done this with a few contracts, we want to hedge some contract that comes due December 16th, we probably want to have a contract, a forward contract expires December 16th. And so whereas it's easy to have and I don't know whether July corn or October corn of whatever it may be there's not a big delivery, there's not a big tailoring of the specific industry's requirements. You can get away with four different expiration dates or S&P

you can get away with four expiration dates or something but if you've got a power contract or something of the sort, to deliver electricity on July 15th and you worry about what you might have to buy in the merchant market to do it you're probably going to need one that contracted July 15th. And I don't know how you standardize, I mean, it's very easy to have standardized October copper and oil, I mean, you know, you got oil contracts extending out for many years or natural gas, but they are just periodic settlement dates. And I think that gets, that gets very tough with a great many derivative contracts. But I don't, I'm no expert on how all this works, I mean, there may be ways of solving that in terms of exchanges.

INTERVIEWER:

Let me ask you about regulation. One of the things that we know from doing some research is that, of course, back in the beginning of the decade or the beginning of 2000 was the Commodities Futures Modernization Act, that had terms in it that said you can't regulate credit derivatives. So they went unregulated. Any opinions on regulation of credit derivatives or derivatives in general?

WARREN BUFFETT:

I think it's very tough to do and I will tell you that whenever I hear the terms modernization or innovation in financial markets, I reach for my wallet (laughs). It's, usually what they mean is revenue producing and I think it's very tough. I mean that's what I got into in my letter of 1982, I mean, you are opening Pandora's box when you give people the right to either invest, speculate or gamble on very long term contracts, you know, with minimal margin requirements and all. I mean, it can pose dangers to the system but it gets down to leverage overall. I mean, if you don't have leverage, you don't get into trouble. That's the only way a smart person can go broke (laughs). And I've always said if you're smart

you don't need it and if you're dumb you shouldn't be using it. So I'm not a big fan of leverage. But leverage and incentives are in my view things that, try to focus on. And recognizing that there's a lot of limitations on what you can do. But if, I mean, we've always felt that way with banks. The bank has the right to use government guaranteed money in effect. You've got to have some limitations on leverage so then they come up with SIVs and derivatives and all kinds of ways to increase leverage without breaking the rules. And then, it's a tough question but I would be fairly tough about how I would go at that. And I don't like to keep going back to it but I, it doesn't seem to be anything talked about much, but the CEO is the guy making the decisions, I'm making the decisions at Berkshire. When I make the decisions at Berkshire, I'm thinking about the fact that a) I've got 99% of my net worth in it and it's all going to charities so I mean, if I cause this place to go broke, there's a lot of downside to me. And there's a lot of downside to the Keywood Company if they do silly things in their construction business. And I think that downside has an effect on people.

INTERVIEWER:

Well, do you think that, I mean, you keep coming back to the CEO and accountability for perhaps unreasonable risks they are taking. Is that an area that you think regulation should address?

WARREN BUFFETT:

Yeah, I think, but, you know, I've never written a Bill in my life so I don't know how you do that. But I do think that if I were in charge I would have some, yeah, I would, wouldn't have to be very complicated. I mean, we're not talking about some small community bank or anything. We're talking about institutions that require government intervention. The FDIC will take care of the small banks and all that. I mean,

a lot of those will be a lot of personal ownership anyway. But FDIC is not the federal government. I mean, that is banks paying for banks errors but when society, the U.S. government starts paying for specific errors that--I think there ought to be a lot of downside.

INTERVIEWER:

Can I follow up on that. You mentioned small banks and community banks. We've read stories and certainly heard reports about community banks investing in CDOs investing in--

WARREN BUFFETT:

They bought a lot of Freddie and Fannie preferreds, a lot of money lost in that.

INTERVIEWER:

Correct, correct. But with respect to CDOs and many of them bought what were rated as triple A tranches of CDOs. Over 90% of the ratings on CDOs have been downgraded to near or around junk status. How much, putting aside legal responsibility because credit rating agencies have asserted they have a First Amendment right, how much though responsibility in the moral sense or otherwise do credit rating agencies have for the decisions by the investment community to rely on their ratings, that triple A meant triple A. How much responsibility do you think the credit rating agencies have for these decisions that the community banks made and subsequently made to their demise?

WARREN BUFFETT:

What do you think if you're a banker? Your job is to assess the credit of whatever you're committing to. And the interesting thing about those CDOs and a lot of them consisted of hybrid bank securities. I mean, so they were actually benefiting and there were a lot of hybrid bank securities put in the CDOs and they were benefiting from

raising money from that forum. And that turned out to be a way poorer asset than they thought. They created the liability to some degree as they grew. But I would get back to the fact that if you run a bank, you know, I think your job is to assess the credit of when you lay out money whether you're buying U.S. treasuries, whether you're bonds of Greece, whether you're buying or lending money to, for construction and, I think I would not want to cop out really, I was relying on a rating agency. And the rating agencies they have models and we all have models in our mind, you know, when we're investing but they've got them all worked out, you know, with a lot of checklists and all of that sort of thing. I don't believe in those myself, only to say I've got a model in my mind, everybody has a model in their mind when they're making investments. But reliance on models, you know, work 98% of the time but it's, they never work 100% of the time. And everybody ought to realize that that's using them.

INTERVIEWER:

You mentioned transparency earlier as well. These CDO instruments were largely opaque in terms of compositions and the like to the investors who were investing in them. They were structured and created though around the ratings and in connection with the ratings and the rating agencies. Do you think, though, that because of the opaqueness of these instruments ratings became in the minds of investors more important than perhaps maybe they should have been?

WARREN BUFFETT:

Well, I would say that, you know, anybody that's investing in something they consider opaque should just walk away. I mean, whether it's a common stock or, you know, new invention or whatever it may be. You know, that's why Graham wrote books is to try and get people to, you know, invest, to take that investment, it's very tough to get

that message across. And you'd think bankers however would have learned by the time they get to run a bank.

INTERVIEWER:

Okay. Let's move away from derivatives now and talk about, I mean, we talked about several areas already today about your views on causes or contributing causes to the financial crisis. Of course we have a statute with a gazillion things in there telling us to investigate and I know time's probably starting to run short so I'd like to first just ask you, you know, what haven't you told us in terms of do you think were, you know, important contributing causes of the crisis. And then I'm going to try to quickly go down the list in our statute and get your ideas on this.

WARREN BUFFETT:

Well, I think the primary cause was a almost universal belief among everybody, and I don't ascribe particular blame to any part of it, but it's Congress, media, regulators, home owners, mortgage bankers, Wall Street, everybody that house prices would go up. And you apply that to a 22 trillion dollar asset class that's leveraged up in many cases and when that goes wrong you're going to have all kinds of consequences and it's going to hit not only the people that did the unsound things but to some extent the people that did the semi-sound and then finally the sound things even if it is allowed to gather enough momentum of its own on the downside, the same kind of momentum it had on the upside. I think contributing to that, causing the bubble to pop even louder was and maybe even to blow it up some was improper incentive systems and leverage. I mean, those--but they will contribute to almost any bubble that you have whether it's the internet or anything else. Incentive systems during the internet were terrible. I mean, you just, you formed a company and you said I'm going to somehow deliver a billion eyeballs and somebody

said well, that's \$50 a piece or something. I mean, you get craziness that goes on there. Leverage was not as much a factor in the internet bubble but I think in this particular bubble because leverage is part of, so much a part of real estate that once you loosen up on that, you provide fuel because that bubble will get even bigger and you made the pop even bigger when it finally did pop.

INTERVIEWER:

Any views on the role of fraud, whether mortgage fraud or other types of fraud in the crisis?

WARREN BUFFETT:

No, I mean, it was obviously a lot of fraud. There was fraud on the parts of the borrowers and there were frauds on part of the intermediaries in some cases. And, but, you better not have a system that is dependent on the absence of fraud. (laughs) It will be with us.

INTERVIEWER:

What about, you know, another thing that we, I think we've seen in the last ten years was different was a lot of financial institutions before used to originate loans and, you know, how novel, carry them on their books. But now we see, you know, the proliferation of mortgage brokers, originate to distribute models, the street packages and securitizes, sends it off to someone else who maybe either keeps it or throws it into CDO and so on and so on. Any opinions on that relative change in the way that mortgage assets are originated?

WARREN Buffett:

No, people will be more careful with their own money than with other people's money. And you can argue that Freddie and Fannie were the ones, you know, they started securitizing in effect and in a huge way people got used to buying mortgage instruments where they were very

divorced from the origination of it. So there's no question that if there'd been a law against laying off mortgages to somebody else that you wouldn't have the same situation. You might not have as much, a lot of good things did happen in the country too, there was a--balancing the two, I'm not sure I could do but I can tell that more mischief will occur if somebody in Norway is buying a mortgage in Omaha than if some guy here is lending his own money. (laughs)

INTERVIEWER:

There certainly appeared to be a loosening of underwriting standards and certainly an increase in what we've termed non-traditional mortgage product whether it's lower down payments, whether it's the liar loans, stated income loans, whether it's option arms, whether it's 228s, 327s, etc., etc. Any views on whether that had any?

WARREN BUFFETT:

Oh, it had had plenty to do, I mean, it fuelled, it fuelled extreme leverage and it fuelled leverage that could only be paid out of the re-sale of the asset rather than the income of the borrower and once you start lending money big time to people where your hope of getting your money back is that the asset goes up rather than the asset produces enough to service the loan, I mean, that very nature whether it's farmland, whether it's oil in Texas, you know, it creates a lot of problems.

INTERVIEWER:

Any views on why we saw the growth in that kind of non-traditional mortgage product?

WARREN BUFFETT:

We believed that, you know, houses were going to go up. Once you think the asset will go up you don't look to anything to anything else. And it became, because it had been going up, an awful lot of people believed it had to keep going up. I mean, it gets back to the nature of bubbles.

INTERVIEWER:

We, I mean, from people we've talked to and articles we've read, I mean, we've heard people talk about or read that, you know, there was a lot of money coming into the U.S. chasing yield. There was the Street wanting it because of the change from buy and hold to the securitization model. Were Fannie and Freddie, you know, changing their purchasing patterns and increasing demand for non-traditional mortgage product for whatever reasons. Any comments on any of those possibilities?

WARREN BUFFETT:

The market system creates incentives to do more business. (laughs) That is the nature of it. And, but I, you know, and people talk about excess funds around the world and all that. I tend to discount that sort of thing. But I don't discount the incentives that everybody in the American public from wanting to do a piece of business if they can do it tomorrow. Doesn't mean that they're terrible people or anything but what, you know, if I'm a realtor and I've seen a house go from \$250 to \$500,000 do I say to the person, now, this buying the house at \$500,000 is kind of dumb because--it just doesn't happen. They say, you know, you better do it today because it's going to be more tomorrow. And so everybody gets into the act, doesn't mean they're evil people. There are some crooks in the process, but overall what happened was not caused by the crooks. It may have caused the crooks to get rich (laughs), a lot of it but it in my view was caused by a mass delusion.

INTERVIEWER:

Throughout the '90s and the 2000s members of Congress, members of the administration were all encouraging home ownership.

WARREN BUFFETT:

Sure.

INTERVIEWER:

Both through statements, through plans and policies. How much of that do you think contributed to the bubble?

WARREN BUFFETT:

It all contributes, but the truth is I've told people, home is a good investment, you know. Particularly if, it's got values beyond what it will do in terms of possible appreciation over time. It really is a way to go short on the dollar. I mean, if you borrow a fair amount of money it gets and most people don't have a good way of being short on the dollar and it's a pretty sound policy to be short dollars as long as you're carrying costs aren't too high. And when interest rates get low the carrying costs are not high. So it is not an unintelligent thing to do. It's only, it's only when it gets into this bubble aspect that it becomes unintelligent. But I would recommend today, you know, if a couple can afford it and you're not paying silly prices in terms of replacement value or things like that and you want to buy a home in Omaha, I would say, you know, have you found the neighborhood you wanted and you're going to, your family's going to live there and right now I think mortgage rates are very attractive, I would say buy it. But I wouldn't say buy three more on speculation and I wouldn't say buy it if it's going to take 50% of your income to service the mortgage. It's a sound idea that went crazy.

INTERVIEWER:

Should it be a government policy to encourage home ownership?

WARREN BUFFETT:

Well, I don't think, I would say it should be a government policy and we've got it through and Fannie and Freddie, we say we're in the mortgage business as a country. To help people who are following sound practice in the one way, I do not see anything wrong with having

a government guarantee program that kicks in when people really have a 20% down payment, really only putting only 30% or so of their income into it. Still people are going to lose their homes for unemployment reasons and death and divorce and disability. I mean, the three Ds. But that's not going to cause a systemic problem. And more people are going to benefit from that program by far than anybody's going to be hurt by it. So I think that the government has a place in that and around the world has a place in it. But I don't think that if you're going to get 20% down payments that you should then take deals on the 3% down payments and then lay off that on some mortgage insurer or something like that. You don't want to encourage people to do things that are going to cause them pain later on. And you're going to have occasional pain for unemployment but, you know what, you don't want system-wide pain because you've encouraged them to do things that are stupid.

INTERVIEWER:

One of the areas in our statute is the role of monetary policy and of course a lot of folks have commented on the low level of interest rates throughout the 2000s. Any view on that as a contributing cause?

WARREN BUFFETT:

Well, it makes it obvious, it makes it easier but no, I don't think that was what caused this. You couldn't have had it if you'd had 15% rates obviously. But it all, you know, it all worked together, you know. And finally the fact that houses kept going up a lot. It just, you know, put a model in people's minds. You have 300 million Americans have got a economic model in their mind and you say, Moody's is dumb for having it and S&P is dumb for having it but it was pervasive.

INTERVIEWER:

Another area in the statute that we're directed to look at and we have been

looking at of course is the role of accounting and specifically mark-to-market rules on accounting. I know you wrote in your shareholder letter or letters that, you know, the mark-to-market accounting rules result in wild swings in your derivative accounting but that you and Mr. Munger and what it is--

WARREN BUFFETT:

We explain it, it is our job to explain it.

INTERVIEWER:

Right, but do, and other people we've talked to and articles we've read have talked about, you know, the mark-to-market accounting rules if nothing else perhaps fueling the downward spiral, you know, in the '07 and '08 timeframe when folks got into liquidity crunches and had to sell assets, etc. Any views on the role of accounting and mark-to-market accounting?

WARREN BUFFETT:

I'm less religious about it than I used to be (laughs). I, because, well, you know, after '29 in the insurance business they put in so-called, I forget, they had a term for it but I think it was called, basically it commissioned evaluations of some sort. And they did not make insurance companies write their stuff down because they said, you know, you're basically putting them all out of business and these are temporary things. And the truth was it probably benefited the country that they didn't liquidate all the insurance companies in the early '30s based on what would have, in effect, been mark-to-market accounting. I still, there's so much mischief when you get away from mark-to-market that I, that I'm still a believer in it but I can see where, I can see certain situations where it might have sort of anti-social effects as well. Getting back to derivatives, I mean, what has always struck me as extraordinary is that you basically have four big auditing firms in the country. And I would guarantee you that they are attesting to the

statements affirmed where they have both sides of a derivative transaction and there is a different value being put on them by the two parties. And they're signing them, I mean, we're talking big numbers sometimes, too. It'd be interesting to take the million contracts or whatever they, a couple of million J.P. Morgan, and find two firms that have the same auditor and compare the valuations. (laughs)

INTERVIEWER:

It might have been a good survey for us. You know, I mean, an area we somewhat touched on that's really, leverage and liquidity are just capital requirements for financial institutions. Were they too low, are they too low?

WARREN BUFFETT:

It's very tough, it's very tough because there's such a difference in how when institutions can be doing, you know, I mean, just take the derivatives book, I mean. How do you measure that compared to straight loans? I mean, are you going to only take the netted off, non-collateralized balance finally, I mean, the residual and say that's the only exposure you have or are you going to weight some for netting, you know, but only compounds it at 10%. It is very tough and, we're going to have higher capital standards in all likelihood but knowing what to measure against and all that, it's just a very difficult problem. And, of course, partly that was solved by people using ratings. And, you know, and the extraordinary thing, if you look at the AIG and my memory is and again, I'm doing all this from memory, my memory is that they got up to like a number of 300 billion of what they call regulatory arbitrage where it enabled largely German banks or certainly European banks to carry less capital against their loans since AIG was guaranteeing those loans against loss and AIG had a triple A rating therefore that carried over into lower capital requirements abroad. And they were getting paid practically

nothing for them and they thought they were running no risk at all. But it was a ratings arbitrage, basically, it was, they called it regulatory arbitrage. But it was based on what ratings required in the way of capital requirements. But, you know, the regulators got a terrible job too, I mean, how do you deal with all these people doing different things and come up with some kind of standard that says what they have to maintain in the way of capital. I don't envy them the job.

INTERVIEWER:

You, an argument you often hear on the other side from institutions that don't want higher capital requirements is it's going to impact us competitively across the globe. Any views on that response?

WARREN BUFFETT:

It would, it would. I mean, just take it to the extreme. If you said that every in the bank in the United States had to have 30% capital and every bank in Europe has 3% capital, you know. To earn the same returns on capital (laughs), they can work on much narrower margins than the American bank. That doesn't mean you don't do it but leverage is a competitive tool in terms of achieving returns on equity. That's why it has to be guarded against.

INTERVIEWER:

Any views on what the right capital levels are for financial institutions?

WARREN BUFFETT:

It's more complicated than that.

INTERVIEWER:

Believe me, I know.

WARREN BUFFETT:

Okay. (laughter)

INTERVIEWER:

Is imposing some kind of leverage restriction and [unintelligible] the risk something that, looking back before banks were able to get into more exotic businesses, you know, 30,

40, 50 years ago, is that something that you think should be a function of government through regulation or is that if Greenspan two years ago, is that something that the market could police itself in some way?

WARREN BUFFETT:

I don't believe the market polices itself, I mean, Greenspan is a friend of mine but he's read more of Ayn Rand than I have, I mean, I'll put it that way. (laughs) So I do not believe the markets police themselves in matters of leverage and other matters. I do, that's why I get back to the incentives of the person. I mean, that makes a difference. It doesn't solve everything, I mean, you can still get terribly optimistic managements that will do very stupid things and all that. But if I had a choice between setting the capital standards and setting the management incentives and that were my only choice with banks, I would rather set the management incentives.

INTERVIEWER:

One of the things we've seen and that I've seen from my previous life as a bank examiner, we particularly saw with the broker dealers was the liquidity issue of their asset liability mismatch. And particularly, you know, that they were, had a lot of short term money.

WARREN BUFFETT:

It's the nature of the national institutions both life insurance companies and banks. The, no capital requirements protect you against a real run. I mean, if your liabilities all are payable virtually that day or I should say virtually all your liabilities are payable that day, you can't run a financial institution and be prepared for that. And that's why we've got the Fed and the FDIC. I mean, you can't stand, if you're a life company or a bank, you can't stand around, you can be the most soundly capitalized firm in town but if I hire, if there were no FDIC and the Fed and you had a bank capitalized with 10%

of capital and I had one with 5% of capital and I hired 50 people to go over and start standing right in front of your bank, you're the guy that's going to fail first. Then when get through with you they're going to come over to my bank too, that's why we don't do that sort of thing because you can't contain the fire over on the other guy's bank. But you can't, you can't stand a run. So you need the Federal Reserve and the FDIC. And even with Northern Rock, the UK government and came and said we guarantee everything they still had lines. I mean, when people are scared they're scared. And there is no reason to leave, I mean, if you see if it's uninsured and you see a line at a bank where you've got your money, get in line. (laughs). You know, buy a place from the guy that's first in line if necessary, you know. And even if you're at another bank, get in line there and take your mad money and put it under a mattress. You can always put it back a week later as long as there no penalties, why in the world, you know. That's why we got a Fed and an FDIC and I think it's one of the, you know, I think the FDIC and Social Security were the two most important things that came out of the '30s. I mean, the system needed an FDIC.

INTERVIEWER:

What did you do, you know, this is, you're raising the issue really of the shadow banking system, the parallels unregulated without FDIC insurance or any other form of insurance other than until they stepped in and guaranteed money market funds as the short term stability and confidence raiser. What did Berkshire Hathaway do with all of its cash, I mean, you don't have --.

WARREN BUFFETT:

That's a very good question because we were, for example, in September in 2008 we faced, I think it was October 6th or something like that we had to come up with six and a half billion for

our Wrigley deal. I was only going to have that in treasury bills even if I had got a minus yield because I had to come up with it. And I didn't know for sure, whether on October 6th, you know, what the situation would be with any bank. Now I thought it was 99.99% that it'd be fine, but I didn't think it was 100%. And I may bring along to the hearing, I sold a treasury bill in December 2008 for \$5,000,090 and it was a \$5,000,000 treasury bill due in April-something where the guy was going to get \$5 million. So he was saying that the treasury bill was \$90 better than his mattress. I mean, he could have put the \$5 million under his mattress and then 90 bucks better off in April than he was by buying the treasury bill. Well, that's the way I felt too. I don't, I still feel that way incidentally. I mean, we don't have a whole list of approved short term investments around here. We have got treasury bills basically and treasury has the right, and is going to print money if necessary and that is triple A, I'm willing to go on the record on that. (laughs).

INTERVIEWER:

That'll give you a rating yourself. (laughter)

WARREN BUFFETT:

But nobody else is triple A in my mind, you know. And if we're really going to protect ourselves if we're not going to, we need to have real money. And now, I let the smaller operations just for matters of convenience do other things. But in terms of the vast chunk of what we have around here it's treasury and it will stay that way. Because I don't know what can happen tomorrow. I don't know if there's a, you know, pick any kind of a hugely disruptive--that's what you have to worry about are the discontinuities and there will be one someday. They closed the stock exchange in 1914, you know, for many months. They closed it for a few days

after 9/11 but who knows what happens tomorrow.

INTERVIEWER:

Speaking of that uncertainty, do you think in the financial crisis the government created some uncertainty by for instance stepping in and orchestrating the deal between J.P. Morgan and Bear whereas not stepping in or at least not stepping in sufficiently to orchestrate a deal for Lehman. Do you think that created uncertainty in the market for market participants?

WARREN BUFFETT:

Yeah, there's no question that you would have expected, having seen them step in at Bear you would have expected to see them step in at Lehman. So when they didn't step in at Lehman, the world panicked. Now it had all these repercussions too in that Lehman commercial paper was held by money market funds and 30 million Americans held money market funds and if you get 30 million Americans worried about whether their money market funds are going to be worth 100 cents on the dollar, they're not going to buy anything, I mean. So they, you know, you create a tsunami, but, and most interestingly, of course, is if Ken Lewis hadn't have bought Merrill on Sunday, I think the system would have stopped, you know. He is (laughs) the guy that turned out to have saved the system. He paid a crazy price in my view, well he could have bought it the next day for nothing because Merrill was going to go when Lehman went. So the government was going to have to step in some place and you can argue that they probably should have stepped at Lehman but I would say this, I consider overall the behavior of Paulson and Bernanke and Sheila Bair and even though I'm not a Republican, even the President, I consider them to have done a terrific job during that period. I mean, you don't call everything right and if they made a

mistake on Lehman they corrected it. And they did everything they could to correct it very quickly and if they hadn't have done that and if Ken Lewis the B of A, we would have, the system would have stopped. It stopped a little bit for a short period anyway. But what we saw fall off into the economy subsequently was nothing compared to I think what would have happened otherwise.

INTERVIEWER:

And following up on that the commercial paper market. You've alluded to what happened in the commercial paper market there. Any thoughts in terms of additional safeguards or anything that could remedy what had happened in--

WARREN BUFFETT:

Pretty tough. We don't buy commercial paper. But I do believe if you ran into a similar situation today the government would guarantee commercial paper, they'd have to. And that's the important part. You have to believe the federal government will act and they will act promptly, decisively and all that sort of thing. That became, I guess, a little bit of a, more than a little bit of a question, significant question after Lehman. The treasury and the Fed remedied that very quickly by taking, in my view, by taking action. I said it was economic Pearl Harbor, but we sent out, you know, we sent out the fleet the next day, but we had the ships in the harbor unfortunately when the day Lehman failed. (laughs) But you saw one of the first TARP type arrangement got defeated in Congress what happened in the market. I mean, Congress was the big fear with, I think, was the biggest fear with the American public at that time.

INTERVIEWER:

How do you draw the line for determining where the government should intervene for specific institutions and not.

WARREN BUFFETT:

Well, I think they did it right in Bear, I mean they wiped out the stockholders pretty much, I mean, you lost 180 down to 10 as it turned out. But if Paulson had his way it would have been \$2 or less. You wiped out the shareholders. Now again, you know, the management, Jimmy Cayne lost a lot of money, but he's a rich man. And so that did not set a good lesson for the rest of the world in my idea but you send a big lesson in terms of the shareholders. And I think if the government has to decide, if troubles are brewing the government should err on the side of overkill.

INTERVIEWER:

How would you decide though between stepping in on Bear and not stepping in on ACME or another financial institution. How do you draw the line in your mind?

WARREN BUFFETT:

Well, with banks it's easy because the FDIC can handle everything except Citigroup and BofA, I mean. They handled Wachovia in their own way, they handled WaMu. I mean, we had 8% or 9% of the deposits of the United States change hands without the federal government getting involved even. But the FDIC could not have, they participated in the situation with Citi, but Citi would have been probably too much. Wachovia was the third largest in the country and they got it done. So, stepping in, you don't need to worry about stepping in on institutions around here, but the chance to step in on Freddie and Fannie there wasn't any question about that. And then you get--they really didn't need to step in, if they did with Morgan Stanley or Goldman Sachs or Wells Fargo. But they did need to get the system, they needed to give the American public the confidence that they would do whatever it took. Now those firms didn't need it as long as the system didn't totally collapse. But as

part of convincing the world that the system wasn't going to totally collapse that they were part of the movie that took place.

INTERVIEWER:

We're very close to being done because we started a little bit early so I thank you. A couple of questions. Do you have any sense as to what the difference between what's going on in Europe is and what went on in Europe is and what happened here because clearly Europe didn't have the same kind of crisis happening.

WARREN BUFFETT:

It's true. It's very different, it's an even more interesting movie (laughs) and since this is on tape somebody will find how it all plays out. I don't know how it'll play out. It's a different situation in that in the United States we were saving ourselves. And we wanted to be saved and we wanted Washington, we knew only the government could save us basically at the time from a colossal collapse. And even with that a year and a half later a lot of people are mad at the people who participated in doing it when all we were doing was trying to save ourselves we weren't trying to save Mexico. It wasn't like we had a North American union where we all were tied to the same currency and Mexico's problems were--can you imagine what the reaction if we'd, if we'd been saving Mexico instead of the United States to the legislature or the regulators who were involved. So Europe, they have to act big but they have a, they have a system where a group of people are going to have to be helping another group. Now we all think we're Americans so when America is saving America we, that can be pretty cohesive. But although like I say, it's still recriminations, all kinds of things have come out of it. Now you picture Europe where you've got a group of people that are being asked perhaps to put up a lot of money and perhaps bear

a lot of burdens perhaps incur inflation to help another group who they don't think have been behaving the way that they would have behaved. And they don't really have the, you know, ethnic social connection, I think it's really problematic what happens.

INTERVIEWER:

But do you think there are any parallels in how their problem developed or is it really a European problem as opposed to a housing bubble?

WARREN BUFFETT:

Probably [unintelligible] because in the end, for a long time everybody thought they were all equal and if you got a Euro denominated bond it didn't make difference or a deposit from any one of 16 countries it was the same then and all of sudden the market perceiving that it wasn't the case. And once people started thinking about it, they realized it really wasn't the case. And this thing's only been around for, you know, less than 15 years or whatever it is. And they start thinking maybe I better line up at that bank. And they don't have to do it physically they start pushing little buttons and the money starts moving around and all of a sudden 16 countries have a problem where they think, most of them think they weren't part of it. And that is, could be enormously contagious. No one has to buy a Greek bond, nobody has to buy a Spanish bond. Now usually when, in America, the central bank has to buy, it'd be a roundabout process but (laughs) we know somebody will buy U.S. bonds tomorrow because we've got a central bank that's totally in sync with the interests of the country. And we'll print money if necessary. And nobody, Greece doesn't have the power to print, you know, they'd be fine if their obligation [unintelligible] It's a very, very interesting problem and I won't predict how it will come out because you've got a tape (laughs) and I'd look very dumb later on.

INTERVIEWER:

So you have any books that you'd like that have been written on the crisis? I know that Sorkin has worked with--

WARREN BUFFETT:

Sorkin has written a very good book. I mean, there have been a number of good books. The book I would write if I was in the writing business, I would write a fictional book and my book would probably be titled something like, If Ken Lewis Hadn't Answered the Phone, and then I would go from there forward with Merrill falling on Monday and describing what the world would have looked like. It'd be a hell of a book. (laughs) I'm not sure what the ending would be but, you know, he got that call on Saturday, he gets a fairness opinion in 24 hours from two guys who are getting \$10 million each. Is the fairness buy Merrill Lynch at \$29 a share which, I mean--

INTERVIEWER:

Chris Flowers.

WARREN BUFFETT:

Chris Flowers and another firm that is affiliated with Chris Flowers. And do you think Chris Flowers would have paid \$29 or \$2.90 for Merrill Lynch on Sunday? (laughs) You know, it's an interesting world, but it may have saved the system some terrible acts. May have actually saved the system.

INTERVIEWER:

Okay. Well.

WARREN BUFFETT:

I don't expect, if you decide to write that book, I don't expect any royalties. (laughs)

INTERVIEWER:

At the rate we're going it'll take a long time. Well, thank you.

A Message from Warren E. Buffett
Chairman, Berkshire Hathaway Inc.

What You Should Know About the Jewelry Business

You don't need to understand the economics of a generating plant in order to intelligently buy electricity. If your neighbor is an expert on that subject and you are a neophyte, your electric rates will be identical.

But jewelry purchases are different. What you pay for an item vs. what your neighbor pays for a comparable item can be, and often is, widely different. Understanding the economics of the business will tell you why.

To begin with, all jewelers turn their inventory very slowly, and that ties up a lot of capital. A once-a-year turn is par for the course. The reason is simple: People buy jewelry infrequently, and when they do, they are making both a major and very individual purchase. Therefore, they want to view a wide selection of pieces before zeroing in on a single item.

Given that their turnover is low, a jeweler must obtain a relatively wide profit margin on sales in order to achieve even a mediocre return on their investment. In this respect, the jewelry business is just the opposite of the grocery business, in which rapid turnover of inventory allows good returns on investment though profit margins are low.

In order to establish a selling price for their merchandise, a jeweler must add to the price they pay for that merchandise, both their operating costs and desired profit margin. Operating costs seldom run less than 40% of sales and often exceed that level. This fact requires most jewelers to price their merchandise at double its cost to them or even more. The math is simple: Jewelers charge \$1 for merchandise that has cost them 50 cents. Then, from their gross profit of 50 cents they typically pay 40 cents for operating costs, which leaves 10 cents of pre-tax earnings for every \$1 of sales. Taking into account the massive investment in inventory, the 10-cent profit is adequate but far from exciting.

At Borsheim's the equation is far different from what I have just described. Because of our single location and the huge volume we generate, our operating expense ratio is usually around 20% of sales. As a percentage of sales, our rent costs alone are fully five points below those of our typical competitor. Therefore, we can, and do, price our goods far below the prices charged by other jewelers. In fact, if they priced to match us, they would operate at very substantial losses. Moreover, in a virtuous circle, our low prices generate ever increasing sales, further driving down our expense ratio, which allows us to reduce prices still more.

How much difference does our cost advantage make? It varies by competitor but, by my calculation, what costs you \$1,000 at Borsheim's will, on average, cost you about \$1,350 elsewhere. This is called the "Borsheim's Price". There are very few instances where we are unable to offer you those great savings due to restrictions, but you will always know upfront if an item is non-discountable.

Of course, price means nothing unless you are sure of the quality of what you are getting. When products are branded, such as watches and chinaware are, comparisons are simple. But jewelry is usually a "blind" item – and that puts virtually all purchasers at the mercy of the seller.

I can remember well how helpless I used to feel in a Fifth Avenue or Rodeo Drive jewelry store, where the only thing I knew for sure was that the operator had extraordinarily high overhead – and that they had to cover it in their sales price. I was also wary of the "upstairs" solo operator who operated on consignment merchandise, since that would have cost them more than merchandise bought outright, and would necessarily have inflated their retail price. And, finally, I always worried about the quality of what I was getting I couldn't tell the difference between an emerald or a diamond worth \$10,000 and one whose value was \$100,000. (I still can't.)

My sense of helplessness led me to an obvious conclusion: “If you don’t know jewelry, know your jeweler.” For that reason, I made all of my jewelry purchases at Borsheim’s for many years before Berkshire Hathaway bought the company. I didn’t know stones, but I did know Ike Friedman, the retailing genius who had built the business from nothing into one of the nation’s largest independent jewelry stores. When I purchased Ike’s business, I did it without an audit but with full confidence that I was getting value received. And that’s just what I got – precisely as I had when I purchased a single piece of jewelry from him.

The main point of this letter is to tell you that you don’t have to live near Omaha to benefit from Borsheim’s. Our “shop-at-home” program brings Borsheim’s to our qualified customers. Simply contact Borsheim’s to describe what you’re looking for – to any degree of detail. We will assemble selections that best reflect your wishes and send them to you. Then, in the comfort of your own home or office, you can conveniently and leisurely select the item(s) you most prefer, or return the entire selection.

Our results from this “shop-at-home” program have been amazing. Customers have loved it and keep coming back for more. Each year, we send out several thousand packages, ranging in value from \$100 to \$500,000. Call us at 800-642-GIFT (4438) to learn how to qualify for Borsheim’s “shop-at-home” program.

At Borsheim’s the service will be exemplary, the price will be exceptional and the merchandise will always be what you are told that it is. You have my word.

Warren E. Buffett
Chairman of the Board

Warren Buffett's Meeting with University of Maryland MBA Students – November 15, 2013

December 8th, 2013 by [dkass](#) under [Uncategorized](#). [No Comments](#).

(Notes taken by Professor David Kass, Department of Finance, Robert H. Smith School of Business, University of Maryland and Rahul Shah, MBA student)

Warren Buffett (WB) met with 20 MBA students from each of eight universities, including the University of Maryland, on November 15, 2013. The MBA students asked 16 questions in the following order:

(1) Has Berkshire Hathaway (BRK) lowered its hurdle rate as it grew larger?

WB: BRK does not have a hurdle rate. The added capital makes it harder to achieve superior returns. If I manage \$1 million I will get better returns than managing \$210 billion (BRK's net worth). Size is the enemy of performance. I would still rather manage \$210 billion than \$1 million.

(2) In the past you said you attribute 85% of your investing to Benjamin Graham and 15% to Philip Fisher. Has that percentage changed?

WB: I developed my investment strategy under Graham. I went to Columbia and learned from Graham. With Graham's approach, you cannot lose money over time. It's very quantitative in nature, and you have to do reasonably well. On the other hand, it has less and less application as you get into bigger and bigger companies with larger sums of money. It's better to buy wonderful businesses at fair prices than so-so businesses at low prices.

With the "cigar approach", you can find a nasty cigar on the ground, with one puff left, can pick it up, light it and you get a free puff. You can keep doing this and get many free puffs. That's one approach, that's what I did. I looked for very cheap stocks quantitatively. After exposure to Fisher and Charlie, I started looking for better companies.

Previously I was doing both. Now we are looking for good companies, not just cheap companies. Railroads are huge, and they will be good in 10 years, and 100 years from now. Burlington Northern is now earning \$6 billion pre-tax, as compared to \$3 billion a few years ago before we bought it. Moving much towards Fisher now and less Ben Graham because we are working with larger sums. With smaller sums, we would be looking at better margins/cheaper stocks. When I got out of school, I went through Moody's manual page by page. Got to page 1433 and learned the good ones were in the back. Western insurance company in 1951 was earning \$29.09 a share, the year before \$21.66. The price of the stock had traded between 3 and 13 the previous 12 months. The price was at 16 when I saw it, less than 1 x earnings. A few years ago, in 2004, someone told me I should look at Korea. I got a book from Citigroup which had 1 stock to a page. Describes all the publicly traded companies in Korea. Went through it and found about 20 companies (ex. Day-Han flower mills) it had book value, eps, and securities. Didn't tell you anything about the share until you look at the price. Found about 20 like that in an afternoon and bought some of all of them, but didn't know enough about all of them to load up on them. If you buy 20 stocks selling at 2 times earnings, you're going to make money. That's Ben Graham and you can make money doing this. If you're working with bigger money, you have to do Fisher/Charlie style and buy big businesses. Berkshire now looks for large, very strong companies. Like Nebraska Furniture Mart – bought in 1983 and it's probably earning 20 times as much now. Charlie told me – "You're never going to disagree with me because you're smart and I'm always right".

(3) What is the process you follow in writing the annual shareholders letter? How do you decide what you're going to write about?

WB: I finished the 2013 letter already, but I will send it out on Feb 28. I already know what I'm going to say, just have to fill in some numbers and send it off.

I try to think of my shareholders as my partners. I try to think of the information I would want them to send me if they were running the place, and I was the shareholder. What would I want to know? This is what I tell them. In my first draft, I address it to my sisters who don't know a lot about finance. "Dear sisters"- I explain to them what they would want to know in their position. I also like to write one section that is a general teaching lesson that doesn't directly apply to Berkshire. This year 2600 words (out of 11,500) are thoughts about investing. I'm talking to all people thinking about investing and how they should go about it. I take one subject and just write a chapter on this, annually. Some people are interested, some are not. If they're going to have most of their money with me, I like to talk to them as if they are in the room with me — economic principles of BRK — so people know what we are all about.

In 1956 I bought a ledger for \$0.49, two pieces of paper for a partnership document but didn't worry about the partnership agreement. I just explained the ground rules in about half a page: This is what I can do, this is what I can't do, this is how I intend to go about it, and this is how I measure my success. If this looks good to you, then buy in. If you don't want to buy in, then don't — we can still be friends. These ground rules are in the back of the Berkshire Hathaway report tailored to investors. In our ground rules, though our management is corporate our attitude is partnership. We consider you as partners. You need to have common ground, just like a marriage. It would be crazy to get married when you differ on important points. The annual shareholders report is ready now. BRK has unusual shareholders, many of whom have 80% of their net worth in BRK. I have almost 100% of my net worth in BRK. But if the market goes down 50% we might rewrite it (laughter).

(4) Why did you convert Goldman Sachs warrants into a smaller stake in the company?

WB: Goldman Sachs and GE, we helped finance them in 2008 which I never dreamt would happen (Imagine GE calling you, telling you they need your financing assistance). BRK received warrants with preferred stocks, expiring in 5 years (Sept 2013). Warrants to buy \$5 billion Goldman Sachs common stock and \$3 billion GE common stock. If we exercised, we would have had to invest an additional \$8 billion. These two companies didn't want to issue all of those new shares. Earlier this year we decided, they didn't want to issue all of those shares, we didn't want to spend \$8 billion. Let's do a settlement, both wanted to. We didn't have to lay out cash and they didn't need to issue all of those shares. BRK ended up with Goldman Sachs shares valued close to \$2 billion without any outlay of BRK's cash. GE was only \$200 million. BRK has only one big warrant issue remaining, with Bank of America. We have warrants that entitle us to buy 700 million shares at \$7.14 a share (\$5 billion) through August 2021. We'll hold the warrants until the dividend becomes high or we'll hold until right before the expiration. Goldman Sachs and GE deals are interesting — who would have guessed those 5 years ago. The money market failed because of Lehman. Money market funds held a lot of Lehman paper. It happened overnight, 30+ million Americans who believed money markets were safe, and then Lehman fails. This caused a major money market fund to "break the buck" and lose value. It became a great silent electronic run on money markets. There was \$3 1/2 trillion in money market funds and \$175 billion of funds flowed out in the first three days after Lehman failed. All money market funds held commercial paper. Companies like GE had a lot of commercial paper. After this, American industry literally stopped. George Bush said, "If money doesn't loosen up, this sucker will go down" — I believe this was the greatest economic statement of all time. This is

why he backed up Paulson and Bernanke. Companies were counting on the commercial paper market. In September 2008, we came right to the abyss. If Paulson and Bernanke had not intervened, in two more days it would have been all over. BRK always has \$20 billion or more in cash. It sounds crazy, never need anything like it, but some day in the next 100 years when the world stops again, we will be ready. There will be some incident, it could be tomorrow. At that time, you need cash. Cash at that time is like oxygen. When you don't need it, you don't notice it. When you do need it, it's the only thing you need. We operate from a level of liquidity that no one else does. We don't want to operate on bank lines. There is no authority for the US Treasury to guarantee money market funds. Their power comes from Congress. Paulson set up an exchange stabilization fund in September 2008 to guarantee money market funds. This stopped the run of money market funds and it was all over. Something like that will happen maybe a couple of times in your lifetime. Two things when it happens again – don't let it ruin you, and if you have money/guts, you'll have an opportunity to buy things at prices that don't make sense. Fear spreads fast, it is contagious. Doesn't have anything to do with IQ. Confidence only comes back one at a time, not en masse. There are periods when fear paralyzes the investment world. You don't want to owe money at that time, and if you have money then you want to buy at those times. "Be greedy when others are fearful, and fearful when others are greedy".

(5) How has your understanding of markets contributed towards your political views?

WB: I wouldn't say knowledge of markets has. My political views were formed by this process. Just imagine that it is 24 hours before you are born. A genie comes and says to you in the womb, "You look like an extraordinarily responsible, intelligent, potential human being. Going to emerge in 24 hours and it is an enormous responsibility I am going to assign to you – determination of the political, economic and social system into which you are going to emerge. You set the rules, any political system, democracy, parliamentary, anything you wish, can set the economic structure, communistic, capitalistic, set anything in motion and I guarantee you that when you emerge this world will exist for you, your children and grandchildren. What's the catch? One catch – just before you emerge you have to go through a huge bucket with 7 billion slips, one for each human. Dip your hand in and that is what you get – you could be born intelligent or not intelligent, born healthy or disabled, born black or white, born in the US or in Bangladesh, etc. You have no idea which slip you will get. Not knowing which slip you are going to get, how would you design the world? Do you want men to push around females? It's a 50/50 chance you get female. If you think about the political world, you want a system that gets what people want. You want more and more output because you'll have more wealth to share around. The US is a great system, turns out \$50,000 GDP per capita, 6 times the amount when I was born in just one lifetime. But not knowing what slip you get, you want a system that once it produces output, you don't want anyone to be left behind. You want to incentivize the top performers, don't want equality in results, but do want something that those who get the bad tickets still have a decent life. You also don't want fear in people's minds – fear of lack of money in old age, fear of cost of health care. I call this the "Ovarian Lottery". My sisters didn't get the same ticket. Expectations for them were that they would marry well, or if they work, would work as a nurse, teacher, etc. If you are designing the world knowing 50/50 male or female, you don't want this type of world for women – you could get female. Design your world this way; this should be your philosophy. I look at Forbes 400, look at their figures and see how it's gone up in the last 30 years. Americans at the bottom are also improving, and that is great, but we don't want that degree of inequality. Only governments can correct that. Right way to look at it is the standpoint of how you would view the world if you didn't know who you would be. If you're not willing to gamble with your slip out of 100 random slips, you are lucky! The top 1% of 7 billion people. Everyone is wired differently. You can't say you do everything yourself. We all have teachers, and people before us who led us to where we are. We can't let people fall too far behind. You all definitely got good slips.

(6) You are one of the few male CEO's who champions women in the workplace. Can you talk about your reasoning and how we can contribute our intelligence to the workplace? (from a woman speaker)

WB: We wrote the Declaration of Independence in 1776 – “All men are created equal” etc. In 1789 we wrote a Constitution – on second thoughts... blacks are only 3/5 of a person. They slipped up. They wrote in such a way that they didn't have to use gender pronouns. They gave themselves away in presidency, they said “He”. Pretty soon all men are created equal became all males are created equal. Move forward to the Gettysburg address, Lincoln repeated the line about All men are created equal. Slipped over the fact that women couldn't vote, couldn't even inherit money in some states. Finally, in 1920, 131 years into this new venture of governance, “Oh yea, women should have a fair stake in vote.” After this, many justices were appointed before O'Connor was. Everyone had expectations of me as a child, but my sisters who were just as smart, were delegated to something different. Here is this country, think about how far we came from using half our talent. Now we are beginning to unleash the potential of the other half. If we only allow people to be CEO's, accountants or lawyers if they are above 5'10", and people under 5'10" must become nurses, etc. that would be crazy, we could not unleash potential. Same thing was the case for women. No one realized it, my dad didn't, and my teachers didn't. Women are obviously just as smart and work just as hard. No one is better at running our annual meetings than Carrie. I think its nuts for a CEO to pass up the most talented person based on their gender. But we are going in the right direction. We're moving towards the ideals we set, but these ideals set by Jefferson weren't practiced until much later.

(7) How do you assess management when acquiring a company?

I handed Mrs. B (Nebraska Furniture Mart) a big check, and none of them (managers of acquired firms) had to work anymore. But will they behave the same after they get the money and I get the stock certificate? Will they work just as hard when they're putting money in their own pocket?

3/4 of our managers are independently wealthy. These people don't need to go to work, but they are putting the work in. If I give him 4 billion dollars, will it be the same results next month? Next year? I don't deal with contracts; I have to size up whether management is going to continue working that same way. Generally, I've been right in my assessments and I've gotten better. They don't need me, I need them.

Why do I come to work? I can do anything I want to do, and yet I come out every morning and can't wait to get into work. I enjoy working Saturdays, talking to students. Why do I do it? I get to paint my own painting. Berkshire Hathaway is my painting. People love creating things. I think I'm Michelangelo, painting the Sistine Chapel but it could look like a blob to someone else. Second thing – I want applause. I like it when people appreciate my painting. If others have their own paintings, then who am I to tell them how to paint it? (Just like management) I appreciate what they do. I know the game, so when I praise them, they know they're getting approval from a critic they like. I have their stock certificate, but it's still their business. It's a good culture when managers really care about the business.

(8) Now information is everywhere. If you were born in Peru today, could you have thrived in the same manner?

WB: Yes, I do. Things are changing around the world. People are able to move within and up through socio-economic classes. America didn't work harder when increasing GDP more than other countries, we allowed for equal opportunity. Didn't even work smarter, just unleashed greater potential. The world is allowing for opportunities for all.

(9) What career path would you advise someone who wants to go into investing today?

WB: You just want to learn everything about it. There's so much to learn. Learning what works and what doesn't work, where value resides and where value doesn't reside. Got my feet wet, at 11 years old (1942) I bought 3 shares of Cities Service Preferred at \$38 1/4. At the same time, my older sister Doris bought also bought 3 shares and my dad bought 4 shares, so we had a round lot of 10 shares. My sister Doris complained about the price of the stock every day when going to school. So I sold it at \$42. Two years later the shares sold for \$200.

I would try to manage money with an audited record so that it would attract more people when doing well. I like running businesses better than investing. It is more fun building businesses than moving money around. Todd Combs and Ted Weschler are each managing \$6 1/2 billion. They each are earning less money than they would if they were running their own hedge funds. But they like being at Berkshire. They have enough money. They have the character that I admire.

(10) Question seeking advice for women.

WB: I recommend reading Personal History by Katherine Graham. Presidents came to see her. She overcame the handicap that her mother and husband told her she was nothing. Many women are succeeding today as CEO's. Susan Jacques, CEO of Borsheim's, is leaving to head the Worldwide Gem Association.

(11) You were the first person to use the term "moats" as competitive advantage. Morningstar has built on this. What do you think about Morningstar's work on moats?

WB: I think they're doing a great job. I came up with this term 40+ years ago because in capitalism, you have these economic castles. Apple, Microsoft, etc. Some have smaller castles. If you have a castle in capitalism, people are going to try to capture it. You need 2 things – a moat around the castle, and you need a knight in the castle who is trying to widen the moat around the castle. How did Coca-Cola build their moat? They deepened the thought in people's minds that Coca-Cola is where happiness is. The moat is what's in your mind. Railroad moats are barriers to entry. Geico's moat is low prices. Every day we try to widen the moat. See's Candies creates a moat in the minds of consumers. It is a more effective gift on Valentine's Day than Russell Stover. See's Candies has raised its price every year on December 26 for 41 years. BRK bought See's Candies for \$25 million in 1972. Today it earns \$80 million. Richard Branson failed 10 years ago with Virgin Cola. Snickers has been the number one candy bar for 40 years.

(12) How do you balance work/family life and what advice do you have for a young professional?

WB: The most important decision you're going to make is who you're going to marry. What's important is that what your thoughts are on big things, must make sure that your spouse has the same thoughts on the same big things. Don't marry someone to change them. Marry someone who is a better person than you are. Always associate yourself with people who are better than you.

(13) Do you have a goal of beating the Dow Jones Industrials by 10 percentage points each year?

WB: Years ago, I was trying to beat the Dow (would be the S&P today). Goal was to beat the Dow by 10 points this year. If the Dow was down 20% and we were down 10%, that would be fine. We don't have some number we expect to make from some business or security. We do what we can that we think is the best at the time. Is this the most intelligent thing we can do, within our circle of competence, that doesn't strain our resources? Hopefully we say yes. We generally think the value of a company is the PV of cash flows until judgment day.

If you really get back to investments – 2600 year ago the expression was “A bird in the hand is worth two in the bush”. But you need to question it – How sure are you that there are two in the bush? How far is the bush? What is the interest rate? (laughter)

In investments, you lay out money now and get more money later on. Berkshire is putting more birds in the bush all the time.

If you are managing only \$1 million, then you should be able to beat the S&P 500 by 10 percentage points with no risk or leverage.

(14) What was the most difficult negotiation you were ever involved in? How did you develop your strategy going in?

WB: Only really learned negotiations from my dad. People have different styles of negotiation. I don't want to be in a negotiation where it “has to end” at some point. Don't want them to have me by the throat while I have them by the throat. Either we give up or one strangles the other. My style is different from most peoples, just say what I do. If you do that throughout your life then stick to it. I can walk away from anything. I say I'll pay \$X, and normally this is the best deal. I don't want to lowball, then you counter, and get to \$X anyway. You spend time and money doing that. I just say what I'll pay, and that works fine once you establish a reputation. You don't want to get in a negotiation that you can't afford to walk away from. Bargaining with people you love is a terrible mistake. It's destructive. The most powerful force in the world is unconditional love.

(15) What has been your biggest investment mistake and how did you learn from it?

WB: It is better to learn from other peoples mistakes rather than your own. Look at all kinds of business failures. I don't believe in beating yourself over it, you're going to make mistakes. My biggest mistake was buying Berkshire Hathaway and trying to make it better. We had all of our money in a bad business, had a drag on all of this capital for 20 years. Even after acquiring National Indemnity. BRK to be the base of what we wanted to grow, this was a mistake. You cannot play the game without making mistakes. We bought Dexter Shoe for \$400 million in BRK stock

which is now worth \$5 – \$6 billion. Dexter Shoe went bankrupt as a result of foreign competition. We lost \$2 billion in Energy Future Holding bonds which KKR had invested in. KKR lost \$8 billion.

(16) When managing other peoples money and making mistakes, how do you deal with the responsibility/burden?

WB: I tell them I'm going to make mistakes, but the goal is to do this and this and this. I might make mistakes in order to do this, but I will still probably achieve this goal. I try to operate in a way where I can't lose significant sums over time. I might not make the most money this way, but I will minimize the risk of permanent loss. If there's 1 in 1000 chance that an investment decision can threaten permanent loss to other people, I just won't do it.

**Notes from the Meeting Dr. George Athanassakos and Ivey MBA and HBA students had with Mr. Warren Buffett
Omaha, NB, January 31, 2014, 10:00 am - 12:00 pm**

Question #1:

As we grow up, our motivations have changed. What is your motivation now and what motivates you every morning when you wake up?

Answer #1:

I want to be the oldest man! There are a lot of things I can do, and I love to work with the people here. I can do the job I love at Berkshire. I get to paint my own painting. I come to work and no one tells me what to do. It's a free canvas. I can choose the colour to paint with. It's the same with my managers. I give them their own brush, and they can paint their painting individually. They do a very good job. At Nebraska Furniture Mart they're expanding into Texas. The job won't change their lives significantly, but it's their painting.

You will want to find a place that you admire and work for them. I'm doing what I love doing. I took a job at the age of 23 with Ben Graham, I offered to work for free and he said I was overpriced. Eventually he did give me a job and I didn't ask about the pay. I loved it and that's the job I'm doing now.

Question #2:

You said in a 2010 interview that the best advice you ever received from your father was unconditional love. How has that impacted your business decisions?

Answer #2:

Yes, I said that the greatest gift that my father ever gave me was unconditional love. Now, that doesn't mean that you get applauded for everything that you do. My father definitely told me if he didn't agree with my actions, but I always knew that he would be there for me.

When I was 13 I moved to Washington. I didn't adjust well and my actions were not exemplary. My father talked to me and told me that I could do better. Throughout my life my father told me he supported me no matter what I wanted to do. It's an enormous factor. If you receive it from your parents that's great, if you don't, it's an uphill battle. That's why, for you guys, choosing a spouse is the most important decision in your life. You need to choose a spouse who believes in you and will give you that unconditional love. The best way to find a spouse like this, I think, is to be lovable.

I became very good friends with a woman who was a Polish Jew. She was in one of the camps during WWII and her sister and her mother were in different camps at the same time. Unfortunately, her sister and mother

never came out. After this experience, she was always very slow to make friends. She would always say to me, "Warren, every time I meet somebody, I always ask myself, would they hide me?" There are some very rich people whose children wouldn't hide them. There's the poem that reads:

A bell's not a bell 'til you ring it,
A song's not a song 'til you sing it,
Love in your heart wasn't put there to stay,
Love isn't love 'til you give it away!

Lots of rich people who don't understand this live very empty lives. No matter what, if you have unconditional love, you'll be alright.

Question #3:

In the acquisition of Heinz, you funded the purchase with debt and partnered with 3G Capital. 3G typically take activist roles, often changing management, while Berkshire Hathaway usually leaves management in place. What made you comfortable with welcoming 3G's strategy?

Answer #3:

The head of 3G Capital, Jorge Paulo, is a good friend and an amazing manager, and mentioned he was looking at Heinz and asked if I was interested. He sent me a two-page proposal, one page financial and one page addressing governance, and I didn't have to change a single word. They are great managers at 3G. No matter how well a business is doing, it can always do better, and 3G managers are the best managers I've ever seen.

At Berkshire Hathaway, we're hands off. We have 70+ businesses, and they generally run themselves. For example, Burlington Northern Railroad has a \$4B capital budget, and I don't review this budget or its capital allocations because I trust their managers. People sell their businesses to Berkshire because they know they will retain control, in part, and won't have to give up what they love. They stay with Berkshire Hathaway forever and appreciate our hands off approach.

Our hands-off-strategy is opposite to that of Jorge Paulo's group. They run the businesses that they own, and they do an amazing job. 3G are great managers, and Jorge Paulo is a great man. We partnered up about a year ago, and we're likely to partner up again sometime in the future.

Question # 4:

Do you believe growth, quantitative and other passive styles of investing will eventually overtake the active investing style?

Answer #4:

There will always be opportunities in the market because of people doing extreme things. Long-Term Capital Management helped with the problems at Salomon. Humans created what happened there, but it wasn't because they didn't have knowledge of markets. In 2008 what happened was also man-made. What happened to Fannie and Freddie, and Lehman in September was man-made. All these things caused extreme valuations.

One of the trades at Long-Term Capital Management is that they would go short on the so-called "on the run" treasury and go long on the one that was slightly different in maturity when they had a spread of 10-15 bps. A new 30-year bond would come out and it would be the "on the run" issue, but there was nothing wrong with a 29-year and a half bond and basically they were the same instrument. They set this trade up to just keep working, but you would have to do it with extreme leverage to make a lot of money. The spread went out to 30 bps, which was crazy to have between the two treasuries, but it happened. That broke certain people, but it offered opportunities to other people who always made sure that extremes in markets could not kill them. That will happen again. You are going to see incredible opportunities. It won't be frequently, but you will see them in your lifetime.

When I got out of school in 1951, in those days they didn't have the Internet, so instead we had these big manuals. Standard & Poor's and Moody's put out some manuals. At the age of 20, I started going through these

books page by page. I also went through the Industrial manual, the Transportation manual, the Utility manual, about 10,000 pages in total. I was looking for things that were cheap. When I got to the back of the book, page 1433, there were companies I had never heard of, but here was a company called Western Insurance Securities. It showed they were earning \$29.09 per share. The year before they only had earned \$21.66. That didn't tell you much until you turned the page and looked at the common stock, and the price on the common stock for the previous year had a range of \$3 to \$13. By the time I saw it, the stock was \$16 per share. I went to the local representatives, the people were good and they had good underwriting. There was nothing wrong with the company.

Somebody told me to take a look at Korea in 2004. They gave me this manual of all the Korean securities. One Sunday I went through this and picked about 20 or so stocks, which were similar to the ones I picked in Moody's. I found a company and presumably they make flour. I would look for good balance sheets and trading at 2 times or 3 times earnings and a business that wouldn't go obsolete. I didn't know enough about any specific ones to put half my money in them, but I knew if I bought 20 stocks I would make very good returns.

Money and courage is needed to invest like this, not even that much intelligence. You only need an IQ of 130, and then you should sell the excess to someone else. What you need is emotional stability and the guts to do things when others are petrified and frozen. It's happened many times in my life. The human animal will react the same. In the fall of 2008, you had 30 million Americans who owned Money Market funds. In aggregate they had three and a half trillion dollars in those funds. To put that money in context it was worth about half of all bank deposits. At the start of September, no one was afraid of these funds, because they it looked exactly the same as cash. Two or three weeks later, when Lehman failed and it went from zero people who were worried to 30 million worried. In the first 3 days following, 175 billion dollars flowed out of money market funds and they had to sell something. They sell the governments first, and it just cascades. When fear enters the room people panic. Confidence comes back one at a time, but fear is all at once.

You will see it again. The future won't be exactly the same, but it rhymes. There will be as much opportunity for value investors as there has ever been. It's just when the opportunity comes along you have to go do it and people won't be cheering you on.

Question # 5:

If you could invest in only one country -- other than the US -- what country would you choose and why?

Answer # 5:

It might well be China. But I would want a big market because we have big money to invest. I like Korea too, but again, it would have to be a big market. It might even be Japan.

We spent last year, in our businesses, over \$10B on plant and equipment. It was a record year. And 90% of that was in the United States. We like the idea of investing outside of the United States, but A) the deals aren't as big, and B) they're not on the radar screen to the same extent.

Our largest investment outside of the United States, interestingly enough, was in Israel. But that was because I got a letter one day from a fellow I have never heard of. It was a page and a quarter long and in it he describes his company and he said 'our family owns it and we only want to sell to Berkshire. If you don't want to buy it, we're not going to sell it. If I've interested you, I'd be glad to come over from Israel and tell you about it.' Well the letter jumped out at me, so I invited him over and he came over. We bought the business for \$4 billion.

We do buy things from all over the world, but they don't come up that often. It just isn't the same as it is in the United States.

But I would say you want to be in a big market and in a place where you have the prospect of a really big return. And you have to understand the game. I would want to know that I understand it. In Korea, I knew about 20 stocks with good balance sheets but those alone can't move the needle at Berkshire. We've got a

huge market value at Berkshire, and so to make real money at Berkshire we have to find big deals. Charlie and I have to go out with our elephant gun; the fly swatter won't cut it.

Question # 6:

What are the top three global problems that you are trying to tackle with the Bill & Melinda Gates Foundation?

Answer # 6:

The top three global problems cannot be tackled by the foundation. Today, we are all living better. Real GDP has increased and people bemoan the 2% GDP growth, but if the population increases at a rate of 10%, that's 20% more output. It is the cyber, nuclear, biological, and chemical attacks that are the problem. Few governments wish ill upon their neighbors. We have always had radicals and will always have them, but the number has increased, as has their ability to inflict damage. The threat is dependent on intent, knowledge, access to raw materials, and deliverability. Intent has always been there and will always be there. The spread of knowledge is increasing. The only complication is the raw materials. However, something will happen eventually because the offense is always ahead of the defense. The foundation cannot tackle these problems as they are governmental problems. When it comes to philanthropy, a person is forced to pick between something that you know you can do or pick something that you might fail at, but one time in four, you might make a big difference. There is equal value in every life; you have to determine how you can have the biggest impact. Right now, the foundation is working on improving medicine outside of the United States, specifically targeting polio. There are many health prospect changes that can be made around the world and a lot of educational opportunities within the United States.

Question # 7:

What is your opinion of the emerging economies like Brazil? Would you be looking to invest in companies in these types of markets, and if so, in which sectors?

Answer # 7:

I have made a number of trips to Brazil and have a fair number of contacts there. I don't have a favorite sector at this time. It's not for me to find ideal sectors; instead nations should promote their key sectors for their particular country. The only criterion I have at this point, is that the investment should be big enough to move the needle at Berkshire. The company from Israel is a good example, where I invested even without visiting the operations. I just try to find a good pitch from a business which is big and has efficient and trustworthy management. If someone can clearly tell me what he has as a business and what he can do as management, I'm willing to invest within 10 minutes (assuming I like the opportunity).

Question # 8:

How would you rate your own success on a scale of 1-10?

Answer # 8:

I don't believe I'm very different from others. I still eat the same food, have a good time when I go out with friends, just like others, the only difference is I travel a little better now. I take my jet when I travel. Success for me is doing what you love and are passionate about and as long as you are doing what you like you'll stand out and outperform. If I have to rate myself I'll always believe I'm a 10. I feel that the way the rich often show off their wealth as a form of "elephant bumping". Buying another house would only be an inconvenience, I'd feel obligated to stay in it instead of my current home which is quite comfortable. For example, I don't like yachts. They only offer the opportunity to do things with greater difficulty at sea, where I feel trapped, that I could have easily done on land (at the Y) for a fraction of the cost. Ultimately, money is not the ultimate measure of success, but rather, it is how many loved ones you have around you.

Question # 9:

What was the thinking behind the kids' series "Secret Millionaires Club"? What are you trying to teach kids about money through the series?

Answer # 9:

My father never pushed me into anything and I tried to do the same with my children. None of my three kids finished the college – we have one degree to pass around the family between the three of them. You got to find your true-self; no one can teach you that. For secret millionaire club I did a series of cartoons in (about) 14 episodes. I played myself and taught history and secret millionaire 'ideas' to all those kids who might otherwise grow without the 'right habits' in regard to money. Myself and the producers hoped to instil better (financial) habits and to help the kids develop. This initiative later caught on with few celebrities and some of them, including Bill Gates and Jay-Z, even appeared in few of the "Secret Millionaire Club" episodes. Some of the issues we tried to address included credit card use and bad debt.

Question # 10:

Females working in male dominated industries, what advice do you have to give young female professionals in an industry dominated by men?

Answer # 10:

Look at how far we came using only half the talent pool, think of what we can do with 100%. If you read the American constitution, when defining judges and congress, it doesn't use personal pronouns, but for presidency, it uses "he" and "his". Also, we had Thomas Jefferson saying "all men are created equal" and again repeated by Abraham Lincoln. But since then we had the 19th amendment, giving women the right to vote. Things are moving along.

Over the last 20 years we have seen a lot of industries change significantly. For instance, Tracy Britt, a 29 year woman, is the Chairman of 4 companies. When I was growing up I met a 98 year old woman in Seattle who was the first female to graduate from Cornell. She had to stand behind a curtain in anatomy class. There's still a long way to go, but we're moving quickly.

If you are working in a male dominated company, just hope that Berkshire Hathaway buys them. If you have a child, 9/10 times the women will do the house work and have a more interrupted life; life is tougher. However, a company that ignores half the talent won't be competitive over time.

Growing up I had teachers who had so much talent because at that time women had only a few options (teacher, clerk, secretary, and one other), so they were way over qualified, and should have been doing something else. I feel I got more than I deserved.

Question #11:

What is the one question you would want to ask if you had an oracle?

Answer #11:

The most important question of all humanity would be, is there a god? I'm agnostic, but I would still want to know. That's the greatest question in the world. Much sooner than you guys, I will find out (laughs).

I like the world it is now, because there is enough uncertainty. I can say I've seen this part of the movie before, but still won't be able to predict the ending. I like it that way as the past is relevant, but it's not determinant of the future. The game is very interesting the way it is now and I wouldn't want to change too much of it.

Question #12:

What do you think was your best non-financial investment in life?

Answer #12:

My two marriage licenses, which I don't know how much I paid for, but if I had to pay a million times that it would still be a bargain. I guess you are looking for a tangible asset, so I would say my home. At the time that I

purchased it, it used up a fair amount of my free capital. The reason why it was so worth it, is because everything has happened there. My kids grew up there, and it's where they and all their friends congregated. Their friends still come around when they're home. While there was a financial side to it, the main motive was not financial and every reason I had to buy the house was fulfilled.

A little while ago, we celebrated my good friend and business partner Charlie's 90th birthday there. We had about 280 people. For a while now I've suspected that Charlie's hearing has been going, but I didn't know how to tell him. I went to the doctor and asked what the best way was to find out and the doctor said to stand across the room, speak at a normal tone of voice, and see if he responds. So at the party, I stood across the room and in a normal tone of voice I asked, "Charlie, I think we should buy Microsoft for \$35.00, do you agree?" He didn't respond so I walked half way across the room and again said, "Charlie, I think we should buy Microsoft for \$35.00, do you agree?" Not a flicker. Finally I walked up almost right beside him and asked, "Charlie, I think we should buy Microsoft for \$35.00, do you agree?" He looked me straight in the face and said, "For the third time, yes!"

Question #13:

Berkshire aims to buy companies that run themselves. When have you had to restructure a firm's operations or management team?

Answer #13:

We've had to change managers, but we've never really had to restructure entire businesses. Changing managers is my least favorite part of this job; however, it is inevitable. We have no retirement policy, and managers know what you're saying is that they're losing it. Most of these managers are friends, and I just hate it. Berkshire has definitely changed managers less than our peers. We own 70+ businesses, and we typically have to change 1-2 managers per year.

One example is an insurance company on the West Coast, where I was good friends with the owner. He developed Alzheimer's, and I delayed taking action for a few years because he was such a good friend. I didn't want to acknowledge it, and I didn't want to see it. I've almost always change managers late. I shouldn't do it late, but I will continue to do it late. In another situation, I had to confront a long time CEO about retirement and he told me: "If I was in your position, I would do the same thing."

Typically, I send a one to two page letter to managers each year with limited instructions, and I ask for a page back to tell me who should succeed them if something happened overnight. Changing managers is part of capitalism, and it is therefore my responsibility; however, this makes it no easier to do. It is also important for me to distinguish between bad investments, which are my fault, and poor management. The CEO is extremely important to a business, so we must take action to get the company back on track. The right CEO equals the right business.

Boards are also a social institution. It is hard to fire people who are good, genuine people but mediocre managers. This is actually the biggest problem in corporate America. I have sat on 19 boards, and it is hard to get rid of upper class mediocrity. It is hard to want to do it.

Question #14:

What is the biggest mistake you've made in your life and what have you learned from it?

Answer #14:

Using Berkshire as the vehicle for the company that has been built. At the time when I owned some shares in Berkshire they were closing down mills and buying back tender offers. The company had asked a price I would tender at, and we had both agreed by word on \$11.50. A month or two later, when I received my tender, they went back on their word and offered at \$11 and 3/8ths. So I went out and bought all the shares and he was no longer CEO. It was a lousy business, but doing well at the time for a short period. I was still running a partnership in Omaha and in early 1967, a local fellow, wanted to sell National Indemnity Insurance Company and I bought it. I bought it and instead of forming a new company to buy it, I put it in Berkshire. I put a good company in with a lousy business. If we had built what is now Berkshire around the insurance

company we would have owned 100% of it instead of what was later to become 70%. And we still had this textile business, which we lugged around for 29 years, which brought down the returns. It was a terrible base on which to build a business.

I made a mistake when I bought a shoe company in the 1990's up in Maine. I gave them \$400M of Berkshire stock for a business that was worth zero. I should have paid cash. Now their shares are worth \$5B. Every time Berkshire stock goes down I feel a little better about that deal. That was really dumb and it was a double play dumb.

In my personal life I just got enormously lucky. I was very lucky with parents, and in terms of the teachers, not just the formal ones, but also friends. The biggest piece of luck I've had is that I have developed 15 or so close friends in my life, and I have never been disappointed by any one of them. Beginning with my partner Charlie Munger, it's hard to find a partner like that and it's almost as important as a marriage. We are both strong-minded, we disagree, but we have never had an argument. These people are my heroes. It's terrible when you get let down, but that has not happened yet. I've made a point at associating with people who are better than I am. You will move towards the behavior of those who you associate with and you will become more like them.

I've had some bad business luck, but you pick yourself up and move on to the next thing. Maybe I'll have some bad luck with this basketball tournament and be out one billion. It'll be fun though, I'll go to the game with the one guy left and bring a cheque for a billion, and we'll probably cheer for different teams.

Question #15:

Since 2008, what's the best pitch you swung at and what's the worst?

Answer #15:

One challenge Berkshire faces is that the company is so large now that it must deal with large deals. Before the 2008 downturn, Berkshire made a commitment to buy a stake in Dow Chemicals for \$3 Billion, but the deal came into effect after the events of October 2008. Berkshire stayed true to the commitment and made the purchase, but in hind sight, there were a lot of better deals to do with \$3 billion. Another thing in hindsight is that Berkshire invested \$15.5 billion between September 15 and October 15, 2008. However, this was pre-emptive by a few months. Had Berkshire not used up the powder early on there were likely better deals to do in early 2009. Burlington Northern has been a great investment and luckily Berkshire had enough money to get the deal and the company was fortunate to have gotten the business.

Question #16:

In 2010, along with Mr. Bill Gates, you publicly announced The Giving Pledge, encouraging the world's wealthiest people to give the majority of their wealth to philanthropic initiatives. Prior to the pledge, you had intended to give the majority of your personal wealth after your death. However, this mindset was changed and your giving now follows a planned schedule. What was the cause of this change in mind set and what is your view of social investing (investing not just solely for profit, but with social objectives)? Do you believe there is a place for social investing or do you believe profit and philanthropy should be separated?

Question #16:

When my wife passed away in 2004, my plans for giving changed. I decided early on that my wife and I had everything that we needed, and that we would give all the excess back to society. Originally, 85% of my wealth was to go to five foundations. I recently decided to double the amount that I'm going to give to my children. I have also pledged that all of my shares of Berkshire Hathaway will be given to the foundations and must be spent within 10 years. I want the current management to make the decisions, who knows who will be in charge after 10 years. The young successful generation, people like Zuckerberg, have the ability to influence the younger generation to socially invest. I do not personally believe that investing and social causes mix. Most proposals that mix these two are confusing and blurry, and as a result, perform poorly as investments and businesses.

Question #17:

Mr. Buffett, can you comment on the recent March Madness bracket competition and the use of Berkshire's name on real-estate? Is this the start of the commercialization of the Berkshire name?

Question #17:

The \$1 Billion March Madness bracket is actually an insurance transaction. Quicken loans will give \$1 Billion over 5 years to anyone who gets a perfect bracket. Berkshire is insuring Quicken Loans against the prize. Berkshire has done similar deals in the past, for example with PepsiCo, which did a contest for someone to draw a certain number. Abnormal insurance transactions are something that Berkshire does. For example, Berkshire insured Alex Rodriguez when he went to the Texas Rangers. Berkshire insured the NCAA tournament once. Berkshire will listen to any insurance proposition and do a deal if it makes sense.

With respect to the question about real-estate branding, Berkshire Hathaway HomeServices Network has grown steadily over recent years into the second largest brokerage in the US. Some of Berkshire's holdings include Clayton Homes as well as the rights to the Prudential's real estate franchise name which was acquired two years ago. The recent branding to operate as Berkshire Hathaway HomeServices Network just makes sense and isn't a big branding push to try and use the Berkshire name more.

Question #18:

What is different about your strategy in the "Private" market?

Question #18:

Under today's conditions, there are lots of deals in the private market, people are buying from each other. There's lots of competition and pressure to buy now or return the money. Berkshire Hathaway only buys if a controlling family/shareholder wants to sell to us. They will come to me and say they want to sell their business to Berkshire Hathaway. They can probably get more money selling to someone else, but they know when I say I am going to buy a company, the deal will close under any circumstances; I won't change the deal on you. Whereas PE firms, after doing due diligence, will change the deal on you. They know when they sell to Berkshire Hathaway it will be a part of Berkshire Hathaway forever. Employees won't have to worry about what will happen the next day.

If you have a good business, why sell it? There however are circumstances that may force you to sell, like family issues or a deep recession. For instance, we bought Burlington because we were in a deep recession. We, Berkshire Hathaway, are the best game in town, except for price. We stick to the price that we give, if I say \$x, its \$x. We don't negotiate and this saves time.

This is an unofficial transcript of Warren Buffett's three-hour March 3, 2014 "Ask Warren" live appearance on CNBC's "Squawk Box."

BECKY QUICK: The ruble is at an all-time low versus the dollar. It fell drastically today, not only against the dollar but also the euro. So investors are sitting up and taking notice. The-- MICE index in Russia was under quite a bit of pressure as well. So-- the-- it may not be playing out by more than just 150 points right now in the U.S., but there are some major moves happening in markets around the globe as investors try to figure this out.

Again, perhaps no better investor to sit down and speak with today than Warren Buffett. We are here in Omaha because-- Berkshire Hathaway's annual letter-- Warren Buffett's annual letter to the shareholders went out on Saturday morning. And, Warren, we've spent some time digesting-- a large annual letter.

WARREN BUFFETT: I get paid by the word.

BECKY: Yeah. So-- a very hefty annual letter that gives people a lot to think about. As you do every year you laid out a lot about your thoughts about investing in general-- and taking a look at the markets. And I would ask you for your macro view on the markets. But in your letter you pointed out that you don't give much credence to people offering macro views.

BUFFETT: No. No, I-- I've been buying businesses and stocks for a lot of years, stocks for-- 71 years and businesses for almost as long. And-- I've never really made a decision based on macro factors. If I find a business I like-- I buy it. I mean, the first stock I bought was in the spring of 1942. And I will tell you, the macro factors were not looking good.

You know, we- were-- it—was right after Pearl Harbor and we were getting clobbered-- in the South Pacific. And-- the war did not look good. Now, I think almost every American thought we were gonna win the war, but when I bought my first stock I spent-- I went in 100%. I spent-- all of my \$120. I was not doing it based on headlines. I was doing it based on what I was getting for my money.

BECKY: But when you did that, when you bought into it, you say you don't look at macros. I can think of times from the past when you have looked at macro effects. When you looked back with stocks at a low you told Americans to buy stocks with both hands.

BUFFETT: Well, occasionally--

BECKY: Yeah.

BUFFETT: --stocks are just demonstratively cheap. I mean, really demonstratively cheap. And--I wrote an article in 1974-- or, I did an interview with Forbes—and in 2008 I wrote an article for The Times. And, I mean, there are occasionally when they're just ridiculously cheap. But-- most of the time they're good value.

BECKY: Uh-huh.

BUFFETT: But there have been a few times when I thought they were so cheap that I-- I should say something.

BECKY: You know, people have pointed out obviously stocks have come a long way since then. People have been analyzing your annual report and realizing that you didn't really say anything like you've said in years past where you said-- I-- one time a few years ago that stocks obviously were a much better value than gold.

This time, the excerpt that you-- put into Fortune a few days ago that people really focusing on had two examples that were both around real estate, 1) the farm that you bought here Nebraska. Another-- some real estate that you invested in just across the street from NYU, from New York University. And that has people speculating, do you think that real estate and other areas are better places for money than stocks right now?

BUFFETT: No, that's they're speculating wrong. I used those-- illustrations because I don't know that much about real estate or farms. And yet it was still possibly to successfully invest them. And--I feel the same way about people on stocks. If they you can have a great, long-- life-long experience in stocks and really not be a specialist in accounting or, you know, know all the ins and outs of capital structures and all of that sort of thing.

And-- I used-- I was just-- I was probably more ignorant of-- the realities of farming, the realities of that building in New York as most people are with stocks. And yet, it was perfectly possible to come to-- an intelligent decision that you could not lose money in those-- investments and that you were probably gonna make quite a bit of money.

BECKY: Yeah. I wondered that. Because there have been a lot of people recently who have raised questions about the stock market, who have worried that it is-- a fool's game to try to get involved. That it's-- the average investor can't get a fair shake. I've heard people like Bill O'Reilly say this very recently, that he doesn't trust the stock market and thinks it's rigged. What do you tell people?

BUFFETT: Well it isn't rigged at all. I mean, there have been occasions where given stocks were absolutely rigged. But-- but it's pretty hard to rig--\$20-plus trillion (LAUGH). And the-- people should forget about calling it the stock market, even. I mean, it's American business.

And-if for some reason you think American business over the next 50 years is likely to be way less productive than it has been in the past-- then you can come to a negative conclusion on it. But I--came to a conclusion on that farm that it was likely to produce a little bit more over the years and that the crops would bring a little bit more over time and I bought it on a 10% yield-basis to start with.

So when you're buying a productive asset you don't wanna-- categorize it by some name or-- and then read in the paper that this or that's gonna go up or down. You wanna look at the business.

If you bought the house next to you to rent to somebody you'd look at the rent you were gonna get, the taxes you were going to pay and-- what you thought the neighborhood would do over a long period of time. And then you'd measure that against the purchase price. The purchase price is all-important. And the stock market just offers you so many opportunities-- the thousands and thousands of different businesses.

You don't have to be an expert on every one of 'em. You don't have to be an expert on 10% of them, even. You just have to have some conviction that either a given company or a group of companies, and I would suggest for most people it should be a group of companies you have to have every conviction that those companies are likely to earn more money five or ten or 20 years from now than they're earning now. And that is not a difficult decision to come to.

BECKY: You also-- revealed something in the annual letter this year, where you said-- you laid out the terms of your will, what you've set aside for your wife. Which, I didn't know any of this.

BUFFETT: Yeah.

BECKY: And--

BUFFETT: Well, I didn't lay out my whole will. There's hope for some of you who haven't been mentioned yet. The-- but I did explain, because I laid out what I thought the average person who is not an expert on stocks should do.

And my widow will not be an expert on stocks. And- I wanna be sure she gets a decent result. She isn't gonna get a sensational result, you know? And since all my Berkshire shares are going-- to philanthropy-- the question becomes what does she do with the cash that's left to her?

And I've been-- part of it goes outright, part of it goes to a trustee. But I've told the trustee to put 90% of it in an S&P 500 index fund and 10% in short-term governments. And the reason for the 10% in short-term governments is that if there's a terrible period in the market and she's withdrawing 3% or 4% a year you take it out of that instead of selling stocks at the wrong time. She'll do fine with that. And anybody will do fine with that. It's low-cost, it's in a bunch of wonderful businesses and it takes care of itself.

BECKY: You've specifically said a Vanguard index--

BUFFETT: Yeah, right. Yeah, well it's-- a very, very low-cost index fund. And there are others. But there are others that aren't so low-cost. And keeping costs to a minimum is enormously important in investing, whether it's farms or buildings in New York, or-- but particularly in stocks. I mean, if you're in effect paying out 1% or 2% annually--

BECKY: Yeah.

BUFFETT: -- of your portfolio, that's a big, big tax-- that you don't have to pay.

BECKY: And people who are at home who are listening to this, they just need to look at the expense ratio.

BUFFETT: That's right.

BECKY: And you could probably get one for 20 to 25 basis points versus 100 to 200 basis points.

BUFFETT: That's right. I think Vanguard's actually a little under 20 basis points. And-- if all of the people that had owned Berkshire 40 years ago had never traded, every day they tried to open the stock and they just wouldn't have been there to trade it, their returns at aggregate would've been exactly our returns.

Now, if they traded around like crazy, they pay people to tell them to own it and everything, their returns would become our returns, less expenses. So it-- you should look for a very, very low-expense-- way of participating. And incidentally at-- at Berkshire-- our expenses are very, very low in relation to the-- 100-plus billion of investments that we have.

BECKY: We do have the opportunity for viewers to write in and ask you their questions. One viewer did write in-- (I'm sorry, I'm looking for the number right now) wrote in the question asking about why-- did you lay out that you had said you set this money aside for your wife to be put into a Vanguard index instead of put back into Berkshire shares.

BUFFETT: Yeah. Well-- Berkshire would be okay. But like I say, I'm giving away all the Berkshire shares. And Vanguard is fine. And-- Berkshire would be fine. But-- I wouldn't-wanna be touting Berkshire to people, generally. I have no problem touting the S&P 500 at a low cost.

BECKY: Let's talk a little bit about what you see in the economy right now. Because through your businesses you have an incredibly good idea about what's happening. You have, not only in the Big Five that are doing things, you have massive investments, you have retail operations. Just, in general, where do you think-- the American economy is headed right now?

BUFFETT: It's-- from what I see, and I do see figures on at least 80 companies or so. And I like to get 'em, and I get 'em fast. It-- exactly what's been going on ever since the fall of 2009 continues. I mean, we've had this moderate but consistent growth-- now for four and a half years. And every now and then we get excited about it speeding up and every now and then we start worrying about a double-dip and all that.

And you-- you've heard all this different commentary over the four and a half years. It's been remarkably consistent. And the GDP figures may bounce around a little bit. In terms of what we see I would say that it's been almost a straight line, but not at-- the kinda slope that people would like. But not flat either. And-- that's exactly what I see to this point.

BECKY: So were we overly optimistic in the fourth quarter and now we're overly pessimistic in the first quarter?

BUFFETT: Probably. We'll know for sure later on. But that's-- it's been that way in my-- we haven't gotten wildly optimistic. And we haven't gotten wildly pessimistic. But over that period you've seen the small waves of optimism and pessimism. And really they-- you know, it's just been pretty darn steady-- improving.

BECKY: How much has weather played a role in fact, I mean, the numbers we've gotten over the last two months have been pretty lousy.

BUFFETT: Yeah.

BECKY: But-- the market's been writing it off saying, "Don't worry about it. It's been bad weather around the country."

BUFFETT: It's a factor. I mean-- our railroad does not work as well when there's lots of snow and extreme cold. NetJet doesn't work as well-- in extreme cold. And-- those things compound on themselves. I mean, if it's terrible weather in one part of the-- country, you know, getting the planes to take care of the people there, it all just pyramids. So there's no question it's been some factor.

BECKY: Every time we bring up weather as an excuse, though, somebody will point out, "Yes. But if you look at housing numbers in the housing market in California, that's been slower, and it hasn't been in-- because of weather there." What do you tell people?

BUFFETT: Well, I can't tell you for sure. But we--have a couple of large real estate brokers--

BECKY: Right.

BUFFETT: --working in California. In fact, the largest one in the lower three counties. We just bought-- we're buying another one in San Jose. It-- it's okay. I mean, and-- the prices are-- the prices have really been quite strong. But you always in the winter have less activity in real estate. But-- we bought several real estate brokerage firms last year. We've already bought one this year and we'll keep buying 'em. I like the business.

BECKY: Okay. We're gonna continue this conversation with Warren Buffett. We have him for the next three hours. Joe, I'll send it back to you in the studio though because I know we have a break we have to get to too.

JOE: Yes, we do. Yeah. I have often thought about-- about Warren's will.

BUFFETT: How do you spell your name again, Joe?

JOE: I mean, saying that-- that-- that I think of you as a father figure, or actually calling you Dad is probably too much. But-- you know, in the past you've given me-- you gave me a couple of bottles of ketchup. You gave me a brick. You gave me a little card-- a NetJet card that was absolutely useless. It had no money on it. And I'm just thinkin'-- are you-- you're sort of--

BUFFETT: I've been--

JOE: --waitin' for the big surprise, aren't you? Is that-- am I gonna find my name-- am I gonna find my name in there, God forbid, when-- when--

BUFFETT: Absolutely. Absolutely.

BUFFETT: No, I've been testin' you, Joe. And-- and what you'll see in my will, and-- it'll say, "To Joe, who wanted to be mentioned in my will, hi, Joe."

JOE: You know, Dad, that would be enough for me. I'd just like to say that. That would-- I'm not looking for anything else. And-- that would be good.

BUFFETT: I'm gonna make that one the record.

JOE: Okay. [You're on Page Six](#) (of *The New York Post*) today. I think maybe I'll talk about that a little bit later since-- I use my-- my will--

BECKY: Uh oh.

JOE: Yeah, he's on Page Six.

BUFFETT: Uh oh.

JOE: He's on Page Six. He's-- you know, he's liable to do anything at any time. So-- it's all in the gossip column. And--so let's save that for later. Coming up--

BECKY: There's a good tease.

JOE: Yep. Yep.

BUFFETT: Yeah.

JOE: Coming up, a special-- Ask Warren edition. I've just asked him to include me in his will. The Executive Edge and taking a look at the future. What would it matter, really? With all-- I mean, \$60 billion, would it-- really? Is it that big a deal? Anyway, Squawk Box with Warren Buffett will return-- in just a moment.

BECKY: Welcome back everybody. Right now it is time for The Executive Edge. This is a special edition of The Executive Edge. This is the Ask Warren edition. We are joined this morning by legendary investor Warren Buffett. And he is answering some of your questions.

Warren, we got a lot of questions that came in from people. I'd like to focus on some that take a look right now at-- Berkshire and some of the things you pointed out in the letter. One came in from Ron Rogers in Ridgewood, New Jersey. And he says that in the Fall of 2013 news came out that you were ever so close to a major, multi-billion dollar acquisition of what would've been another elephant. I assume you would not disclose the name of the acquisition target, but would you tell us what industry group it's in?

BUFFETT: Yeah, I'm-- I better not even say what industry it was in. But incidentally-- because there aren't that many companies in the industry. And-by the size of it you could probably know down to two or three companies. It didn't happen.

But there's-- you're always seeing the leaves rustling, if-- nothing else. I mean, then-- then there's gotta be something behind those leaves. We will-- we have nothing real hot at the moment, but-- we have things we're working on.

BECKY: Yeah. You-- said also on the annual shareholder-- in the-- in the annual letter to shareholders that-- when it comes to taking a look at what happened with Heinz that this is a template for things--

BUFFETT: Right.

BECKY: --that Berkshire might do in the future. Have—you spoken with 3G about doing another type of acquisition like a Heinz?

BUFFETT: Well, we-- we've talked about generally-- yeah, so it-- we--don't have a name.

BECKY: Uh-huh

BUFFETT: But both George Palo Lemon, who was my partner in that, and I would love to do another one. And-- they have an appetite for-- making acquisitions. And they have an appetite for making big acquisitions. And--

BECKY: And so do you.

BUFFETT: And-- - yeah. And-- we're a good pair that way. And-- and-- and-- they also do the work and we do the financing. And that's-- an arrangement that I can get used to. So I-- everything that's happened with Heinz-- in terms of negotiating the contract, coming up with the buy whatever it may be, every experience has been 100% satisfactory. So I really look forward to doing something further with them. And I think we will.

BECKY: You--talked a little bit about the Heinz acquisition in the letter, but how are things going so far?

BUFFETT: Well, things are going very well. But the Bernardo-- Hees took over in June. He-- he's done everything logically that we're on the zero-base budgeting. As I put in the report, I--would expect the earnings of Heinz to be significantly better this year than any year in history.

BECKY: You-- pointed out that you're not somebody-- the difference between this and a private equity deal is that Berkshire plans on holding this for a long, long time.

BUFFETT: Forever. Yeah.

BECKY: Forever. Would you be surprised, though, to see a Heinz IPO sometime in the next five to seven years?

BUFFETT: Yeah, it could happen. Because-- the 3G people, they did that with Burger King. And--they have a number of investors. I don't know how many. The primary investors I know. But they-- no, but I just don't know the number. But the-- some of those people, undoubtedly will wanna get out.

And if the figures get good, as I would assume they would-- they might have a chance to get out with a significant profit. And-- when they do, we have no obligation to-- 'cause they have no obligation to sell the shares to us. And we, so it would be totally voluntary on their part. But-- if they were going to sell those shares and I found the price acceptable, I'd certainly offer to buy the shares from them. I--

BECKY: Because right now you're equal partners.

BUFFETT: Yeah. We're equal partners. And we'd be equal partners even if the number of shares were somewhat different. Psychologically we are equal partners, even if the -- share count isn't equal. But I would like-- I would like, over time, to increase it. Sure. It's our kinda business.

It's forever. It's will-- it will be a profitable business. It should-- it-- it'll be a worldwide business, and it is a worldwide business. And it just fits into Berkshire. And our problem is putting money to work. So we're not looking to take money out of things. We're looking to put more money to work.

BECKY: But did it create a problem to have the guys who are still on the board at Burger King selling ketchup to places like McDonald's?

BECKY: No. McDonald's sells itself. I'll put it that way. I'm not sure the customer felt that way. But-certain of the franchisees, as I understand it-- sort of objected to the fact that the guy across the street who was selling-- hamburgers against them also was CEO and come from Burger King. He had been the CEO of Burger King. And I-believe he's still vice chairman. And-- certain franchisees of McDonald's were not happy about that.

BECKY: That's a big account though, correct?

BUFFETT: It's a big account. But- Berkshire's gonna have a lot of crossed lines as we get larger. There will be times when-- that-- the actions of one subsidiary irritate the competitors of another subsidiary. So you got-- that's just gonna happen.

BECKY: All right. We're gonna continue this conversation. Let's get back to Joe in the studio right now though.

JOE: All right-- Becky. A big night in Hollywood. One of the big winners last night-- at the Academy Awards. 12 Years a Slave won best picture. The movie also picked up award for Best Adapted Screenplay and Supporting Actress. But it was Gravity that took home the most statues-- seven in all-- including Best Director.

And it-- it's in reference to this, Warren, that-- that you're in Page Six. And I'll just let you know that your story is in between a big-- a picture of Kim Kardashian-- in a low-cut dress where the thing says she's got her own version of the Golden Globes (this is, you know, The New York Post) and then-- this is ridicu-- and then on the right-- is a picture of Branjolina. Brad and Angie. And then you're in the middle. And-- it says--

BUFFETT: They probab--

JOE: But-- yeah, go ahead.

BUFFETT: They probably asked for that placement, Joe.

JOE: Yeah. Yeah, they asked for that placement. And it says that-- that Harvey Weinstein invited you-- to his pre-Oscars party but-- you were kinda snippy back to him and you said-- you really appreciate it but you weren't gonna go to the Oscars this year since you weren't nominated. So you were gonna stay home. And--

BUFFETT: I'm a sore loser.

JOE: You are. You-- and then I looked up-- I looked you up on IMDB to see what-- and it this classic-- this movie database, "Warren Buffett was born on August 30th, 1930 in Omaha as Warren Edward Buffett. He is an actor known for Wall Street, money n--" it says this right here. "You are an actor known for Wall Street, Money Never Sleeps, and then Das-something. Some g-- German thing." But-- and then it's got all your appearances. And it does include Squawk Box as some of your-- (LAUGH) some of your best-- appearances. What kind of--

BUFFETT: I put it right at the top, always.

JOE: You have been offered roles, haven't you? I'm sure constantly. And you turn 'em down? It's just not the right-- the right role for you? Or?

BUFFETT: Actually, I may have a small one under-- consideration right now. But I am-- I have told my agent to feature the Squawk Box appearances as tops on my resume. That that is most likely to get attention in Hollywood.

JOE: Yes. But I'm trying to think. You could-- you could be different things. If you really wanted to be, you could break out a character. You could be, like, a Bond villain and I mean, you would think about it at-- at this point. I mean, it's not your forte. But, I mean, I'm sure you get a lot of offers. You would've been on Breaking Bad--

BUFFETT: Joe, I'm thinking more glamour roles, actually. That may be why they haven't stepped up yet.

JOE: Leading man. Leading man.

BUFFETT: I could probably get a lot of those villain roles.

JOE: Leading man-type yeah, fr-- leading man-type roles. That's an idea too. That's an idea too. All right. Coming up, we're gonna-- we'll be back with Warren and Buffett-- jeeze, with Warren and Becky. With Warren and Buffett-- in a minute. But first, the news from Ukraine this morning, a big impact-- having on the market. We'll have more questions-- for Mr. Buffett, think about more movie roles for him-- when Squawk Box is right back.

JOE: And the markets, obviously watching all the developments coming out of Ukraine this morning. Russian president Vladimir Putin sending forces into the Crimea region, in his words,

to protect Russian citizens. Western leaders almost universally condemning the actions and-- vowing to use economic and diplomatic measures to pressure Russia to withdraw.

The weekend events putting pressure on the global markets as well. The futures are down sharply this morning. European markets are also-- taking a hit. There's where we're down over 150 now on the-- the DOW. There are the European markets-- down across the board.

Russian markets are also lower-- at this hour-- as you can see down-- that's a significant number there, 12%. And-- so the dollar. Take a quick look, you can see against the yen, the euro-- especially the Russian rubel which hit a new all-time low. Gold has been in a little mini bull market on its own. And it's up another \$23. You can see that-- just-- since-- the December lows. It's quite a move. Let's get back-- to Becky and Warren Buffett in Omaha. Becky-- you got the-- the oracle there. I guess-- the Ukraine is front and center.

BECKY: That's right. Now, Warren talked a little bit earlier about how difficult it is to try and look at some of these broader things and figure out what it's going to mean for the markets. But, Warren, you wouldn't be selling anything today based on this.

BUFFETT: No. I—if stocks are cheaper I'll be b-- more likely to be buying 'em. I we were-- we were buying, I think, one stock on Friday. And-- presumably selling lower today. And that's terrific.

BECKY: Was it Wells Fargo?

BUFFETT: Good try.

BECKY: I thought I'd give it a try. In fact, a lot of the questions that have come in from viewers and from Berkshire shareholders too have been related to your investments. And you did detail quite a bit of your big holdings and what you thought about some of these. But let me give you some of the questions that have come in.

Frank Ronnie-- writes in, "You've held Coca Cola, Wells Fargo and American Express for 20-plus years. If you didn't sell those stakes down during the great bubble of the late-90s or during the last financial crisis, is it fair to say that you will never sell these stocks? And can you envision a scenario that would actually make you sell any of these positions?"

BUFFETT: It's fair to say that-- it's very unlikely that we would sell 'em in any given year. Probably any given five-year period. But-- we need money to buy operating businesses. We could sell any one of those stocks, or maybe-- a group of them. Our preference at Berkshire is to keep buying operating-- big operating businesses.

And-- we like owning equities. We'll make money in the equities as an alternative. But in terms of building Berkshire for the long-term, we just like adding our earning power-- big chunks of earning power from operating businesses, which we are going to keep forever. So none of the stocks are forever. But they're for-- generally for very long terms.

BECKY: There have been a lot of questions that have come in regarding IBM. Let me go to one from Hong Kong. A gentleman named Rojesh Padjwani who writes that, "IBM has underperformed the S&P 500 by a big margin since you acquired a stake in it. While you've clearly mentioned in an earlier interview that you'd prefer that share price does not do so well so the company can buy back more of its share at a lower price, has the company's financial performance, especially revenue trend, disappointed you? And do you feel that you made a rare mistake by stepping outside of your circle of confidence?"

BUFFETT: Well, the revenue trends have-- been less than-- anticipated. Although not dramatically less than anticipated. The financial numbers have been pretty good, but it's been helped by low tax rates and things of that sort. There is a transition going on in the business-- you know, particularly in-- in terms of the cloud.

And-- so I would say it's fair-- it's fair to say that I know less about the future of IBM than I might know about the future of Wells Fargo or-- Coca Cola or the businesses we own. I think I do know enough about it that I feel good about owning the stock. But-- -- my level of understanding of a company like IBM is not as high as my level of understanding of a Wells Fargo or a Coke.

In terms of the price action, that doesn't make any difference to me. That-- if-- IBM bought in a lot of stock last year. And if the stock had been even lower they would've bought-- they would've gotten more shares. So the fewer the shares outstanding the better I-- the better I like it. And they've continued to buy in shares. They buy 'em at a good clip, and I-- I like that. But I would like to see the revenues pick up.

BECKY: What do you think of the job (IBM CEO) Ginni Rometty is doing?

BUFFETT: Well, I think she got handed the company at the time of a real transition-- in the-- in the business. And--her record-- I feel fine with her at this point. I-- but her record will be judged, you know, five years from now. There's a lot going on in that business. And-- I think they're doing well. But--the final score will be five years or ten years from now.

BECKY: Are you buying more shares?

BUFFETT: We bought a few more shares last year. Not-- not very many. And-- I think we bought a few shares this year.

BECKY: Okay. Let me also ask you a question that came in. This is number 32, folks. It's Dan Youngberg who writes in, "Are you still as positive on rails? Which besides yours is good?" Meaning which besides Burlington Northern is good? "And what about the rail car companies?"

BUFFETT: Yeah. Well, there's four big railroads in the United States. And Kansas City Southern's another significant railroad. And two in the East, two in the West. And-- the rail business, over time, will be a very decent business. It's an enormous asset to the country.

And there won't be more-- yes, there may be more-- there could be some high-speed passenger and all that sort of thing railroad. But in terms of basic, freight railroads-- you've got the configuration in this country that's going to exist for a long time. And rail does move goods-- heavy goods very cheaply over long distances. And-- it's also in-- environmental-- environmentally friendly compared to-- highway traffic. So the future of railroads is very good.

BECKY: Also--

BUFFETT: And I would say that that's true of all the four railroads. And--

BECKY: A question came in from someone named Curtis Carter. He says, "Do you have any plans to use Burlington Northern and Santa Fe right of way for mid-America energy to move electricity East to West? And are you considering electrifying the railroads?"

BUFFETT: Well, the answer to both is no.

BECKY: Okay. That's a question that I've heard from others before, so I--

BUFFETT: Yeah. Yeah.

BECKY: --kinda wondered about it.

BUFFETT: If anybody can figure out a way we can make a lot of money off the right of way that we haven't thought about I'd love to hear of it. But that isn't the way.

BECKY: In terms of how the railroad is doing though, you did take some time to really lay it out. The railroad-- has-- Burlington Northern has really benefitted from the shale boom that we've seen-- in parts of the country.

BUFFETT: It's benefitted. And-- -- but all of the rails have done well recently. And, in fact, the Union Pacific, which is our direct competitor, has been-- has done very well. So it-- it's a business that-- has real economic advantages if you-- if you look at fuel costs, if you look at a driver's wages and on the highway. And-- as long as more goods move from place to place in this country rails are gonna get their share. And-- it should be good-- it should be a very profitable business.

BECKY: What about the Keystone Pipeline? That that question was raised several times by shareholders. And by--

BUFFETT: Well, I think that--

BECKY: --others who say, "Wait a second, do you really want the Keystone Pipeline to come? Because it's a direct contrib-- co-- a direct competitor to what would happen with Burlington--"

BUFFETT: It's not that big a competitor. It's moving—it would be moving-- crude down from Canada. And that-- no, I think probably the Keystone Pipeline's a good idea for the country.

BECKY: Do you expect that the president might actually pass it sometime?

BUFFETT: I have no idea.

BECKY: I had seen a study recently that came out from the State Department that suggested that if the Keystone Pipeline were put in it would end up saving lives, versus moving that oil via the railroad. I think it's something like six lives a year.

BUFFETT: Yeah. Well--

BECKY: Like, in--

BUFFETT: --both sides are gonna come up with that, certainly. They're--

BECKY: But that was from the State Department. It wasn't from--

BUFFETT: Yeah.

BECKY: --the key--

BUFFETT: Oh, yeah. Well, and they may well be right. There are leaks on pipelines. And, you know, occasional explosion, but that's very, very, very, very rare. But if you measure moving millions of barrels for a hundred years-- one versus the other, I-- I'm not sure how it would come out.

And it would-- and it depends on what's going on. They're gonna change rail cars, obviously. It is-- the-- particularly the oil from the Bakken and from the Eagle Ford as well-- has turned out to be more volatile than people anticipated. And that's going to require-- for one thing, we've lowered the speeds, you know-- in-- in that area. But it's gonna re-- it's-- it's gonna require the kinda tank car too.

BECKY: Yeah. Burlington just said that it was buying 5,000 new tank cars--

BUFFETT: Yeah.

BECKY: --that are higher--

BUFFETT: They're on the shelf there to go. They're an order. So it takes-- it takes time. We're-- with a different company, Marmon, we're in the tank car manufacturing business. And-- and there will be changes made. And there should be changes made.

And it's fair to say that we've found, in the last year or so, that it's more dangerous to move certain types of crude, certainly, than was thought previously. And, you know, that's-- there's no question about it. There's no question about it.

BECKY: You know-- a lot of the rail tank car companies rose on the announcement that Burlington Northern was going to be in the market for buying more of these things. Will they be buying them from mar-- from Marmon? Or are they gonna outsource that--

BUFFETT: They-- buy 'em from--

BECKY: --and buy them from wherever?

BUFFETT: --well, they-- yeah. But the problem with buying 'em is that there's a big backlog at not only Marmon's tank car subsidiary but Trinity and others that make-- make cars. So-- our backlog runs into the middle of 2015. Those aren't-- those aren't all for crude oil tank cars. Most tank cars don't carry crude oil.

BECKY: Right.

BUFFETT: When you see-- a train with a lot of tank cars on it, most of that is not crude oil. But some of it is. And more of it's-- has been in-- in recent years. So you can't just flip a switch and get 5,000 cars. There will be retrofitting that takes place, I'm sure.

BECKY: Right.

BUFFETT: And-- that's-- my guess is some of that will get moved to the-- to the front of the line because it-- there-- it's more important to get it done immediately. But-- but the tank car problem is a problem. And it should be addressed. It's being addressed. But you can't change the whole tank car fleet overnight.

BECKY: All right, we're gonna continue this conversation with Warren. Joe, we'll send it back to you right now.

JOE: Becky, is Buffett a Creighton fan? Hoops? Do you know? 'Cause they're in Omaha.

BUFFETT: You

BECKY: I don't know. I don't know.

BUFFETT: You bet. I'm-- I-- and there's a game against-- Providence next-- fri-- it's-- Saturday. It's our final game. I'm gonna be there to watch McDermott score about 60 points.

JOE: Oh, yeah? Yeah. Well, I-- because I guess you missed what happened over the weekend against my-- Xavier--

BUFFETT: Oh. Oh, no. Oh, no, let's not hear about that. No, don't tell me.

JOE: Number nine—

JOE: Number nine? I hope-- not any-- not any longer, my friend. It's tough to go into--

BUFFETT: I know. I know.

JOE: It's tough to go into Cintas Center. That was fun to watch. Anyway, I figured you were-- a hoops-- yeah, they're-- two good Jesuit schools, right, against each other? I like that.

BUFFETT: You bet.

JOE: All-- all right.

BUFFETT: You bet. We had-- we had-- we had-- we had a Cinderella team back in 1942 when I was a kid. And I've been waiting for a return.

JOE: Wow. I don't even remember that. All right-- coming up-- Apple and Microsoft in this-- in the news this morning. The futures-- are right now down less. I saw about 150, again, not quite as bad now. Now down 146. But more Squawk Box-- with Warren Buffett next.

BECKY: All right, Joe, we're going to continue our questions for Warren Buffett this morning. Again we've been taking questions from viewers. We've getting more this morning that have been coming in, but one of the things that happened over the last several months, Warren is there was a story out that suggested that the committee that looks at systemically important financial institutions said that it was considering Berkshire.

Now, again this was a story that was just kind of lightly sourced that went through. I wonder, first of all, if you've heard from them. And second of all, there's a question that came in from William Andersen in Salem, Oregon who said that, "Given Berkshire's policy to maintain a large surplus of capital, would Berkshire being declared too big to fail concern you? And would the increased regulation that could come with that designation be worth it to Berkshire to speed up the unwinding of the derivatives to below the threshold so that it would not be given that designation?"

BUFFETT: Yeah, our-- we've heard absolutely nothing from the people in charge of what's called sify. And our lawyers, I've checked that. And I would not think we would be under--our derivatives as a-- well, A) they're winding down to begin with.

But in nominal value, they're well, let's see Deutsche Bank has \$60 trillion, so they're less than 1/10 of one percent of Deutsche Bank for example. And we have loads of liquidity. We have all these different streams of earning power. I think it's very unlikely.

BECKY: Those derivatives will wind down I think on average around 2020? Isn't that--

BUFFETT: Well the equity parts do. The credit ones all did wind down and we have very minor collateral requirements. We have no condition--we never have any significant short-term debt. We always have bundles of cash. We always have cash coming in every month.

It would seem very unlikely that we get categorized. We're large, but Exxon/Mobil's large. Apple is large. I mean, there's other large companies. It's not based on size. It's based on whether you're likely to get into trouble.

BECKY: All right, let's continue this focus on Washington. The president is coming out with his budget tomorrow, President Obama, and the early read that we've gotten on this is that it is going to be one that is maybe a little less inviting to Republicans, that he feels like he's already made his outreaches in the past, and that they haven't been effective. What do you think that does to the environment in Washington?

BUFFETT: Well, it's hard to imagine the environment getting much worse. As, you know, it's more or less a stalemate, in Washington, because there's a little loosening up, perhaps, but you have a significant portion of the Republican party that can hold the entire Republican party hostage, and that the Republican party can hold the legislative process hostage. So unless there's a real change in attitudes it's hard to see much happening.

BECKY: We did have a lot of questions that came in on the political front. One of the ones that came in under the ask Warren-- Twitter hashtag, was, "Warren, I know that you are concerned about the wealth gap. Are you supportive of raising the minimum wage, and tying it to inflation?"

BUFFETT: You're talking about the minimum wage for 60 years-- I used to work for minimum wage. That got my attention first when I was getting 75 cents an hour in pennies, but I-- it really cuts both ways. I mean, it-- you'd like to have people being paid more, but you also want to have as many people employed as possible. So that one cuts both ways. And I can argue either side of that.

I think the one thing that does make sense is to increase the earned income tax credit. I mean, that does increase the income of people who are working, and there's no question that the market system, which is the greatest system ever seen for producing lots of goods and services, also leaves more and more people behind as it gets more and more specialized. And we've seen that, and that's something that a very rich country should address. But I think the earned income tax credit is the better way.

BECKY: Meaning that you'd rather—and when I've asked people like Peter Orszag that question, he'd say, he'd like to see both of these things, the earned income tax credit, and a higher minimum wage.

BUFFETT: I wouldn't fight him on it-- on the minimum wage, but I think you can accomplish way more through the earned income tax credit without negative effects than the minimum wage. I mean, if you could have a minimum wage of \$15 and it didn't hurt anything else, I would love it. But clearly that isn't the case. So there's tradeoffs on the minimum wage, and it's very hard to quantify those tradeoffs. People come out with these exact studies. They don't know.

BECKY: No, but the CBO recently came out with a study that suggested half a million jobs would be lost, 500,000, if the government were to go to \$10.10 an hour by the year 2016. They said that it could be either zero or it could be a million jobs that were lost. Where do you think the likely falls?

BUFFETT: I agree with them. They don't know. I don't know. You know directionally that it goes-- the situation. Otherwise, you know, we'd have a \$15 minimum wage if it wasn't going to affect employment, I'd be 100% for it. But, it would. So I don't know and it's very hard to quantify the tradeoffs. And usually you just get proponents of either side just pulling out the figures to substantiate their position.

The earned income tax credit I think is much clearer. I mean that puts more money in the pockets of people who are working for low wages. And that's what I'd like to see. And it doesn't distort the market system in any great way. But, you know, that's the way I would go.

BECKY: And Berkshire employs, what, 330,000 employees?

BUFFETT: About 330,000.

BECKY: How many of them make minimum wage?

BUFFETT: Very, very few. I mean, I can't give you the answer, but it'd be very, very few.

BECKY: Okay, let's ask a related question that comes in from Ian M. on Twitter. He says, "If you were advising Obama on economic policy, what's the greatest thing his administration could do right now to accelerate job growth?"

BUFFETT: Well, I think that obviously further fiscal stimulus would increase job growth but you pay a price for that. I think the market system will grow jobs over time, as it has been the last four years. It's just that we had such a shock to the system five years ago, and we really were in the emergency room. And the recovery has been slow. And I think most people expected that, but they're still disappointed with it as it happens.

BECKY: You know, we had Sam Zell on "Squawk Box" on Friday, and he came up with a really interesting analogy. He almost put some of the blame on the Federal Reserve at this point saying that when you have zero interest rates it's like not having a shot clock in a basketball game. That there's no severe incentive to get that money into investments at this point, that people think they have a lot of time.

BUFFETT: Well, I would disagree with that. I mean, if I've got money at zero interest rates, I want to get it out. And I'm looking for projects all the time, and we just in plant and equipment, we invested over \$11 billion last year. That was a record for us. But I-- any project that comes to

me that has a reasonable payout, whether it's wind farms in Iowa or whatever it may be you know, I love building more freight cars-- whatever it may be.

And zero interest rates really pushes me. I mean, if interest rates were 15%, you know, I would be sitting here with a 15% alternative and it would be much tougher for capital projects to catch my eye. So I would argue just the reverse.

BECKY: Let me ask you one more on the political front. Stan Duzy writes in. He says, "How do you compare the President of the United States' performance with Brian Moynihan's performance over the last five years?" Obviously you own a big stake in Bank of America that Brian Moynihan runs.

BUFFETT: The U.S. of America and Bank of America. They both have very, very tough jobs, and they both settled down to do them. And you do things one thing at a time. And Brian Moynihan took something that was a big, big mess which he inherited and—the size was almost overwhelming. And he just methodically has worked on one problem after another. And-- but he did not have to get the United States congress to agree with him.

BECKY: We're going to continue this conversation-- again, Warren Buffett is with us for the remainder for the show. Joe, right now, though, we'll send it back over to you.

JOE: See, I'd be out there dreaming about Warren Buffett coming back to me. I don't know if I can kiss up --

BECKY: And work your way back in there again, aren't you.

JOE: I mean, we started talking about the will. When you start talking about the will again, that's all I can think about now. Take it away, Beck.

BECKY: If you're wondering--

BUFFETT: I've got it in there now. It says to Joe Kernan who wanted to be mentioned in my will, "Hi, Joe."

BECKY: There you are. Hey, Joe Kernan. And he did ask how to spell it, too, to make sure he gets it spelled the right way. But speaking of, if you're just wondering how big those numbers actually are that he'd be talking about, the Forbes 2014 world billionaires list is out.

And if you want to take a look at it this morning, we happen to have one of the gentlemen who is on that top of the list who's there. Bill Gates comes in at number one, with \$76 billion. Carlos Slim has \$72 billion. Amancio Ortega comes in at \$64 billion and Warren Buffett, number four, at \$58.2 billion. Warren, we were talking about it, how much have you given away over the last several years?

BUFFETT: Well, I gave away about 160,000 A shares, so--

BECKY: Which would be?

BUFFETT: Yeah, \$16 billion--

BECKY: You're better at math than I am.

BUFFETT: \$27 billion or so.

BECKY: \$27 billion. So even after that, you still have \$58.2 billion on the list. You're number four. Here's the list. We have it right here.

BUFFETT: Don't take it too seriously.

BECKY: I want to ask some questions that have continued to come in from viewers. Part of what you talk about every year in the annual report, or the annual letter is you lay out how each of the insurance companies have done. You lay out how each of the businesses have done. Someone named LatticeWork with M and G-- writes in and says, "How has the latest rise of extreme weather events changed the calculus faced by Ajit Jain in reinsurance?" And I know you talk to Ajit just about every day.

BUFFETT: Yeah, it's interesting. I think the public has the impression that because there's been so much talk about climate that events of the last ten years from an insurance standpoint in climate have been unusual. The answer is they haven't.

I mean, we-- you read about these events, but you were reading about events 30 or 40 or 50 years ago. And we've been remarkably free of hurricanes in the United States in the last five years. So if you were writing hurricane insurance, it's been all profit. There have been more -- some more tornadoes than normal, but it's not had any effect in terms, so far-- the effects of climate change if any have not affected our-- they have not affected the insurance market.

BECKY: They haven't. So that's not something at all that you guys have changed your calculus on --

BUFFETT: I have made no difference. I calculate the probabilities in terms of catastrophes no differently than a few years ago.

JOE: Hey Warren and--

BUFFETT: That may change in ten years.

JOE: I think it's been three thousand days since it something like a category two hit landfall. That's the longest in history for a hurricane. And you mentioned tornadoes. Last year it was actually well below. I don't know about if you add up all the recent years, but, I watched you after, you know, Al Gore's big year it was a horrible year, but the one that he said we're going to have-- that's going to be repeated year after year, the one where he had-- we went

through the whole Greek alphabet and started again, with hurricanes. I watched you, you knew. You knew. you knew, you knew, you knew. And you knew that that was going to be an opportunity to raise premiums, and then not really have any events over the -- and it played out, exactly like you thought. I don't know how you do it.

BUFFETT: Well I love the apocalyptic predictions on it, because-- you're right, it probably does affect rates. And the truth is that writing U.S. hurricane insurance has been very profitable in the last five or six years. Now the rates have come down very significantly, so, we aren't writing much-- if anything in the U.S. Our biggest single cat risk would be earthquakes in New Zealand.

JOE: And yeah, but what do you think of the perception right now, I mean it's-- I think it's from the mainstream media, but we are under the impression that adverse weather events are happening every couple a days, and that it's never been like this before in history. For some reason that's what people tell me.

And it's, you know, it's nice to be able to include them all into one thing, you know, when you include droughts, floods, too much snow, too little snow. When you can include it all into one big thing, it makes it look, you know, like you're pretty smart.

BUFFETT: It hasn't been true so far, Joe.

JOE: Yeah. All right. Well thank you --

BUFFETT: and you know, yeah.

JOE: I know, I know.

BUFFETT: We always think it's cold. But it was cold all about 50 years ago.

BECKY: Let me ask you --

JOE: The only thing that is weird is that the Great Lakes have-- I think they're almost totally frozen over. I don't know if we've ever seen that. I think we got one more to go, or something. So that's a little weird.

BUFFETT: Yeah.

JOE: Yeah, all right.

BUFFETT: Well, we don't insure against that.

BECKY: You know, Jim Cramer's been watching this morning as well, Warren, and he writes in a question too He says that in your shareholders letter, you always speak so positively about fabulous ways to transport goods. Do you think that keystone should be approved? I know we

talked a little bit about this earlier, but I didn't really put you on the line. Do you think Keystone should be approved?

BUFFETT: I'd vote yes.

BECKY: You would vote yes for the Keystone.

BUFFETT: Yeah.

BECKY: He always wonders about creation of jobs, too, so energy and job creation is really-- pipelines and energy renaissance is what Jim's pointing out.

BUFFETT: Well, yeah, but I don't believe in the Keystone pipeline because of the jobs you make building it. I mean, you could build anything and create jobs. But I believe that-- I just believe it's a useful pipeline.

BECKY: You do? Okay. Great. We're going to continue this conversation. Again, Joe, we've got Warren Buffett here. He's with us for the rest of the program.

BECKY: Well, Joe, I can't think of a better day to have Warren Buffett sitting right next to us. Warren Buffet, the Chairman and CEO of Berkshire Hathaway, to talk about what's happening. And Warren, I know you are a long term investor, but when people wake up and look at the futures, and see down 150 because of what's happening in Ukraine, and questions about the economy, I suppose, at this point, and whether what happens there spreads here, what do you tell them?

BUFFETT: Well, I tell them that when I got up this morning, I actually looked at a stock on the computer in the trades in London that we're buying and it's down and I felt good.

BECKY: What was the stock?

BUFFETT: It was an English stock.

BECKY: So you look at this, I mean would you have done that anyway, whether or not the futures were down? Would you still be buying?

BUFFETT: Well, I had a price limit on it and we were buying it on Friday, but it's cheaper this morning and that's good news.

BECKY: So you buy more.

BUFFETT: Absolutely.

BECKY: When people start to think, "Wow, this could be the beginning of something really bad, it could be even a World War III situation, it could be a return to the Cold War," does any of that ever go through your mind?

BUFFETT: Well, if you tell me all of that is going to happen, I will still be buying the stock. You're going to invest your money in something over time. The one thing you could be quite sure of is if we went into some very major war, the value of money would go down.

I mean, that's happened in virtually every war that I'm aware of. So the last thing you'd want to do is hold money during a war. And you might want own a farm. You might want to own an apartment house. You might want to own securities. But, I mean during World War II you know, the stock market advanced and stock markets advance over time.

American businesses are going to be worth more money. Dollars are going to be worth less so that money won't buy you quite as much. But you're going to be a lot better off owning productive assets over the next 50 years than you will be owning pieces of paper or I might throw in bitcoins.

BECKY: You know, I've been meaning to ask you your opinion about bitcoin. What do you think of it?

BUFFETT: It's not a currency. I mean, you know, it does not meet the test of a currency. I wouldn't be surprised if it's not around in ten or 20 years.

BECKY: Why does it not meet the definition of a currency?

BUFFETT: Well, because-- people say, "Well, I'll sell you goods in bitcoins." But they change the price of those every time the price of the dollar changes in relation to bitcoins. They're pricing off the dollar. They could say, "Well, I'll sell it to you in barrels of oil." But if every time the price of oil changes they change the number of barrels you have to have, that's not-- your oil is not the currency.

BECKY: Yeah, but the yuan does that, too. And people still look at that as a potential currency.

BUFFETT: Which one?

BECKY: The yuan, the Chinese yuan.

BUFFETT: Well, yeah, well it is a currency. But it is not a durable means of exchange. It's not a storer of value.

BECKY: And you said yourself you wouldn't be surprised if it's not around in ten years?

BUFFETT: I would not be surprised. I don't know that, but it's interesting to me. I mean, it's been a very speculative, you know, kind of Buck Rogers type thing and people buy and sell them because they hope they go up or down just like they did with tulip bulbs a long time ago.

BECKY: Well the situation in the Ukraine you have said you're not that worried about. But in the letter to shareholders, you did lay out something that's been on the horizon that you are concerned about and that's what's happening with pension funds, the promises that have been made. Question came in from the Disher, saying, "What impact will unfunded government pension and benefits have on economic health in ten to 20 years?"

BUFFETT: Well, the government pensions aren't the problem. The private pensions are. The government has the power to tax. And it has the power to print money. We are not in a dangerous U.S. fiscal situation. We at some-- we have to quit having our debt grow as a percentage of GDP. It made sense to have it happen during-- when things were terrible five years ago.

But we can have a deficit which creates more debt, but not at a rate that is-- grows faster than the GDP grows. So if GDP is going to grow at two percent. In real terms, but the Fed has a policy that is sort of shooting for two percent inflation on top of that. That would mean, like, four percent in terms of nominal GDP. And you literally could have debt grow at four percent and it would maintain the same relationship to nominal GDP as it does now.

We are not in-- the trend is wrong. There is a danger if that goes on, although a lot of countries have gone far beyond where we've gone. But I don't like seeing it go up as a percentage of GDP. But this country is in wonderful shape.

BECKY: If you say that government pensions aren't the problem because the government has the power to tax, what do you say to somebody who has a private pension? Should they be worried about it? Should they think that they're still going to get it when they retire?

BUFFETT: Well, if they've got a private pension from corporations, it's protected by the pension benefit guarantee corp.

BECKY: Guarantee, right.

BUFFETT: And that has come into play in many pension plans. But the state municipal pension plans-- well, the one right here in Omaha is in terrible shape and almost got a lot of resources and it's a healthy community and all that

I mean, we can work our way out of it, but people, both who have made the promises and the elected general-- generally have not understood what they were doing when they were making pension promises. And there's a long tail to the problem so it doesn't catch up for a while.

But it's inextricable over time, and we are starting to reap the problems that were sowed decades ago in pension plans. And you're going to be reading a lot more about them. Of course in Detroit, they're going to have to scale back the promises.

BECKY: What do you think about the decision in Detroit where at this point it looks like everyone's going to take a haircut. But the bondholders are going to take a much bigger haircut. In fact that prompted a question from Gary Gambino who writes in, "Are muni bonds safe given your concern about the public pensions?"

BUFFETT: Well, some muni bonds are safe and some aren't, just like some corporate bonds are safe and some aren't. It depends on the debt paying capacity of the entity that owes you money, and if you take the Omaha Public Power district, which runs the electric operation here, those bonds are safe. They've got enough debt paying capacity, they can take care of things. But if you take a city like Stockton, California or something where they just they borrowed too much money.

BECKY: But in the situation in Detroit, it looks at this point like municipal bondholders are going to take a much bigger haircut than those in the pensions. They're not going to be treated equally.

BUFFETT: Yeah, the pensions are going to take relative to pain inflicted, my guess is the pensions problems are going to take-- or pension holders are going to--

BECKY: Feel it more.

BUFFETT: Oh, absolutely. I mean if somebody's getting \$1500 a month and it's cut to \$750 a month, that is huge. The bondholders are going to take a big cut. The debt's just got way, way, way out of proportion to the taxable base. And the problem with a city or a state is that if the math gets kind of overwhelmingly bad you set a cycle in motion where people leave and go someplace else that doesn't have the trouble. So it's--there're plenty of problems ahead in municipal finance.

BECKY: All right, we're going to continue this conversation. But, Joe, we'll send it back to you right now.

BECKY: In just about 15 minutes, we'll be introducing our viewers to the three T's at Berkshire Hathaway. Investment managers Ted Weschler, Todd Combs, and financial assistant to Warren Buffett, Tracy Britt Cool. These are the three T's that Warren has talked about extensively, and there's an awful lot of public interest in these three figures. This is the first time that three of them will be sitting down together, and talking on camera. So, we do have a lot coming up. We're back with Warren Buffett in Omaha. And Warren, let's talk a little bit about why you chose the three T's, how you came up with these three individuals?

BUFFETT: Well, when I'm not around, my job will be broken into two pieces, and one is running the business, the CEO, but then the investment end will be run by others. And it became important to bring on the right kind of investment people and so Charlie and I had talked about that. We-- well, the first time we took a trip, I think I had hundreds and hundreds and hundreds of applications that I was reading on the trip to China.

And we found two terrific managers, and they're not only terrific in terms of their investment ability, which had been proven over time, been proven to me, but they are really the right kind of individuals. I mean, they want to be with Berkshire. They'll be with Berkshire forever. And they're the kind of fellows you'd want to have marry your daughter.

I mean basically, we-- Charlie and I care about that, and in Tracy I've tried with assistants once or twice in the past but she came along and she's just done a perfect job. I mean, there're all kinds of things at Berkshire that I should do that I don't want to do. So, I hand those off to her. And the three of them have -- they've been worth a very, very substantial amount to Berkshire. It's demonstrable in terms of the financial performance of the two that manage investments --

BECKY: Todd and Ted.

BUFFETT: But it's also been very clear in terms of Tracy's performance with the subsidiaries that have been turned over to her.

BECKY: Todd and Ted are each managing about \$7 billion.

BUFFETT: \$7 billion now.

BECKY: \$7 billion a piece.

BUFFETT: Right.

BECKY: They started out on a lower base was it, like, two or three billion dollars, and you've built up more and more over time?

BUFFETT: Yeah, yeah, and even most of them three billion originally, yeah.

BECKY: So what is it that you see in each of them, that made you think that they think like you do when it comes to investments?

BUFFETT: Well, I talked to them some, but I looked at what they'd done. It isn't just an investment record that impresses me, it's how that investment record was achieved. And there are people that are just in tune with the, even kind of markets, and then when the market changes, they never-- they really can't adapt.

But Todd and Ted look at investments very much like I do. I mean, they look at stocks not as stocks. They look at them as pieces of businesses, and they evaluate business. They're really business analysts, when you get right down to it. And then they translate that into investment decisions.

And they both have a fundamental soundness to them but they're also-- it's a combination of soundness and brilliance. And you want both. And they think about things that haven't happened yet in terms of problems. They're-- not in terms of dreaming about great projects that are pie in the sky, but they're always thinking about the downside. And they've made

Berkshire billions of dollars already that we would have otherwise made, and they'll make us many billions more.

Tracy has gone into a variety of situations – usually the smaller companies that where one reason or another, we needed something done-- sometimes a management change. And she's done a lot better job than I could do. And she's done such a good job, that when one woman took over Johns Manville a year or two ago, she asked that Tracy be made the Chairman of the Board of that.

And Chairman of the Board of our subsidiaries, really, it's just an overseer from Berkshire's standpoint. They represent the shareholder, in a sense. And so she's taken on four of those, and she'll take on more as time goes along. And, she also will be a great repository of knowledge about all these companies for my successor.

BECKY: You know, let's talk about some of the succession notes that you made, in the annual letter. And you always do talk about this not only with the shareholders, but with the board. You say that the board-- something struck me this time around, where you said-- that the board knows who your choices would be, if there was an immediate need for a successor, when it comes to the CEO position, but you said that those people were either working at Berkshire right now, or were available to Berkshire. And that made me question that you're looking outside the company potentially for successors?

BUFFETT: No. No. No, the successor will be from within the company. All the candidates are now-- all of the candidates have been over the years and the successor will come from inside Berkshire. We've got you know, we've got so many businesses, we got a shot at evaluating a lot a talent. And there is a lot of talent there.

And some of them would have the talent to run the place overall. Others wouldn't. They're more specialists in their own business. But, particularly then, when combined with Todd and Ted, who bring an investment perspective, which is useful in acquisitions, analyzing acquisitions, I think we're as well equipped for the next century as anybody.

BECKY: And you mentioned both Todd and Ted, so I assume you look at the potential CIO part of your job be the investment part of your job as something that more than one person could take on as your successor?

BUFFETT: Well, those two could handle it, very well.

BECKY: Those two could handle it together.

BUFFETT: That doesn't preclude a third person, but I'm not looking for one.

BECKY: And also, when it comes to who the successor as CEO might be, I've asked you in the past, would it be a woman, and you said none of the candidates at that point were--

BUFFETT: Not at present.

BECKY: Not at present.

BUFFETT: No, I mean that doesn't rule it out. I hope I last long enough so we get some women on the list. But, there-- no, the top candidates now are men.

BECKY: And- those candidates, is that going to -- a list that's changed over the last year?

BUFFETT: Doesn't change very much. It's very slow to change. You know, they shouldn't be on the list if it's quite changeable.

BECKY: Right. Okay, let's talk about some other issues that people have written in about as well. In fact concerning Todd and Ted, we got a letter that came in from Bora Kostick, who writes, "In the letter you mentioned Todd and Ted created significant values in matters unrelated to portfolio activities. Can you give some examples?"

BUFFETT: Well in making an acquisition related in media general where we acquired a bunch of newspapers and also made an investment in the company Ted did all that. In terms of working in the RESCAP bankruptcy, Ted did that. He wasn't getting paid for these at all, I mean, this is extraneous work.

We just recently completed a deal in the last week or so where we exchange our Phillips 66 stock for a combination of cash plus a specialty chemical operation. That was Todd. I mean I may have partially conceived of the idea, but I just turned it over to him.

And those sort of things might not have gotten done if I had to do them myself. And there's some threshold at which I have to say, "The heck with it." And having them has been invaluable on that. I mean we're talking things that are worth hundreds and millions of dollars in addition to the billions of dollars they've made us on portfolio.

BECKY: And you've talked a lot about their compensation. Both of them were managing their own hedge funds before, and the compensation structure in Berkshire is very different than the two and 20 you would get if you were a hedge fund manager.

BUFFETT: That's right. If they-- last year they started with about five billion each. If they'd put it under the mattress under the standard hedge fund arrangement they each would've made about \$100 million. I mean, that shows you how nutty the arrangement is.

But they would have literally made \$100 million by sticking it under the mattress. If they put it in an index fund, and gotten the two and 20, they each would've made over \$300 million. All they had to do was buy the vanguard index. And they each would've made over \$300 million. They also would've gotten more favorable tax treatment on it then they got by getting a salary from Berkshire.

So imagine I mean, you can retire forever on \$300 million. So one year you go, you put the money in an index fund so it just shows that the-- it shows you amounts you get by asset gathering rather than asset managing. I mean even though a great many hedge funds in recent years have not delivered high performance, they've delivered high fees.

But our arrangement is that they get a salary and then they get which to most hedge fund guys would look like nothing, and then they get paid on the excess. They get ten percent of the excess over the S&P performance. But it's done over a three year staggered period. So they can't have just one up year and then another down year, or something of the sort.

So that's the same arrangement I have with Lou Simpson at GEICO for 30 years. So, only if they do better than I can do by sticking the money in an S&P fund do they get paid a dime of performance. And it seems to me that's quite logical, but it's not something that the hedge fund community is out there pushing harder for.

BECKY: They both beat your performance last year, didn't they?

BUFFETT: I'm sorry you brought that up. They not only beat my performance, they smashed my performance.

BECKY: All right, up next, we're going to talk about the market's reacting to the situation in Ukraine, plus some stocks you need to watch at the open. And at the top of the hour, a behind the scenes look at what makes Berkshire Hathaway tick. We will have Tracy Britt Cool, Warren Buffett's financial assistant, plus Berkshire investment managers Todd Combs and Ted Weschler, all right here with us, right on set. Squawk Box will be right back.

JOE: Okay, thank you-- Jim Maceda, let's toss it back out to Becky. At this point-- the one thing that-- that we keep hearing, Becky, and that's somethin' I'd ma-- maybe take a little solace. He knows how expensive it would be to-- if he-- if Russia needs to-- take all of Ukraine's problems.

And maybe money is the one thing that we can count on, you know, that-- that-- you know, these leaders aren't reasonable and absolute power corrupts absolutely. But it'd be a lot easier to have the-- West and Europe and United States sort of pitching in to help this-- this huge region's economy.

BECKY: Yeah, that-- I guess that was Michelle's point earlier this morning. Maybe the markets can step in and put a little pressure where that was done. I noticed some earlier coverage that noted that-- Ukraine, the guys who are in charge at Ukraine now, instead of sending in their military are sending in the oligarchs there, the wealthy, the influential people, to try and make the argument about why this should be done-- from a peaceful perspective. And that might make a difference, too.

JOE: Yeah, yeah. I kind of think of Buffett as kind of an oligarch. I guess that's probably-- that's a stretch to some extent, but-- you know, and we just-- actually, you know what? I don't think he's rich enough to be an oligarch in most of these-- these Eastern countries.

BECKY: Right, yeah. And some of these guys have built up an incredible stores of wealth. But you're right, it is a special morning here on Squawk Box. We have Warren Buffett here answering all of your questions. He's been doing that throughout the morning.

Right now, we also have a rare interview with Berkshire Hathaway investment managers Todd Combs and Ted Weschler, plus Tracy Britt Cool, who is Warren Buffett's financial assistant. All three of them are here. And this is a rare treat because, I don't think you three have ever sat down together for an interview, have you?

MULTIPLE VOICES: No. No.

BECKY: We-- we've talked in the last block about-- why Warren chose each of you. And he explained a little bit about-- what he finds so interesting in each of you. What I'd love to hear from you three is why you chose Berkshire Hathaway and maybe how you found your way to Berkshire, because each of you had a very different path. Todd, let's talk a little bit about w-- when you first w-- talked to Buffett. When did that happen, to Warren?

TODD COMBS: Well, I reached out to Charlie. And we had a series of conversations-- over the course of several months, before one day I was out visiting in L.A. and he said that-- just outta the blue after a three or four-hour breakfast that-- in classic Charlie style that Warren would really like to meet me, not that-- I'd really like to meet Warren.

But-- and then he went on for about five or ten minutes about how much Warren would like to meet me and so forth. And-- so, I came out to Omaha. And Warren and I spent the day together talking about everything from baseball to-- business and insurance. And-- and just very interesting.

BECKY: And you-- you've moved your whole family to Omaha. When did you move?

COMBS: That's right. After I joined-- the kids finished-- out the year in school back in Connecticut and we moved the entire family out right after I joined. And so we've been out here, I guess, coming up on about three years now.

BECKY: Okay.

COMBS: And it's been wonderful.

BECKY: And it's been wonderful, and you guys love Omaha.

COMBS: Absolutely. The-- my wife and the kids all love it. It's been an absolutely wonderful experience. Omaha's a great town. And the people really make it there. It's just been an excellent experience.

BECKY: Ted, I love your story, too, for how you came here. Because over the course of two years, you've paid \$5.3 million for two lunches with Warren. How-- how'd that happen?

TED WESCHLER: Donated 5.3 million.

I like-- I like your version. And then, Becky, I go-- and when reading Warren's letters probably since '79 when I started college. And-- it was kind of a bucket list thing for me, that I always wanted to meet the guy. And, I think, as you know, Glide Foundation, terrific charity in San Francisco, does an annual auction. And I wanted to know more about Glide there, so we spent half a day out at Glide, understanding the charity. And I thought, "Hey, this is-- this a terrific charity to really help the otherwise helpless." And I bid on the auction and ended up winning. And--

BECKY: Did you keep hitting the button at the last minute, to try and make sure you were the high bid?

WESCHLER: Not quite. Not quite. Not quite. But it-- but I end-- ended up getting it and-- came out to-- like, my only condition on it that I asked for was I wanted to do it anonymously. And I-- I didn't want-- we were set up at Smith & Wollensky's and-- we opted to do it in Omaha, actually, I requested that.

And I came out and visited with Warren. And-- it was just fun. I mean, we really hit it off. And I was expecting kind of-- a stiff hour-or-so meeting. And it ended up being this, you know-- long visit at the office and a terrific-- dinner, where we had a lot of-- just, you know, common interests and laying-- thought about things very-- similarly.

And, you know, that was that. And-- I was pretty happy to have it checked off. And the following year-- I said, "You know, I really don't wanna see the price of this go down." So, mentally-- mentally, I said, "Well, if we-- if you're gonna go for the same price or less, I wanna make the donation again and help out Glide."

And it-- and that happened. And I came out the second time, and again, and we really just had-- had a terrific visit. And toward the end of the evening-- and I had my, you know, little yellow legal pad of questions I was asking Warren. And I wanted to make sure I hit all of 'em. And I said, "You know, you can ask me anything you want, too." Out of the blue, he said, "Well-- I think you might be a good fit at Berkshire. Would you have any interest?" And it was-- it was the last thing in my mind. It really just completely turned me off, but--

BECKY: Did it floor you to hear it?

WESCHLER: Totally. Totally. Yeah, I mean, y-- really, they had totally threw me off. And-- but I-- I didn't wanna be dismissive. I mean, you know, this guy is like a hero, you can't just say, "No way." And so I started thinking about it.

And-- you know, it-- it was right at that point, I'd run my own fund for 12 years. The regulations on hedge funds were changing. I was gonna-- had a staff of two people and me that ran my fund. I was gonna have to bring a compliance person in. And life was gonna get

complicated. Thought, "Wow, this is actually a way to simplify things and do what I love to do, which is be an analyst."

BECKY: And Tracy, your path to Berkshire-- is one that a lot of people-- I know when the students come out-- to meet with Warren, they always ask him-- "How did Tracy do that?" and "Should I change my name to start with T?" I've heard that question last week, between you three. How did you find your way to Berkshire?

TRACY BRITT COOL: Well, meeting Warren was also on my bucket list but I didn't have \$5.3 million. So, I had to take another path. And I came out with one of the student groups-- an organization that I was involved with called Smart Woman Securities. Warren loved to support women in investing and wa-- women in business.

And it was a great opportunity to meet-- Warren. I really enjoyed that experience. Like I said, it was once in a lifetime. And a couple years later-- later, I decided to write a letter to Warren and just say, "Can I come out and spend a day, a week, a month, I'll do anything if you let me spend some time with you," fully assuming he would say no and I would say I tried and we'd go about our way. But fortunately he said yes. So, I-- came out that summer, worked on a small project for him, thought, "Wow," again, "this is a once in a lifetime--

BECKY: What was the project?

BRITT COOL: --"experience." I was looking at the-- looking at the Lehman bankruptcy. And so it was a very daunting task, and one where I don't think I ended up having-- too much value to add. But it was really interesting. And it allowed Warren and I to have an opportunity to have a variety of discussions about business management investing. And those are all great for me, and I think, my guess, a good opportunity for him as well to learn more about me.

BECKY: You know-- Warren, you must get letters all the time from people who wanna come to work here. You must meet people all the time. But- what about these three in particular really jumped out--

BUFFETT: Sometimes-- things jump out at you. I mean, it-same way as when we bought **Iscar**. You know, that was a one and a page-- one-and-a-quarter page letter from Israel, and we made a \$5 billion purchase on it. And it-- it's-- to some extent, not perfectly, but people do give themselves away.

And I've had literally thousands of letters from people who wanted to do hedge fund type-- or— manage money force. And—they also had a longer record and everything. But it-- it's-- it's more than having had a good five years or something of the sort. You know, I've seen a lot of investment managers come and go. So, it's a judgment about their intellect. But it's also just as much a judgment about their character. And-- we've got the right three here. And they don't come along every day. You

BECKY: They don't. And-- in fact, there-- there's been a lot of interest in all three of you. We've gotten a lotta questions that have come in from our viewers. And we've been posing some of those questions to Warren this morning. But if you-- if you three don't mind, I'd like to ask you three some of the questions that have been coming in, too.

Part of what's really come up is just-- Todd and Ted, I'll ask you this first-- how you invest and how you see the world. Ted Ehrhardt writes in-- guys, this is number 82-- Ted Ehrhardt writes in, "When you identify a company, for example, that seems worth a deeper look, what does your investment process generally look like? What do you like to read? And how much time is typically spent before you're ready to actually make an investment?" And I'll start with you two on this.

COMBS: Go ahead, Ted.

WESCHLER: Okay. So, I'd say that it's-- investing well, not turning over a lotta stones. And the way that I spend my day-- is just reading-- annual reports, transcripts-- delta reports, regulatory filings, channel checks-- anything I can get my hands on, really-- trade magazines, etcetera. And so 99% of what you look at you can dismiss-- within five minutes. It

BECKY: What-- what's the magic thing that tells you, "There's no way that this is something"?

WESCHLER: Well, there's kind of-- you know, Charlie talked about mental models and-- and so forth. There-- there's a lotta things—Think about like a gating analysis or a flow chart. There's a lotta things that come along-- obviously, valuation being one.

And being able to understand the business-- and technology is an area that-- sector that I traditionally haven't done much in because I think it's very hard-- to know what a lotta the businesses will look like five years from now. So, there's a lotta things that you go through this gating process that are just completely eliminated.

And if you know that you can't get comfortable with it, you don't need to spend any more time on it. So, it's the 1% of ideas that are really exciting that you-- it's kinda like a needle in a haystack-- you know-- you just know when you've done this long enough when there's something there. And that's really exciting, because if you love investing that's what you can spend the next 500-- thousand hours on, really digging into--

BECKY: Five hundred thousand hours.

WESCHLER: Somethin' like that--

BECKY: How much do you read every day? Because didn't Warren tell you at one point that that's the most important thing you should be doing?

WESCHLER: Yeah, when he came to Columbia and spoke to the business school and-- Professor Bruce Greenwald's class and-- in either late '01 or early '02-- the very last question that was

posed to him was-- what his secret was. And he had this-- I'll never forget-- he had this giant pile of paper and he pulled it out.

It was a complete hodgepodge. And he said that he reads 500 pages a week. And-- anyone can do it. And-- you know, it's like compound knowledge. If you start today, you just build over time. And so that's when I started. And then somewhere around 500, sometimes a little bit more pages a week. And that can be all those things I mentioned before-- annual reports and transcripts and regulatory filings and so forth. But that-- that's really the process-- to answer your question--

BECKY: Yeah, there's-- no easy way to it. It's--

WESCHLER: No, no--

BECKY: --building up knowledge over years and years and years.

WESCHLER: That's right. That's right. And then, you know, as Warren had said before, it is compound knowledge. You get better and better at it. It's spotting those gating factors. I can look at a bank or-- you know, certain companies and certain sectors much faster than I would-- you know, five, ten years ago.

BECKY: Warren, that reminds me of something you said when you made that Bank of America investment. When did you first read Bank of America? I mean, you'd built that up over decades--

BUFFETT: Yeah, I read that probably 55 years ago I read a book called Biography of the Bank. But I probably read their annual report every year for 50 years. It-- I-- you know, the same things happen many times. I mean, it and the beauty of it is that it is knowledge is cumulative. And even what you're learning about Company A will help you thinking about Company B.

BECKY: Ted, how about you? How does your approach differ? Or is it the same?

WESCHLER: It's very similar. I think things that are distinguishing -- I'm a little bit quirky. I typically don't meet management. I don't talk to management.

BECKY: Why?

WESCHLER: I-- historically, when-- I was in private equity for 15 years. And generally, if you become a CEO of a company or a really good salesman, one way or the other, and you're gonna probably spin people. And-- I made a couple big mistakes when I got involved in situations where I liked people too much.

And, I generally like people. So, the way to avoid that is put the filter on that rely on reading transcripts, 10ks, 10qs. And the other key thing-- and it-- I mean, plays off of everything-- Warren and Todd just said is, you know, know the situation. Wait for the right price.

BECKY: Right.

WESCHLER: You're just always reading about things. But, you know, people-- most of the times the price won't be right, but be ready.

BECKY: Be ready.

COMBS: Yeah.

BECKY: Tracy, people have a lotta interest as to what you've been doing with the company that you kind of parachuted in on. Warren talked earlier about how when he has a company that's in a little bit of trouble, with some of these ones that he hasn't spent the time with, he's asked you for some help. Tom Roth from New Jersey writes in and he says, "What are your plans for Benjamin Moore going forward?" I'm interested in that, but I'm also just interested in-- what is it you do when you parachute in.

BRITT COOL: Definitely. At Benjamin Moore, we have a tremendous quality of a brand there as well as a great company with great people. And it's just a situation where we need to give a little bit more attention to our dealers. So, over the last ten years or so we've underinvested in our dealer network.

And now what we're trying to do is reinvigorate them with trust and helping them understand-- that we're here for them for the long haul. We're not gonna be through other channels. We're not gonna make commitments in other directions, but really for them. And I would say when I go into a company, it's helping the management team identify the direction which we need to move. And in situations that I'm involved, typically there's been some sort of industry change, business shift, somewhere where we've lost a way a little bit.

And we can use resources within Berkshire. Other Berkshire companies are usually the first place I look to for knowledge and experience and asking, like, "Can you come in and help? Can you talk to us about how you manage that in your warehouse, how you went to market with a specific brand, how you approached some issue that was of specific significance to you, and how can you leverage that knowledge within Berkshire at our other companies?"

BECKY: Okay. Guys, another question that has come in-- this is directed to Ted and Todd. Both of your compensations are tied to each other in an 80/20 split. If you could pick any investment manager besides the ones you're sitting with to have a similar split, who would you pick? And I think Warren's sitting here, too, so you can't choose them.

COMBS: Ninety-nine/one they might go for it

WESCHLER: They can't pick Charlie either?

BECKY: No, I'm gonna take him outta the running. I'm gonna take him outta the running. But-- you both have long careers. You both have worked with a lotta people over the years. Is there somebody else who impressed you along the way? I think that's what they're trying to get at.

WESCHLER: You wanna go first?

COMBS: I have names that I've recommended people to. I'm just not 100% sure that they would necessarily wanna be recommended. I'll tell you, Lou Simpson was at-- at Geico for a very long time at Berkshire. And there's-- a fellow named Tom Bancroft that runs the fund-- out in La Jolla that worked for Lou for about 13 years. And he's done wonderful. I've referred people-- over to him before. And—

BUFFETT: Larry Putnam worked for-- La-- Larry Putnam died-- unfortunately. But he-- managed money very well after he left-- left us.

BECKY: Right

COMBS: Mary Wentler joined our board. I don't think she takes outside money, but cer-- I've known her for probably ten, 12 years. And she has a wonderful long-term track record-- as does Tom.

BECKY: And what do you think, Ted?

WESCHLER: I'm thinking-- I-- I've never met him, but David Tepper's got as good of--a 20-year track record as anybody out there. And he's proven able to, you know, do well in tough markets and do well in rising markets. And I-- I always respected that.

BECKY: All right, that's a great point. Another question for you. Do you own any Berkshire Hathaway shares personally? And if you were still running your hedge funds, would you buy it for your funds? If you do own shares, do you think that Berkshire shares would be better off if it were broken up due to the conglomerate discount it appears to have been stuck with the last five plus years? What do you guys think?

WESCHLER: I-- I do own-- some Berkshire. Owned it when I joined. I probably would not have it in the fund. Typically, when I manage my own fund, I-- am-- a lotta what I do at Berkshire's, I like to become the largest shareholder on a given company. And that's kinda hard to do with Berkshire. And the third part of that question?

BECKY: The third part, would you break up the company?

WESCHLER: Oh, break-- no, no, no. No reason to break it up. That—

BECKY: That's what I thought—

WESCHLER: --would-- yeah—

BECKY: --you might say.

WESCHLER: --you don't wanna mess with it.

BECKY: Todd?

COMBS: Yes, same answer. I own it as well. I owned it-- when I ran Castle Point. And-- yeah, there-- there's-- there-- I don't think there's that much a conglomerate discount, but certainly doesn't need to be broken up.

BECKY: Ted, specifically, this question came in for you. And there's been a lotta talk about DaVita—

WESCHLER: Uh-huh.

BECKY: --recently. And you know that that was a stock that you identified. And Mark Blakely from Tulsa, Oklahoma, wrote in and said, "Would Ted Weschler explain what he likes about DaVita HealthCare Partners and why he finds this company such a great investment? Since Berkshire signed an agreement not to own more than 25% of DaVita, does Ted or Berkshire have any other intentions besides being a large shareholder?"

WESCHLER: Okay. I followed the dialysis industry for, mmmm 30 years now. Right outta college I started-- studying. And so I know the space reasonably well. And I think the broad filters that I apply for healthcare investment in general is-- number one, "Does the healthcare company deliver better quality of care than somebody could get anywhere else?" And DaVita falls into that.

Number two, "Do you-- does it deliver a net savings to the healthcare system?" In other words, is the total bill for U.S. healthcare cheaper because of the efficiency that the company provided? DaVita checks that box. And lastly, "Do you get a high return on capital, predictable growth-- and, you know, shareholder-friendly management?" Absolutely. And all three of those together-- you know, you've got healthcare is whatever, 17%, 18% of GDP. You got an incredibly talented team running that company. I'm not sure what the stock will do over the next year or the next two years, but very comfortable at five years from now it'll be-- a more valuable franchise.

BECKY: Uh-huh. Can I ask you both-- you both-- Direct TV. Is that right?

COMBS & WESCHLER: Yeah.

BECKY: You both like Direct TV. When did you see that? When did it first pop out at you? Todd?

COMBS: Well, yeah, I think I was-- in the name and my fund probably eight years ago and then bought it when I came onboard as well.

WESCHLER: I'd started following cable and satellite about ten years ago. Kept an eye on it the whole time. And it was one of the first things I bought when I got-- when I came to Berkshire.

BECKY: How much back and forth is there? I mean-- in terms of when you, like, see a stock you like and you identify it, do you talk to Warren before you buy it? Or do you just go ahead, buy it, and maybe tell him at some point down the road?

WESCHLER: Give him a heads-up-- just because there's a concern that he may we may know something institutionally that's inside. So, we know--

BECKY: Oh--

WESCHLER: --we don't want to create a problem.

BECKY: --right. Warren, you've talked about that before.

BUFFETT: Yeah--

BECKY: You just have to make sure that there's not a Berkshire conflict--

BUFFETT: Yeah, that we're not taking the place over tomorrow.

COMBS: But-- we do have total autonomy. And Warren, in fact, insists on it. So it's not a matter of going to him and asking him if we can buy it or anything like that, as Ted said. It's literally for compliance reasons, to make sure there isn't anything going on that we don't know about.

BECKY: Warren, anytime that there's an SEC filing that says Berkshire is compiling a stake in such and such company, everybody immediately runs out and says, "Warren Buffett is buying it."

BUFFETT: Yeah.

BECKY: How do we know what you're buying, what these guys are buying? How does it all--

BUFFETT: You don't know for sure, but the chances are-- you know, if it's-- if it's a multibillion dollar position-- although they have no multi-million -- position to approach two billion-- but if it's really large, it's probably mine. And if it's really small, it's probably theirs. It's probably not mine that I'm just starting on although it could be.

BECKY: Uh-huh. Tracy, one of the things we've talked about this morning is Heinz and how that acquisition's been going. What have you seen from what you've been doing with the company and sitting onboard?

BRITT COOL: It's going very well. I think that it-- there again is a company where we have a tremendous brand and we have a great team with Bernardo and the-- rest of individuals there. And they're continuing to move forward. And I think that that company will be much stronger a couple years from now than it is today.

BECKY: Uh-huh. And-- Warren, just your thoughts about having these three in the office. This is a picture, by the way, that was in the annual report. You've never had a picture in the annual report before, but this is a picture--

BUFFETT: It shows how flexible we are.

BECKY: --yeah, which--

BUFFETT: Yeah.

BECKY: --when you realize there's 330,000 employees at Berkshire, this is the headquarter staff.

BUFFETT: The entire head office with the exception of two people who missed-- the lunch. Here's the most valuable person to Berkshire, this Don... my assistant, but this fella over here at Mark Millard's example. He's in charge of \$40 billion of cash.

And-- he moves it around. And-- you know, I give him guidelines. But they-- it's a sensational group. And we're all on one floor. Our tax return is 23,000 pages. That's twice as high as I am. And they put out the 10Ks and the 10Qs and they handle the inquiries about Berkshire, the public relations, investor relation-- all sorts of things. And they do a sensational job. I couldn't be more proud of 'em.

BECKY: Well-- Todd, Ted, Tracy, I wanna thank you three for joining us today. We really appreciated your time. And it's been great getting to hear from all of you.

WESCHLER, COMBS & BRITT COOL: Thanks. Thanks for having us.

BECKY: --thank you so much. And this conversation with Warren Buffett is going to continue. In fact, when we come back, personal income and spending data are out. And then we'll get back to our interview with more of your questions for Warren Buffett. Right now, though, as we take-- as we head to a break, take a look at what's been happening with the U.S. equity futures.

JOE: This is Ask Warren day and I have been wanting to talk about the final four at some point because Warren is a huge here is going to the Creighton game I've sent you some stuff as hard as it is for me to believe

BECKY: --Yeah I'm still trying to look this up. Joe has a question on this. And- Joe, we should mention the news that is just out in the last half hour about the billion dollar bracket deal that Berkshire Hathaway is ensuring with-- Quicken Loans. And this is something we've heard about for a while. And this is all tied into March Madness. If you pick the perfect bracket, you win a billion dollars?

BUFFETT: Yeah. Well-- or \$500 million immediate value or \$25 million a year for 40 years.

BECKY: And-- Joe, the news that was out today is that Yahoo is also getting in on the deal, which Warren, that's pretty surprising looking at what had happened. It sounded like Yahoo had its own plans to go ahead with a deal like this. They didn't go ahead with that because Quicken Loans went out first.

BUFFETT: Right.

BECKY: And- now we heard today that Yahoo's joining up.

BUFFETT: And now they're joining forces. Yeah, yeah--

JOE: You know what, Warren?

BUFFETT: --it was new to me just a few --

JOE: You-- you got a better chance at Power Ball. Okay-- you're a genius. What-- is-- do you have a quick -- have you figured out the odds on this? Because I-you know, I think I could pick the team that wins. I think I might be okay pickin' the Final Four if I was really lucky. But just the very first round, pickin' those, you-- with-- what happens, and then pickin' 16, then pickin' eight, then pickin' four? That-- it's impossible! And some

BUFFETT: Yeah. Well--

JOE: --some autistic kid supposedly did it. I can't tell whether this is an urban legend or not that this kid actually did this.

BUFFETT: This defeatism is not like you, Joe. I mean-- if you could put in 15 million entries, which we expect to get-- then do you think you'd have a shot at it?

JOE: No. And I don't think you'd be--

BUFFETT: Oh

JOE: --I don't think you'd be puttin' up-- I don't think you'd be puttin' up a billion if you thought people had a shot at it, either.

BUFFETT: Well, oh, they have a shot at it. Yeah, no, the one thing I-- I've seen these calculations, for people will assume it's a random event so they take--

JOE: No.

BUFFETT: --two to the 63rd--

JOE: Yeah.

BUFFETT: --you know. But it is not a random event. I made calculations myself before entering into this insurance contract. And Ajit Jain-- also made calculations. And we were in the same ballpark and--

JOE: But did you s--

BUFFETT: --obviously went ahead with it.

JOE: --you see what's happened. I mean, B.C. beats Syracuse-- I mean, you look at-- it-- it's-- unbelievable-- I don't know who's good. I can't tell. I-- you know, one team I think is good is Florida. That's all I can figure out. Florida seems--

BUFFETT: Yeah.

JOE: --they seem really-- I don't know, after that, everybody seems like they've got-- you know, they've been killed by what is it, Goliath and-- you know, the giant. I mean, it

BUFFETT: Well, Joe, if you look at-- I think the last hundred and the last what-- 20-- it will be 27 years, maybe 28 years-- whatever it is-- they've had 64, there's been, like, 112 will say number one seed's playing number 16 seed and the number one seed has won every single--

JOE: Yeah, that's true.

BUFFETT: one of those games.

JOE: --who would you pick in the Final Four, Warren? You got Creighton in there?

BUFFETT: Well, I've got-- Creighton. Yeah, you bet. . Well, yeah, I would say maybe Arizona, too.

JOE: Yeah, Arizona. Florida. And-- and then Virginia looked good.

BUFFETT: Yeah--

JOE: OVirginia who won their . Yeah.

WARREN BUFFETT --now that you've told me about Florida, yeah, they're definitely gonna be in there.

JOE: Right. We're pickin' the number one. We're so good. Aren't we? We're pickin' the number one.

BUFFETT: Yeah.

JOE: Oh, pickin' the number one seed.

BUFFETT: Yeah.

JOE: All right-- well, we're gonna take--

BECKY: Hey, Joe, we--should point out, though-- before we go to break, we should point out when we have time to talk a lot much-- a lot more about the March Madness strategy, because both Warren and Dan Gilbert from Quicken Loans are gonna be joining us on set for Squawk Box on March 14th. So, we'll get into more depth with them on that day, too.

JOE: Wow, I can't-- that's--gonna be so much fun, isn't it? And-- and we'll--

JOE: --have our bracket--

BUFFETT: --a little more information then.

JOE: Yeah. And we'll have our brackets done by then-- you know, our TV news or brackets and all that stuff. Awesome. All right. We'll have-- much more of Omaha and Warren Buffett in just a couple a minutes. You got his Final Four. But first, a quick news headline.

BECKY: And welcome back to Squawk Box, this is a special edition in Omaha, Nebraska with Warren Buffett, who's been with us all morning long, answering your questions, and Warren, we continue to get questions that are coming in from viewers. Jeff Burton writes in: "What's your opinion on so-called 'activist investors'? Do you really think that they are acting in the best interest of the targeted companies and the shareholders, or are they more just interested in making a quick profit for themselves?"

BUFFETT: Well, I think generally speaking-- they aren't just making a quick profit, and there's a law against making quick profits-- but our whole attitude in our own business and what we like to see with the business we own stock in, is we wanna for the people who are gonna stay in, rather than the ones who are going to get out. Now at any given time, you can make more money, usually selling the company than running.

I mean, most stocks-- most of the time, not all of time, sell at some discount to what you could actually sell the company for that day-- that day for. So you know, a little more activist activity might be just selling the company-- and I think that would be a big, big mistake.

I mean, I've seen cases-- where really good companies have sold for a third or a quarter what they were worth during-- and the answer isn't to sell the company, the answer is to keep running the company well. The answer may well be to buy in their own stock when they're selling at that kind of a discount. So I-- the money is flowing into activist funds because they've had good performance lately. And- so-- and that money will get put to work; so I think you're going to see a lot of activity in that field, that-- you know, I could do certain things to jiggle up the price of Berkshire-- in the short run, that would not be good for the company over five or ten years--

BECKY: Like what?

BUFFETT: Well, you can spin off one stock that might be a hot type-- I mean, one-- of our divisions, it might be a pretty big, hot division, but it-- if it's a really good business, I just as soon keep it for Berkshire. And--there's a lot of efficiencies from a tax standpoint and a capital allocation standpoint, from being under one umbrella. So-- I am running the company for people who want to stick around, not for the ones who are leaving.

BECKY: All right, let's take what you just said and apply that to some specific instances. Nelson Peltz is right now pushing on Pepsi to split up the company so it makes more sense apart than together.

BUFFETT: Yeah. I don't think if I own Pepsi-- if I was the only holder of it or my family was the only holder of it I don't think I'd split it up.

BECKY: Because?

BUFFETT: I just-- I think that Frito Lay, it is an extremely good business, it's a better business than the soft drink business, but I think the soft drink business is good business, too, and I don't see a need to split 'em up.

BECKY: On that point, lemme point to a question that came in from a Neil Hagstrom . He said: "Are you worried about Coca Cola's declining in the near future?" Just the business of Coca Cola itself.

BUFFETT: Well, it's under a lot more pressure than it was ten or 15 years ago, particularly in the United States. But their sales went up last year, just as they go up almost every year, in terms of-- even in cases of carbonated soft drinks. And you know, right now, 3% of all the liquids people in their mouths, throughout the whole seven billion people, are Coca Cola products, and I think maybe that 3% will go up a little over time.

And I think they've got-- you know, wonderful brands and wonderful acceptance throughout the world. Coca Cola brand itself sold a hundred million more cases last year, I remember, than the year before, and they sold more that year than the year before.

It's a very, very good business-- but it's under more attack. Their-- the tax situation in Mexico, there's certainly-- a lot of groups that are working to-- certainly, not in the interest of Coke. The interesting thing is that diet soft drinks have actually gone down more in this country than--the-- sugar drinks, which you wouldn't think would be case, by which your--

BECKY: All the water drinks-- are not carbonated drinks--

BUFFETT: (UNINTEL) way up--

BECKY: --have gone way up.

BUFFETT: Well, water-- water's gone way up. But still, close to a quarter of all liquids consumed in the United States are carbonated soft drinks.

BECKY: Wow.

BUFFETT: You know, I drink five a day and I'm feeling good.

BECKY: Yeah, you had two on the set with you this morning.

BUFFETT: Yeah, well, and I'll finish 'em, too.

BECKY: Let's go back to activist investing, I want to apply it to another situation.

BUFFETT: Sure.

BECKY: Apple has also been the target of an activist investor, Carl Icahn, who was pushing for them to do something to bring back shareholder value, in terms of buying back stock. He's actually dropped his proxy-- request that he had on. The company has spent a lot of money buying back shares. What did you think of that whole situation--

BUFFETT: Well, I think that what they've done is probably pretty sound-- but shareholder value, taking shareholder value doesn't mean doing something to get the stock up tomorrow. I mean, shareholder value means building the most value over a five or ten-year period, that you can do with the resources, it's your command-- and that does not mean trying to-- every-- every day, to have the stock go up.

And-- the whole firm shareholder value sorta puzzles me a little. I mean, the way we build shareholder value at Berkshire is by building the earning power over 49 years and-- you know, any given day, that-- that he's splitting the stock, I'm not sure that that would mean anything, anyway, but I have a lot of suggestions along that line.

So what if the stock goes up? I mean, that's good for the stock people that are leaving. And it's bad for the people that are entering it, you know, basically. What you really want to do is build earning powers, sustainable earning power over time. And my guess is, at Apple, they're working very hard on that.

BECKY: Yeah, we had a question that came in from Simon Chow, and we know you're a huge fan of Breaking Bad. He writes in: "What lessons or situations from Breaking Bad do you think are most applicable to investing?"

BUFFETT: I'm not sure all I know is, I should call Saul if I'm in trouble.

BECKY: All right, well, we're going to continue this conversation in just a moment. Again, Warren Buffett is with us today and Joel, we'll send it back over to you.

JOE: All right, all right, Becky? I'm gonna ask about what he's watching now, but-- get-- maybe to get that, we gotta take a break.

BECKY: Well, welcome back to a special edition of Squawk Box, we are sitting down with Warren Buffett of Berkshire Hathaway this morning, wrapping up what has been three hours of him answering your questions. And Warren, we do have other questions that have come in, I know we're not going to get through all of them, but Ben Sigel wrote in with a specific question-- about-- a Berkshire company. He wants to know: "Were Warren and Charlie aware of, before the recent change in policy, that Business Wire was selling access to high frequency trading firms?"

BUFFETT: No, I--didn't know. It's-- important to realize though that Business Wire sells to thousands of people and they-- it's all simultaneous, so no high frequency trader ever was getting information a thousandth of a second before the others. But they apparently were working with it a little faster when they got it. So anyway, when we found that out, we cut 'em off, anyway. But they were-- they were getting simultaneous delivery not early delivery.

BECKY: And I guess the question would be, though, if they could get simultaneous delivery as the wire service, anybody relying on a wire service would have a slower of gateway, by a fraction of a second.

BUFFETT: By a fraction of a second.

BECKY: Yeah, and maybe that's where they were making hay with it. Another question came in from-- our Robert Frank, one of the reporters at CNBC, and-- he covers the wealthy, he-- brings up the question, "You and Gates have been number one and number two at the top of the Forbes U.S. Billionaire List for years now, what year do you think someone else will break the duopoly at the top and who will it most likely be?"

BUFFETT: I really-- I can't tell you who's-- you know, three four or five-- you know, I'm-giving away stock, Bill gave a way lot in the past and he'll give away more in the future. So it-- iwill be-- it will probably be somebody who isn't giving away as much. But I-- don't know who that'll be.

BECKY: Okay, Joe has a question.

JOE: Yeah, just a quicker one, just getting back one more time, that-- you know, if anyone would see the effect of climate change I would think Berkshire would, in terms of-- especially because we've built out the population so much bigger and we've built in areas where-- you know, years ago, maybe you wouldn't have seen property casualty claims and now it seems like you would see 'em.

With-where CO2 levels are, are you surprised you haven't seen an effect and would you be absolutely shocked if they have to pair back climate sensitivity models to CO2? I mean, are you-- a firm believer that you're gonna see events in the future?

BUFFETT: What I think--I'm no physicists-- Joe, and you know, so I-- all I'm doing is reading--

JOE: look there's no climate scientists aren't physicists, either, that's one thing we know for sure.

BUFFETT: Yeah, but I think it's- the kinda question that deserves lots of attention. In terms of our insurance business, it has no effect, in terms of the prices we're charging this year versus five years ago, and I don't think it'll have any effect on what we're charging three years or five years from now. But I do think that-- that-- you know, we do have one planet, and I think we outta pay a lot of attention to what's going on--

JOE: I agree, I agree.

JOE: We've gotta make sure that-- that we're focusing on the right-- things, though, in terms of keeping the planet livable, I agree, wholeheartedly, thanks, Warren. Anyway, do you-- is there anyone that we don't have on our list of 25? Any outliers that you think that we should have that will revolutionize-- business and-- and just the world? You've probably seen that list. You're on it. I'm-- I'm sure you're gonna be there as a Graham and Dodd (PH) genius.

BUFFETT: Yeah, well, Charlie Munger is my man.

JOE: Yeah, that's good. Have you thought about me at all or no-- but probably-- not in your will or on this list, you haven't thought of me, have you? I'm just chopped liver--

BUFFETT: I'll tell ya this, I--agree that I'll put ya either in my will or on the list, one of the two.

JOE: Okay, all right.

BUFFETT: But - I'll make the decision.

JOE: All right.

BECKY: Warren, before we go again, for the people who weren't tuned in at the very top of the show at 6:00 AM Eastern-- your thoughts on what's happening with the economy right now? Because probably the biggest question that a lot of people are wondering in the economy is, have we seen a significant slowdown from the fourth quarter, third and fourth quarter of last year? What- do you think, based on what you're seeing in the businesses?

BUFFETT: I don't think so, except to the extent that whether it does hit certain types of industries. But my impression is that the American economy for five years, has been moving at a fairly steady rate, upwards, not as fast as people would like. But-- I think that absolutely continues now.

I mean, I think we're moving ahead at a couple of percent a year; and incidentally, a couple percent a year, if you have 1% population growth and 2% gain in output, it means that in a generation, you have a 20% gain of output per capita in the country.

Warren Buffett Watch

Keeping Track of America's Billionaire Next Door

 CNBC.com

That is not bad. I mean, at any other time in the history of the world almost, that would have been Nirvana. So if we have 20% more, I'll put for your children where we have today, and they have 20% more in the next generation. That is not bad, and we're on a cliff that's somewhat better than that.

BECKY: And-- finally, just looking at the stock market today, there have been a lot of people nervous about what's happened in-- in the situation in the Ukraine. You would tell them?

BUFFETT: I would tell them it doesn't change anything. If you've got-- if you've got a wonderful business of your own, you know, in Peoria, Illinois, why in the world would you sell it today because of what's happening in the Ukraine? If you've got a farm that's producing for you, if you've got an apartment or house that's fully occupied, why in the world would it sell it today because of what's happening in the Ukraine?

The same applies if you have a wonderful-- a piece of a wonderful business or a piece of many wonderful businesses. People do-- they react too much to short-term things in the stock market, whereas, they behave quite rationally when they get into other investments.

BECKY: Well, Warren, I want to thank you for being so generous with your time today.

BUFFETT: Thank you.

Warren Buffett: We took a stand on Coke's pay package

By Stephen Gandel, senior editor April 28, 2014: 5:00 AM ET

 Recommend 41

In an interview with *Fortune*, Buffett defends high CEO pay, says his successor is a 'he' and says it's time to reexamine the corporate tax code.

PHOTO: PAUL MORIGI/GETTY

FORTUNE -- Last week, Warren Buffett declined to vote against a controversial stock option plan for Coca-Cola's (**KO**) top executives that he thought was excessive. That has unleashed a wave of criticism against the legendary investor and CEO of insurance conglomerate Berkshire Hathaway (**BRKA**), typically a media darling. *New York Times* columnist Joe Nocera **called Buffett** a coward. Shortly after the Coke vote, Buffett sat down with *Fortune* to defend himself.

Despite the criticism, Buffett says he believes he took a forceful stand against the Coke pay package. What's more, he says that he has little power to stop companies from handing out excessive pay. That's a big change from a few years ago, when Buffett wrote that large shareholders like himself were the only ones who could turn back runaway executive compensation within corporate America. Apparently, Buffett and others like him are outmatched as well.

Buffett also confirmed the widely held belief that, at least for now, his picked successor is male. Sorry, **Tracy Britt Cool**.

Fortune: Do you think executive compensation is out of whack with the rest of America?

Warren Buffett: Well, I don't think it is out of whack with the value an outstanding executive could bring. If you run a multibillion-dollar company the difference between a 10 and an eight is huge in terms of value. I don't think it is out of line in terms of entertainers or sports figures. Still, almost on a voluntary basis, I think it should be somewhat restrained in some cases.

MORE: [How Warren Buffett helped save Harley-Davidson](#)

In the past, you have said executive stock option plans are "a free lottery ticket" and "fair only by chance" and that they are compensation plans built for "managerial Rip Van Winkles who are looking to doze off."

All of that can be true.

In 2006, you said that the only way to change excessive executive compensation is if large shareholders like yourself take a stand -- demanding a fresh start. Why didn't you vote against the Coke [option] plan?

I think we did take a stand in abstaining. That's a very loud voice coming from Berkshire. It obviously means we don't approve of the plan.

Why not also abstain in the vote about the directors?

Because I actually think they have a good bunch of directors. What was done with their plan is so much the other guys doing it so we will do the same thing. The idea of fundamentally reexamining the whole thing doesn't occur to these companies, and it's very unlikely to, and their consultants are not likely to recommend it.

And what companies are doing with stock options is capitalizing executive compensation. It is shareholders years from now that are going to pay this expense.

I actually have written -- I may put it in the annual report next year -- a memo to the board of directors of Berkshire as to what I think would be a sensible option plan for the CEO of Berkshire who succeeds me. And he would be -- in this case it would be a he at the present time -- the only one who would receive options because he would be the only one who is responsible for the overall success of the operation.

One of the things Coke has said to defend its plan is that it's not just for its top executives but for its 6,500 employees. But you don't think that's a defense.

No, I don't think that's a defense.

And again, back to the Rip Van Winkle CEOs, according to the Coke plan, the company's return could go down 10% a year, and the executives would still qualify for billions?

It's a royalty on time.

Have you read the new book on inequality, Thomas Piketty's *Capital in the Twenty-First Century*?

I have read about six reviews on it. But not the book.

Are you planning to read it?

I don't know. I have read so many reviews I think I know what it says. I may or may not, but it is the kind of book that there is reasonable chance I will read.

The *New York Times* said recently, based on a study, that you have lost your alpha. Do you remember the last place you saw it, and if I find it, can I keep it?

Lost my what?

Lost your alpha. Your ability to outperform the market.

Yeah. But I think some fellow wrote a response to that. It wasn't me. We'll find out.

David Witt, who had been described as a mild-mannered accountant in Middle America and a Berkshire shareholder, and would like a little bit of his money back. Why won't you give it to him?

I wrote a long essay on dividends and repurchases in the annual report. It was just a year ago. And I explained in great detail why I think he is better off if he doesn't get [a dividend]. We are having the vote now, and you will find it interesting how the shareholders feel about that.

Why do you love paying individual taxes but hate paying corporate taxes?

I will not pay a dime more of individual taxes than I owe, and I won't pay a dime more of corporate taxes than we owe. And that's very simple. In my own case, I offered one time to match a voluntary payment that any Senators pay, and I offered to triple any voluntary payment that Mitch McConnell made, but they never took me up on it.

MORE: [When grads are jobless, schools come to the rescue](#)

Actually, [Berkshire's] tax rate is pretty high if you look at it. But if it could be lower, I would have it lower. I will do anything that is basically covered by the law to reduce Berkshire's tax rate. For example, on wind energy, we get a tax credit if we build a lot of wind farms. That's the only reason to build them. They don't make sense without the tax credit.

In the shareholder letter this year, you talked about a growing problem with public pension plans. What do you think the solution is?

The solution is to either change the promises or tax more. But the trouble is for any given politician he's only going to be there for a year or two. His best solution is to do nothing because he will be gone. And it isn't the kind of problem that you wake up tomorrow and causes the lights to go out or the streets to not get shoveled. It is the easiest problem in the world to postpone.

In Omaha, I would not like to change the promises that have been made to the people who work publicly. So I think we should probably tax more. But that won't work in many municipalities or states. The problems are too big relative to the tax base. You can't tax enough in Detroit to pay the pensions that have been promised. They have gone too far.

What do you think we should do, or should we do something about the offshoring of U.S. jobs, and U.S. corporations not paying taxes on goods they are producing and selling to Americans?

It has just gotten way out of hand because tax rates are so low in certain countries. And there are some companies, particularly when you are dealing with intellectual property, where you can set up a rationale to say your earnings are taking place in Ireland or Bermuda or something like that, when they are really originating in large part here. Those companies pile up huge cash balances overseas, and then they say, Give us a tax free period and we will bring it back. But that would of course just induce them to do more of that over there once they find out they can get away with it. It's a crazy situation, but it has developed over the years. That part of the tax code has really got to be looked at hard at some point.

At last year's annual meeting, you said you were concerned about the Federal Reserve's exit from quantitative easing and their monetary stimulus. How do you think the Fed has done exiting it, and are you still concerned about what might happen?

Well, I said it's a really interesting movie because the stakes are high and we don't know the ending. But I would say that's still the situation. But so far we haven't seen any big problems associated with it.

So are you less concerned about the end of QE?

No. It's still an interesting movie. I don't know how it comes out. That's why I find it so interesting.

Thanks.

Bill Gates, Charlie Munger and Warren Buffett participate in a "selfie" taken by CNBC's Becky Quick in Omaha. In this live interview, Buffett says that based on his experiences with college students who visit Omaha, selfies are "all the rage."

This is an unofficial transcript of Warren Buffett, Charlie Munger and Bill Gates appearing live with Becky Quick on CNBC's "Squawk Box," Monday, May 5, 2014.

BECKY QUICK, CNBC: We are live this morning from the Nebraska Furniture Mart, which is one of many Berkshire businesses. Warren, this business in particular, really sees a huge surge of business on the shareholders weekend. What kind of numbers have come through here and how many shareholders do you think were actually here this weekend?

WARREN BUFFETT, BERKSHIRE HATHAWAY CHAIRMAN & CEO: We'll do over \$40 million in one week here at the Furniture Mart. That's a lot of business. Most furniture stores don't do that in a year, and it's our biggest week of the year. In fact, it's a normal month. We do about \$450 million a year at this store. So it's a normal month, and we do it all in a week. And the stockholders get more excited every year. I mean, I run into people in the elevator a month or two ahead of time. They say thank you for holding the meeting, patting me on the back. They want to come on to the Furniture Mart.

CNBC SQUAWK BOX TRANSCRIPT: Monday, May 05, 2014

PAGE 1 OF 46

BECKY: So you told us before you expected maybe 38,000 people this year. What do you think the numbers were?

BUFFETT: Not any less than that. This was the biggest meeting by quite a margin because we filled not only the main auditorium, but we filled all three overflow rooms and spilled over to the Hilton, and there were people in the exhibition hall. We can never get a perfect count, but I'm sure we beat anything in the past by at least 3,000. And I wouldn't be surprised if we beat it by 5,000.

BECKY: So somewhere between 38 and 40,000 is what you're guessing?

BUFFETT: Yes.

BECKY: Let's talk a little bit about what Joe was mentioning. I had not seen the ten-year (U.S. note yield) yet this morning. He talked about how it was 2.75 percent. Why do you think this is? Is this a sign of concern about what's happening? What would be your guess?

BUFFETT: I don't know. I'm not good on interest rates. One thing I know ten years from now they probably won't be at 2.57 or 3.57.

BECKY: Does it catch your attention, though, when you see the ten-year continue to decline? Most people thought it would definitely would have to go up this year.

BUFFETT: It's surprising, but I'm used to getting surprised in markets. And we issue bonds from time to time. So lower rates are, the more we like to issue them, and the longer we like to issue them.

BECKY: So would a ten-year at this level change any of your behavior in the business? Would you do anything differently?

BUFFETT: No, if it moved up or 50 basis points or down 50 basis points, we would not do anything differently. We don't react to macro factors at Berkshire. Our macro factor is the country will do better over time. That guides us in everything we do.

BECKY: If you had to make a guess right now, would you guess that the ten-year would end the year above or below the 3 percent?

BUFFETT: I don't think about that. If you told me I had to pick a figure, I would pick higher.

BECKY: Let's talk about one of the issues that came up repeatedly at the shareholders meeting, actually it only came up a couple times, but I did get a

lot of questions related to it in my email box where shareholders were sending things in. That's Coca-Cola. Joe (Kernen) already alluded to that this morning. And let's talk about what has happened. I know we've had a lot to say, but there was some criticism. Some people who didn't understand why if you thought Coca-Cola's equity plan was excessive, you didn't say something before the vote and you didn't take your 9.1 percent of the outstanding shares and vote no.

BUFFETT: Yeah. We had no desire, never will have a desire to go to war with Coca-Cola. It's a wonderful company, it's treated us wonderfully, the management has always been totally candid with us. I think we've got the right leader. I'm sure we've got the right leader, Muhtar Kent, but we did think the program was excessive. With those two beliefs we felt the best thing to do was express our opinions privately to the management who listened carefully and to abstain from voting at this meeting. And we think — I know we'll have some very constructive discussions with Coca-Cola between now and when they implement any plan.

BECKY: Barron's out over the weekend, there was an article in the back of it from Carl Icahn. I know you're friends with Carl and you're both on the Giving Pledge together, but this article says why Buffet is wrong on Coke. He's got a different style than you do.

BUFFETT: I hope so.

BECKY: Do you think — first of all, what do you think about what Carl said, and second of all, do you think that your style will be effective in this situation?

BUFFETT: I do think our styles will be effective. And I think our style actually will be more effective than the style that might be proposed by Carl. But Carl moves in other types of businesses and he goes in where — often, at least, he goes in where there's a problem. There isn't a problem at Coca-Cola. There was a plan that was proposed that was excessive. It's very easy to make it non-excessive. All you have to do is spread the authorization over more years than the four years they talked about having it in the proxy. And that's easy to do. Whether it actually turns out to be excessive will depend on the actions they take subsequent to this. They have not locked it in stone that they're going to use the stockholder four years.

I would say generally or frequently, at least, Carl is working with managements with different attitudes, and they probably have a different attitude toward him than Coke has towards me.

BECKY: Have you spoken with Muhtar Kent to this point? When we talked to you Thursday you had not.

BUFFETT: I have not talked to him since the meeting.

BECKY: Since the Coca-Cola meeting.

BUFFETT: Since Coca-Cola's meeting, which was on the 23rd.

BECKY: One other pointed question that came from shareholders this weekend — and I got several iterations of this, too, in my inbox — your son, Howard Buffet, is on the board. He voted in favor of this plan and there were some people who questioned. Howard is expected to be the chairman when you step away from the company to be the protector of the culture there. Does this raise any questions or should shareholders have questions about his ability to protect the culture when he voted for a plan that you, yourself, didn't like?

BUFFETT: Yeah. I voted for plans over the years — I've on the board for 55 years. I voted for plans I didn't like. I actually voted for acquisitions I didn't like. I opposed a few too, but there's only so many bullets you can use in the gun. If you start objecting to this and this and this, pretty soon people don't pay any attention to you. You want to save your bullets for when they really count. And I have never seen a comp committee come into a boardroom, in all my time, and hundreds of times, I've never seen them come in with a recommendation and heard a no vote.

The board delegates to a committee. They say you go out and work on this. They may say to the Governor's committee, you go out and work on getting directors, all kinds of things.

And once a board has delegated to a committee and they've spent hours working on something, and then they report it and there's 20 other items on the agenda and the Chairman calls on the comp committee to give his report and gives it in about 30 seconds, it never gets voted against. And it would be regarded as sort of usurping the power of the committee to all of a sudden say I've got a better idea. I haven't talked to the compensation consultants, I haven't looked at the figures, but I still have a better idea. It doesn't happen.

BECKY: A lot of people have been stunned by your comments on corporate governance. I don't think stunned by what you've said, but that you said it. There's been this idea that boards are clubby, basically come out and said that's the case.

BUFFETT: I've written that for 30 years. I've seen boards operate. It's always interesting to me to read academic discussions of boards. I have this theory — I could be in the movies or something. But boards are in part business organizations and in part social organizations. People walk into those with their behavior formed by dozens of — usually your people have

CNBC SQUAWK BOX TRANSCRIPT: Monday, May 05, 2014

PAGE 4 OF 46

achieved some standing, perhaps, in the community. So they've learned how to get along with other people. And they don't suddenly change their stripes when they come into a board meeting. So there's a great tendency to behave in a socially acceptable way and not necessarily in a business maximization way. The motives are good; the behavior is formed by decades earlier.

And people like to get along with other people, most people. Carl, maybe not as strongly as others. I love Carl, but he may enjoy battle. Some people do that. Generally you don't get invited on boards if you've got a person that actually loves a fight.

BECKY: Your point is that this is not too much different than the rest of the world.

BUFFETT: Yeah, I think that's very true. And it doesn't mean because you don't get into fights that you can't get things done, and it doesn't mean there aren't certain issues that — I've been involved with a couple situations where a proposal to buy a company has come to the board and been shot down. What happens in that case is one person finally pipes up. It's a little like the kid saying the Emperor is wearing no clothes and everybody will come on board. But the first person to speak is like belching at the dinner table. And then sometimes other people start belching and the move away from you. Depends on the situation, but there are some people that have bravery to be followers in a situation like that but not to initiate it. You've seen that in other aspects of human behavior.

BECKY: Andrew has a question from back at CNBC headquarters, too. Andrew?

ANDREW ROSS SORKIN, CNBC: I was going to say it's remarkably honest what Warren is saying. The question is whether it should be this way. Whether from the outside there's a sense that people are more strident in the boardroom, more brave or willing to come forward, or that the social issues aren't supposed to impact the way people behave or the way they think. Even though of course they do. I hear you saying this is what happens. My question is should it happen this way?

BUFFETT: Well, no, obviously you know everybody would speak freely and all of that sort of thing, and dialogue would be encouraged and the chairman would love to hear reasons why his ideas were no good, but it isn't quite that way.

And I think it's probably — you will get some of that. I will give you a great example. I mean, we bought \$700 million worth of Solomon Preferred in 1987. It was a big investment for Berkshire.

Charlie and I were put on the board. Our preferred was convertible at 38 because the stock had been selling in the mid 30s.

We went to the very first board meeting, was right after October 19th, 1987, here we are two brand-new directors. One of the first items on the agenda was the change, the option price of all the options outstanding at Solomon from prices in their 30s, down to \$17 a share. Nobody proposed to change our conversion price from \$38 down to 37.50, but the \$35 options the employees were getting — including the people sitting at the table were going to get changed down to \$17 a share. Charlie and I voted for it. We probably mumbled our vote. But those things happen. And we later on objected to a few things at Solomon, too. But you can't object a lot.

And bear in mind, too, Andrew, this is important. There are a number of directors at any company that are making two or three hundred thousand dollars a year, and that money is important to them. And what they really hope is they get invited to go on other boards.

Now if a CEO comes to another CEO and says I hear you've got so-and-so on the board, we need another woman or whatever it may be, oh, she will behave.

If they say she raises hell at every meeting, she's not going to be on the next board. On the other hand, if they say she's constructive, her compensation committee recommendations have been spot on, et cetera, she's got another \$300,000 a year job. That's the real world.

ANDREW: One quick follow up. In the Wall Street Journal this morning, they were pointing out a comment you made in 2009, when you talked about speaking out on the most egregious cases of CEO compensation, and you said quote, the way to get big shots to change their behavior is to embarrass them. I was hoping you could try to explain the distinction between what you were talking about then in 2009 and, perhaps, this Coca-Cola situation today.

BUFFETT: Well, I don't really want to embarrass the Coca-Cola Company. I like the people and everything. But I think perhaps if you ask some people, I don't know whether they use the word "embarrass," but they would prefer I didn't do it, I'm sure.

Like I say, I used that word in 2009, so I'm stuck with it. I wasn't looking to embarrass them, but I was certainly looking to have them reexamine what they're doing. They're in a great position to reexamine it, because they haven't used a share in this authorization yet. And even though they said in the proxy statement that they expected to use it over four years, that could easily be changed.

They generally issue, I believe, their options in either January or February. So they have a lot of time to think about what's best. And they are. The one thing I can guarantee you, they are decent, high-grade people. They will do what's right. But I don't believe the best way to do that is to go to war with them.

BECKY: Warren, if I could ask just quickly, you said in the past there have been deals that you've shot down. My first thought is to Quaker Oats and Coca-Cola. How did that happen?

BUFFETT: Well, it got very public and basically the management sort of let the world know that Coca-Cola was buying Quaker Oats. And there was a meeting rather hastily called in New York, and directors went into that room. And I was not the first one to say that giving away 11 percent or so of the Coca-Cola Company to obtain Gatorade primarily, although a bunch of other foods came with it. But Coca-Cola really didn't want the foods, they wanted Gatorade.

We thought the first proposed opposition to it, I should say, said he didn't think that mathematically made sense, to giveaway 11 percent of Coca-Cola to get a single product, Gatorade.

I had come into the meeting feeling the same way. I just didn't speak first in that case. Then I spoke, and by the time I got through, the deal did not go through.

BECKY: And the whole table was belching?

BUFFETT: Most of them were belching. It was sort of a belching contest there. And the company had the whole thing to go through. The press people were there. It was in the evening, as I remember. Everybody was on deadline, and, you know, let's get this done.

There's usually that sort of momentum attached to any deal. You can't oppose five in a row. I mean, you become totally ineffective at that point. But that was a big deal. And a number of the directors had reservations about it, and that became apparent as this first director spoke up. But the other ones probably wouldn't have spoken up.

BECKY: Including yourself.

BUFFETT: I'm not sure. But we won't know that. I think I probably would have. I mean, that was not a deal that made sense to me.

BECKY: Okay, Warren, if you'll bear with us. We have to take a commercial break. But we have much more to come with Warren Buffet. We will be back after that very quick break.

Also starting at 8 a.m. Eastern time, Berkshire vice chairman, Charlie Munger, and Bill Gates will be our special guest. We will be sharing a stage. All three of those gentlemen will be with us live.

Andrew, I'll send it back over to you.

ANDREW: Okay, Becky.

(Commercial break)

BECKY: Okay. Thanks, Joe.

We are back again with Warren Buffett. And, Warren, after the shareholders meeting this weekend we talked about how they were thirty-eight to forty thousand shareholders here. There are always a number of interesting people to see in this audience. Kathy Ireland was there with you tossing newspapers on Saturday morning.

BUFFETT: She was a newspaper carrier herself.

BECKY: Right. She did a good job. Bill Ackman was here, David Winters, the glitterati of the financial world. Mario Gabelli, also Jorge Paulo was here from 3G. I ran into him a couple of times. The partnership that you with 3G when it comes to Heinz — first of all, how is Heinz doing? And second of all, would you do more deals like this with 3G with Jorge Paulo.

BUFFETT: Yeah. The Heinz deal is going well. Is that doesn't surprise me at all. We would not have done Heinz by ourselves, certainly at that price. There is no one I'm more impressed with than Jorge Paulo. I will add his associates in terms of their operating abilities. The chance to join him was terrific. I would love to join them again.

One thing I like about them, is they think big. They're likely to come up with a big one some day. Maybe next year, maybe the year after, who knows when. And I think if they need some financial — a financial partner, I think they'll do it with us.

So it's a big plus for Berkshire to have an association with Jorge Paulo, and his associates.

BECKY: Is there anything the two of you are cooking up right now?

BUFFETT: Well, he does the cooking and I do the tasting. His mind is incapable of not thinking about possible deals. And we will not do anything ever hostile at all, that's ruled out. But when the phone rings and they say it's Jorge calling, I feel good.

BECKY: So he was here this weekend. We talked about that. How much cash do you have on hand at Berkshire now?

BUFFETT: Well, counting everything except the regulated subsidiaries, we have probably have around 47 billion, something like this.

BECKY: You like to keep 20 billion on hand, so that still gives you 20 billion to play with.

BUFFETT: Yeah, and we could raise more pretty fast.

BECKY: How?

BUFFETT: We could raise them by debt, but we can also raise them by selling securities. We have well over 100 billion in securities. We have over 150 as far as that's concerned. But we could come up with — I like to be challenged on that.

BECKY: If that were the case, if we did have to come up with some money quickly because you saw a deal you really liked, what would be the security you would sell first?

BUFFETT: Well, if we had to do it very quickly, we might borrow some money and sell securities over a longer period of time. But we would look at the prices of the securities, which change daily, and we would look at what I think about the companies, which doesn't change daily but does change over time.

And if we needed a lot of money, we would have to be looking at some of the bigger things. But since I don't have a deal today, I don't have to think about what I would sell today.

BECKY: Just to get to some of those securities that you do own, you mentioned over the weekend that you met recently with Mary Barra of GM for lunch.

BUFFETT: Right.

BECKY: What did you think —

BUFFETT: I just met her at a conference.

BECKY: At that the Fortune Most Powerful Women conference?

BUFFETT: Yeah, exactly. And that was the first time I'd seen her. I don't own that stock, personally, at Berkshire. One of our two managers does.

But Mary was there, and I think she's terrific. She can run a company at Berkshire, that's for sure. She loves cars. I told her she was a car guy. Just all the way through, and she knows cars. Every aspect of it that you get into, she knows the impact, the tradeoffs involved between weight and style and price. I mean, she just has cars down forward and backward. And she loves General Motors. Her father was there a long period of time. She's made for the job.

BECKY: Have you had any concerns about the GM recall news? Obviously that happened before her time. Anything that made you reconsider whether you own the stock right now?

BUFFETT: Well, again, it wouldn't be my decision. Actually, it's Ted Weschler's decision, but she inherited a mess, and it's not a small one. It's a particular concern to the American public because the government did save General Motors in 2009, and these events which happened prior to that. But General Motors is in the forefront of most Americans. Buying cars are important to them.

So Mary is basically on a hot seat. But it's not a seat of her own making. I don't think there's anybody that will be better at handling it. It won't be handled in a week or a month. It's the nature of problems like that to go on a while.

BECKY: Warren Buffett is our guest host. We will have a lot more coming up. We'll send it back to you guys.

(Commercial break.)

BECKY: Welcome back, everybody. We are with our guest host today, Warren Buffett, life in Omaha at the Nebraska Furniture Mart.

This weekend for Berkshire Hathaway is a lot of business, Warren, a lot of serious talk that comes out, but there's also some fun time. Yesterday you spent the day going to Borsheims and selling jewelry yourself.

BUFFETT: A couple hours.

BECKY: And the first thing you did —

BUFFETT: Crazy Warren, my prices can't be touched.

BECKY: So you were selling yourself. You also spent some time playing a little Bridge and playing some table tennis, ping-pong. I want to show you this shot. You were going up against Ariel (Hsing.)

BUFFETT: Yes, she is the women's national champ and played in the Olympics and won a couple matches.

BECKY: You got the great shot off. You said forget it. I'm sitting down. You get a shot on Ariel and you're out, right?

BUFFETT: One great shot a year.

BECKY: There has been a lot of stuff that we talked about that has been very serious business, though. One of the things that come up was another one of your holdings, Bank of America.

Bank of America very recently had to pull back their plan to increase the dividend and buy back more shares because there was a mess up in the regulatory capital. They were off by a big number. Was it 4 billion?

BUFFETT: Something like that.

BECKY: About \$4 billion. I just wonder, as a shareholder, as someone who has a big stake in the company, did that concern you?

BUFFETT: No. The answer is no. It did not affect the Gap net worth, the GAP earnings or anything of that sort. And, actually, the change they're making with our preferred adds 5 billion to regulatory capital.

BECKY: Really?

BUFFETT: Yes. They are changing our preferred from a cumulative preferred to noncumulative preferred, and that changes that category of capital by 5 billion. I'm not saying that's a good reason for making the 4 billion error.

I've made mistakes. We've made mistakes. It doesn't involve any loss of money or anything. It's structured debt that they acquired when they took over Merrill Lynch.

Again, after I took over Solomon — Solomon was a merger I took over in 1991. When I took over, there was a plug item in the balance sheet. Some item that floated around every day. And that was because they had not been able to find — they had not been able to reconcile the books since 1981, ten years earlier. And Arthur Anderson were our auditors. They came in and explained to me as the new CEO, you'll see this 180 million or whatever it is, move around different amounts. But don't worry, someday we'll figure it out.

BECKY: Did that concern you?

BUFFETT: Sure, it concerned me. One of the companies had been on a cash basis and one on a trade-day basis and somehow they never got it worked out.

We had a situation in our savings and loan many, many years ago where we couldn't work it out. So we just ran out the bank account and started all over again.

BECKY: So you're not concerned. You think Brian Moynihan is doing a terrific job?

BUFFETT: I think Brian Moynihan is doing a terrific job. He's got a lot of problems to deal with, not of his making. He's just methodically worked his way through. And one of the problems is when he thinks he's worked his way through, there's a few more.

He's done the right things. He's simplified the bank dramatically, brought down the balance sheet. He's brought it back to the fundamentals. Bank of America has a wonderful deposit franchise, and it will do well over time. When I first bought the stock, when I was talking to Brian, I said you have a long period ahead of you. You'll work through all of this.

BECKY: Our guest host this morning is Warren Buffett. We have a lot more to talk about with him.

Coming up we are also waiting on quarterly results from Pfizer. We'll break out those numbers as soon as they're released.

Plus, we have two more headliners to our set right here at the Nebraska Furniture Mart in Omaha. Berkshire Hathaway's Charlie Munger and Microsoft's Bill Gates. Both of them, of course, board members at Berkshire Hathaway. They will be joining us starting at 8 a.m Eastern time.

"Squawk Box" returns right after this quick break.

(Commercial break.)

JOE: Let's get back to Becky in Omaha with special guest, Warren Buffett. I know Andrew mentioned that the "I" word, inversion, was discussed a little bit out there as well, and I'm sure in the broader context of what we should do here with corporate taxes and the whole tax code. Anyway, Becky, back to you.

BECKY: Joe, let's jump right into that. Pfizer is a good jumping off point for all of this. Warren, I know we've talked a lot about some the merger and acquisition activity. It's a little different this time around.

CNBC SQUAWK BOX TRANSCRIPT: Monday, May 05, 2014

PAGE 12 OF 46

Some of the acquiring stocks have actually risen on some the news. But what's really caught our attention are situations like Pfizer, where Pfizer buying AstraZeneca, it has said that it would move its tax domicile if this deal goes through to the UK because they would be paying a lower tax rate there. What does that tell you about business, what does it tell you about the U.S. tax code, the corporate tax code?

BUFFETT: We're getting more mergers that are tax driven, and that's one of the reasons maybe the acquired stock goes up because you're actually talking not only about buying a business, but you're talking about bringing down the tax rate for the acquirer. And that's been coming along to some degree. You saw insurance companies go to Bermuda and you've seen Valiant pull off a number of these, and my guess is that as Valiant is going along, the people at Pfizer are probably just thinking, this is getting out of hand. We've got to bring our tax rate down too.

So it will gather momentum, and my guess is that when you get to companies of this size, this prominence, and with this speed-up of momentum, my guess is that Congress one way or another addresses this. But that could go either direction in terms of how they address it. And whether they just try to work on this little aspect of the code that allows this, which is not insignificant, or whether that forces them to rethink sort of all corporate taxes, we'll find out. But I do think it's going to get attention.

BECKY: The president has already put it in his budget for this year. It's not been closely focused on, except for potentially by some of these companies that are considering doing these things. The president has proposed to make it tougher to move your tax domicile. Right now if you have 20 percent of your shareholders outside the United States, you're allowed to do that, but the president has proposed moving that up to 50 percent. Some people look at that and say, wait a second, why don't you just deal with the tax code overall and make it a little more attractive for people to be here rather than moving somewhere else?

BUFFETT: Well, that's the fight that's going to go on, and —

BECKY: What's the right move?

BUFFETT: Well, everybody talks about tax reform. People love to use the word tax reform, and very few people are for tax reform that

increases their own taxes. They have all kinds of other things that they don't like in the code for helping other people, and they want to get that corrected. But I have yet to hear from anybody pretty much that wants to — equates tax reform with some set of proposals that increases their own taxes. And this whole thing on the foreign situation I think will cause one hell of a fight in corporate America.

BECKY: But you're talking about a policy that right now pushes companies like Pfizer that pay a relatively high tax rate, 27 percent, and pushes them away. It keeps the people who maybe aren't paying rates nearly as high. Isn't that an argument for simplifying the tax code, not handing away as many incentives or advantages to other people, and getting everybody to pay, like Simpson-Bowles suggested, closer to 28 percent?

BUFFETT: Yeah, you'd like to get everybody the same. We'd like to see that, but that's because we're paying more than 28 percent, bring us down. And somebody who's paying 20 percent — and I can name a lot of companies — they're not going to like it if that activity brings them up to 28 percent. So if you go for something that's revenue neutral, a lot of companies are going to get hurt, and they will probably squeal more than the people who are getting some benefit out of the changes.

I think there may be enough action going on now that despite what I've said, you will get some new resolution of the situation on corporate taxes generally beyond the question of just foreign tax rates. But it will take a lot, because as soon as company X's taxes are going to go up a couple points pro forma under some new proposal, they will have lobbyists lined up in Washington that will stretch to Baltimore.

BECKY: Andrew, you have a question, too?

ANDREW: Well, it was a question that I wanted to follow up with Warren on, which is that we asked a question of you on the panel over the weekend at the meeting whether Berkshire would ever pursue a deal like what Pfizer is doing, an inversion of some sort, and you said no. And I ran into a couple investors who wanted to know why wouldn't you do it. If, for example, I think you pay about \$8.9 billion in taxes last year. If you could take that number down to \$7 billion or \$6 billion, you couldn't come up with a rationale for why that would make sense from a shareholder perspective?

CNBC SQUAWK BOX TRANSCRIPT: Monday, May 05, 2014

PAGE 14 OF 46

BUFFETT: Well, for one, we do not come close to having 20 percent of our shareholders outside the United States, and you know, it might require me moving. I'm not sure that Charlie moving would get the job done.

So I ... I'm being half facetious with that. We do not feel that we are unduly burdened by federal income taxes. But it does get a little annoying to us when we see other people paying far lower tax rates while engaging in the same sort of business that we engage in. But Berkshire operated under 52 percent tax rates and 48 percent tax rates, and we make a lot of money under U.S. tax rates.

JOE: Warren, when you talk about the 20 percent, we've talked about this a lot too, a lot of companies have been induced to move operations overseas by the tax rate, and the 20 percent represents a blended rate that they're now paying because they've already reacted to what they see, so that's one thing.

Number two, I've been told that the president, in corporate tax reform, won't go for anything that is even revenue neutral. He wants to actually raise revenue in any type of reform that comes from corporate taxation. And you just mentioned that to keep it revenue neutral, taxes are going to go up on some companies, maybe they'll come down on other ones, so some people will like it, some people won't.

That sort of implies that this level of revenue right now is appropriate, which sort of goes against — I think that it goes against — in other words, the total number that we take from our corporations, if we need to keep it revenue neutral, then that means that our corporations are not overtaxed as far as the big picture goes. Who's to say that right now — I mean, there is another side that would say that corporations right now are competitively disadvantaged globally because they're just too high. So in fact if it's not revenue neutral, if it actually lowers taxes for the entire group, that that's not necessarily a bad thing, that would bring us more in line globally. And then you could get people signed on because most corporations would have lower taxes. Am I wrong?

BUFFETT: If you want to take corporate taxes down, just tell me again whose taxes you want to take up in terms of keeping the overall —

JOE: I don't want to keep it. I'm saying that we don't need to keep it neutral, that it should be a lower amount, because we're disadvantaged now globally because it's too high.

BUFFETT: Joe, we do almost \$200 billion worth of business, and we pay normal rates on most. We have certain deals that are tax advantaged in terms of wind power and solar power. We are not at a competitive disadvantage with the rest of the world at Berkshire Hathaway —

JOE: Some companies are. Some are, and that's why they're doing some of these things, right —

BUFFETT: They're doing it to pay even lower taxes. Pfizer is a very profitable company. You look at the return on net tangible assets at Pfizer. It's terrific. They'd like to make even more money by not paying taxes. But they have a wonderful business paying U.S. corporate tax rates, and all you have to do is look at —

JOE: I don't know what profit's fair and what isn't. I don't know whether they make too much or they make too little. But if we're leaving trillions of dollars overseas and they're induced to do this and they're moving headquarters, and other companies that have lower tax rates can come in here and buy our assets because they can offer more money than domestic companies can, none of these things seem like it's the optimal way for us to be competing globally at this point.

BUFFETT: On balance, American companies have bought more foreign companies in the last 20 years than vice versa. So we have actually been net investing over there.

But beyond that, if you look at corporate taxes as a percentage of GDP, since World War II they've come down from 4 percent to about 2 percent. In fact, under 2 percent. That's while corporate profits have been hitting record levels. So if you look at the budget of the United States, individuals have paid more taxes, corporations have come down from 4 percent of GDP to 2 percent of GDP. No other group has come down as much percentage-wise as corporations. Corporations are doing fine in the United States.

JOE: We should acknowledge that then and not worry about it, but it does leave trillions of dollars that would be — we could bring it back and use it for infrastructure.

BUFFETT: They could bring it back now. They just don't want to pay the tax. And if you let them bring it back cheap, they're going to try and make even more over there with the idea they can bring it back cheap.

JOE: I know. That's why you need to change the overall rate. Go ahead.

BUFFETT: The number one industry with cash over there is the tech industry. There isn't a tech company I know of the major companies making lots of money that has got the least bit of a problem in financing their businesses. What they would rather do is borrow the money here and as Amazon — as Apple's doing. But that's because they've got loads of cash. They'll borrow it here, they'll borrow it very cheap. But they do not have a need for cash for their business. They have a need for cash to repurchase shares because the shareholders are pushing them for it. But they are not using that money to build plants and equipment in the United States. They are using it to repurchase shares.

BECKY: Warren, you yourself said that it's okay to follow the tax rules and not get out of taxes entirely, but if you can avoid taxes by doing something differently. In fact, you've done some deals recently, including the sale of the Washington Post shares that were tax advantaged.

BUFFETT: Sure. We've never lobbied for a tax advantage. But in terms of the tax code, we do not figure up our tax return for the year and then add a tip of 15 percent like on a restaurant check. We pay what we owe. And by paying what we owe, we've earned substantial returns on capital. We've never foregone a capital investment because we were here in the United States instead of some foreign country. And we've bought foreign businesses.

JOE: The *(Wall Street) Journal* today says the only reason that you're building wind farms at all, you know they're not economically feasible, is for the tax breaks.

ANDREW: He said that over the weekend.

CNBC SQUAWK BOX TRANSCRIPT: Monday, May 05, 2014

PAGE 17 OF 46

BUFFETT: We've said that publicly for years.

JOE: That sounds like taking advantage of a little line here, line there in the tax code to actually invest and to have a whole wind farm unit just based on the tax advantages. That doesn't seem like in keeping in the spirit of the law.

BUFFETT: No, it is in keeping with the spirit of the law. The U.S. Congress decided that they wanted to encourage wind farms, they wanted to encourage solar, they wanted to encourage low-income housing. And all of those proponents of the law, actually it was President George Bush, 41, that had me in the Oval Office to congratulate me because we were investing in low-income housing tax credits.

JOE: Why do you make a distinction between that and what some of the U.S. companies are doing when it comes to an inversion?

BUFFETT: Well, I think they can do it with an inversion if they want. I think that is one that's likely to get — I'm not saying they're doing anything illegal at all in following the rules on inversion. I would personally change that part of the law. And other people might change the part of the law about wind tax credits, but I'm not attacking Pfizer for following the U.S. tax law. And that provision wasn't even put — I'm sure it wasn't put in there because of Pfizer. I'm just saying that it's probably a mistake to have that part of it. And people can argue whether it's a mistake to have the wind tax credits. But American business, I will tell you, whether it's Berkshire Hathaway or Pfizer or Apple, are doing wonderfully under this tax code and are not short of capital in any way, shape or form, or are having any trouble competing. Now, you can make other arguments for changing the tax code, but you can't really make those arguments, in my view.

BECKY: Great. We will continue this conversation. We do have a lot more with Warren Buffett. Guys, I will send it back to you. Also coming up at 8 a.m. Eastern time, we should point out, Berkshire Hathaway Vice Chairman Charlie Munger and Microsoft Founder Bill Gates will both be joining us live right here on the set with Warren Buffett. Andrew, right now, though, I'll send it back to you.

(Commercial break.)

BECKY: Thank you. Guys, again, we are spending the morning with Berkshire Hathaway Chairman and CEO Warren Buffett. Warren, one of the things that I saw last night, kind digging online, was an article in *The Economist*, where they suggested that maybe you should break up Berkshire Hathaway, that for your successor, it would be easier to run the company if it were smaller or broken into pieces. What do you think about that idea?

BUFFETT: Well, there are real advantages to having the company together. I mean, one big advantage is the ability to allocate capital from businesses where it can't be used effectively. Maybe frozen capital can be used effectively, but incremental capital has very little value and we can move that over to other areas, which have capital needs beyond the amount they're generating themselves. So capitalism is about capital allocation. The whole idea is putting resources in the right places. And we've got the ability to look at 70-plus companies, various industries and everything else, and allocate capital wherever it makes the most sense. And most companies, if they're in the XYZ business, they feel that they look at the opportunities in XYZ and if they can't find any good ones, they may do some ones that aren't quite so good. And if they need capital, if they have to go to capital markets and incur the expense of that. So we have a seamless, very efficient way of rearranging capital among businesses, which in aggregate will spend like 12 billion on capital this year.

BECKY: You and Charlie Munger, your partner, are incredible capital allocators. You have proven that over decades and decades of time. It does raise the question, though, what are you doing to prepare your potential successors to make sure that they are equally good at allocating capital?

BUFFETT: The board will not put a person into the job as CEO of Berkshire that they don't think is terrific at allocating capital. And the candidates we have, I've got no worries about. There are plenty of people that are very good at something else and might meet a lot of the tests, but would not meet the capital allocation test and they should not be in the job.

BECKY: Is there an argument, though, that any potential successor spend time at more than just one unit, simply from the perspective that you don't want to look at that unit as the best place always just to make sure you get a broader view of the business.

BUFFETT: You want somebody in the top position that doesn't have favorites, doesn't have anybody on the blacklist, that doesn't feel way more comfortable in putting capital in area A than area B. But really, looking at it from the standpoint of the Berkshire shareholders and saying, where can this money be used best? And that money may be used in repurchasing shares.

BECKY: I was just going to bring that up. The other idea is that you want somebody who is allocating capital to businesses you own, but when there's not money that's put there, you would go out and buy other stock. So now you're going to have more than one person who's making that decision. (Portfolio managers) Todd (Combs) and Ted (Weschler) have been in the position of looking at stocks. How does that work? Is it a triumvirate?

BUFFETT: Here's a big plus. They're not the bosses, but we will have a lot of money in not only stocks, but bonds, various forms of securities. And we've got two terrific people to carry out that function. They will not be the Chief Executive Officer, but they will be there to help the Chief Executive Officer in that arena. Just like people that run given business are there to help in their areas. But the chief executive should think exactly like an owner. And an owner is trying to figure out where to put the capital to best advantage and we will generate a lot of capital. So it's a very important function.

BECKY: Todd Combs and Ted Weschler are the two individuals you've been talking about. There were several questions raised by shareholders this weekend, wondering when they were going to get to hear a little bit more from Todd and Ted. What do you think? Would they be in a position of maybe taking questions at an annual meeting down the road, too?

BUFFETT: That's not impossible. They're not publicity hounds or anything of the sort, and they like managing money. And the record of how they do on that will be available for the shareholders to see. But they are not interested at all, for example, in talking about their investment ideas. Why should they be? They worked hard to develop them. They're not about to pass them out.

BECKY: We're going to continue this conversation in just a moment. But Joe, Charlie Munger is here, he showed up early, so we're going to put him on the set when we come right back.

JOE: Excellent. That's going to be fun. And Warren has said that Charlie is doing very well in middle age, flourishing.

ANDREW: Can I tell you, he's amazing. This weekend, I mean, it's inspirational. He's sharper than anybody at this table.

JOE: Well, that's a low bar, as we've said many times. More Warren Buffett still ahead. And we have a special guest coming up in the next hour. Microsoft Founder Bill Gates is going to join us. He's a member of CNBC's top 25 leaders over the past 25 years in business. We're going to talk tech, the legacy of Microsoft, and of course, his plans to change the world. "Squawk Box" is coming right back.

(Commercial break.)

BECKY: We are spending the morning with Berkshire Hathaway chairman and CEO Warren Buffett, and now we're adding another special guest, Berkshire Hathaway vice chairman Charlie Munger. Charlie, it is a pleasure to see you this morning. Thank you so much for joining us.

CHARLIE MUNGER, BERKSHIRE HATHAWAY VICE CHAIRMAN: I'm delighted to be here.

BECKY: People come every year because they want to hear the two of you on stage together. I talked to so many shareholders this weekend about it. You guys have been doing this together for how long, being on stage, taking questions from the shareholders?

MUNGER: Mostly 50 years, more or less, isn't it, Warren?

BUFFETT: Yeah, about that.

BECKY: So I guess my question is other than being a year older for all of us, what's different or what did you learn this year, because I know the two of you say that you learn something just about every day? Did you learn anything this weekend?

MUNGER: I think you always learn something, but it's hard to put a finger on it. I very seldom have an ecstatic moment, like Archimedes.

BUFFETT: I always learn something. One of the things that I have fun with, I have a lot of fun with, is the annual meeting is just getting up there and hearing what Charlie's got to say.

BECKY: I was going to ask you this. Do you ever talk about it in advance?

BUFFETT: Never, ever.

MUNGER: Preparation would be cheating.

BECKY: You two have perfect comedic timing. Has it gotten better over the years? Did you hit that off the first day?

MUNGER: We are natural wise asses.

BUFFETT: That's what attracted us to each other.

BECKY: I've heard the story before, but I know a lot of our viewers haven't. You two met, Warren, when you were 29, and Charlie, you were 35?

BUFFETT: Correct, yes.

BECKY: Can you tell us a little bit about that meeting?

BUFFETT: It was at a local dinner, our wives were there, and after about five minutes Charlie was rolling on the floor laughing at his own jokes. I've been known to do that myself. There's not many guys like us in the world, so I better hook up with him.

BECKY: What is it that you two share in common. What similarities do you think you have? Charlie?

MUNGER: Well, the Omaha background, and I think we're both very intellectually curious. We both kind of like competing in games. And I think we both love ideas. And I like to ask Warren what he wants to be remembered as, and he says a teacher. Who else in America who is a CEO says he wants to be remembered as a teacher? I like it.

BECKY: Charlie, what do you want to be remembered as?

MUNGER: Well, I wouldn't mind being remembered as a teacher, but I won't be. (Laughter)

BUFFETT: I think he will be.

MUNGER: I may be remembered as a wise ass.

BECKY: One of the things I've always wondered is how Berkshire Hathaway really works with the Chairman and the vice chairman. How often do you two talk? Because, Charlie, you're in California.

MUNGER: Way less than we used to because we know what the other thinks. We're not wasting a lot of time checking what we already know.

BUFFETT: We're like an old married couple. We just sort of grunt at each other, but we know what the grunts mean. But originally, and this is when phone conversation was fairly expensive and we were not rich, we would talk for hours a lot of days. But now we may talk once every two weeks or something like that.

BECKY: You did say, though, Warren, that you spoke with Charlie about the Coca-Cola decision before you came to any conclusions.

BUFFETT: Right.

BECKY: What did you two think about that as you were talking?

MUNGER: It took about ten seconds.

BECKY: Really?

MUNGER: I do not find that a difficult decision.

BECKY: The abstention or the —

MUNGER: I thought he did it just right. He complained a little, but not too vociferously. I think that was just the right tone, and with compliments which were deserved to the management of Coca-Cola. I thought he handled it perfectly.

BECKY: Let me ask you two about the acquisition that you just did. There was a \$3 billion acquisition that you announced for Berkshire

Energy last week. Do you guys talk about everything that comes through?

MUNGER: That wasn't even talked about by me.

BECKY: What do you mean?

MUNGER: Warren and (Berkshire Hathaway Energy CEO) Greg Abel did that one. My guess is Warren didn't talk about it for more than a minute or two.

BUFFETT: That's true. I got the facts on it and I liked the deal and I knew Charlie would like it. So why waste a phone call?

BECKY: So that's a \$3 billion acquisition. What kind of rates, as the level that you think, oh, I really need to talk this through with Charlie?

BUFFETT: Well, usually if I talk it through it's because down deep I know I might be doing something dumb, and he'll tell me.

BECKY: Warren, you said over the weekend that you're probably more inclined towards actions than Charlie is. Charlie, you had a response to that.

MUNGER: Well it depends on the action. We're both very action pro when it's obvious.

BUFFETT: Depends on what kind of margin!

BECKY: But you said over the weekend that he's called you something before.

MUNGER: The Abominable "No" Man. He likes that. Kinda kidding.

BUFFETT: When we talked on a Thursday night about doing Burlington, Northern Santa Fe, and Charlie was on board, and you know, immediately he thinks, he sees the facts so fast and thinks so fast, and he doesn't waste any time making arguments just for the hell of it, you know, that are speeches or anything like that. I would say that the quality that we share is that to a great extent, we're rational. And we don't waste a lot of time exploring things that are just nonsense.

BECKY: What is something that you thought was going to be a great idea until you talked to Charlie?

BUFFETT: Well, if you go back far enough, I called him one time on the Pittsburgh and West Virginia Railroad. This is 40 years ago. I said, Charlie, do you think we ought to put a lot of money on the Pittsburgh and West Virginia Railroad? And Charlie said to me, Warren, if you've studied it carefully, and you think you know all the facts, you're going to pay attention to it, if you're going to put a lot of your own money in it. He said, then I'll just shut my eyes and say no.

BECKY: And was he right?

BUFFETT: He was right. That's the irritating part. If you take the batting average of the times we disagreed, he's been right a very high percentage of the time.

BECKY: Charlie, I know that you are in California now, but you make it out every year for this meeting.

MUNGER: That's my hometown. I like coming.

BECKY: What's important to you about being here and about seeing the people at Berkshire?

MUNGER: Well, it's a very remarkable experience to go back to your hometown every year as part of something as big as Berkshire, which keeps getting bigger and more admired as the decades go by. It's very pleasant.

BECKY: You two have been excellent about knowing your circles of competency. There was a question from a shareholder this weekend asking how they could identify their own circles of competency. Charlie, do you have any advice to anybody who's trying to figure that out themselves?

MUNGER: Well I'm really better at determining my level of incompetency and then just avoiding that. And I prefer to think that question through in reverse.

BUFFETT: He likes to invert. He says, all I want to know is where I'm going to die so I'll never go there. I mean, that's his approach

generally is casting out a whole bunch of things. He's good at pointing out where my levels of competency ends.

BECKY: And Charlie, honestly, for somebody who was trying to figure that out, how do you know when you're getting out over your skis?

MUNGER: All I can say is we have a good batting average, and that is probably because we're probably a little more competent than we think we are. There's some modesty in what we're doing.

BUFFETT: It probably is very useful. There's a lot of reasons why the partnership works. But to have someone that you respect enormously say, you know, you're really out in an area where you don't belong, Warren. I mean, I will pay attention to him when he says that, and he'll say it.

So there's real utility in our functions together, for one to simply just say, are you sure you know what you're talking about?

BECKY: That raised another question at the shareholders meeting. I mean, you two work so well together. When you look at a potential successor for the CEO position at Berkshire, how do you help them along the way to try and make sure that they find someone who they can work equally well with and who can also point out when maybe they're making an incorrect decision?

MUNGER: I hardly know anybody who's done very well in life in terms of cognition that doesn't have somebody trusted to talk to. Einstein would not have been able to do what he did without people to talk to. Didn't need many, but he needed some.

You organize your own thoughts as you try and convince other people. It's a very necessary part of operations. If you had some hermit sitting on a mountain, he wouldn't do very good.

BUFFETT: And Charlie, by the way...

MUNGER: We have some of those, and they aren't very good.
(Laughter)

BUFFETT: Charlie will always emphasize the fact that we ought to state the other guy's case as well as he can and better than he can if possible. That's when you get to where you can think through your

own case better, and that may be his legal training to some extent. But he starts out stating the opposite case.

BECKY: Gentlemen, we are going to continue this conversation in just a moment. Andrew, I'll send it back to you.

(Commercial break.)

BECKY: Welcome back to a special edition of "Squawk Box".

We do have some breaking news just hitting from the retail company Target. Target is saying its CEO Gregg Steinhafel is stepping down. His resignation takes effect immediately. In his resignation letter he says that Target has faced some unprecedented challenges in recent months, most notably that massive data breach where millions of Americans' information was briefed. And this all happened over the holiday season, started right around Thanksgiving, went through early December. And that is something that the stock took a huge hit on. Steinhafel says that he's been focusing on ensuring Target emerges from the data breach as a better company, and that now is the right time for new leadership.

Target CFO John Mulligan is going to be serving as interim CEO until a permanent successor is found. It also says that Roxanne Austin, who is a current member of Target Board of Directors, she has been appointed as the interim nonexecutive Chair of the Board. They say both will be serving in those roles until their permanent replacements are named.

The company also says that they've asked Steinhafel to serve in an advisory capacity during that transition and that he has agreed. The board says it's deeply grateful to Gregg for his significant contributions and outstanding service for his notable 35-year career with the company.

But our guest hosts today, again, Charlie Munger and Warren Buffett. Gentlemen, the news on Target comes not only after the data breach, but also after Target's expansion into Canada. That is something that has been a target for analysts who have said that that was the wrong move. You two have an awful lot of experience when it comes to retail.

BUFFETT: We have a lot of awful experience, actually.

BECKY: You guys have a long history with the department store and other stores. But Charlie, you're still on the board of directors at Costco.

MUNGER: Yes, but I'm not running it.

BECKY: But I wonder what you two think about news like this. Target has had a rough run over the last six months or so.

MUNGER: Well, I think these data breaches are so likely that we'll see more of them, and I don't think the CEO is necessarily at some terrible fault.

BECKY: I wonder if this has more to do with the Canadian expansion than the data breach itself, because Steinhafel has come out and tried to be very forthright.

MUNGER: I think Warren and I can match anybody's failures in retail.

BUFFETT: Yeah, we have a really bad record, starting in 1966. We bought what we thought was a second-rate department store in Baltimore at a third-rate price, but we found out very quickly that we bought a fourth-rate department store at a third-rate price. And we failed at it, and we failed ...

MUNGER: Quickly.

BUFFETT: Yeah, quickly. That's true. We failed other times in retailing. Retailing is a tough, tough business, partly because your competitors are always attempting and very frequently successfully attempting to copy anything you do that's working. And so the world keeps moving. It's hard to establish a permanent moat that your competitor can't cross. And you've seen the giants of retail, the Sears, the Montgomery Wards, the Woolworth's, the Grants, the Kresges. I mean, over the years, a lot of giants have been toppled.

MUNGER: Most of the giants of yesteryear are done.

BUFFETT: Target went into Canada. It cost a lot of money to go there, and it can be tough. Everybody is already doing business with somebody there, and your competitor is never standing still. So that

CNBC SQUAWK BOX TRANSCRIPT: Monday, May 05, 2014

PAGE 28 OF 46

even though you think they have vulnerability at this moment when you start in on something when your store is completed a year later, they're moving, too. It's always a moving target. It is a tough business.

BECKY: And yet here we are at the Nebraska Furniture Mart that Berkshire has done very well with.

BUFFETT: Nobody is going to be able to compete with the Nebraska Furniture Mart. I mean, this store does more home furnishing business than any store in the country. And what are we in, I don't know, the 50th market in the country? This store does \$450 million annually. It's doing \$40 million during the Berkshire shareholders week. There's no store that remotely can offer the variety. There's no store that can undersell us. But to achieve that kind of dominance, you can't do it with a chain of stores in Canada when you're competing with Wal-Mart up there and a whole bunch of other people.

BECKY: Warren, I know you use the internet a lot. But I wonder if Charlie, Warren, if either of you ever buys anything on Amazon?

MUNGER: My children buy it for me occasionally. I have never done it personally.

BUFFETT: My assistant.

BECKY: What do you think about the Amazon business model, though?

MUNGER: Well, I think it's very disruptive compared to everybody else, I think it's a formidable model that is going to change America.

BUFFETT: I agree. It's one of the most powerful models that I've seen in a lifetime, and it's being run by a fellow that has had a very clear view of what he wants to do, and does it every day when he goes to work, and is not hampered by external factors like people telling him what he should earn quarterly or something of the sort. And ungodly smart, focused. He's really got a powerful business, and he's got satisfied customers. That's hugely important.

BECKY: Charlie, earlier we got the chance to talk with Warren about some of the U.S. corporate tax code and some of the new acquisitions that we've seen. Pfizer reported earlier this morning, so we talked a

little bit about Pfizer's plan to buy AstraZeneca and use an inversion where they would move their tax domicile to the UK because I guess they pay about 27 percent here in the United States. If it was a UK tax domicile they would pay closer to 21 or 22 percent.

There was a little bit of conversation around —

MUNGER: Well, I think the pharmacy companies try and get to the tax rate, they're on their way to zero. That's the only one that would make them happy.

BECKY: What do you think about that whole practice, though? Berkshire has taken advantage of tax code in the past to make sure it's doing things in the most tax effective way.

MUNGER: We would never take our U.S. tax rate to zero on purpose, or even close to it. For other people that's sort of an ideal.

BECKY: Getting to 22 percent is still more than a lot of U.S. companies would be paying, if Pfizer does do that inversion and goes ahead and moves the tax domicile.

MUNGER: It's the rage now to get the tax rate down.

BECKY: I think Joe Kernan, my colleague, has a question back at home, too. Joe?

JOE: I'm just reading in the past that you have talked to Warren about this before, Charlie, right? You are on the record. Here's a headline: Buffet clashes with Munger over U.S. corporate taxes at a meeting.

I will quote what you said. "The corporate tax rate should be much lower. When the rest of the world keeps bringing the rates down, there's some disadvantage to us if we're much higher."

Did you change your opinion on that recently, Charlie, or do you still feel that way?

MUNGER: I would not — there's something to be said for making the tax rate a little lower, but going from 35 to 33 or something is not like taking it to zero by moving your pharmaceutical manufacturing to some tiny little place.

JOE: I'm not asking about a lot of places — go ahead.

MUNGER: I think the economy might work a little better if the corporate tax rate was low. But I think it would be a mistake for American corporations to get really low taxes.

BUFFETT: And when you talk about the tax rate being lower, you're not talking aggregate corporate tax rates being lower; you're just talking about evening out the rate, right?

MUNGER: Yes. I would like a consistent rate that everybody paid.

BECKY: Something more like Simpson-Bowles was talking about, getting rid of a lot of the —

MUNGER: Something more like Latvia.

BECKY: Latvia?

BUFFETT: Nobody knows what the hell Latvia means —

JOE: Charlie, what is the rate in Latvia? Do you know?

MUNGER: They have a single tax rate.

JOE: So does Lithuania. It's like 15 percent. I think it's 10 percent, but a 15 percent flat tax on everyone else. But I think the corporate rate is 10 percent in Lithuania.

MUNGER: Generally speaking, I would tax consumption higher and earning power of business a little lower. It just works so well in Hong Kong and various places. I don't think we deserve it, but maybe the economy would work better if we had it.

ANDREW: Can I follow up with you on something else you said over the weekend, and Warren did, too. Another sort of unconventional thought. We had a conversation in the question about compensation and the disclosure of compensation. You made a point that I think many of our viewers may find surprising about how disclosure may not be a good thing. Do you want to elaborate?

MUNGER: Well, I think envy is one of the major problems of the human condition, and that's why it figured so prominently in the laws

CNBC SQUAWK BOX TRANSCRIPT: Monday, May 05, 2014

PAGE 31 OF 46

of Moses. Remember, he said you couldn't even covet your neighbor's donkey.

BUFFETT: I never have.

MUNGER: Yeah, but other people did. And so I think this race to have high compensation because other people do, has been fomented by all this publicity about higher earnings.

I think it's quite counterproductive for the nation. There's a natural reaction to all this disclosure because everybody wants to match the highest. Warren, I think that's a crazy race for us to get into.

BUFFETT: I've never been on a board of directors where the CEO came in and, waving the proxy statement of some competitor, and said, Here, this guy is making less. I probably should be making less, too.

It doesn't happen. There is a rationing effect that is produced by the publication of large salaries. And every comp committee is not hearing the comparison by the consultant to the fourth quartile or the third quartile. It's always to the second quartile, and that will produce a rationing. It's very natural to think if you're a director of the ABC Corp. and the CEO of the XYZ Corp is getting more, well, our guy is at least as good as theirs. And it goes on and on and on. So publication of the top salaries has cost the American shareholder money. Maybe disclosure is the great disinfectant, all of that, sunshine is the great disinfectant. Sunshine has cost American shareholders money when it comes to paying their managers.

MUNGER: You're right, a peculiarity of ours, but we're right, just as Moses was.

(Laughter.)

BUFFETT: And other people in between.

BECKY: We're going to continue this conversation with Charlie and Warren.

In fact, when we come back, we are adding yet another amazing business leader to this conversation, Microsoft founder Bill Gates will join us live right after this break.

CNBC SQUAWK BOX TRANSCRIPT: Monday, May 05, 2014

PAGE 32 OF 46

Our conversation will continue in just a moment. Also, as we head to the break, check out the "Squawk Box" market indicator. We have seen futures under a little bit of pressure this morning. You'll see right now futures are still in the red. We'll also take a look at the ten-year note, because the yield there dipped below 2.6 percent. Stick around. "Squawk Box" will be right back.

(Commercial break.)

BECKY: All right. Joe, thank you very much. Again, we are speaking to Warren Buffett, the Chairman and CEO of Berkshire Hathaway. Charlie Munger, the vice chairman, and now we are adding another powerful business leader to the roundtable: Bill Gates. He is the founder of Microsoft and the co-chair of the Bill and Melinda Gates Foundation. He's also a member of the CNBC First 25 list that was revealed last week and he is on the board of directors right here at Berkshire. That's why we have these gentlemen here today. Bill, thank you for joining us this morning.

BILL GATES, MICROSOFT FOUNDER: Great to be here.

BECKY: One of the things I would love to hear from you three is just what it is you talk about. When you just sat down you were talking about Mongolia. You guys will talk about anything and everything. What do you know about Mongolia?

GATES: Well, business stories are fascinating to us and all the demand for minerals has meant that countries like Mongolia have opened up big new mines and the country's deciding what they're going to do with the revenues they're getting from that. A friend we have owns 10 percent of the retail operations in Ulan Bator so he was telling us how that's all working.

BECKY: When you were at the board of directors meeting today, obviously you can't talk about specifics on things, how do those board of directors go? How are things led?

MUNGER: It's a lovefest.

BUFFETT: (Laughs) I hope so.

MUNGER: It's not a highly critical place.

GATES: Are we supposed to say that?

(Laughter)

MUNGER: I don't care.

BECKY: Warren, you did make the comment over the weekend that when it comes to boards, too often they don't look for Dobermans, they look for Cocker Spaniels and then try to make sure their tails are wagging. Is that how the Berkshire board runs, too?

BUFFETT: No, Berkshire we look for directors that were shareholder-oriented, business-savvy, and interested in Berkshire. And we think those criteria make sense. Other people have a whole bunch of different checklists. But we have a group of directors that get paid virtually nothing, and they have to — their interest has to come about because they find the place interesting, and in many cases because they have huge investments. And they made those investments themselves. Nobody gave them shares. So it's a very unusual board. But it's a terrific board.

BECKY: We heard the story about how you and Charlie first met up. How about the story about how you and Bill first met?

BUFFETT: Well, he was forced to meet me.

GATES: That's true. My mom was having (former *Washington Post* publisher) Kate Graham and Warren over, and I was still sort of maniacal about not doing anything but working at Microsoft and so I agreed to come by. I actually — I made this mistake thinking that Warren's view of the world was just about charts and stock volumes and not about the fundamentals of business.

So when we met and he was asking me how do you compete with IBM, how do you price your stock, where is it going, it was fantastic. It was the most fun conversation I'd ever had. So that started an amazing friendship.

BUFFETT: We got to the bedroom, talking, and the governor of Washington had come. And Bill's dad was a wonderful man, but he got irritated with the fact that we were sitting in the bedroom talking.

CNBC SQUAWK BOX TRANSCRIPT: Monday, May 05, 2014

PAGE 34 OF 46

And finally he came in very politely, he said, "Would you boys think about talking to the Governor?"

BECKY: So you stayed a little longer than maybe you planned?

GATES: Yeah, both sides wondered what these two groups were going to talk about, and had an amazing day. And it was only a few weeks later that I went up and Warren had a group of friends who were talking about business and stocks and so it's been a conversation ever since then.

BECKY: You know, Charlie, you made the comment over the weekend that when it comes to frugal people, you collect these type of people at Berkshire. You're looking for frugal people. But one thing I have noticed. You tend to collect friends and colleagues who have all those characteristics that Bill was just talking about. People who look at business and who think through it. How did that happen?

MUNGER: Well, when you like people who are intellectually curious, and I don't see how you can wise up all the time if you aren't working at it.

BECKY: How do you do that? Do you read every day?

MUNGER: Sure.

BUFFETT: I knew Charlie and Bill would hit it off.

GATES: Charlie's amazing.

BECKY: Let me ask each of you. What is something that you're reading now or you've read recently that you would recommend that other people read? Bill.

GATES: Zeke Emanuel wrote a book about medical costs in America and how we got to the complex situation we have. And he makes some predictions about the future. And people can disagree with him. Actually I disagree with some of it. But it's very well written, and we should have a more informed dialogue about that critical topic.

BECKY: Charlie, how about you?

MUNGER: Well, I have just read "Faraday, Maxwell, and the Electromagnetic Field."

BECKY: What is that?

MUNGER: It's a combination of scientific biography and explanation of the physics, particularly relating to electricity. It's just the best book of its kind I have ever read, and I just hugely enjoyed it. Couldn't put it down. It was a fabulous human achievement. And neither of the writers is a physicist.

BECKY: Neither of them. Okay. Warren?

BUFFETT: Why the light goes on when you hit the switch, but I couldn't understand the book. I had to move on.

I read (former U.S. Treasury Secretary) Tim Geithner's book which will be out in another week or so, and anybody, politician or financial manager, financial supervisor should read that book. Tim correctly says that you're going to run into more panics in the future, and there's not a thing about them and here is what to do. And it's a very, very good book.

BECKY: He thinks we'll run into more financial panics. How far down the road?

BUFFETT: He has no idea. And I have no idea. He just says humans are behaving the same way. And he describes how they behaved in various ways and how they behaved this time. And what has to be done. It's a good book.

BECKY: In other words, next time will not be different. There will be a next time?

BUFFETT: There will be a next time.

MUNGER: It may be led by the same people.

BECKY: By the same people meaning?

MUNGER: The financiers.

BECKY: The banks.

MUNGER: Other than a woman.

(Laughter)

(Commercial break.)

BECKY: Our special guests this morning will all be at the Berkshire board meeting later today: Warren Buffett, Charlie Munger, and Bill Gates.

Gentlemen, people would die for the opportunity to get here and sit and talk to you about business. What I would like to do is just throw some topics out to you and maybe you guys can respond on your thoughts on things.

First up, about activist investors. We have seen a rise of activist investing. Carl Icahn, Bill Ackman, who was actually here this weekend. I just wonder what the three of you think about activist investing. Is it a good thing for America or not?

Charlie?

MUNGER: Well, sometimes it's good, and sometimes it's awful. And I'm afraid that's just the way it is.

BECKY: Bill, what about you? What do you think about it?

GATES: Well, there's a level of discipline that shareholders, in the hierarchy, they should be viewing the actions of the board management. Sometimes it seems to get focused on very short-term things, like the dividend policy, as opposed to the strength of the management team and the long-term strategy. But shareholders having power is a very important part of the system.

BECKY: Can shares get hijacked, though, by a shareholder who is very loud but who happens to have a small position in a stock?

GATES: Only if the press allows it to happen.

(Laughter)

BECKY: Well, you can say we've been guilty of that. We will certainly take any and all activist shareholders.

BUFFETT: You have thousands of corporations. Some of them are going to be poorly run and some of them are going to be run in a very self-interested manner by the managers. What is the correction for that? And activism can be a correction for some of that.

I think very often the activism — and they are attracting money on this basis. The money is pouring into activist-related-type investment vehicles. The measure really is whether you get the stock up in a very short period of time.

I can remember when the best-managed company I knew in the United States, Capital Cities, was selling for a third of what it was worth. And an activist might come around and say, 'Why don't you sell off the properties or something?'

So an immediate bump in the stock price should not be the measure of whether somebody has accomplished something successfully in a corporation. But there are times when change is needed in corporations and they're not going to do it themselves.

BECKY: Andrew has a question too. Andrew?

ANDREW: Warren, I want to follow up on something we talked about over the weekend, which is actually Bill Ackman's approach in this recent transaction between Valeant and Allergan, where he effectively teamed up with Valeant and bought shares of Allergan before they actually made the bid, knowing that the bid was coming. Some people have argued that is the equivalent of front-running or inside trading. I wanted to get your thoughts on that tactic from a policy perspective and what you think it means to the market.

BUFFETT: Well, I'm sure he had it well-lawyered. But, you know, if I bought that stock because I'd learned that somebody might be doing something and I learned it in certain way, I would be in trouble. But if they join forces, you know, certainly a company that has in mind making a bid is entitled to buy some stock. And how big a group you can form, maybe you could form a group with a whole hedge fund community and have them all go out and buy stock like crazy for a couple weeks. And if they're part of a group, maybe it doesn't help.

But I would say this: If that should be the case, it probably should be changed.

BECKY: Joe?

JOE: Thanks, Beck. All three of these great gentlemen, I would like to just hear them opine quickly on this. I'm going to say his name again: Thomas Piketty. He's a French elitist academic that has the hottest book on economics right now. (*Capital in the Twenty-First Century*.) I'm sure you have read about it. It talked about capitalism in the down side in terms of income and quality. That capitalism he says by definition engenders, that we've just been lucky in recent years that it's not even worse.

So we're revisiting what system is the most appropriate. I think about you, Bill Gates, and what you're able to do with everything that you amass in your lifetime through capitalism in some respect, and certainly you're doing a lot of good with it now.

But in and of itself, is capitalism good or a bad thing?

GATES: Well, of course it's a fantastic thing versus any other system we've tried. And Piketty's mostly talking about retained wealth. That is, if you have high returns on capital for generations, then you get a group of people that have a disproportionate part of the money. If you think about the three fortunes represented here, these are first-generation fortunes that show there is dynamism in this system. He makes some assumptions about returns that I'm not sure are true for the long-term. But the direct remedy for what he's talking about is some type of estate tax or well tax. He actually comes out for a well tax, which I think is hard to do. But an estate tax, which I happen to believe in, is something that would reduce the phenomena that he talks about.

But —

JOE: I've talked to Warren about this before too, and you guys can answer too, but to give all your money away beforehand, I think Warren has actually admitted to me that he thinks in the private sector that it will be better used by charitable organizations because it does avoid — when you give it all away, it does avoid it going to Uncle Sam in the end anyway, right?

ANDREW: Well, that's a problem too. It's still a generational issue. I don't get to answer for Bill.

BUFFETT: But you set it up in a case there in the sense that if I didn't give it all to philanthropy, I can arrange it so it's greater than this. But I could certainly create 60 percent that would be dynastic wealth. And if I was really concerned about dynastic wealth, as many people are, I could set it up so that far more than 60 percent went to —

JOE: You could bequeath it all to the federal government if you thought it was going to be a good use of the funds.

BUFFETT: That's a choice. I'm just saying the choice is not between philanthropy and — it's false to say you can't create —

JOE: That's not what I'm saying. I'm just saying you have never necessarily looked like you thought the government was the best place to allow capital to be utilized.

BUFFETT: I agree with you on that.

JOE: That's pretty good.

BECKY: Gentlemen, we're going to take a very quick break here. Of course, Joe, we do have more coming up after this.

(Commercial break.)

BECKY: Welcome back to a special edition with "Squawk Box". Our special guests this morning: Warren Buffett, Charlie Munger, and Bill Gates.

Gentlemen, another topic I would like to hear from you on. High-frequency trading. Charlie, I'd like to get your opinion about what you think about high-frequency traders. Is the book right, that lays out for Michael Lewis that they are — they're skimming off the top and it's a fixed market?

MUNGER: Well, of course they have an advantage. Cleverly obtained. Of course it does the rest of the civilization no good at all. It's the functional equivalent of letting rats into a grainery. (Pause) No, I don't like it.

CNBC SQUAWK BOX TRANSCRIPT: Monday, May 05, 2014

PAGE 40 OF 46

(Laughter)

BUFFETT: I wondered what his point was.

BECKY: Charlie, Bill, do you agree or — Warren, Bill, do you agree or disagree with Charlie?

GATES: It doesn't seem like it's much value added because it's not, when you get — you really need the liquidity, it's not guaranteed to be there. So I'm not an expert on it, but it seems like a strange source of profit.

BUFFETT: It's not a liquidity provider. It may create more volume. But that's not the same as being a liquidity provider. To the extent that it's front-running, I think society generally has been against front-running for good reasons and where it's — in the old-fashioned front-running, they had rules against it.

Here they gained a natural advantage by speed just by figuring out how the system worked and then getting there first, and that adds nothing to GDP or anything, a real output of goods and services. On the other hand, the market isn't regulated. And for the small investor, they've never had it so good. And high-frequency trading I don't think costs them a penny probably.

BECKY: I see Bill nodding with that. Charlie, you agree with that too?

MUNGER: Somebody is paying it. God is not creating extra money.

BUFFETT: It's the big orders.

GATES: If you don't trade very often, then all these frictional costs can be quite modest.

BECKY: If you're a frequent day trader. Running in and out.

MUNGER: The big institutions operating on behalf of the little people. No, I think it's a curse, and I think the author of the book was basically right.

BECKY: Andrew has a question too. Andrew.

MUNGER: And he writes well, too.

ANDREW: Warren, related to this, one of the Berkshire companies is Business Wire. They reached a settlement along with PR Newswire and a couple of the others with the (New York State) Attorney General Eric Schneiderman about this idea of front-running — go ahead.

BUFFETT: I have to correct that, Andrew. They've reached no settlement. They had decided — I had decided, along with (CEO) Cathy Baron Tamraz, when an article appeared in the *Journal* about it, we always provided simultaneous distribution, and we continued to provide simultaneous distribution, but we did get rid of the five high-frequency traders who had no edge in the time at which they received things. But we got rid of them, in any event, but that was not pursuant to any settlement. That was a decision that was made at Business Wire.

ANDREW: I'm glad you cleared that up. What was the settlement part, then?

BUFFETT: There was no settlement. There was no settlement. We got — we made — I think there was an article late in the week in the *Journal*, and Cathy talked to me early the following week, and after assuring myself that they were getting totally simultaneous distribution, I said we don't need them. So we got rid of them.

BECKY: Gentlemen, let me ask a very quick — go ahead, Joe.

MUNGER: I said I love it. Wish there was more of it.

BECKY: Let me ask you quickly about the situation in Ukraine. How much time do any of you spend thinking about that? How concerned should we be from a geopolitical risk standpoint?

MUNGER: What in the hell do I know about the Ukraine? I — I'm glad I'm not making those decisions.

BECKY: Do you worry that it will spill over and affect business —

MUNGER: Well, of course you worry a little when you see a pattern that reminds you of Hitler.

BECKY: Right.

CNBC SQUAWK BOX TRANSCRIPT: Monday, May 05, 2014

PAGE 42 OF 46

MUNGER: But basically, yeah, I regard myself as totally incompetent to judge what should be done.

BECKY: Bill, Warren, either of you want to follow up after that and say that you are more competent to make a decision on it?

BUFFETT: Totally. It's not hard to improve.

GATES: When you have a global economy, so when you have disputes between countries, like Europe's dependency on Russian gas, you sometimes will make — to make political points, you'll sometimes take economic pain, and it's a great debate, you know, what penalties should there be to discourage more take-over behavior. And you actually have the business community having one view and talking to the politicians.

I don't think it's going to get terrible, but it certainly would be high on the list of concerns right now.

BUFFETT: When you get a shift in boundaries, it can set other forces in motion and nobody knows what those forces may be. And there may be political popularity considerations. All kinds of things start happening.

So once you shake things up, you never can be sure, on international matters, what will be item 2, item 3, and item 4. They have their own dynamic.

So it's not a plus. And nobody knows how it's going to turn out. But something has been put in motion, and it would be nice to see it come to rest.

BECKY: We'll continue this conversation in just a moment. Andrew.

ANDREW: Thank you. And, Warren, I want to thank you for correcting me on the Business Wire issue. I also noticed some of the reporting has been bad on this. Eric Schneiderman applauded Business Wire and their decision to do this. It wasn't part of the settlement or any type of accord. Despite some of that reporting.

Coming up we've got a lot more coming up from Omaha, Warren Buffett, Charlie Munger, and Bill Gates. It doesn't get any better than that kind of conversation.

(Commercial break.)

BECKY: Welcome back, everybody. Some final thoughts right now from Warren Buffett, Charlie Munger, and Bill Gates. Gentlemen, in the commercial break I love your conversations that continue to go on. You were talking about Apple and Samsung; Apple just winning a minor court victory of \$120 million to get paid. What I wonder is what you think of the patent wars. Charlie?

MUNGER: Well, when I was young, there wasn't much money that changed hands based on patents, and now they're hugely important. I think patents are too easily granted now. I don't think we need as much patent protection as we have. Bill will probably disagree.

BECKY: The patent office has had a hard time keeping up with technology. Bill, should people get paid for their creations and inventions?

GATES: Well, there's entire industries like the drug industry that only exist because if you invent something you're allowed some protection. The particulars of the system have gotten very complex, and you could talk about various improvements. But the idea that innovation in and of itself should be protected, you should get paid. That's been a very successful idea going all the way back to the steam engine.

BECKY: Bill, I do want to ask you, we talked a little bit this morning about how you are no longer the largest shareholder of Microsoft. You've been selling down that stake. Why is that?

GATES: I've sold for over a decade the same number of shares every quarter. That plan lasts through the end of this year. You know, I'm going to retain a lot of Microsoft stock, but the U.S. Treasury's done well, many billions of dollars. And you know, I'm excited about the stuff I'm doing at Microsoft right now, you know, re-examining all its strategies, and a lot of great work going on.

BECKY: Are you excited about the new CEO, Satya Nadella?

GATES: Yeah, Satya is off to an amazing start. He's drawing on a broad set of people in the company to get them to rethink how can Microsoft move a bit faster and really distinguish ourselves with things like Office 365.

BECKY: Let me ask you all about energy policy. I come back to this, Charlie, because you've said some things in previous meetings - maybe it was two or three years ago - that kind of changed my thinking about it, just the idea of whether or not we should be exporting natural gas and some of our natural resources. Your idea was that we should save it all.

MUNGER: Yeah, I'm totally against exporting natural gas. I don't like oil to be exported, either. I'm all for using up our oil more slowly and discovering it more slowly. I'm all by myself on this. I feel very lonely.

BECKY: Why is it that you think we shouldn't export it?

MUNGER: I think this stuff is utterly precious. I feel it's like the topsoil of Iowa. We don't want it to go away too fast. I also have old-fashioned capitalist ideas that intelligent, responsible people are always suffering now to make later better. I don't like making today great by making later worse.

BECKY: Warren, you agree with Charlie?

BUFFETT: Well, if I were in charge of running the United States for the next 500 years, I would want the ability to produce energy in a way that would take care of national defense under all circumstances. Because I would not want to be dependent on the rest of the world in that respect.

But if otherwise I could use up, you know, as important an item to the planet as energy and use the other guy's, and like I said, if I have responsibility for hundreds and hundreds of years, I would use the other guy's and trade him little pieces of paper for it. But I would always want to have an up-to-date national defense.

MUNGER: That's two of us, out of 300 million.

BECKY: Let me ask all three of you. All three of you are investors that spend a lot of time thinking about things. I wonder, with the

CNBC SQUAWK BOX TRANSCRIPT: Monday, May 05, 2014

PAGE 45 OF 46

stock market hitting new highs, if that concerns any of the three of you, if things are starting to look expensive at these levels. Bill, what do you think?

GATES: Well, relative to interest rates, equities are still a bargain. And, you know, so you've really got to have an opinion about interest rates to be an investor of any kind in this market. It's such a key factor. You know, by historical measures, yes, interest rates were very different in most of those time periods.

BECKY: Have you been surprised that interest rates have stayed so low this year?

GATES: Well, the central banks are making sure that's the case. They are trying to stimulate these economies as best they can. The fact that it requires the gas pedal being pushed to the floor as much as it does is an amazing and even a little bit scary thing.

BECKY: Charlie, what do you think?

MUNGER: Well, I think under what Bill Gross calls the "new normal," common stocks may not do quite as well in the future as they did in the last 100 years. But that doesn't mean that the Mungers are going to sell their common stock in an effort to buy them back later cheaper.

BECKY: Warren, how about you?

BUFFETT: Well, the option is to own equities or own fixed dollars. I think it's clear you own equities. I do not think they're in crazy territory. But most of the time stocks have been in a zone of reasonableness over my lifetime. I think they're in the zone of reasonableness now. And certainly if you said to me it's either going to have to be long the 30-year bond and short an index fund for 30 years or vice versa, it would be long index fund. I would be long in stocks.

MUNGER: We all would.

BECKY: Gentlemen, I want to thank you all for your time today. We really appreciate it. That does it for us. Make sure you join us tomorrow. Right now it's time for Squawk on the Street.

Memo

To: Berkshire Hathaway Managers (“The All-Stars”)
cc: Berkshire Directors
From: Warren E. Buffett
Date: December 19, 2014

This is my biennial letter to reemphasize Berkshire’s top priority and to get your help on succession planning (yours, not mine!).

The top priority – trumping everything else, including profits – is that all of us continue to zealously guard Berkshire’s reputation. We can’t be perfect but we can try to be. As I’ve said in these memos for more than 25 years: “We can afford to lose money – even a lot of money. But we can’t afford to lose reputation – even a shred of reputation.” We *must* continue to measure every act against not only what is legal but also what we would be happy to have written about on the front page of a national newspaper in an article written by an unfriendly but intelligent reporter.

Sometimes your associates will say “Everybody else is doing it.” This rationale is almost always a bad one if it is the main justification for a business action. It is totally unacceptable when evaluating a moral decision. Whenever somebody offers that phrase as a rationale, in effect they are saying that they can’t come up with a *good* reason. If anyone gives this explanation, tell them to try using it with a reporter or a judge and see how far it gets them.

If you see anything whose propriety or legality causes you to hesitate, be sure to give me a call. However, it’s very likely that if a given course of action evokes such hesitation, it’s too close to the line and should be abandoned. There’s plenty of money to be made in the center of the court. If it’s questionable whether some action is close to the line, just assume it is outside and forget it.

As a corollary, let me know promptly if there’s any significant bad news. I can handle bad news but I don’t like to deal with it after it has festered for awhile. A reluctance to face up immediately to bad news is what turned a problem at Salomon from one that could have easily been disposed of into one that almost caused the demise of a firm with 8,000 employees.

Somebody is doing something today at Berkshire that you and I would be unhappy about if we knew of it. That's inevitable: We now employ more than 330,000 people and the chances of that number getting through the day without any bad behavior occurring is nil. But we can have a huge effect in minimizing such activities by jumping on anything immediately when there is the slightest odor of impropriety. Your attitude on such matters, expressed by behavior as well as words, will be the most important factor in how the culture of your business develops. Culture, more than rule books, determines how an organization behaves.

In other respects, talk to me about what is going on as little or as much as you wish. Each of you does a first-class job of running your operation with your own individual style and you don't need me to help. The only items you need to clear with me are any changes in post-retirement benefits, acquisitions, and any unusually large capital expenditures. But I like to read, so send along anything that you think I may find interesting.

* * * * *

I need your help in respect to the question of succession. I'm not looking for any of you to retire and I hope you all live to 100. (In Charlie's case, 110.) But just in case you don't, please send me a letter or email giving your recommendation as who should take over tomorrow if you should become incapacitated overnight. These letters will be seen by no one but me unless I'm no longer CEO, in which case my successor will need the information. Please summarize the strengths and weaknesses of your primary candidate as well as any possible alternates you may wish to include. Most of you have participated in this exercise in the past and others have offered your ideas verbally. However, it's important to me to get a periodic update, and now that we have added so many businesses, I need to have your thoughts in writing rather than trying to carry them around in my memory. Of course, there are a few operations that are run by two or more of you – such as the Blumkins, the Merschmans, the pair at Applied Underwriters, etc. – and in these cases, just forget about this item. Your note can be short, informal, handwritten, etc. Just mark it "Personal for Warren."

Thanks for your help on all of this. And thanks for the way you run your businesses. You make my job easy.

WEB/db

P.S. Another minor request: Please turn down all proposals for me to speak, make contributions, intercede with the Gates Foundation, etc. Sometimes these requests for you to act as intermediary will be accompanied by "It can't hurt to ask." It will be easier for both of us if you just say "no." As an added favor, don't suggest that they instead write or call me. Multiply 80 or so businesses by the periodic "I think he'll be interested in this one" and you can understand why it is better to say no firmly and immediately.

**Notes from the Meeting Dr. George Athanassakos and Ivey MBA and HBA
students had with Mr. Warren Buffett
Omaha, NB, February 27, 2015, 10:00 am - 12:00 pm**

Question #1:

How do you pick winners (the right people)? How do you know they are the right fit for your company?

Answer #1:

I believe there are always winners but picking the right winner for my company is a challenge. I know an individual who is definitely going to outperform the S&P but he's the last guy on earth I'd want my daughter to marry. So first and foremost, you have to feel good around them, you must enjoy their company, like a friend or a family member. If you feel good around them, it means they have characteristics you admire and are moving in the direction you want to associate with. These people represent who you'd like to be and you may perceive them even as better than yourself. You can admire their behaviour or intellect but always judge them as a human being if you want to be their friend. These people do 10 things for every 1 thing you ask for; they go above and beyond what you expect of them. You want to associate with first-class people (like William Ruane, one of the classiest individuals).

Question 2#

What is your personal definition of 'success'? How has it changed over the course of your career?

Answer#2:

The saying goes that success is about getting what you want, while happiness is about wanting what you get. For myself happiness is more important. My goal was always financial independence; working for myself and finding a job where I admire the people I work with. I was interested in being in a position to control the decision making process. At age 25, I had enough money to live off of. I had two children and the equivalent of roughly \$2M in today's money. Everything since then has been surplus.

As you move along in your career, you always want to consider your inner scorecard – how you feel about your own performance and success. You should worry more about how well you perform rather than how well the rest of the world perceives your performance. The success of Berkshire has always been more important than my own personal success in terms of financial returns. The most important takeaway is that you should always try to be a good person.

Question#3**How do you develop conviction for contrarian ideas? How do you perceive risk?****Answer#3:**

At Berkshire we have certain filters that have been developed. If in the course of a presentation or evaluation part of a proposal or of an idea hits a filter then there is no way I will invest. Charlie has similar filters. We don't worry about a lot of things as we only have to be right about a certain number of things – things that are within our circle of competence. A great example is the Nebraska Furniture Mart that you visited this morning. Mrs. B took cash because she didn't understand stocks. It is important to know what I can do. I have no idea which company will dominate in the auto industry in the next 5 years so I don't pick. I prefer simple things in my circle of competence. Good decisions scream at you. For example in 2008 you shouldn't have been afraid just because assets were cheap. In your entire investment lifetime you may have 6 times when this happens and it is 'raining gold'.

With regards to risk, the Berkshire portfolio suffered a 2% loss once and had 1% losses twice in our history. This was all in 1974 and 1975 when we sold assets cheap to buy other assets cheaper. Stocks are riskless if held over a long time frame as you are simply giving up purchasing power now for later. Cash is the risky asset. Risk in stocks is not what the companies will do. Traditional finance teaches that Beta is a measure of risk but volatility isn't risk. Risk is loss of purchasing power. Volatility declines over a long enough timeframe. It is individuals that make investments risky. In our report that is due out tomorrow I talk about how risk needs to be rethought. People think stocks are riskier than bonds, which is not true for a long time horizon.

Question#4:**Have you ever made money on someone else's ideas?**

My preference is for my own ideas. I prefer to find good companies trading at fair prices. You can make money on cigarette butt investing but this works better with small amounts of money and was more effective years ago. You can't build businesses out of cigar butts. I don't read analyst reports and, although I get served up many ideas I don't seek outside ideas. I stay within my circle of competence. Berkshire's AUM means the universe of potential investments is smaller even though good, attractively priced ideas are often poorly covered. For instance, recently I did screening of the Korean market and found a few interesting opportunities.

I used a 1950s (1951) Moody's manual by sector. There was some good stuff in the back on page 1433. Western Insurance was a company that I looked at. It had an EPS of \$29 and the high price was \$13. Nobody showed me this. So I checked it out with insurance brokers and it checked out OK so I bought into the company.

All in all, I prefer to read "raw" financial reports and talk to industry representatives.

Question 5: Both you and Mr. Munger are writing down your 50-year visions. What are these visions going to be?

Over the past 50 years, we've always focused on buying companies that are scalable. With the companies that we've acquired, we believe we have created something very scalable. We also have the right form, culture and business to grow at a reasonable rate over time.

Question #6:**How do you feel about income inequality?****Answer #6:**

Income equality will get worse but the term income inequality is in itself flawed because implies that equality is something we should aspire to. We should aspire towards equal opportunity. But as capitalism moves forward, the bottom 10% or 20% will find themselves further and further behind. This is because society has become much more specialized. Back in the farming days, the income difference between someone with an IQ of 150 vs. someone with an IQ of 80 would not have been disastrous, since most people could do farm work. Then we moved into manufacturing, a bit more specialized, but still okay. Now the market structure is giving more advantage to people with particular skills. Take the example of boxing. Before the advent of TV, the best boxers may be getting six thousand dollars per fight. Now we have Manny and Mayweather, who will be fighting for hundreds of millions. Someone came along and invented TV, and then someone figured out how to promote the fight and make money.

Another big factor that affects income inequality is the tax code, which is largely skewed to favour the super rich. The top 400 gross income earners based on their tax returns pay less than 20% tax.

So the market system doesn't really address inequality. However, it is the best system that we have.

Question #7:**How would you characterize the state of corporate governance today? Do activist investors bring value to shareholders?****Answer #7:**

If I were solely interested in attracting money as a new money manager, I would call myself activist investor as they are very popular now. As the numbers of activist investors grow, these managers are having more and more trouble finding companies to be active in. On the other hand, the self-cleansing method of management in companies has continuously failed.

One problem with activist investors is that they are sometimes only looking for a "pop" in the stock, so I personally do not like the short term horizon of some activists and would only back a small handful of activist investors.

The activist phase has not reached its peak yet and will be with us until activist funds stop making money. Wall Street pushes great ideas until they are silly. It is important to remember the limitations of ideas and once there are too many activist investors there will be problems.

Question #8:**With the rise of social media and constant information it seems students are losing the ability to sit down, think, and formulate their own thoughts like you have in the past. We prefer short bits of information to novels. Can you talk about whether you view this as a problem and the impact that deep and independent thought has had on your career?****Answer #8:**

A good part of our success is that we spend a lot of time thinking. At Berkshire, we don't have any meetings or committees, and I can think of no better way to become more intelligent than sit down and read. In fact, that's what Charlie and I mostly do.

The teaching of efficient markets produces a disadvantage for students and a big advantage for those who read and try to find value. It personally give me an edge when other people are not paying attention to reading and thinking, and are instead on their phones. It means that I gain knowledge from reading a few 10-K's while others are tweeting what they had for breakfast.

I've seen a lot of change in my lifetime, especially among how people spend their time.

Question #9:

What are questions investors should ask but usually don't when evaluating companies

Answer #9:

Start by looking at 7-8 companies in the industry and ask the management typical due diligence questions. Also, ask the management of each company which competitor they would be willing to put their net worth in for the next 10 years. Then ask which of their competitors they would short. This will provide important insights into the industry that even those who work their whole life in the industry would not realize.

On a personal level, I recommend that people do this with the network of people they know.

Among your friends, who is one person you most want to emulate and who would you want to be least like. You can approach this by thinking about which of your peers you would want to own 10% of for the rest of their lives and which ones you would like to short. Then identify the qualities that make you want to emulate them and try to internalize those qualities. Do the opposite for the friends you would want to short. You are currently still young and can get rid of your bad habits, "The chains of habit are too light to be felt until they are too heavy to be broken".

Question #10:

Mr. Buffett, given Burger King's recent acquisition of Tim Hortons, can you comment on the potential for US companies to continue inverting into Canada?

Answer #10:

The primary reason for Berkshire being involved with 3G Capital was because they are good and trustworthy individuals, not for the tax benefit. The most federal income tax that Burger King has ever paid was approximately \$30 million but their earnings are in the neighbourhood of \$12 billion so the tax shelter benefits are negligible. Further, given that Tim Hortons earns 2x as much as Burger King and that the Canadian Government had to approve that the acquisition was a net benefit to Canada, this acquisition was not a typical tax inversion. That being said, to prevent further inversions in the future, I would not be surprised if corporate tax law in the United States were changed to prevent these inversions in the foreseeable future. However, as a result of numerous wealthy and influential individuals and organizations lobbying for preferential treatments the obstacles preventing such tax changes are large.

Question #11:

You mentioned Mrs. B earlier, and in your annual letter last year, you mentioned students like us could learn a lot from Mrs. B – what do you think are the top lessons we can learn from Mrs. B?

Answer #11:

Think about how improbable it is that a woman walks out of Northern China, can't speak a word of English, and just out of proceeds of that \$2,500 that she saved from selling used clothing for 16 years, she built a store worth close to \$1B. There must be something to learn from that, because she didn't invent anything. She didn't have any money, store or training. Yet she won. Sam Walton is another example, compared to Sears in the late 1960s - 100 stores in Chicago, probably 20 million credit card customers, first call on every piece of real estate, unlimited financial resources, yet someone with a pick-up truck in Arkansas beat them.

Charlie and I love to read biographies, and what we like to ask is "what makes these people succeed and what makes the ones that fail?" I use Sears as an example to show the ABCs of failure – Arrogance, Bureaucracy and Complacency. And Sears had them all. When you build an organization that has been incredibly successful, you have to work extremely hard to fight off arrogance, bureaucracy and complacency.

One thing that Sam Walton and Mrs. B had in common is they had passion for the business. It isn't about the money, at all. It was about winning. Passion counts enormously; you have to really be doing it because you love the results, rather than the money. When we buy businesses, we are looking for people that will not lose an ounce of passion for the business even after their business is sold. And getting in bed with people like that is what it's all about.

Question #12:

In your 2013 essay, you stated that you were optimistic about the future of the US economy, in particular with regard to the role that women play in the economy. Could you expand on your thoughts from that essay?

Answer#12:

Before women and minorities were involved in the economy (i.e., pre 1920), America achieved a lot (GDP per capita increased, over a few decades, six times) with only half of its workforce. Imagine the types of gains that could be made using the full workforce. We have moved in the right direction over the past 15-20 years. My sisters have the same intellectual capacity, and have excellent personal attributes, but they never had the same opportunities being born at the same time as me, to reach the same level of success. Instead, they were expected to marry well. Even today there remains room for improvement. Only three of twelve directors at Berkshire are women. On March 5, 2015 I will release my sixth tweet ever which will have to do with an announcement related to female management.

Question #13:

What are some common traits of good investors?

Answer#13:

A firmly held philosophy and not subject to emotional flow. Good investors are data driven and enjoy the game. These are people doing what they love doing. It really is a game, a game they love. They are driven more by being right than making money, the money is a consequence of being right. Toughness is important. There is a lot of temptation to cave in or follow others but it is important to stick to your own convictions. I have seen so many smart people do dumb things because of what everyone else is doing. Finally good investors are forward looking and don't dwell on either past successes or failures but rather

look toward the future. Just look at history to see how bad things have been. We had World War 2 and a Civil War. This Country works!

Question #14

What customs have you witnessed overseas that American businesses should adopt?

Answer#14:

It is important to play with better players than you. The US is the best place to operate and you don't need to go beyond the US. It is easy to see success but it is more difficult to repeat the success. It is also important to study failure as much as you study success. In general, I find it very interesting to observe the market every day. For instance the 2008 crisis was a great movie and nobody knew how it would end. In my opinion China has changed their system to be more "US like".

Question#15

What will advance American competitiveness in the next 20 years? What are the biggest threats to that competitiveness?

Answer#15:

There is an abundance of information available these days, which is amazing. It's important to realize that everyone in this room is living a better life than John D. Rockefeller. In the next 20 years, we will be living incomparably better lives than we do now. I hesitate to think about the service my dentist provided me 20 years ago. At the same time, I'm sure that in 20 years people will feel the same way.

The drawback of growth, however, is that evil can leverage this progress to harm a significantly greater proportion of the population. I see the biggest threat to American competitiveness as represented by the acronym CNBC, namely Cyber, Nuclear, Biological and Chemical. By far the greatest threat to humanity is that of a Nuclear war. If I could allocate all my resources to effectively combat this threat, I would. Unfortunately there are very few effective channels that could effect this change.

Question #16:

Increasingly companies are reporting non-GAAP earnings that add amortization of intangible assets back to net earnings using the justification that intangibles such as software are 'non wasting' assets. Given that you have indicated in previous Berkshire annual meetings that companies try to dress up financial statements with EBITDA, could you provide your thoughts on this non-GAAP trend?

Answer #16:

This trend is seen to be more industry specific and management usually tries to convince you that some expenses aren't really expenses. It started with EBITDA. Depreciation is not only a real expense but the worst kind of expense because you pay it up front. Your plant and equipment is paid for upfront and companies record this cost over time as a non-cash expense. Amortization however may not always be a real economic expense, a strong example of this is customer relations as it doesn't diminish as fast as amortization if it does at all. Software development costs & stock options however, are a form of economic expense. When I hear companies talking about "Non-GAAP" I am very suspicious of what they do because "there really isn't only one cockroach in the kitchen."

Question #17:

What are the things that you need to be able to value a business?

Answer #17:

In order to best understand a company, you first have to understand the industry. Only focus on companies and industries you understand. Don't go outside your circle of competence. You need to know what the strengths of the company are in relation to the competition, if they have a good management team, and most importantly, what the moat is. If you don't know how many competitors the company has, do not invest in the company. Coke's moat is that it has no taste accumulation, and the moat of railroad companies are that no one can build anymore because of saturation. That is why I am currently invested in both industries.

Question #18:

You have expressed a commitment to philanthropy and have done this through the Gates Foundation and your children. Is there a particular cause that is important to you?

Answer #18:

I would ideally like to contribute to solving CNBC (Cyber Nuclear Biological Chemical) as I see it as the biggest existential threat to humans, but I have not found an appropriate vehicle to do so. In my early days, I had set up a fund to support my wife's foundation. Although she wanted to donate the excess cash that we had, I didn't want to lose the power of compounding. If I had donated \$1 then, I could be giving up a \$1000 in potential future donations, so it was really important to me to keep compounding my money.

I would not be efficient at all in doing philanthropy. That's why I outsource it to five foundations including the Gates Foundation and to my kids, who are a lot more passionate about solving world problems. I'd actually prefer to tackle a global issue and fail, than tackle a local one.

Money has no utility to me anymore as I am very happy with what I have but it has enormous utility to others in the world. More possessions to me would actually be a liability than an asset.

I am also trying to persuade more people to join the Giving Pledge, where individuals sign an agreement to donate more than 50% of their wealth after they die. So far, 127 people have signed up which is a great thing. The other day we got Mark Zuckerberg to sign up, which is a huge win for us because he'll go on to inspire many other young billionaires to donate their wealth, as they'll look up to him and do the same thing.

Better Than Raising the Minimum Wage

Help Americans who need it with a major, carefully crafted expansion of the Earned Income Tax Credit.

May 21, 2015 7:12 p.m. ET

The American Dream promises that a combination of education, hard work and good behavior can move any citizen from humble beginnings to at least reasonable success. And for many, that promise has been fulfilled. At the extreme, we have the Forbes 400, most of whom did not come from privileged backgrounds.

Recently, however, the economic rewards flowing to people with specialized talents have grown dramatically faster than those going to equally decent men and women possessing more commonplace skills. In 1982, the first year the Forbes 400

was compiled, those listed had a combined net worth of \$93 billion. Today, the 400 possess \$2.3 trillion, up 2,400% in slightly more than three decades, a period in which the median household income rose only about 180%.

Meanwhile, a huge number of their fellow citizens have been living the American Nightmare—behaving well and working hard but barely getting by. In 1982, 15% of Americans were living below the poverty level; in 2013 the proportion was nearly the same, a dismaying 14.5%. In recent decades, our country's rising tide has not lifted the boats of the poor.

No conspiracy lies behind this depressing fact: The poor are most definitely not poor because the rich are rich. Nor are the rich undeserving. Most of them have contributed brilliant innovations or managerial expertise to America's well-being. We all live far better because of Henry Ford, Steve Jobs, Sam Walton and the like.

Instead, this widening gap is an inevitable consequence of an advanced market-based economy. Think back to the agrarian America of only 200 years ago. Most jobs could then be ably performed by most people. In a world where only primitive machinery and animals were available to aid farmers, the difference in productivity between the most talented among them and those with ordinary skills was modest.

Many other jobs of that time could also be carried out by almost any willing worker. True, some laborers would outdo others in intelligence or hustle, but the market value of their output would not differ much from that of the less talented.

Visualize an overlay graphic that positioned the job requirements of that day atop the skills of the early American labor force. Those two elements of employment would have lined up reasonably well. Not today. A comparable overlay would leave much of the labor force unmatched to the universe of attractive jobs.

That mismatch is neither the fault of the market system nor the fault of the disadvantaged individuals. It is simply a consequence of an economic engine that constantly requires more high-order talents while reducing the need for commodity-like tasks.

The remedy usually proposed for this mismatch is education. Indeed, a top-notch school system available to all is hugely important. But even with the finest educational system in the world, a significant portion of the population will continue, in a nation of great abundance, to earn no more than a bare subsistence.

To see why that is true, imagine we lived in a sports-based economy. In such a marketplace, I would be a flop. You could supply me with the world's best instruction, and I could endlessly strive to improve my skills. But, alas, on the gridiron or basketball court I would never command even a minimum wage. The brutal truth is that an advanced economic system, whether it be geared to physical or mental skills, will leave a great many people behind.

In my mind, the country's economic policies should have two main objectives. First, we should wish, in our rich society, for every person who is willing to work to receive income that will provide him or her a decent lifestyle. Second, any plan to do that should not distort our market system, the key element required for growth and prosperity.

That second goal crumbles in the face of any plan to sizably increase the minimum wage. I may wish to have all jobs pay at least \$15 an hour. But that minimum would almost certainly reduce employment in a major way, crushing many workers possessing only basic skills. Smaller increases, though obviously welcome, will still leave many hardworking Americans mired in poverty.

The better answer is a major and carefully crafted expansion of the Earned Income Tax Credit (EITC), which currently goes to millions of low-income workers. Payments to eligible workers diminish as their earnings increase. But there is no disincentive effect: A gain in wages always produces a gain in overall income. The process is simple: You file a tax return, and the government sends you a check.

In essence, the EITC rewards work and provides an incentive for workers to improve their skills. Equally important, it does not distort market forces, thereby maximizing employment.

The existing EITC needs much improvement. Fraud is a big problem; penalties for

it should be stiffened. There should be widespread publicity that workers can receive free and convenient filing help. An annual payment is now the rule; monthly installments would make more sense, since they would discourage people from taking out loans while waiting for their refunds to come through. Dollar amounts should be increased, particularly for those earning the least.

There is no perfect system, and some people, of course, are unable or unwilling to work. But the goal of the EITC—a livable income for everyone who works—is both appropriate and achievable for a great and prosperous nation. Let's replace the American Nightmare with an American Promise: America will deliver a decent life for anyone willing to work.

Mr. Buffett is chairman and CEO of Berkshire Hathaway.

I have good news. First, most American children are going to live far better than their parents did. Second, large gains in the living standards of Americans will continue for many generations to come.

Some years back, people generally agreed with my optimism. Today, however, pollsters find that most Americans are pessimistic about their children's future. Politicians, business leaders and the press constantly tell us that our economic machine is sputtering. Their evidence: GDP growth of only 2% or so in recent years.

Before we shed tears over that figure, let's do a little math, recognizing that GDP per capita is what counts. If, for example, the U.S. population were to grow 3% annually while GDP grew 2%, prospects would indeed be bleak for our children.

But that's not the case. We can be confident that births minus deaths will add no more than 0.5% yearly to America's population. Immigration is more difficult to predict. I believe 1 million people annually is a reasonable estimate, an influx that will add 0.3% annually to population growth.

In total, therefore, you can expect America's population to increase about 0.8% a year. Under that assumption, gains of 2% in real GDP—that is, without nominal gains produced by inflation—will annually deliver 1.2% growth in per capita GDP.

This pace no doubt sounds paltry. But over time, it works wonders. In 25 years—a single generation—1.2% annual growth boosts our current \$59,000 of GDP per capita to \$79,000. This \$20,000 increase guarantees a far better life for our children.

In America, it should be noted, there's nothing unusual about that sort of gain, magnificent though it will be. Just look at what has happened in my lifetime.

I was born in 1930, when the symbol of American wealth was John D. Rockefeller Sr. Today my upper-middle-class neighbors enjoy options in travel, entertainment, medicine and education that were simply not available to Rockefeller and his family. With all of his riches, John D. couldn't buy the pleasures and conveniences we now take for granted.

Two words explain this miracle: innovation and productivity. Conversely, were today's Americans doing the same things in the same ways as they did in 1776, we would be leading the same sort of lives as our forebears.

Replicating those early days would require that 80% or so of today's workers be employed on farms simply to provide the food and cotton we need. So why does it take only 2% of today's workers to do this job? Give the credit to those who brought us tractors, planters, cotton gins, combines, fertilizer, irrigation and a host of other productivity improvements.

To all this good news there is, of course, an important offset: in our 241 years, the progress that I've described has disrupted and displaced almost all of our country's labor force. If that level of upheaval had been foreseen—which it clearly wasn't—strong worker opposition would surely have formed and possibly doomed innovation. How, Americans would have asked, could all these unemployed farmers find work?

We know today that the staggering productivity gains in farming were a blessing. They freed nearly 80% of the nation's workforce to redeploy their efforts into new industries that have changed our way of life.

You can describe these developments as productivity gains or disruptions. Whatever the label, they explain why we now have our amazing \$59,000 of GDP per capita.

This game of economic miracles is in its early innings. Americans will benefit from far more and better “stuff” in the future. The challenge will be to have this bounty deliver a better life to the disrupted as well as to the disrupters. And on this matter, many Americans are justifiably worried.

Let’s think again about 1930. Imagine someone then predicting that real per capita GDP would increase sixfold during my lifetime. My parents would have immediately dismissed such a gain as impossible. If somehow, though, they could have imagined it actually transpiring, they would concurrently have predicted something close to universal prosperity.

Instead, another invention of the ensuing decades, the Forbes 400, paints a far different picture. Between the first computation in 1982 and today, the wealth of the 400 increased 29-fold—from \$93 billion to \$2.7 trillion—while many millions of hardworking citizens remained stuck on an economic treadmill. During this period, the tsunami of wealth didn’t trickle down. It surged upward.

In 1776, America set off to unleash human potential by combining market economics, the rule of law and equality of opportunity. This foundation was an act of genius that in only 241 years converted our original villages and prairies into \$96 trillion of wealth.

The market system, however, has also left many people hopelessly behind, particularly as it has become ever more specialized. These devastating side

effects can be ameliorated: a rich family takes care of all its children, not just those with talents valued by the marketplace.

In the years of growth that certainly lie ahead, I have no doubt that America can both deliver riches to many and a decent life to all. We must not settle for less.
