SECOND ANNUAL LETTER TO LIMITED PARTNERS

The General Stock Market Picture in 1957

In last year's letter to partners, I said the following:

My view of the general market level is that it is priced above intrinsic value. This view relates to blue-chip securities. This view, if accurate, carries with it the possibility of a substantial decline in all stock prices, both undervalued and otherwise. In any event I think the probability is very slight that current market levels will be thought of as cheap five years from now. Even a full-scale bear market, however, should not hurt the market value of our work-outs substantially.

If the general market were to return to an undervalued status our capital might be employed exclusively in general issues and perhaps some borrowed money would be used in this operation at that time. Conversely, if the market should go considerably higher our policy will be to reduce our general issues as profits present themselves and increase the work-out portfolio.

All of the above is not intended to imply that market analysis is foremost in my mind. Primary attention is given at all times to the detection of substantially undervalued securities.

The past year witnessed a moderate decline in stock prices. I stress the word "moderate" since casual reading of the press or conversing with those who have had only recent experience with stocks would tend to create an impression of a much greater decline. Actually, it appears to me that the decline in stock prices has been considerably less than the decline in corporate earning power under present business conditions. This means that the public is still very bullish on blue chip stocks and the general economic picture. I make no attempt to forecast either business or the stock market; the above is simply intended to dispel any notions that stocks have suffered any drastic decline or that the general market, is at a low level. I still consider the general market to be priced on the high side based on long term investment value.

Our Activities in 1957

The market decline has created greater opportunity among undervalued situations so that, generally, our portfolio is heavier in undervalued situations relative to work-outs than it was last year. Perhaps an explanation of the term "work-out" is in order. A work-out is an investment which is dependent on a specific corporate action for its profit rather than a general advance in the price of the stock as in the case of undervalued situations. Work-outs come about through: sales, mergers, liquidations, tenders, etc. In each case, the risk is that something will upset the applecart and cause the abandonment of the planned action, not that the economic picture will deteriorate and stocks decline generally. At the end of 1956, we had a ratio of about 70-30 between general issues and work-outs. Now it is about 85-15.

During the past year we have taken positions in two situations which have reached a size where we may expect to take some part in corporate decisions. One of these positions accounts for between 10% and 20% of the portfolio of the various partnerships and the other accounts for about 5%. Both of these will probably take in the neighborhood of three to five years of work but they presently appear to have potential for a high average annual rate of return with a minimum of risk. While not in the classification of work-outs, they have very little

dependence on the general action of the stock market. Should the general market have a substantial rise, of course, I would expect this section of our portfolio to lag behind the action of the market.

Results for 1957

In 1957 the three partnerships which we formed in 1956 did substantially better than the general market. At the beginning of the year, the Dow-Jones Industrials stood at 499 and at the end of the year it was at 435 for a loss of 64 points. If one had owned the Averages, he would have received 22 points in dividends reducing the overall loss to 42 points or 8.470% for the year. This loss is roughly equivalent to what would have been achieved by investing in most investment funds and, to my knowledge, no investment fund invested in stocks showed a gain for the year.

All three of the 1956 partnerships showed a gain during the year amounting to about 6.2%, 7.8% and 25% on yearend 1956 net worth. Naturally a question is created as to the vastly superior performance of the last partnership, particularly in the mind of the partners of the first two. This performance emphasizes the importance of luck in the short run, particularly in regard to when funds are received. The third partnership was started the latest in 1956 when the market was at a lower level and when several securities were particularly attractive. Because of the availability of funds, large positions were taken in these issues. Whereas the two partnerships formed earlier were already substantially invested so that they could only take relatively small positions in these issues.

Basically, all partnerships are invested in the same securities and in approximately the same percentages. However, particularly during the initial stages, money becomes available at varying times and varying levels of the market so there is more variation in results than is likely to be the case in later years. Over the years, I will be quite satisfied with a performance that is 10% per year better than the Averages, so in respect to these three partnerships, 1957 was a successful and probably better than average, year.

Two partnerships were started during the middle of 1957 and their results for the balance of the year were roughly the same as the performance of the Averages which were down about 12% for the period since inception of the 1957 partnerships. Their portfolios are now starting to approximate those of the 1956 partnerships and performance of the entire group should be much more comparable in the future.

Interpretation of results

To some extent our better than average performance in 1957 was due to the fact that it was a generally poor year for most stocks. Our performance, relatively, is likely to be better in a bear market than in a bull market so that deductions made from the above results should be tempered by the fact that it was the type of year when we should have done relatively well. In a year when the general market had a substantial advance I would be well satisfied to match the advance of the Averages.

I can definitely say that our portfolio represents better value at the end of 1957 than it did at the end of 1956. This is due to both generally lower prices and the fact that we have had more time to acquire the more substantially undervalued securities which can only be acquired with patience. Earlier I mentioned our largest position which comprised 10% to 20% of the assets of the various partnerships. In time I plan to have this represent 20% of the assets of all partnerships but this cannot be hurried. Obviously during any acquisition period, our primary interest is to have the stock do nothing or decline rather than advance. Therefore, at any given time, a fair proportion of our portfolio may be in the sterile stage. This policy, while requiring patience, should maximize long term profits.

I have tried to cover points which I felt might be of interest and disclose as much of our philosophy as may be imparted without talking of individual issues. If there are any questions concerning any phase of the operation, I would welcome hearing from you.

THE GENERAL STOCK MARKET IN 1958

A friend who runs a medium-sized investment trust recently wrote: "The mercurial temperament, characteristic of the American people, produced a major transformation in 1958 and 'exuberant' would be the proper word for the stock market, at least".

I think this summarizes the change in psychology dominating the stock market in 1958 at both the amateur and professional levels. During the past year almost any reason has been seized upon to justify "Investing" in the market. There are undoubtedly more mercurially-tempered people in the stock market now than for a good many years and the duration of their stay will be limited to how long they think profits can be made quickly and effortlessly. While it is impossible to determine how long they will continue to add numbers to their ranks and thereby stimulate rising prices, I believe it is valid to say that the longer their visit, the greater the reaction from it.

I make no attempt to forecast the general market - my efforts are devoted to finding undervalued securities. However, I do believe that widespread public belief in the inevitability of profits from investment in stocks will lead to eventual trouble. Should this occur, prices, but not intrinsic values in my opinion, of even undervalued securities can be expected to be substantially affected.

RESULTS IN 1958

In my letter of last year, I wrote:

"Our performance, relatively, is likely to be better in a bear market than in a bull market so that deductions made from the above results should be tempered by the fact that it was the type of year when we should have done relatively well. In a year when the general market had a substantial advance, I would be well satisfied to match the advance of the averages."

The latter sentence describes the type of year we had in 1958 and my forecast worked out. The Dow-Jones Industrial average advanced from 435 to 583 which, after adding back dividends of about 20 points, gave an overall gain of 38.5% from the Dow-Jones unit. The five partnerships that operated throughout the entire year obtained results averaging slightly better than this 38.5%. Based on market values at the end of both years, their gains ranged from 36.7% to 46.2%. Considering the fact that a substantial portion of assets has been and still is invested in securities, which benefit very little from a fast-rising market, I believe these results are reasonably good. I will continue to forecast that our results will be above average in a declining or level market, but it will be all we can do to keep pace with a rising market.

TYPICAL SITUATION

So that you may better understand our method of operation, I think it would be well to review a specific activity of 1958. Last year I referred to our largest holding which comprised 10% to 20% of the assets of the various partnerships. I pointed out that it was to our interest to have this stock decline or remain relatively steady, so that we could acquire an even larger position and that for this reason such a security would probably hold back our comparative performance in a bull market.

This stock was the Commonwealth Trust Co. of Union City, New Jersey. At the time we started to purchase the stock, it had an intrinsic value \$125 per share computed on a conservative basis. However, for good reasons, it

paid no cash dividend at all despite earnings of about \$10 per share which was largely responsible for a depressed price of about \$50 per share. So here we had a very well managed bank with substantial earnings power selling at a large discount from intrinsic value. Management was friendly to us as new stockholders and risk of any ultimate loss seemed minimal.

Commonwealth was 25.5% owned by a larger bank (Commonwealth had assets of about \$50 Million – about half the size of the First National in Omaha), which had desired a merger for many years. Such a merger was prevented for personal reasons, but there was evidence that this situation would not continue indefinitely. Thus we had a combination of:

1. Very strong defensive characteristics;
2. Good solid value building up at a satisfactory pace and;
3. Evidence to the effect that eventually this value would be unlocked although it might be one year or ten years. If the latter were true, the value would presumably have been built up to a considerably larger figure, say, \$250 per share.

Over a period of a year or so, we were successful in obtaining about 12% of the bank at a price averaging about \$51 per share. Obviously it was definitely to our advantage to have the stock remain dormant in price. Our block of stock increased in value as its size grew, particularly after we became the second largest stockholder with sufficient voting power to warrant consultation on any merger proposal.

Commonwealth only had about 300 stockholders and probably averaged two trades or so per month, so you can understand why I say that the activity of the stock market generally had very little effect on the price movement of some of our holdings.

Unfortunately we did run into some competition on buying, which railed the price to about \$65 where we were neither buyer nor seller. Very small buying orders can create price changes of this magnitude in an inactive stock, which explains the importance of not having any "Leakage" regarding our portfolio holdings.

Late in the year we were successful in finding a special situation where we could become the largest holder at an attractive price, so we sold our block of Commonwealth obtaining \$80 per share although the quoted market was about 20% lower at the time.

It is obvious that we could still be sitting with \$50 stock patiently buying in dribs and drabs, and I would be quite happy with such a program although our performance relative to the market last year would have looked poor. The year when a situation such as Commonwealth results in a realized profit is, to a great extent, fortuitous. Thus, our performance for any single year has serious limitations as a basis for estimating long term results. However, I believe that a program of investing in such undervalued well protected securities offers the surest means of long term profits in securities.

I might mention that the buyer of the stock at \$80 can expect to do quite well over the years. However, the relative undervaluation at \$80 with an intrinsic value \$135 is quite different from a price \$50 with an intrinsic value of \$125, and it seemed to me that our capital could better be employed in the situation which replaced it. This new situation is somewhat larger than Commonwealth and represents about 25% of the assets of the various partnerships. While the degree of undervaluation is no greater than in many other securities we own (or even than some) we are the largest stockholder and this has substantial advantages many times in determining the length of time required to correct the undervaluation. In this particular holding we are virtually assured of a performance better than that of the Dow-Jones for the period we hold it.

THE CURRENT SITUATION

The higher the level of the market, the fewer the undervalued securities and I am finding some difficulty in

securing an adequate number of attractive investments. I would prefer to increase the percentage of our assets in work-outs, but these are very difficult to find on the right terms.

To the extent possible, therefore, I am attempting to create my own work-outs by acquiring large positions in several undervalued securities. Such a policy should lead to the fulfillment of my earlier forecast – an above average performance in a bear market. It is on this basis that I hope to be judged. If you have any questions, feel free to ask them.

WARREN E. BUFFETT 2-11-59

1959 Letter
WARREN E. BUFFETT
5202 Underwood Ave. Omaha, Nebraska

The General Stock Market in 1959:

The Dow-Jones Industrial Average, undoubtedly the most widely used index of stock market behavior, presented a somewhat faulty picture in 1959. This index recorded an advance from 583 to 679, or 16.4% for the year. When the dividends which would have been received through ownership of the average are added, an overall gain of 19.9% indicated for 1959.

Despite this indication of a robust market, more stocks declined than advanced on the New York Stock Exchange during the year by a margin of 710 to 628. Both the Dow-Jones Railroad Average and Utility Average registered declines.

Most investment trusts had a difficult time in comparison with the Industrial Average. Tri-Continental Corp. the nation's largest closed-end investment company (total asset \$400 million) had an overall gain of about 5.7% for the year. Fred Brown, its President, had this to say about the 1959 marked in a recent speech to the Analysts Society:

"But, even though we like the portfolio, the market performance of Tri-Continental's holdings in 1959 was disappointing to us. Markets in which investor sentiment and enthusiasm play so large a part as those of 1959, are difficult for investment managers trained in values and tuned to investing for the long-term. Perhaps we haven't had our space boots adjusted properly. However, we believe that there is a limit to risks that an investing institution such as Tri-Continental should take with its stockholders' money, and we believe that the portfolio is in shape for the year ahead."

Massachusetts Investors Trust, the country's largest mutual fund with assets of \$1.5 billion showed an overall gain of about 9% for the year.

Most of you know I have been very apprehensive about general stock market levels for several years. To date, this caution has been unnecessary. By previous standards, the present level of "blue chip" security prices contains a substantial speculative component with a corresponding risk of loss. Perhaps other standards of valuation are evolving which will permanently replace the old standard. I don't think so. I may very well be wrong; however, I would rather sustain the penalties resulting from over-conservatism than face the consequences of error, perhaps with permanent capital loss, resulting from the adoption of a "New Era" philosophy where trees really do grow to the sky.

Results in 1959:

There has been emphasis in previous letters on a suggested standard of performance involving relatively good results (compared to the general market indices and leading investment trusts) in periods of declining or level prices but relatively unimpressive results in rapidly rising markets.

We were fortunate to achieve reasonably good results in 1959. The six partnerships that operated throughout the year achieved overall net gains ranging from 22.3% to 30.0%, and averaging about 25.9%. Portfolios of these partnerships are now about 80%comparable, but there is some difference due to securities and cash becoming available at varying times, payments made to partners, etc. Over the past few years, there hasn't been any partnership which has consistently been at the top or bottom of performance from year to year, and the variance is narrowing as the portfolios tend to become comparable.

The overall net gain is determined on the basis of market values at the beginning and end of the year adjusted for payments made to partners or contributions received from them. It is not based on actual realized profits during the year, but is intended to measure the change in liquidating value for the year. It is before interest allowed to partners (where that is specified in the partnership agreement) and before any division of profit to the general partner, but after operating expenses.

The principal operating expense is the Nebraska Intangibles Tax which amounts to .4% of market value on practically all securities. Last year represented the first time that this tax had been effectively enforced and, of course penalized our results to the extent of .4%.

The present portfolio:

Last year, I mentioned a new commitment which involved about 25% of assets of the various partnerships. Presently this investment is about 35% of assets. This is an unusually large percentage, but has been made for strong reasons. In effect, this company is partially an investment trust owing some thirty or forty other securities of high quality. Our investment was made and is carried at a substantial discount from asset value based on market value of their securities and a conservative appraisal of the operating business.

We are the company's largest stockholder by a considerable margin, and the two other large holders agree with our ideas. The probability is extremely high that the performance of this investment will be superior to that of the general market until its disposition, and I am hopeful that this will take place this year.

The remaining 65% of the portfolio is in securities which I consider undervalued and work-out operations. To the extent possible, I continue to attempt to invest in situations at least partially insulated from the behavior of the general market.

This policy should lead to superior results in bear markets and average performance in bull markets. The first prediction may be subject to test this year since, at this writing, the Dow-Jones Industrials have retraced over half of their 1959 advance.

Should you have any questions or if I have not been clear in any respect, I would be very happy to hear from you.

Warren E. Buffett
2-20-60

1960 Letter
WARREN E. BUFFETT
5202 Underwood Ave. Omaha, Nebraska

The General Stock Market in 1960:

A year ago, I commented on the somewhat faulty picture presented in 1959 by the Dow-Jones Industrial Average which had advanced from 583 to 679, or 16.4%. Although practically all investment companies showed gains for that year, less than 10% of them were able to match or better the record of the Industrial Average. The Dow-Jones Utility Average had a small decline and the Railroad Average recorded a substantial one.

In 1960, the picture was reversed. The Industrial Average declined from 679 to 616, or 9.3%. Adding back the dividends which would have been received through ownership of the Average still left it with an overall loss of 6.3%. On the other hand, the Utility Average showed a good gain and, while all the results are not now available, my guess is that about 90% of all investment companies outperformed the Industrial Average. The majority of investment companies appear to have ended the year with overall results in the range of plus or minus 5%. On the New York Stock Exchange, 653 common stocks registered losses for the year while 404 showed gains.

Results in 1960:

My continual objective in managing partnership funds is to achieve a long-term performance record superior to that of the Industrial Average. I believe this Average, over a period of years, will more or less parallel the results of leading investment companies. Unless we do achieve this superior performance there is no reason for existence of the partnerships.

However, I have pointed out that any superior record which we might accomplish should not be expected to be evidenced by a relatively constant advantage in performance compared to the Average. Rather it is likely that if such an advantage is achieved, it will be through better-than-average performance in stable or declining markets and average, or perhaps even poorer- than-average performance in rising markets.

I would consider a year in which we declined 15% and the Average 30% to be much superior to a year when both we and the Average advanced 20%. Over a period of time there are going to be good and bad years; there is nothing to be gained by getting enthused or depressed about the sequence in which they occur. The important thing is to be beating par; a four on a par three hole is not as good as a five on a par five hole and it is unrealistic to assume we are not going to have our share of both par three's and par five's.

The above dose of philosophy is being dispensed since we have a number of new partners this year and I want to make sure they understand my objectives, my measure of attainment of these objectives, and some of my known limitations.

With this background it is not unexpected that 1960 was a better-than-average year for us. As contrasted with an overall loss of 6.3% for the Industrial Average, we had a 22.8% gain for the seven partnerships operating throughout the year. Our results for the four complete years of partnership operation after expenses but before interest to limited partners or allocation to the general partner are:

Year	Partnerships Operating Entire Year	Partnership Gain	Dow-Jones Gain
1957	3	10.4%	-8.4%
1958	5	40.9%	38.5%

1959	6	25.9%	19.9%
1960	7	22.8%	-6.3%

It should be emphasized again that these are the net results to the partnership; the net results to the limited partners would depend on the partnership agreement that they had selected.

The overall gain or loss is computed on a market to market basis. After allowing for any money added or withdrawn, such a method gives results based upon what would have been realized upon liquidation of the partnership at the beginning, of the year and what would have been realized upon liquidation at year end and is different, of course, from our tax results, which value securities at cost and realize gains or losses only when securities are actually sold.

On a compounded basis, the cumulative results have been:

Year	Partnership Gain	Dow-Jones Gain
1957	10.4%	-8.4%
1958	55.6%	26.9%
1959	95.9%	52.2%
1960	140.6%	42.6%

Although four years is entirely too short a period from which to make deductions, what evidence there is points toward confirming the proposition that our results should be relatively better in moderately declining or static markets. To the extent that this is true, it indicates that our portfolio may be more conservatively, although decidedly less conventionally, invested than if we owned "blue-chip" securities. During a strongly rising market for the latter, we might have real difficulty in matching their performance.

Multiplicity of Partnerships:

A preceding table shows that the family is growing. There has been no partnership which has had a consistently superior or inferior record compared to our group average, but there has been some variance each year despite my efforts to "keep all partnerships invested in the same securities and in about the same proportions. This variation, of course, could be eliminated by combining the present partnerships into one large partnership. Such a move would also eliminate much detail and a moderate amount of expense.

Frankly, I am hopeful of doing something along this line in the next few years. The problem is that various partners have expressed preferences for varying partnership arrangements. Nothing will be done without unanimous consent of partners.

Advance Payments:

Several partners have inquired about adding money during the year to their partnership. Although an exception has been made, it is too difficult to amend partnership agreements during mid-year where we have more than one family represented among the limited partners. Therefore, in mixed partnerships an additional interest can only be acquired at the end of the year.

We do accept advance payments during the year toward a partnership interest and pay interest at 6% on this payment from the time received until the end of the year. At that time, subject to amendment of the agreement by the partners, the payment plus interest is added to the partnership capital and thereafter participates in profits and losses.

Sanborn Map:

Last year mention was made of an investment which accounted for a very high and unusual proportion (35%) of our net assets along with the comment that I had some hope this investment would be concluded in 1960. This hope materialized. The history of an investment of this magnitude may be of interest to you.

Sanborn Map Co. is engaged in the publication and continuous revision of extremely detailed maps of all cities of the United States. For example, the volumes mapping Omaha would weigh perhaps fifty pounds and provide minute details on each structure. The map would be revised by the paste-over method showing new construction, changed occupancy, new fire protection facilities, changed structural materials, etc. These revisions would be done approximately annually and a new map would be published every twenty or thirty years when further pasteovers became impractical. The cost of keeping the map revised to an Omaha customer would run around \$100 per year.

This detailed information showing diameter of water mains underlying streets, location of fire hydrants, composition of roof, etc., was primarily of use to fire insurance companies. Their underwriting departments, located in a central office, could evaluate business by agents nationally. The theory was that a picture was worth a thousand words and such evaluation would decide whether the risk was properly rated, the degree of conflagration exposure in an area, advisable reinsurance procedure, etc. The bulk of Sanborn's business was done with about thirty insurance companies although maps were also sold to customers outside the insurance industry such as public utilities, mortgage companies, and taxing authorities.

For seventy-five years the business operated in a more or less monopolistic manner, with profits realized in every year accompanied by almost complete immunity to recession and lack of need for any sales effort. In the earlier years of the business, the insurance industry became fearful that Sanborn's profits would become too great and placed a number of prominent insurance men on Sanborn's board of directors to act in a watch-dog capacity.

In the early 1950's a competitive method of under-writing known as "carding" made inroads on Sanborn's business and after-tax profits of the map business fell from an average annual level of over \$500,000 in the late 1930's to under \$100,000 in 1958 and 1959. Considering the upward bias in the economy during this period, this amounted to an almost complete elimination of what had been sizable, stable earning power.

However, during the early 1930's Sanborn had begun to accumulate an investment portfolio. There were no capital requirements to the business so that any retained earnings could be devoted to this project. Over a period of time, about \$2.5 million was invested, roughly half in bonds and half in stocks. Thus, in the last decade particularly, the investment portfolio blossomed while the operating map business wilted.

Let me give you some idea of the extreme divergence of these two factors. In 1938 when the Dow-Jones Industrial Average was in the 100-120 range, Sanborn sold at \$110 per share. In 1958 with the Average in the 550 area, Sanborn sold at \$45 per share. Yet during that same period the value of the Sanborn investment portfolio increased from about \$20 per share to \$65 per share. This means, in effect, that the buyer of Sanborn stock in 1938 was placing a positive valuation of \$90 per share on the map business (\$110 less the \$20 value of the investments unrelated to the map business) in a year of depressed business and stock market conditions. In the tremendously more vigorous climate of 1958 the same map business was evaluated at a minus \$20 with the buyer of the stock unwilling to pay more than 70 cents on the dollar for the investment portfolio with the map business thrown in for nothing.

How could this come about? Sanborn in 1958 as well as 1938 possessed a wealth of information of substantial value to the insurance industry. To reproduce the detailed information they had gathered over the years would have cost tens of millions of dollars. Despite "carding" over \$500 million of fire premiums were underwritten

by “mapping” companies. However, the means of selling and packaging Sanborn’s product, information had remained unchanged throughout the year and finally this inertia was reflected in the earnings.

The very fact that the investment portfolio had done so well served to minimize in the eyes of most directors the need for rejuvenation of the map business. Sanborn had a sales volume of about \$2 million per year and owned about \$7 million worth of marketable securities. The income from the investment portfolio was substantial, the business had no possible financial worries, the insurance companies were satisfied with the price paid for maps, and the stockholders still received dividends. However, these dividends were cut five times in eight years although I could never find any record of suggestions pertaining to cutting salaries or director's and committee fees.

Prior to my entry on the Board, of the fourteen directors, nine were prominent men from the insurance industry who combined held 46 shares of stock out of 105,000 shares outstanding. Despite their top positions with very large companies which would suggest the financial wherewithal to make at least a modest commitment, the largest holding in this group was ten shares. In several cases, the insurance companies these men ran owned small blocks of stock but these were token investments in relation to the portfolios in which they were held. For the past decade the insurance companies had been only sellers in any transactions involving Sanborn stock.

The tenth director was the company attorney, who held ten shares. The eleventh was a banker with ten shares who recognized the problems of the company, actively pointed them out, and later added to his holdings. The next two directors were the top officers of Sanborn who owned about 300 shares combined. The officers were capable, aware of the problems of the business, but kept in a subservient role by the Board of Directors. The final member of our cast was a son of a deceased president of Sanborn. The widow owned about 15,000 shares of stock.

In late 1958, the son, unhappy with the trend of the business, demanded the top position in the company, was turned down, and submitted his resignation, which was accepted. Shortly thereafter we made a bid to his mother for her block of stock, which was accepted. At the time there were two other large holdings, one of about 10,000 shares (dispersed among customers of a brokerage firm) and one of about 8,000. These people were quite unhappy with the situation and desired a separation of the investment portfolio from the map business, as did we.

Subsequently our holdings (including associates) were increased through open market purchases to about 24,000 shares and the total represented by the three groups increased to 46,000 shares. We hoped to separate the two businesses, realize the fair value of the investment portfolio and work to re-establish the earning power of the map business. There appeared to be a real opportunity to multiply map profits through utilization of Sanborn's wealth of raw material in conjunction with electronic means of converting this data to the most usable form for the customer.

There was considerable opposition on the Board to change of any type, particularly when initiated by an outsider, although management was in complete accord with our plan and a similar plan had been recommended by Booz, Allen & Hamilton (Management Experts). To avoid a proxy fight (which very probably would not have been forthcoming and which we would have been certain of winning) and to avoid time delay with a large portion of Sanborn’s money tied up in blue-chip stocks which I didn’t care for at current prices, a plan was evolved taking out all stockholders at fair value who wanted out. The SEC ruled favorably on the fairness of the plan. About 72% of the Sanborn stock, involving 50% of the 1,600 stockholders, was exchanged for portfolio securities at fair value. The map business was left with over \$1,25 million in government and municipal bonds as a reserve fund, and a potential corporate capital gains tax of over \$1 million was eliminated. The remaining stockholders were left with a slightly improved asset value, substantially higher earnings per share, and an increased dividend rate.

Necessarily, the above little melodrama is a very abbreviated description of this investment operation. However, it does point up the necessity for secrecy regarding our portfolio operations as well as the futility of measuring our results over a short span of time such as a year. Such control situations may occur very infrequently. Our bread-and-butter business is buying undervalued securities and selling when the undervaluation is corrected along with investment in special situations where the profit is dependent on corporate rather than market action. To the extent that partnership funds continue to grow, it is possible that more opportunities will be available in "control situations."

The auditors should be mailing your financial statement and tax information within about a week. If you have any questions at all regarding either their report or this letter, be sure to let me know.

Warren E. Buffett 1-30-61

1960 Letter
BUFFETT PARTNERSHIP, LTD.
810 KIEWIT PLAZA
OMAHA 31, NEBRASKA

July, 1961

TO MY PARTNERS:

In the past, partners have commented that a once-a-year letter was “a long time between drinks,” and that a semi-annual letter would be a good idea. It really shouldn’t be too difficult to find something to say twice a year; at least it isn’t this year. Hence, this letter which will be continued in future years.

During the first half of 1961, the overall gain of the Dow-Jones Industrial Average was about 13%, including dividends. Although this is the type of period when we should have the most difficulty in exceeding this standard, all partnerships that operated throughout the six months did moderately better than the Average. Partnerships formed during 1961 either equaled or exceeded results of the Average from the time of formation, depending primarily on how long they were in operation.

Let me, however, emphasize two points. First, one year is far too short a period to form any kind of an opinion as to investment performance, and measurements based upon six months become even more unreliable. One factor that has caused some reluctance on my part to write semi-annual letters is the fear that partners may begin to think in terms of short-term performance which can be most misleading. My own thinking is much more geared to five year performance, preferably with tests of relative results in both strong and weak markets.

The second point I want everyone to understand is that if we continue in a market which advances at the pace of the first half of 1961, not only do I doubt that we will continue to exceed the results of the DJIA, but it is very likely that our performance will fall behind the Average.

Our holdings, which I always believe to be on the conservative side compared to general portfolios, tend to grow more conservative as the general market level rises. At all times, I attempt to have a portion of our portfolio in securities at least partially insulated from the behavior of the market, and this portion should increase as the market rises. However appetizing results for even the amateur cook (and perhaps particularly the amateur), we find that more of our portfolio is not on the stove.

We have also begun open market acquisition of a potentially major commitment which I, of course, hope does nothing marketwise for at least a year. Such a commitment may be a deterrent to short range performance, but it gives strong promise of superior results over a several year period combined with substantial defensive characteristics.

Progress has been made toward combining all partners at yearend. I have talked with all partners joining during this past year or so about this goal, and have also gone over the plans with representative partners of all earlier partnerships

Some of the provisions will be:

(A) A merger of all partnerships, based on market value at yearend, with provisions for proper allocation among partners of future tax liability due to unrealized gains at yearend. The merger itself will be tax-free, and will result in no acceleration of realization of profits;

(B) A division of profits between the limited partners and general partner, with the first 6% per year to partners based upon beginning capital at market, and any excess divided one-fourth to the general partner and three-fourths to all partners proportional to their capital. Any deficiencies in earnings below the 6% would be carried forward against future earnings, but would not be carried back. Presently, there are three profit arrangements which have been optional to incoming partners:

	Interest Provision	Excess to Gen. Partner	Excess to Ltd. Partners
(1)	6%	1/3	2/3
(2)	4%	1/4	3/4
(3)	None	1/6	5/6

In the event of profits, the new division will obviously have to be better for limited partners than the first two arrangements. Regarding the third, the new arrangement will be superior up to 18% per year; but above this rate the limited partners would do better under the present agreement. About 80% of total partnership assets have selected the first two arrangements, and I am hopeful, should we average better than 18% yearly, partners presently under the third arrangement will not feel short-changed under the new agreement;

(C) In the event of losses, there will be no carry back against amounts previously credited to me as general partner. Although there will be a carry-forward against future excess earnings. However, my wife and I will have the largest single investment in the new partnership, probably about one-sixth of total partnership assets, and thereby a greater dollar stake in losses than any other partner of family group, I am inserting a provision in the partnership agreement which will prohibit the purchase by me or my family of any marketable securities. In other words, the new partnership will represent my entire investment operation in marketable securities, so that my results will have to be directly proportional to yours, subject to the advantage I obtain if we do better than 6%;

(D) A provision for monthly payments at the rate of 6% yearly, based on beginning of the year capital valued at market. Partners not wishing to withdraw money currently can have this credited back to them automatically as an advance payment, drawing 6%, to purchase an additional equity interest in the partnership at yearend. This will solve one stumbling block that has heretofore existed in the path of consolidation, since many partners desire regular withdrawals and others wish to plow everything back;

(E) The right to borrow during the year, up to 20% of the value of your partnership interest, at 6%, such loans to be liquidated at yearend or earlier. This will add a degree of liquidity to an investment which can now only be disposed of at yearend. It is not intended that anything but relatively permanent funds be invested in the partnership, and we have no desire to turn it into a bank. Rather, I expect this to be a relatively unused provision, which is available when something unexpected turns up and a wait until yearend to liquidate part of all of a partner's interest would cause hardship;

(F) An arrangement whereby any relatively small tax adjustment, made in later years on the partnership's return will be assessed directly to me. This way, we will not be faced with the problem of asking eighty people, or more, to amend their earlier return over some small matter. As it stands now, a small change, such as a decision that a dividend received by the partnership has 63% a return of capital instead of 68%, could cause a multitude of paper work. To prevent this, any change amounting to less than \$1,000 of tax will be charged directly to me.

We have submitted the proposed agreement to Washington for a ruling that the merger would be tax-free, and that the partnership would be treated as a partnership under the tax laws. While all of this is a lot of work, it will make things enormously easier in the future. You might save this letter as a reference to read in conjunction with the agreement which you will receive later in the year.

The minimum investment for new partners is currently \$25,000, but, of course, this does not apply to present partners. Our method of operation will enable the partners to add or withdraw amounts of any size (in round \$100) at yearend. Estimated total assets of the partnership will be in the neighborhood of \$4 million, which enables us to consider investments such as the one mentioned earlier in this letter, which we would have had to pass several years ago.

This has turned out to be more of a production than my annual letter. If you have any questions, particularly regarding anything that isn't clear in my discussion of the new partnership agreement, be sure to let me know. If there are a large number of questions, I will write a supplemental letter to all partners giving the questions that arise and the answers to them.

Our Performance in 1961

I have consistently told partners that it is my expectation and hope (it's always hard to tell which is which) that we will do relatively well compared to the general market in down or static markets, but that we may not look so good in advancing markets. In strongly advancing markets I expect to have real difficulty keeping up with the general market.

Although 1961 was certainly a good year for the general market, and in addition, a very good year for us on both an absolute and relative basis, the expectations in the previous paragraph remain unchanged.

During 1961, the general market as measured by the Dow-Jones Industrial Average (hereinafter called the "Dow") showed an over-all gain of 22.2% including dividends received through ownership of the Dow. The gain for all partnerships operating throughout the entire year, after all expenses of operation, but before payments to limited partners or accrual to the general partner, averaged 45.9%. The details of this gain by partnership are shown in the appendix along with results for the partnerships started during the year.

We have now completed five full years of partnership operation, and the results of these five years are shown below on a year-by-year basis and also on a cumulative or compounded basis. These results are stated on the basis described in the preceding paragraph; after expenses, but before division of gains among partners or payments to partners.

Year	Partnerships Operating Entire Year	Partnership Gain	Dow-Jones Industrials Gain*
1957	3	10.4%	-8.4%
1958	5	40.9%	38.5%
1959	6	25.9%	19.9%
1960	7	22.8%	-6.3%
1961	7	45.9%	22.2%

* Including dividends received through ownership of the Dow.

On a compounded basis, the cumulative results have been:

Year	Partnership Gain	Dow-Jones Industrials Gain
1957	10.4%	-8.4%
1957-58	55.6%	26.9%
1057-59	95.9%	52.2%
1957-60	140.6%	42.6%
1957-61	251.0%	74.3%

These results do not measure the gain to the limited partner, which of course, is the figure in which you are most interested. Because of the varying partnership arrangements that have existed in the past, I have used the over-all net gain (based on market values at the beginning and end of the year) to the partnership as being the fairest measure of over-all performance.

On a pro-forma basis adjusted to the division of gains entailed in our present Buffett Partnership, Ltd. agreement, the results would have been:

Year	Limited Partners' Gain	Dow Gain
1957	9.3%	-8.4%
1958	32.2%	38.5%
1959	20.9%	19.9%
1960	18.6%	-6.3%
1961	35.9%	22.2%

COMPOUNDED

1957	9.3%	-8.4%
1957-58	44.5%	26.9%
1957-59	74.7%	52.2%
1957-60	107.2%	42.6%
1957-61	181.6%	74.3%

A Word About Par

The outstanding item of importance in my selection of partners, as well as in my subsequent relations with them, has been the determination that we use the same yardstick. If my performance is poor, I expect partners to withdraw, and indeed, I should look for a new source of investment for my own funds. If performance is good, I am assured of doing splendidly, a state of affairs to which I am sure I can adjust.

The rub, then, is in being sure that we all have the same ideas of what is good and what is poor. I believe in establishing yardsticks prior to the act; retrospectively, almost anything can be made to look good in relation to something or other.

I have continuously used the Dow-Jones Industrial Average as our measure of par. It is my feeling that three years is a very minimal test of performance, and the best test consists of a period at least that long where the terminal level of the Dow is reasonably close to the initial level.

While the Dow is not perfect (nor is anything else) as a measure of performance, it has the advantage of being widely known, has a long period of continuity, and reflects with reasonable accuracy the experience of investors generally with the market. I have no objection to any other method of measurement of general market performance being used, such as other stock market averages, leading diversified mutual stock funds, bank common trust funds, etc.

You may feel I have established an unduly short yardstick in that it perhaps appears quite simple to do better than an unmanaged index of 30 leading common stocks. Actually, this index has generally proven to be a reasonably tough competitor. Arthur Wiesenberger's classic book on investment companies lists performance for the 15 years 1946-60, for all leading mutual funds. There is presently over \$20 billion invested in mutual funds, so the experience of these funds represents, collectively, the experience of many million investors. My own belief, though the figures are not obtainable, is that portfolios of most leading investment counsel organizations and bank trust departments have achieved results similar to these mutual funds.

Wiesenberger lists 70 funds in his "Charts & Statistics" with continuous records since 1946. I have excluded 32 of these funds for various reasons since they were balanced funds (therefore not participating fully in the general market rise), specialized industry funds, etc. Of the 32 excluded because I felt a comparison would not be fair,

31 did poorer than the Dow, so they were certainly not excluded to slant the conclusions below.

Of the remaining 38 mutual funds whose method of operation I felt was such as to make a comparison with the Dow reasonable, 32 did poorer than the Dow, and 6 did better. The 6 doing better at the end of 1960 had assets of about \$1 billion, and the 32 doing poorer had assets of about \$6-1/2 billion. None of the six that were superior beat the Dow by more than a few percentage points a year.

Below I present the year-by-year results for our period of operation (excluding 1961 for which I don't have exact data, although rough figures indicate no variance from the 1957-60 figures) for the two largest common stock open-end investment companies (mutual funds) and the two largest closed-end investment companies:

Year	Mass. Inv. Trust	Investors Stock	Lehman	Tri-Cont.	Dow	Limited Partners
1957	-12.0%	-12.4%	-11.4%	-2.4%	-8.4%	9.3%
1958	44.1%	47.6%	40.8%	33.2%	38.5%	32.2%
1959	8.2%	10.3%	8.1%	8.4%	19.9%	20.9%
1960	-0.9%	-0.1%	2.6%	2.8%	-6.3%	18.6%

(From Moody's Banks & Finance Manual, 1961)

COMPOUNDED

Year	Mass. Inv. Trust	Investors Stock	Lehman	Tri-Cont.	Dow	Limited Partners
1957	-12.0%	-12.4%	-11.4%	-2.4%	-8.4%	9.3%
1957-58	26.8%	29.3%	24.7%	30.0%	26.9%	44.5%
1957-59	37.2%	42.6%	34.8%	40.9%	52.2%	74.7%
1957-60	36.0%	42.5%	38.3%	44.8%	42.6%	107.2%

Massachusetts Investors Trust has net assets of about \$1.8 billion; Investors Stock Fund about \$1 billion; Tri-Continental Corporation about \$.5 billion; and Lehman Corporation about \$350 million; or a total of over \$3.5 billion.

I do not present the above tabulations and information with the idea of indicting investment companies. My own record of investing such huge sums of money, with restrictions on the degree of activity I might take in companies where we had investments, would be no better, if as good. I present this data to indicate the Dow as an investment competitor is no pushover, and the great bulk of investment funds in the country are going to have difficulty in bettering, or perhaps even matching, its performance.

Our portfolio is very different from that of the Dow. Our method of operation is substantially different from that of mutual funds.

However, most partners, as all alternative to their investment in the partnership, would probably have their funds invested in a media producing results comparable to the Dow, therefore, I feel it is a fair test of performance.

Our Method of Operation

Our avenues of investment break down into three categories. These categories have different behavior characteristics, and the way our money is divided among them will have an important effect on our results, relative to the Dow in any given year. The actual percentage division among categories is to some degree planned, but to a great extent, accidental, based upon availability factors.

The first section consists of generally undervalued securities (hereinafter called "generals") where we have nothing to say about corporate policies and no timetable as to when the undervaluation may correct itself. Over the years, this has been our largest category of investment, and more money has been made here than in either of the other categories. We usually have fairly large positions (5% to 10% of our total assets) in each of five or six generals, with smaller positions in another ten or fifteen.

Sometimes these work out very fast; many times they take years. It is difficult at the time of purchase to know any specific reason why they should appreciate in price. However, because of this lack of glamour or anything pending which might create immediate favorable market action, they are available at very cheap prices. A lot of value can be obtained for the price paid. This substantial excess of value creates a comfortable margin of safety in each transaction. This individual margin of safety, coupled with a diversity of commitments creates a most attractive package of safety and appreciation potential. Over the years our timing of purchases has been considerably better than our timing of sales. We do not go into these generals with the idea of getting the last nickel, but are usually quite content selling out at some intermediate level between our purchase price and what we regard as fair value to a private owner.

The generals tend to behave market-wise very much in sympathy with the Dow. Just because something is cheap does not mean it is not going to go down. During abrupt downward movements in the market, this segment may very well go down percentage-wise just as much as the Dow. Over a period of years, I believe the generals will outperform the Dow, and during sharply advancing years like 1961, this is the section of our portfolio that turns in the best results. It is, of course, also the most vulnerable in a declining market.

Our second category consists of "work-outs." These are securities whose financial results depend on corporate action rather than supply and demand factors created by buyers and sellers of securities. In other words, they are securities with a timetable where we can predict, within reasonable error limits, when we will get how much and what might upset the applecart. Corporate events such as mergers, liquidations, reorganizations, spin-offs, etc., lead to work-outs. An important source in recent years has been sell-outs by oil producers to major integrated oil companies.

This category will produce reasonably stable earnings from year to year, to a large extent irrespective of the course of the Dow. Obviously, if we operate throughout a year with a large portion of our portfolio in work-outs, we will look extremely good if it turns out to be a declining year for the Dow or quite bad if it is a strongly advancing year. Over the years, work-outs have provided our second largest category. At any given time, we may be in ten to fifteen of these; some just beginning and others in the late stage of their development. I believe in using borrowed money to offset a portion of our work-out portfolio since there is a high degree of safety in this category in terms of both eventual results and intermediate market behavior. Results, excluding the benefits derived from the use of borrowed money, usually fall in the 10% to 20% range. My self-imposed limit regarding borrowing is 25% of partnership net worth. Oftentimes we owe no money and when we do borrow, it is only as an offset against work-outs.

The final category is "control" situations where we either control the company or take a very large position and attempt to influence policies of the company. Such operations should definitely be measured on the basis of several years. In a given year, they may produce nothing as it is usually to our advantage to have the stock be stagnant market-wise for a long period while we are acquiring it. These situations, too, have relatively little in common with the behavior of the Dow. Sometimes, of course, we buy into a general with the thought in mind that it might develop into a control situation. If the price remains low enough for a long period, this might very well happen. If it moves up before we have a substantial percentage of the company's stock, we sell at higher levels and complete a successful general operation. We are presently acquiring stock in what may turn out to be control situations several years hence.

Dempster Mill Manufacturing Company

We are presently involved in the control of Dempster Mill Manufacturing Company of Beatrice, Nebraska. Our first stock was purchased as a generally undervalued security five years ago. A block later became available, and I went on the Board about four years ago. In August 1961, we obtained majority control, which is indicative of the fact that many of our operations are not exactly of the "overnight" variety.

Presently we own 70% of the stock of Dempster with another 10% held by a few associates. With only 150 or so other stockholders, a market on the stock is virtually non-existent, and in any case, would have no meaning for a controlling block. Our own actions in such a market could drastically affect the quoted price.

Therefore, it is necessary for me to estimate the value at yearend of our controlling interest. This is of particular importance since, in effect, new partners are buying in based upon this price, and old partners are selling a portion of their interest based upon the same price. The estimated value should not be what we hope it would be worth, or what it might be worth to an eager buyer, etc., but what I would estimate our interest would bring if sold under current conditions in a reasonably short period of time. Our efforts will be devoted toward increasing this value, and we feel there are decent prospects of doing this.

Dempster is a manufacturer of farm implements and water systems with sales in 1961 of about \$9 million. Operations have produced only nominal profits in relation to invested capital during recent years. This reflected a poor management situation, along with a fairly tough industry situation. Presently, consolidated net worth (book value) is about \$4.5 million, or \$75 per share, consolidated working capital about \$50 per share, and at yearend we valued our interest at \$35 per share. While I claim no oracular vision in a matter such as this, I feel this is a fair valuation to both new and old partners. Certainly, if even moderate earning power can be restored, a higher valuation will be justified, and even if it cannot, Dempster should work out at a higher figure. Our controlling interest was acquired at an average price of about \$28, and this holding currently represents 21% of partnership net assets based on the \$35 value.

Of course, this section of our portfolio is not going to be worth more money merely because General Motors, U.S. Steel, etc., sell higher. In a raging bull market, operations in control situations will seem like a very difficult way to make money, compared to just buying the general market. However, I am more conscious of the dangers presented at current market levels than the opportunities. Control situations, along with work-outs, provide a means of insulating a portion of our portfolio from these dangers.

The Question of Conservatism

The above description of our various areas of operation may provide some clues as to how conservatively our portfolio is invested. Many people some years back thought they were behaving in the most conservative manner by purchasing medium or long-term municipal or government bonds. This policy has produced substantial market depreciation in many cases, and most certainly has failed to maintain or increase real buying power.

Conscious, perhaps overly conscious, of inflation, many people now feel that they are behaving in a conservative manner by buying blue chip securities almost regardless of price-earnings ratios, dividend yields, etc. Without the benefit of hindsight as in the bond example, I feel this course of action is fraught with danger. There is nothing at all conservative, in my opinion, about speculating as to just how high a multiplier a greedy and capricious public will put on earnings.

You will not be right simply because a large number of people momentarily agree with you. You will not be right simply because important people agree with you. In many quarters the simultaneous occurrence of the two above factors is enough to make a course of action meet the test of conservatism.

You will be right, over the course of many transactions, if your hypotheses are correct, your facts are correct, and your reasoning is correct. True conservatism is only possible through knowledge and reason.

I might add that in no way does the fact that our portfolio is not conventional prove that we are more conservative or less conservative than standard methods of investing. This can only be determined by examining the methods or examining the results.

I feel the most objective test as to just how conservative our manner of investing is arises through evaluation of performance in down markets. Preferably these should involve a substantial decline in the Dow. Our performance in the rather mild declines of 1957 and 1960 would confirm my hypothesis that we invest in an extremely conservative manner. I would welcome any partner's suggesting objective tests as to conservatism to see how we stack up. We have never suffered a realized loss of more than 0.5% of 1% of total net assets, and our ratio of total dollars of realized gains to total realized losses is something like 100 to 1. Of course; this reflects the fact that on balance we have been operating in an up market. However, there have been many opportunities for loss transactions even in markets such as these (you may have found out about a few of these yourselves) so I think the above facts have some significance.

The Question of Size

Aside from the question as to what happens upon my death (which with a metaphysical twist, is a subject of keen interest to me), I am probably asked most often: "What affect is the rapid growth of partnership funds going to have upon performance?"

Larger funds tug in two directions. From the standpoint of "passive" investments, where we do not attempt by the size of our investment to influence corporate policies, larger sums hurt results. For the mutual fund or trust department investing in securities with very broad markets, the effect of large sums should be to penalize results only very slightly. Buying 10,000 shares of General Motors is only slightly more costly (on the basis of mathematical expectancy) than buying 1,000 or 100 shares.

In some of the securities in which we deal (but not all by any means) buying 10,000 shares is much more difficult than buying 100 and is sometimes impossible. Therefore, for a portion of our portfolio, larger sums are definitely disadvantageous. For a larger portion of the portfolio, I would say increased sums are only slightly disadvantageous. This category includes most of our work-outs and some generals.

However, in the case of control situations increased funds are a definite advantage. A "Sanborn Map" cannot be accomplished without the wherewithal. My definite belief is that the opportunities increase in this field as the funds increase. This is due to the sharp fall-off in competition as the ante mounts plus the important positive correlation that exists between increased size of company and lack of concentrated ownership of that company's stock.

Which is more important -- the decreasing prospects of profitability in passive investments or the increasing prospects in control investments? I can't give a definite answer to this since to a great extent it depends on the type of market in which we are operating. My present opinion is that there is no reason to think these should not be offsetting factors; if my opinion should change, you will be told. I can say, most assuredly, that our results in 1960 and 1961 would not have been better if we had been operating with the much smaller sums of 1956 and 1957.

And a Prediction

Regular readers (I may be flattering myself) will feel I have left the tracks when I start talking about predictions. This is one thing from which I have always shied away and I still do in the normal sense.

I am certainly not going to predict what general business or the stock market are going to do in the next year or two since I don't have the faintest idea.

I think you can be quite sure that over the next ten years there are going to be a few years when the general market is plus 20% or 25%, a few when it is minus on the same order, and a majority when it is in between. I haven't any notion as to the sequence in which these will occur, nor do I think it is of any great importance for the long-term investor.

Over any long period of years, I think it likely that the Dow will probably produce something like 5% to 7% per year compounded from a combination of dividends and market value gain. Despite the experience of recent years, anyone expecting substantially better than that from the general market probably faces disappointment.

Our job is to pile up yearly advantages over the performance of the Dow without worrying too much about whether the absolute results in a given year are a plus or a minus. I would consider a year in which we were down 15% and the Dow declined 25% to be much superior to a year when both the partnership and the Dow advanced 20%. I have stressed this point in talking with partners and have watched them nod their heads with varying degrees of enthusiasm. It is most important to me that you fully understand my reasoning in this regard and agree with me not only in your cerebral regions, but also down in the pit of your stomach.

For the reasons outlined in my method of operation, our best years relative to the Dow are likely to be in declining or static markets. Therefore, the advantage we seek will probably come in sharply varying amounts. There are bound to be years when we are surpassed by the Dow, but if over a long period we can average ten percentage points per year better than it, I will feel the results have been satisfactory.

Specifically, if the market should be down 35% or 40% in a year (and I feel this has a high probability of occurring one year in the next ten--no one knows which one), we should be down only 15% or 20%. If it is more or less unchanged during the year, we would hope to be up about ten percentage points. If it is up 20% or more, we would struggle to be up as much. The consequence of performance such as this over a period of years would mean that if the Dow produces a 5% to 7% per year overall gain compounded, I would hope our results might be 15% to 17% per year.

The above expectations may sound somewhat rash, and there is no question but that they may appear very much so when viewed from the vantage point of 1965 or 1970. It may turn out that I am completely wrong. However, I feel the partners are certainly entitled to know what I am thinking in this regard even though the nature of the business is such as to introduce a high probability of error in such expectations. In anyone year, the variations may be quite substantial. This happened in 1961, but fortunately the variation was on the pleasant side. They won't all be!

Miscellaneous

We are now installed in an office at 810 Kiewit Plaza with a first-class secretary, Beth Henley, and an associate with considerable experience in my type of securities, Bill Scott. My father is sharing office space with us (he also shares the expenses) and doing a brokerage business in securities. None of our brokerage is done through him so we have no "vicuna coat" situation.

Overall, I expect our overhead, excluding interest on borrowings and Nebraska Intangibles Tax, to run less than 0.5 of 1% of net assets. We should get our money's worth from this expenditure, and you are most cordially invited to drop in and see how the money is being spent.

With over 90 partners and probably 40 or so securities, you can understand that it is quite a welcome relief to me to shake loose from some of the details.

We presently have partners residing in locations from California to Vermont, and net assets at the beginning of 1962 amounted to \$ 7,178,500.00. Susie and I have an interest in the partnership amounting to \$1,025,000.00, and other relatives of mine have a combined interest totaling \$782,600.00. The minimum for new partners last year was \$25,000, but I am giving some thought to increasing it this year.

Peat, Marwick, Mitchell & Company did an excellent job of expediting the audit, providing tax figures much earlier than in the past. They assure me this performance can be continued.

Let me hear from you regarding questions you may have on any aspects of this letter, your audit, status of your partnership interest, etc. that may puzzle you.

Cordially Warren E. Buffett.

APPENDIX

Partnerships Operating Throughout 1961

Partnership	1/1/61 Capital at Market	Overall Gain in 1961*	Percentage Gain
Buffett Associates	486,874.27	225,387.80	46.3%
Buffett Fund	351,839.29	159,696.93	45.4%

July 6, 1962

A Reminder:

In my letter of January 24, 1962 reporting on 1961, I inserted a section entitled. "And a Prediction." While I have no desire to inflict cruel and unusual punishment upon my readers, nevertheless, a reprinting of that section, in its entirety, may be worthwhile:

And a Prediction

Regular readers (I may be flattering myself) will feel I have left the tracks when I start talking about predictions. This is one thing from which I have always shied away and I still do in the normal sense.

I am certainly not going to predict what general business or the stock market are going to do in the next year or two since I don't have the faintest idea.

I think you can be quite sure that over the next ten years there are going to be a few years when the general market is plus 20% or 25%, a few when it is minus on the same order, and a majority when it is in between. I haven't any notion as to the sequence in which these will occur, nor do I think it is of any great importance for the long-term investor.

Over any long period of years, I think it likely that the Dow will probably produce something like 5% to 7% per year compounded from a combination of dividends and market value gain. Despite the experience of recent years, anyone expecting substantially better than that from the general market probably faces disappointment.

Our job is to pile up yearly advantages over the performance of the Dow without worrying too much about whether the absolute results in a given year are a plus or a minus. I would consider a year in which we were down 15% and the Dow declined 25% to be much superior to a year when both the partnership and the Dow advanced 20%. I have stressed this point in talking with partners and have watched them nod their heads with varying degrees of enthusiasm.

It is most important to me that you fully understand my reasoning in this regard and agree with me not only in your cerebral regions, but also down in the pit of your stomach.

For the reasons outlined in my method of operation, our best years relative to the Dow are likely to be in declining or static markets. Therefore, the advantage we seek will probably come in sharply varying amounts. There are bound to be years when we are surpassed by the Dow, but if over a long period we can average ten percentage points per year better than it, I will feel the results have been satisfactory.

Specifically, if the market should be down 35% or 40% in a year (and I feel this has a high probability of occurring one year in the next ten--no one knows which one), we should be down only 15% or 20%. If it is more or less unchanged during the year, we would hope to be up about ten percentage points. If it is up 20% or more, we would struggle to be up as much. The consequence of performance such as this over a period of years would mean that if the Dow produces a 5% to 7% per year over-all gain compounded, I would hope our results might be 15% to 17% per year.

The above expectations may sound somewhat rash, and there is no question but that they may appear very much so when viewed from the vantage point of 1965 or 1970. It may turn out that I am completely wrong. However, I feel the partners are certainly entitled to know what I am thinking in this regard even though the nature of the business is such as to introduce a high probability of error in such expectations. In anyone year, the variations may be quite substantial. This happened in 1961, but fortunately the variation was on the pleasant side. They won't all be!

The First Half of 1962:

Between yearend 1961 and June 30, 1962 the Dow declined from 731.14 to 561.28. If one had owned the Dow during this period, dividends of approximately \$11.00 would have been received so that overall a loss of 21.7% would have been the result of investing in the Dow. For the statistical minded, Appendix A gives the results of the Dow by years since formation of the predecessor partnerships.

As stated above, a declining Dow gives us our chance to shine and pile up the percentage advantages which, coupled with only an average performance during advancing markets, will give us quite satisfactory long-term results. Our target is an approximately 1/2% decline for each 1% decline in the Dow and if achieved, means we have a considerably more conservative vehicle for investment in stocks than practically any alternative.

As outlined in Appendix B, showing combined predecessor partnership results, during the first half of 1962 we had one of the best periods in our history, achieving a minus 7.5% result before payments to partners, compared to the minus 21.7% overall result on the Dow. This 14.2 percentage points advantage can be expected to widen during the second half if the decline in the general market continues, but will probably narrow should the market turn upward. Please keep in mind my continuing admonition that six-months' or even one-year's results are not to be taken too seriously. Short periods of measurement exaggerate chance fluctuations in performance. While circumstances contributed to an unusually good first half, there are bound to be periods when we do relatively poorly. The figures for our performance involve no change in the valuation of our controlling interest in Dempster Mill Manufacturing Company, although developments in recent months point toward a probable higher realization.

Investment Companies during the First Half:

Past letters have stressed our belief that the Dow is no pushover as a yardstick for investment performance. To the extent that funds are invested in common stocks, whether the manner of investment be through investment companies, investment counselors, bank trust departments, or do-it-yourself, our belief is that the overwhelming majority will achieve results roughly comparable to the Dow. Our opinion is that the deviations from the Dow are much more likely to be toward a poorer performance than a superior one.

To illustrate this point, we have continually measured the Dow and limited partners' results against the two largest open-end investment companies (mutual funds) following a program of common stock investment and the two largest closed-end investment companies. The tabulation in Appendix C shows the five -years' results, and you will note the figures are extraordinarily close to those of the Dow. These companies have total assets of about \$3.5 billion.

In the interest of getting this letter out promptly, we are mailing it before results are available for the closed-end companies. However, the two mutual funds both did poorer than the Dow, with Massachusetts Investors Trust having a minus 23% overall performance, and Investors Stock Fund realizing a minus 25.4%. This is not unusual as witness the lead article in the WALL STREET JOURNAL of June 13, 1962 headed "Funds vs. Market." Of the 17 large common stock funds studied, everyone had a record poorer than the Dow from the peak on the Dow of 734, to the date of the article, although in some cases the margin of inferiority was minor.

Particularly hard hit in the first half were the so-called "growth" funds which, almost without exception, were down considerably more than the Dow. The three large "growth" (the quotation marks are more applicable now) funds with the best record in the preceding few years, Fidelity Capital Fund, Putnam Growth Fund, and Wellington Equity Fund averaged an overall minus 32.3% for the first half. It is only fair to point out that because of their excellent records in 1959-61, their overall performance to date is still better than average, as it may well be in the future. Ironically, however, this earlier superior performance had caused such a rush of new investors to come to them that the poor performance this year was experienced by very many more holders than enjoyed the excellent performance of earlier years. This experience tends to confirm my hypothesis that investment performance must be judged over a period of time with such a period including both advancing and declining markets. There will continue to be both; a point perhaps better understood now than six months ago.

In outlining the results of investment companies, I do so not because we operate in a manner comparable to them or because our investments are similar to theirs. It is done because such funds represent a public batting average of professional, highly-paid investment management handling a very significant \$20 billion of securities. Such management, I believe, is typical of management handling even larger sums. As an alternative to an interest in the partnership, I believe it reasonable to assume that many partners would have investments managed similarly.

Asset Values:

The above calculations of results are before allocation to the General Partner and monthly payments to partners. Of course, whenever the overall results for the year are not plus 6% on a market value basis (with deficiencies carried forward) there is no allocation to the General Partner. Therefore, non-withdrawing partners have had a decrease in their market value equity during the first six months of 7.5% and partners who have withdrawn at the rate of 6% per annum have had a decrease in their market value equity during the first half of 10.5%. Should our results for the year be less than plus 6% (and unless there should be a material advance in the Dow, this is very probable) partners receiving monthly payments will have a decrease in their market value equity at December 31, 1962. This means that monthly payments at 6% on this new market equity next year will be on a proportionately reduced basis. For example, if our results were an overall minus 7% for the year, a partner receiving monthly payments who had a market value interest of \$100,000 on January 1, 1962 would have an equity at December 31, 1962 of \$87,000. This reduction would arise from the minus 7% result, or \$7,000 plus monthly payments of \$500 for an additional \$6,000. Thus, with \$87,000 of market equity on January 1, 1963, monthly payments next year would be \$435.00.

None of the above, of course, has any applicability to advance payments received during 1962 which do not participate in profits or losses, but earn a straight 6%.

APPENDIX A

DOW-JONES INDUSTRIAL AVERAGE

Year	Closing Dow	Change for Year	Dow Dividend	Overall Result from Dow	Percentage Result
1956	499.47	--	--	--	--
1957	435.69	-63.78	21.61	-42.17	-8.4%
1958	583.65	147.96	20.00	167.96	38.5%

BUFFETT PARTNERSHIP, LTD.
810 KIEWIT PLAZA
OMAHA 31, NEBRASKA

November 1, 1962

TO MY PARTNERS FOR 1963:

Here we go on the annual paper flurry. Two copies of an amended partnership agreement for 1963 are enclosed. The one with the General Provisions attached is to be kept by you and the other single-page agreement should be returned. There are no substantive changes of any sort from last year's agreement. This amendment is merely to allow for a few new partners and in several places to reword in clearer (we hope) language provisions of the present agreement. Practically all of the rewording is in General Provision 5 (paragraph 7 in last year's agreement). Rather than have a separate amending document, we have incorporated the changes into one complete document embodying the entire agreement.

We are also enclosing two commitment letters (one for you--one to be returned) on which you are to indicate your wishes regarding additions or withdrawals at January 1st. We would like to have the agreement and the commitment letter back by December 1st. However, the commitment letter can be amended right up until the end of the year (not after) so if you should have a change of plans and you have already mailed us your commitment letter, all you have to do is get in touch with me, and I will make whatever changes you desire.

Any withdrawals will be paid immediately after January 1st. Any additions must reach us by January 10th, and should they be paid in during November, they will take on the status of advance payments and draw interest at the rate of 6% until yearend.

Please be sure the signature on your partnership agreement is notarized. Partners in Omaha may obtain the notarization at our office if they wish. Also, be sure to let us know by an appropriate circle on the commitment letter whether you wish to receive monthly payments in 1963. In order to be sure everyone understands this, let me again state that these monthly payments are in no sense guaranteed earnings or anything of the sort. They represent a convenient form of regular withdrawal, which to the extent we earn better than 6% are payments from earnings, and to the extent we don't, are payments from capital.

Complete tax information for your 1962 return will be in your hands by January 20th. If you should need an estimate of your tax position before that time, let me know and I will give you a rough idea. We will also send out a short letter on taxes in late December.

Having read this far, you are entitled to a report on how we have done to date in 1962. For the period ending October 31st, the Dow-Jones Industrials showed an overall loss, including dividends received, of approximately 16.8%. We intend to use the same method of valuing our controlling interest in Dempster Mill Manufacturing at this yearend that we did at the end of last year. This involved applying various discounts to the balance sheet items to reflect my opinion as to what could be realized on a very prompt sale. Last year this involved a 40% discount on inventories, a 15% discount on receivables, estimated auction value of fixed assets, etc., which led to an approximate value of \$35.00 per share.

The successful conversion of substantial portions of the assets of Dempster to cash, at virtually 100 cents on the dollar, has been the high point of 1962. For example, inventory of \$4.2 million at last yearend will probably be about \$1.9 million this yearend, reducing the discount on this item by about \$920,000 (40% of \$2.3 million reduction). I will give this story my full journalistic treatment in my annual letter. Suffice to say at this point that applying the same discounts described above will probably result in a yearend value of at least \$50.00 per share. The extent of the asset conversion job can perhaps best be illustrated in a sentence by pointing out that whereas

we had \$166,000 of cash and \$2,315,000 of liabilities at November 30, 1961 (Dempster fiscal yearend), we expect this year to have about \$1 million in cash and investments (of the type the Partnership buys) against total liabilities of \$250,000. Prospects for further improvement in this situation in 1963 appear good, and we expect a substantially expanded investment portfolio in Dempster next year.

Valuing Dempster at \$50 per share, our overall gain (before any payments to partners) to October 31st for the Partnership has been 5.5%. This 22.3 percentage-points advantage over the Dow, if maintained until the end of the year, will be among the largest we have ever had. About 60% of this advantage was accomplished by the portfolio other than Dempster, and 40% was the result of increased value at Dempster.

I want all partners and prospective partners to realize the results described above are distinctly abnormal and will recur infrequently, if at all. This performance is mainly the result of having a large portion of our money in controlled assets and workout situations rather than general market situations at a time when the Dow declined substantially. If the Dow had advanced materially in 1962, we could have looked very bad on a relative basis, and our success to date in 1962 certainly does not reflect any ability on my part to guess the market (I never try), but merely reflects the fact that the high prices of generals partially forced me into other categories or investment. If the Dow had continued to soar, we would have been low man on the totem pole. We fully expect to have years when our method of operation will not even match the results of the Dow, although obviously I don't expect this on any long-term basis or I would throw in the towel and buy the Dow.

I'll cut this sermon short with the conclusion that I certainly do not want anyone to think that the pattern of the last few years is likely to be repeated; I expect future performance to reflect much smaller advantages on average over the Dow.

Each letter ends with the request that you let me know about anything that isn't clear. Please be sure that you do this. We are all geared up with secretarial help, a new typewriter, etc., and we want to be sure that this letter and agreement are understood by all.

**Cordially,
Warren E. Buffett**

WEB:bf

P/S: There are no prizes for being the last ones to get in the agreement and commitment letter, so please get to it as soon as possible. Remember the commitment letter can be amended by a postcard or a phone call--we are just trying to get the bulk of the work out of the way well before December 31st so we can concentrate on getting the audit, tax information, etc., out pronto at yearend.

BUFFETT PARTNERSHIP, LTD.
810 KIEWIT PLAZA
OMAHA 31, NEBRASKA

January 18, 1963

The Ground Rules

Some partners have confessed (that's the proper word) that they sometimes find it difficult to wade through my entire annual letter. Since I seem to be getting more long-winded each year, I have decided to emphasize certain axioms on the first pages. Everyone should be entirely clear on these points. To most of you this material will seem unduly repetitious, but I would rather have nine partners out of ten mildly bored than have one out of ten with any basic misconceptions.

1. In no sense is any rate of return guaranteed to partners. Partners who withdraw one-half of 1% monthly are doing just that--withdrawing. If we earn more than 6% per annum over a period of years, the withdrawals will be covered by earnings and the principal will increase. If we don't earn 6%, the monthly payments are partially or wholly a return of capital.
2. Any year in which we fail to achieve at least a plus 6% performance will be followed by a year when partners receiving monthly payments will find those payments lowered.
3. Whenever we talk of yearly gains or losses, we are talking about market values; that is, how we stand with assets valued at market at yearend against how we stood on the same basis at the beginning of the year. This may bear very little relationship to the realized results for tax purposes in a given year.
4. Whether we do a good job or a poor job is not to be measured by whether we are plus or minus for the year. It is instead to be measured against the general experience in securities as measured by the Dow-Jones Industrial Average, leading investment companies, etc. If our record is better than that of these yardsticks, we consider it a good year whether we are plus or minus. If we do poorer, we deserve the tomatoes.
5. While I much prefer a five-year test, I feel three years is an absolute minimum for judging performance. It is a certainty that we will have years when the partnership performance is poorer, perhaps substantially so, than the Dow. If any three-year or longer period produces poor results, we all should start looking around for other places to have our money. An exception to the latter statement would be three years covering a speculative explosion in a bull market.
6. I am not in the business of predicting general stock market or business fluctuations. If you think I can do this, or think it is essential to an investment program, you should not be in the partnership.
7. I cannot promise results to partners. What I can and do promise is that:
 - a. Our investments will be chosen on the basis of value, not popularity;
 - b. That we will attempt to bring risk of permanent capital loss (not short-term quotational loss) to an absolute minimum by obtaining a wide margin of safety in each commitment and a diversity of commitments; and
 - c. My wife, children and I will have virtually our entire net worth invested in the partnership.

Our Performance in 1962

I have consistently told partners that we expect to shine on a relative basis during minus years for the Dow, whereas plus years of any magnitude may find us blushing. This held true in 1962.

Because of a strong rally in the last few months, the general market as measured by the Dow really did not have such a frightening decline as many might think. From 731 at the beginning of the year, it dipped to 535 in June, but closed at 652. At the end of 1960, the Dow stood at 616, so you can see that while there has been a good deal of action the past few years, the investing public as a whole is not too far from where it was in 1959 or 1960. If one had owned the Dow last year (and I imagine there are a few people playing the high flyers of 1961 who wish they had), they would have had a shrinkage in market value of 79.04 or 10.8%. However, dividends of approximately 23.30 would have been received to bring the overall results from the Dow for the year to minus 7.6%. Our own overall record was plus 13.9%. Below we show the year-by-year performance of the Dow, the partnership before allocation to the general partner, and the limited partners' results for all full years of Buffett Partnership, Ltd.'s and predecessor partnerships' activities:

Year	Overall Results from Dow	Partnership Results (1)	Limited Partners Results (2)
1957	-8.4%	10.4%	9.3%
1958	38.5%	40.9%	32.2%
1959	20.0%	25.9%	20.9%
1960	-6.2%	22.8%	18.6%
1961	22.4%	45.9%	35.9%
1962	-7.6%	13.9%	11.9%

(1) For 1957-61 consists of combined results of all predecessor limited partnerships operating throughout entire year after all expenses but before distributions to partners or allocations to the general partner.

(2) For 1957-61 computed on basis of preceding column of partnership results allowing for allocation to general partner based upon present partnership agreement.

The following table shows the cumulative or compounded results in the same three categories, as well as the average annual compounded rate:

Year	Overall Results from Dow	Partnership Results	Limited Partners Results
1957	-8.4%	10.4%	9.3%
1957-58	26.9%	55.6%	44.5%
1957-59	52.3%	95.9%	74.7%
1957-60	42.9%	140.6%	107.2%
1957-61	74.9%	251.0%	181.6%
1957-62	61.6%	299.8%	215.1%
Annual Compounded Rate	8.3%	26.0%	21.1%

My (unscientific) opinion is that a margin of ten percentage points per annum over the Dow is the very maximum that can be achieved with invested funds over any long period of years, so it may be well to mentally modify some of the above figures.

Partners have sometimes expressed concern as to the effect of size upon performance. This subject was reflected upon in last year's annual letter. The conclusion reached was that there were some situations where larger sums

helped and some where they hindered, but on balance, I did not feel they would penalize performance. I promised to inform partners if my conclusions on this should change. At the beginning of 1957, combined limited partnership assets totaled \$303,726 and grew to \$7,178,500 at the beginning of 1962. To date, anyway, our margin over the Dow has indicated no tendency to narrow as funds increase.

Investment Companies

Along with the results of the Dow, we have regularly included the tabulations on the two largest open-end investment companies (mutual funds) following a common stock policy, and the two largest diversified closed-end investment companies. These four companies, Massachusetts Investors Trust, Investors Stock Fund, Tri-Continental Corp. and Lehman Corp. manage over \$3 billion and are probably typical of most of the \$20 billion investment company industry. My opinion is that their results parallel those of most bank trust departments and investment counseling organizations which handle, in aggregate, vastly greater sums.

The purpose of this tabulation, which is shown below, is to illustrate that the Dow is no pushover as an index of investment achievement. The advisory talent managing just the four companies shown commands annual fees of approximately \$7 million and this represents a very small fraction of the industry. Nevertheless, the public batting average of this highly-paid talent indicates results slightly less favorable than the Dow. In no sense is this statement intended as criticism. Within their institutional framework and handling the many billions of dollars involved, I consider such average results virtually the only possible ones. Their merits lie in other than superior results.

Both our portfolio and method of operation differ substantially from the companies mentioned above. However, most partners, as an alternative to their interest in the partnership would probably have their funds invested in media producing results comparable with investment companies, and I, therefore feel they offer a meaningful test of performance.

Year	Mass. Inv. Trust (1)	Investors Stock (1)	Lehman (2)	Tri-Cont. (2)	Dow	Limited Partners
1957	-11.4%	-12.4%	-11.4%	-2.4%	-8.4%	9.3%
1958	42.7%	47.5%	40.8%	33.2%	38.5%	32.2%
1959	9.0%	10.3%	8.1%	8.4%	20.0%	20.9%
1960	-1.0%	-0.6%	2.5%	2.8%	-6.2%	18.6%
1961	25.6%	24.9%	23.6%	22.5%	22.4%	35.9%
1962	-9.8%	-13.4%	-13.0%	-10.0%	-7.6%	11.9%

(1) Computed from changes in asset value plus any distributions to holders of record during year.

1957-60	36.4%	41.6%	38.2%	44.8%	42.9%	107.2%
1957-61	71.3%	76.9%	70.8%	77.4%	74.9%	181.6%
1957-62	54.5%	53.2%	48.6%	59.7%	61.6%	215.1%

Annual Compounded Rate	7.5%	7.4%	6.8%	8.1%	8.3%	21.1%
------------------------	------	------	------	------	------	-------

The Joys of Compounding

I have it from unreliable sources that the cost of the voyage Isabella originally underwrote for Columbus was approximately \$30,000. This has been considered at least a moderately successful utilization of venture capital. Without attempting to evaluate the psychic income derived from finding a new hemisphere, it must be pointed out that even had squatter's rights prevailed, the whole deal was not exactly another IBM. Figured very roughly, the \$30,000 invested at 4% compounded annually would have amounted to something like \$2,000,000,000,000 (that's \$2 trillion for those of you who are not government statisticians) by 1962. Historical apologists for the Indians of Manhattan may find refuge in similar calculations. Such fanciful geometric progressions illustrate the value of either living a long time, or compounding your money at a decent rate. I have nothing particularly helpful to say on the former point.

The following table indicates the compounded value of \$100,000 at 5%, 10% and 15% for 10, 20 and 30 years. It is always startling to see how relatively small differences in rates add up to very significant sums over a period of years. That is why, even though we are shooting for more, we feel that a few percentage points advantage over the Dow is a very worthwhile achievement. It can mean a lot of dollars over a decade or two.

	5%	10%	15%
10 Years	\$162,889	\$259,374	\$404,553
20 Years	\$265,328	\$672,748	\$1,636,640
30 Years	\$432,191	\$1,744,930	\$6,621,140

Our Method of Operation

Our avenues of investment break down into three categories. These categories have different behavior characteristics, and the way our money is divided among them will have an important effect on our results, relative to the Dow, in any given year. The actual percentage division among categories is to some degree planned, but to a great extent, accidental, based upon availability factors.

The first section consists of generally undervalued securities (hereinafter called "generals") where we have nothing to say about corporate policies and no timetable as to when the undervaluation may correct itself. Over the years, this has been our largest category of investment, and more money has been made here than in either of the other categories. We usually have fairly large positions (5% to 10% of our total assets) in each of five or six generals, with smaller positions in another ten or fifteen.

Sometimes these work out very fast; many times they take years. It is difficult at the time of purchase to know any compelling reason why they should appreciate in price. However, because of this lack of glamour or anything pending which might create immediate favorable market action, they are available at very cheap prices. A lot of value can be obtained for the price paid. This substantial excess of value creates a comfortable margin of safety in each transaction. Combining this individual margin of safety with a diversity of commitments creates a most attractive package of safety and appreciation potential. We do not go into these generals with the idea of getting the last nickel, but are usually quite content selling out at some intermediate level between our purchase price and what we regard as fair value to a private owner.

Many times generals represent a form of "coattail riding" where we feel the dominating stockholder group has plans for the conversion of unprofitable or under-utilized assets to a better use. We have done that ourselves in

Sanborn and Dempster, but everything else equal we would rather let others do the work. Obviously, not only do the values have to be ample in a case like this, but we also have to be careful whose coat we are holding.

The generals tend to behave market-wise very much in sympathy with the Dow. Just because something is cheap does not mean it is not going to go down. During abrupt downward movements in the market, this segment may very well go down percentage-wise just as much as the Dow. Over a period of years, I believe the generals will outperform the Dow, and during sharply advancing years like 1961. This is the section of our portfolio that turns in the best results. It is, of course, also the most vulnerable in a declining market, and in 1962, not only did we not make any money out of our general category, but I am even doubtful if it did better than the Dow.

Our second category consists of "work-outs. These are securities whose financial results depend on corporate action rather than supply and demand factors created by buyers and sellers of securities. In other words, they are securities with a timetable where we can predict, within reasonable error limits, when we will get how much and what might upset the applecart. Corporate events such as mergers, liquidations, reorganizations, spin-offs, etc., I lead to work-outs. An important source in recent years has been sell-outs by oil producers to major integrated oil companies.

This category will produce reasonably stable earnings from year to year, to a large extent irrespective of the course of the Dow. Obviously, if we operate throughout a year with a large portion of our portfolio in work-outs, we will look extremely good if it turns out to be a declining year for the Dow, or quite bad if it is a strongly advancing year.

We were fortunate in that we had a good portion of our portfolio in work outs in 1962. As I have said before, this was not due to any notion on my part as to what the market would do, but rather because I could get more of what I wanted in this category than in the generals. This same concentration in work-outs hurt our performance during the market advance in the second half of the year.

Over the years, work-outs have provided our second largest category. At any given time, we may be in five to ten of these; some just beginning and others in the late stage of their development. I believe in using borrowed money to offset a portion of our work-out portfolio, since there is a high degree of safety in this category in terms of both eventual results and intermediate market behavior. For instance, you will note when you receive our audit report, that we paid \$75,000 of interest to banks and brokers during the year. Since our borrowing was at approximately 5%, this means we had an average of \$1,500,000 borrowed from such sources. Since 1962 was a down year in the market, you might think that such borrowing would hurt results. However, all of our loans were to offset work-outs, and this category turned in a good profit for the year. Results, excluding the benefits derived from the use of borrowed money, usually fall in the 10% to 20% per annum range. My self-imposed standard limit regarding borrowing is 25% of partnership net worth, although something extraordinary could result in modifying this for a limited period of time.

You will note on our yearend balance sheet (part of the audit you will receive) securities sold short totaling some \$340,000. Most of this occurred in conjunction with a work-out entered into late in the year. In this case, we had very little competition for a period of time and were able to create a 10% or better profit (gross, not annualized) for a few months tie-up of money. The short sales eliminated the general market risk.

The final category is I "control" situations, where we either control the company or take a very large position and attempt to influence policies of the company. Such operations should definitely be measured on the basis of several years. In a given year, they may produce nothing as it is usually to our advantage to have the stock be stagnant market-wise for a long period while we are acquiring it. These situations, too, have relatively little in common with the behavior of the Dow. Sometimes, of course, we buy into a general with the thought in mind that it might develop into a control situation. If the price remains low enough for a long period, this might very well happen. Usually, it moves up before we have a substantial percentage of the company's stock, and we sell

at higher levels and complete a successful general operation.

Dempster Mill Manufacturing Company

The high point of 1962 from a performance standpoint was our present control situation --73% owned Dempster Mill. Dempster has been primarily in farm implements (mostly items retailing for \$1,000 or under), water systems, water well supplies and jobbed plumbing lines.

The operations for the past decade have been characterized by static sales, low inventory turnover and virtually no profits in relation to invested capital.

We obtained control in August, 1961 at an average price of about \$28 per share, having bought some stock as low as \$16 in earlier years, but the vast majority in an offer of \$30.25 in August. When control of a company is obtained, obviously what then becomes all-important is the value of assets, not the market quotation for a piece of paper (stock certificate).

Last year, our Dempster holding was valued by applying what I felt were appropriate discounts to the various assets. These valuations were based on their status as non-earning assets and were not assessed on the basis of potential, but on the basis of what I thought a prompt sale would produce at that date. Our job was to compound these values at a decent rate. The consolidated balance sheet last year and the calculation of fair value are shown below.

(000's omitted)					
Assets	Book Figure	Valued @	Adjusted Valuation	Liabilities	
Cash	\$166	100%	\$166	Notes Payable	\$1,230
Accts. Rec. (net)	\$1,040	85%	\$884	Other Liabilities	\$1,088
Inventory	\$4,203	60%	\$2,522		
Ppd. Exp. Etc.	\$82	25%	\$21		
Current Assets	\$5,491		\$3,593	Total Liabilities	\$2,318
Cash Value Life ins., etc.	\$45	100 Est. net auction value	\$45	Net Work per Books:	\$4,601
Net Plant Equipment	\$1383		\$800	Net Work as Adjusted to Quickly Realizable Values	\$2,120
Total Assets	\$6,919		\$4,438	Shares outstanding 60,146 Adj. Value per Share	\$35.25

Dempster's fiscal year ends November 30th, and because the audit was unavailable in complete form, I approximated some of the figures and rounded to \$35 per share last year.

Initially, we worked with the old management toward more effective utilization of capital, better operating margins, reduction of overhead, etc. These efforts were completely fruitless. After spinning our wheels for about six months, it became obvious that while lip service was being given to our objective, either through inability or unwillingness, nothing was being accomplished. A change was necessary.

A good friend, whose inclination is not toward enthusiastic descriptions, highly recommended Harry Bottle for

our type of problem. On April 17, 1962 I met Harry in Los Angeles, presented a deal which provided for rewards to him based upon our objectives being met, and on April 23rd he was sitting in the president's chair in Beatrice.

Harry is unquestionably the man of the year. Every goal we have set for Harry has been met, and all the surprises have been on the pleasant side. He has accomplished one thing after another that has been labeled as impossible, and has always taken the tough things first. Our breakeven point has been cut virtually in half, slow-moving or dead merchandise has been sold or written off, marketing procedures have been revamped, and unprofitable facilities have been sold.

The results of this program are partially shown in the balance sheet below, which, since it still represents non-earning assets, is valued on the same basis as last year.

(000's omitted)					
Assets	Book Figure	Valued @	Adjusted Valuation	Liabilities	
Cash	\$60	100%	\$60	Notes payable	\$0
Marketable securities	\$758	Mrkt. 12/31/62	\$834	Other liabilities	<u>\$346</u>
Accts. Rec. (net)	\$796	85%	\$676	Total liabilities	\$346
Inventory	\$1,634	60%	\$981	Net Worth:	
Cash value life ins.	\$41	100%	\$41	Per Books	\$4,07
Recoverable Income Tax	\$170	100%	\$170		7
Ppd. Exp. Etc.	<u>\$14</u>	25%	<u>\$4</u>	As Adjusted to quickly realizable values	\$3,12 5
				Add: proceeds from potential exercise of option to Harry Bottle	<u>\$60</u>
Current Assets	\$3,473		\$2,766	Shares outstanding 60,146	
Misc. Invest.	\$5	100%	\$5	Add: shs. Potentially outstanding under option 2000	
				Total shs. 62,146	
Net Plant Equipment	<u>\$945</u>	Est. net auction value	<u>\$700</u>	Adjusted value per share	\$51.2 6
Total Assets	\$4,423		\$3,471		

Three facts stand out: (1) Although net worth has been reduced somewhat by the housecleaning and writedowns (\$550,000 was written out of inventory; fixed assets overall brought more than book value), we have converted assets to cash at a rate far superior to that implied in our year-earlier valuation. (2) To some extent, we have converted the assets from the manufacturing business (which has been a poor business) to a business which we think is a good business -- securities. (3) By buying assets at a bargain price, we don't need to pull any rabbits out of a hat to get extremely good percentage gains. This is the cornerstone of our investment philosophy: "Never count on making a good sale. Have the purchase price be so attractive that even a mediocre sale gives good results. The better sales will be the frosting on the cake."

On January 2, 1963, Dempster received an unsecured term loan of \$1,250,000. These funds, together with the funds all ready "freed-up" will enable us to have a security portfolio of about \$35 per share at Dempster, or considerably more than we paid for the whole company. Thus our present valuation will involve a net of about \$16 per share in the manufacturing operation and \$35 in a security operation comparable to that of Buffett Partnership, Ltd.

We, of course, are devoted to compounding the \$16 in manufacturing at an attractive rate and believe we have some good ideas as to how to accomplish this. While this will be easy if the business as presently conducted earns money, we have some promising ideas even if it shouldn't.

It should be pointed out that Dempster last year was 100% an asset conversion problem and therefore, completely unaffected by the stock market and tremendously affected by our success with the assets. In 1963, the manufacturing assets will still be important, but from a valuation standpoint it will behave considerably more like a general since we will have a large portion of its money invested in generals pretty much identical with those in Buffett Partnership, Ltd. For tax reasons, we will probably not put workouts in Dempster. Therefore, if the Dow should drop substantially, it would have a significant effect on the Dempster valuation. Likewise, Dempster would benefit this year from an advancing Dow which would not have been the case most of last year.

There is one final point of real significance for Buffett Partnership, Ltd. We now have a relationship with an operating man which could be of great benefit in future control situations. Harry had never thought of running an implement company six days before he took over. He is mobile, hardworking and carries out policies once they are set. He likes to get paid well for doing well, and I like dealing with someone who is not trying to figure how to get the fixtures in the executive washroom gold-plated.

Harry and I like each other, and his relationship with Buffett Partnership, Ltd. should be profitable for all of us.

The Question of Conservatism

Because I believe it may be even more meaningful after the events of 1962 I would like to repeat this section from last year's letter:

"The above description of our various areas of operation may provide some clues as to how conservatively our portfolio is invested. Many people some years back thought they were behaving in the most conservative manner by purchasing medium or long-term municipal or government bonds. This policy has produced substantial market depreciation in many cases, and most certainly has failed to maintain or increase real buying power.

"Conscious, perhaps overly conscious, of inflation, many people now feel that they are behaving in a conservative manner by buying blue chip securities almost regardless of price-earnings ratios, dividend yields, etc. Without the benefit of hindsight as in the bond example, I feel this course of action is fraught with danger. There is nothing at all conservative, in my opinion, about speculating as to just how high a multiplier a greedy and capricious public will put on earnings.

You will not be right simply because a large number of people momentarily agree with you. You will not be right simply because important people agree with you. In many quarters the simultaneous occurrence of the two above factors is enough to make a course of action meet the test of conservatism.

"You will be right, over the course of many transactions, if your hypotheses are correct, your facts are correct, and your reasoning is correct. True conservatism is only possible through knowledge and reason.

I might add that in no way does the fact that our portfolio is not conventional prove that we are more

conservative or less conservative than standard methods of investing. This can only be determined by examining the methods or examining the results.

I feel the most objective test as to just how conservative our manner of investing is arises through evaluation of performance in down markets. Preferably these should involve a substantial decline in the Dow. Our performance in the rather mild declines of 1957 and 1960 would confirm my hypothesis that we invest in an extremely conservative manner. I would welcome any partner's suggesting objective tests as to conservatism to see how we stack up. We have never suffered a realized loss of more than ½ of 1% of total net assets and our ratio of total dollars of realized gains to total realized losses is something like 100 to 1. Of course, this reflects the fact that on balance we have been operating in an up market. However there have been many opportunities for loss transactions even in markets such as these (you may have found out about a few of these yourselves) so I think the above facts have some significance.

In 1962, we did realize a loss on one commitment or 1.0% and our ratio of realized gains to losses was only slightly over 3 to 1. However, compared to more conventional (often termed conservative which is not synonymous) methods of common stock investing, it would appear that our method involved considerably less risk. Our advantage over the Dow was all achieved when the market was going down; we lost a bit of this edge on the way up.

The Usual Prediction

I am certainly not going to predict what general business or the stock market are going to do in the next year or two, since I don't have the faintest idea.

I think you can be quite sure that over the next ten years, there are going to be a few years when the general market is plus 20% or 25% a few when it is minus on the same order, and a majority when it is in between. I haven't any notion as to the sequence in which these will occur, nor do I think it is of any great importance for the long-term investor. If you will take the first table on page 3 and shuffle the years around, the compounded result will stay the same. If the next four years are going to involve, say, a +40%, -30%, +10% and -6%, the order in which they fall is completely unimportant for our purposes as long as we all are around at the end of the four years. Over a long period of years, I think it likely that the Dow will probably produce something like 5% per year compounded from a combination of dividends and market value gain. Despite the experience of the last decade, anyone expecting substantially better than that from the general market probably faces disappointment.

Our job is to pile up yearly advantages over the performance of the Dow without worrying too much about whether the absolute results in a given year are a plus or a minus. I would consider a year in which we were down 15% and the Dow declined 25% to be much superior to a year when both the partnership and the Dow advanced 20%.

For the reasons outlined in our method of operation, our best years relative to the Dow are likely to be in declining or static markets. Therefore, the advantage we seek will probably come in sharply varying amounts. There are bound to be years when we are surpassed by the Dow, but if over a long period we can average ten percentage points per year better than it, I will feel the results have been satisfactory.

Specifically, if the market should be down 35% or 40% in a year (and I feel this has a high probability of occurring one year in the next ten --no one knows which one), we should be down only 15% or 20%. If it is more or less unchanged during the year, we would hope to be up about ten percentage points. If it is up 20% or more, we would struggle to be up as much. It is certainly doubtful we could match a 20% or 25% advance from the December 31, 1962 level. The consequence of performance such as this over a period of years would mean that if the Dow produces a 5% per year overall gain compounded, I would hope our results might be 15% per year.

The above expectations may sound somewhat rash, and there is no question but that they may appear very much so when viewed from the vantage point of 1965 or 1970. Variations in any given year from the behavior described above would be wide, even if the long-term expectation was correct. Certainly, you have to recognize the possibility of substantial personal bias in such hopes.

Miscellaneous

This year marked the transition from the office off the bedroom to one a bit (quite a bit) more conventional. Surprising as it may seem, the return to a time clock life has not been unpleasant. As a matter of fact, I enjoy not keeping track of everything on the backs of envelopes.

We are starting off this year with net assets of \$9,405,400.00. At the start of 1962, Susie and I had three “non-marketable security” investments of other than nominal size, and two of these have been sold. The third will be continued indefinitely. From the proceeds of the two sales, we have added to our partnership interest so that we now have an interest of \$1,377,400.00. Also, my three children, mother, father, two sisters, two brothers-in-law, father-in-law, three aunts, four cousins, five nieces and nephews have interests directly or indirectly totaling \$893,600.00.

Bill Scott who has fit into our operation splendidly has an interest (with his wife) of \$167,400.00; A very large portion of his net worth. So we are all eating our own cooking.

You will note from the auditor's certificate that they made a surprise check during the year and this will be a continuing part of their procedure. Peat, Marwick, Mitchell & Co. again did an excellent job on the audit, meeting our rather demanding time schedules.

Susie was in charge of equipping the office which means we did not follow my “orange crate” approach to interior decorating. We have an ample supply of Pepsi on hand and look forward to partners dropping in.

Beth Feehan continues to demonstrate why she is the high priestess of the CPS (certified professional secretary, that is) group.

Partners did a wonderful job of cooperating in the return of agreements and commitment letters, and I am most appreciative of this. It makes life a lot easier. Enclosed you will find Schedule “A” to your partnership agreement. You will be receiving your audit and tax figures very soon, and if you have questions on any of this be sure to let me hear from you.

**Cordially,
Warren E. Buffett**

BUFFETT PARTNERSHIP, LTD.
810 KIEWIT PLAZA
OMAHA 31, NEBRASKA

July 10, 1963

First Half Performance

During the first half of 1963, the Dow Jones Industrial Average (hereinafter called the "Dow") advanced from 652.10 to 706.88. If one had owned the Dow during this period, dividends of \$10.66 would have been received, bringing the overall return from the Dow during the first half to plus 10.0%.

Our incantation has been: (1) that short-term results (less than three years) have little meaning, particularly in reference to an investment operation such as ours that devotes a portion of resources to control situations, and; (2) That our results relative to the Dow and other common-stock-form media, will be better in declining markets and may well have a difficult time just matching such media in bubbling markets.

Nevertheless, our first-half performance, excluding any change in Dempster valuation (and its valuation did change --I'm saving this for dessert later in the letter) was plus 14%. This 14% is computed on total net assets (not non-Dempster assets) and is after expenses, but before monthly payments (to those who take them) to partners and allocation to the General Partner. Such allocations are academic on an interim basis, but if we were also plus 14% at yearend, the first 6% would be allocated to partners according to their capital, plus three-quarters of the balance of 8% (14% -6%), or an additional 6%, giving the limited partners a plus 12% performance.

Despite the relatively pleasant results of the first half the admonitions stated two paragraphs earlier hold in full force. At plus 14% versus plus 10% for the Dow, this six months has been a less satisfactory period than the first half of 1962 when we were minus 7.5% versus minus 21.7% for the Dow. You should completely understand our thinking in this regard which has been emphasized in previous letters.

During the first half we had an average net investment in "generals" (long positions in generals minus short positions in generals) of approximately \$5,275,000. Our overall gain from this net investment in generals (for a description of our investment categories see the last annual letter) was about \$1,100,000 for a percentage gain from this category of roughly 21%. This again illustrates the extent to which the allocation of our resources among various categories affects short-term results. In 1962 the generals were down for the year and only an outstanding performance by both of the other two categories, "work-outs" and "controls," gave us our unusually favorable results for that year.

Now this year, our work-outs have done poorer than the Dow and have been a drag on performance, as they are expected to be in rising markets. While it would be very nice to be 100% in generals in advancing markets and 100% in work-outs in declining markets, I make no attempt to guess the course of the stock market in such a manner. We consider all three of our categories to be good businesses on a long-term basis, although their short-term price behavior characteristics differ substantially in various types of markets. We consider attempting to gauge stock market fluctuations to be a very poor business on a long-term basis and are not going to be in it, either directly or indirectly through the process of trying to guess which of our categories is likely to do best in the near future.

Investment Companies

Shown below are the usual statistics on a cumulative basis for the Dow and Buffett Partnership, Ltd. (including predecessor partnerships) as well as for the two largest open-end (mutual funds) and two largest closed-end

investment companies following a diversified common-stock investment policy:

Year	Dow	Mass.Inv. Trust (1)	Investors Stock (1)	Tri-Cont. (2)
1957	-8.4%	-11.4%	-12.4%	-2.4%
1957 – 58	26.9%	26.4%	29.2%	30.0%
1957 – 59	52.3%	37.8%	42.5%	40.9%
1957 – 60	42.9%	36.4%	41.6%	44.8%
1957 – 61	74.9%	71.3%	76.9%	77.4%
1957 – 62	61.6%	54.5%	53.2%	59.7%
1957 – 6/30/63	77.8%	72.4%	69.3%	75.7%
Annual Compounded Rate	9.3%	8.7%	8.4%	9.1%

Year	Lehman (2)	Partnership (3)	Limited Partners (4)
1957	-11.4%	10.4%	9.3%
1957 – 58	24.7%	55.6%	44.5%
1957 – 59	34.8%	95.9%	74.7%
1957 – 60	38.2%	140.6%	107.2%
1957 – 61	70.8%	251.0%	181.6%
1957 – 62	46.2%	299.8%	215.1%
1957 – 6/30/63	60.8%	355.8%	252.9%
Annual Compounded Rate	7.6%	26.3%	21.4%

Footnotes :

- (1) Computed from changes in asset value plus any distributions to holders of record during year.
- (2) From 1963 Moody's Bank & Finance Manual for 1957-62. Estimated for first half 1963.
- (3) For 1957-61 consists of combined results of all predecessor limited partnerships operating throughout entire year after all expenses but before distributions to partners or allocations to the general partner.
- (4) For 1957-61 computed on basis of preceding column of partnership results allowing for allocation to general partner based upon present partnership agreement.

The results continue to show that the most highly paid and respected investment advice has difficulty matching the performance of an unmanaged index of blue-chip stocks. This in no sense condemns these institutions or the investment advisers and trust departments whose methods, reasoning, and results largely parallel such investment companies. These media perform a substantial service to millions of investors in achieving adequate diversification, providing convenience and peace of mind, avoiding issues of inferior quality, etc. However, their services do not include (and in the great majority of cases, are not represented to include) the compounding of money at a rate greater than that achieved by the general market.

Our partnership's fundamental reason for existence is to compound funds at a better-than-average rate with less exposure to long-term loss of capital than the above investment media. We certainly cannot represent that we will achieve this goal. We can and do say that if we don't achieve this goal over any reasonable period excluding

an extensive speculative boom, we will cease operation.

Dempster Mill Manufacturing Company

In our most recent annual letter, I described Harry Bottle as the “man of the year”. If this was an understatement.

Last year Harry did an extraordinary job of converting unproductive assets into cash which we then, of course, began to invest in undervalued securities. Harry has continued this year to turn under-utilized assets into cash, but in addition, he has made the remaining needed assets productive. Thus we have had the following transformation in balance sheets during the last nineteen months:

November 30, 1961 (000's omitted)

Assets	Book Figure	Valued @	Adjusted Valuation	Liabilities	
Cash	\$166	100%	\$166	Notes Payable	\$1,230
Accts. Rec. (net)	\$1,040	85%	\$884	Other Liabilities	<u>\$1,088</u>
Inventory	\$4,203	60%	\$2,522		
Ppd. Exp. Etc.	<u>\$82</u>	25%	<u>\$21</u>	Total Liabilities	\$2,318
Current Assets	\$5,491		\$3,593	Net Worth:	
				Per Books	\$4,601
Cash Value Life ins., etc.	\$45	100%	\$45	As adjusted to quickly realizable values	\$2,120
Net Plant & equipment	<u>\$1,383</u>	Est. Net Auction Value	<u>\$800</u>		
Total Assets	\$6,919		\$4,438	Share outstanding 60,146. Adj. Value per Share	\$35.25

I have included above the conversion factors we have previously used in valuing Dempster for B.P.L. purposes to reflect estimated immediate sale values of non-earning assets.

As can be seen, Harry has converted the assets at a much more favorable basis than was implied by my valuations. This largely reflects Harry's expertise and, perhaps, to a minor degree my own conservatism in valuation.

As can also be seen, Dempster earned a very satisfactory operating profit in the first half (as well as a substantial unrealized gain in securities) and there is little question that the operating business, as now conducted, has at least moderate earning power on the vastly reduced assets needed to conduct it. Because of a very important-seasonal factor and also the presence of a tax carry forward, however, the earning power is not nearly what might be inferred simply by a comparison of the 11/30/62 and 6/30/63 balance sheets. Partly because of this seasonality, but more importantly, because of possible developments in Dempster before 1963 yearend, we have left our Dempster holdings at the same \$51.26 valuation used at yearend 1962 in our figures for B.P.L.'s first half. However, I would be very surprised if it does not work out higher than this figure at yearend.

One sidelight for the fundamentalists in our group: B.P.L. owns 71.7% of Dempster acquired at a cost of \$1,262,577.27. On June 30, 1963 Dempster had a small safe deposit box at the Omaha National Bank containing securities worth \$2,028,415.25. Our 71.7% share of \$2,028,415.25 amounts to \$1,454,373.70. Thus, everything above ground (and part of it underground) is profit. My security analyst friends may find this a rather primitive method of accounting, but I must confess that I find a bit more substance in this fingers and toes method than in any prayerful reliance that someone will pay me 35 times next year's earnings.

Advance Payments and Advance Withdrawals

We accept advance payments from partners and prospective partners at 6% interest from date of receipt until the end of the year. While there is no obligation to convert the payment to a partnership interest at the end of the year, this should be the intent at the time of payment.

Similarly, we allow partners to withdraw up to 20% of their partnership account prior to yearend and charge them 6% from date of withdrawal until yearend when it is charged against their capital account. Again, it is not intended that partners use US like a bank, but that they use the withdrawal right for unanticipated need for funds.

The willingness to both borrow and lend at 6% may seem "un- Buffett-like." We look at the withdrawal right as a means of giving some liquidity for unexpected needs and, as a practical matter, are reasonably sure it will be far more than covered by advance payments.

Why then the willingness to pay 6% for advance payment money when we can borrow from commercial banks at substantially lower rates? For example, in the first half we obtained a substantial six-month bank loan at 4%. The answer is that we expect on a long-term basis to earn better than 6% (the general partner's allocation is zero unless we do although it is largely a matter of chance whether we achieve the 6% figure in any short period. Moreover, I can adopt a different attitude in the investment of money that can be expected to soon be a part of our equity capital than I can on short-term borrowed money. The advance payments have the added advantage to us of spreading the investment of new money over the year, rather than having it hit us all at once in January. On the other hand, 6% is more than can be obtained in short-term dollar secure investments by our partners, so I consider it mutually profitable. On June 30, 1963 we had advance withdrawals of \$21,832.00 and advance payments of \$562,437.11.

Taxes

There is some possibility that we may have fairly substantial realized gains this year. Of course, this may not materialize at all and actually does not have anything to do with our investment performance this year. I am an outspoken advocate of paying large amounts of income taxes -- at low rates. A tremendous number of fuzzy, confused investment decisions are rationalized through so-called "tax considerations."

My net worth is the market value of holdings less the tax payable upon sale. The liability is just as real as the asset unless the value of the asset declines (ouch), the asset is given away (no comment), or I die with it. The latter course of action would appear to at least border on a Pyrrhic victory.

Investment decisions should be made on the basis of the most probable compounding of after-tax net worth with minimum risk. Any isolation of low-basis securities merely freezes a portion of net worth at a compounding factor identical with the assets isolated. While this may work out either well or badly in individual cases, it is a nullification of investment management. The group experience holding various low basis securities will undoubtedly approximate group experience on securities as a whole, namely compounding at the compounding rate of the Dow. We do not consider this the optimum in after-tax compounding rates.

I have said before that if earnings from the partnership can potentially amount to a sizable portion of your total taxable income, the safe thing to do is to estimate this year the same tax you incurred last year. If you do this, you cannot run into penalties. In any event, tax liabilities for those who entered the partnership on 1/1/63 will be minimal because of the terms of our partnership agreement first allocating capital gains to those having an interest in unrealized appreciation.

As in past years, we will have a letter out about November 1st (to partners and those who have indicated an interest to me by that time in becoming partners) with the amendment to the partnership agreement, commitment letter for 1964, estimate of the 1963 tax situation, etc.

My closing plea for questions regarding anything not clear always draws a blank. Maybe no one reads this far. Anyway, the offer is still open.

Cordially,

Warren E. Buffett

November 6, 1963

To My Partners for 1964:

Enclosed is the usual assortment of Thanksgiving reading material:

- (1) Two copies of an amended partnership agreement for 1964. The one with the General Provisions attached is to be kept by you (exactly the same as last year) and the other single page agreement is to be signed, notarized and returned to us. Partners in Omaha may come in and obtain the notarization at our office.
- (2) A copy of that priceless treatise, "The Ground Rules," I would like every partner to read this at least once a year, and it is going to be a regular item in my November package. Don't sign the partnership agreement unless you fully understand the concepts set forth and are in accord with them -- mentally and viscerally.
- (3) Two copies of the commitment letter for 1964, one to be kept by you and one returned to us. You may amend this commitment letter right up to midnight, December 31st, so get it back to us early, and if it needs to be changed, just let us know by letter or phone.

Any withdrawals will be paid immediately after January 1st. You may withdraw any amount you desire from \$100 up to your entire equity. Similarly, additions can be for any amount and should reach us by January 10th. In the event you are disposing of anything, this will give you a chance to have the transaction in 1964 if that appears to be advantageous for tax reasons. If additions reach us in November, they take on the status of advance payments and draw interest at the rate of 6% until yearend. This is not true of additions reaching us in December.

Complete tax information for your 1963 return will be in your hands by January 25th. If you should need an estimate of your tax position before that time, let me know and I will give you a rough idea. We will also send out a short letter on taxes in late December.

At the end of October, the overall result from the Dow for 1963 was plus 18.8%. We have had a good year in all three categories, generals, work-outs and controls. A satisfactory sale on a going concern basis of Dempster Mill Manufacturing operating assets was made about a month ago. I will give the full treatment to the Dempster story in the annual letter, perhaps climaxed by some lyrical burst such as "Ode to Harry Bottle." While we always had a built-in profit in Dempster because of our bargain purchase price, Harry accounted for several extra servings of dessert by his extraordinary job. Harry, incidentally, has made an advance payment toward becoming a limited partner in 1964-- we consider this the beginning, not the end.

However, 1963 has not been all Dempster. While a great deal can happen the last two months and therefore interim results should not be taken too seriously, at the end of October the overall gain for the partnership was about 32%. Based on the allocation embodied in our agreement, this works out to plus 25 1/2% for the limited partners before monthly payments to those who take them. Of our approximate \$3 million gain, something over \$2 million came from marketable securities and a little less than \$1 million from Dempster operating assets. The combined gain from our single best general and best work-out situation approximated the gain on the Dempster operating assets.

You should be aware that if our final results relative to the Dow for 1963 are as favorable as on October 31st, I will regard it as an abnormal year. I do not consider a 13.2 percentage point margin to be in the cards on a long term basis. A considerably more moderate annual edge over the Dow will be quite satisfactory.

Cordially

Warren E. Buffett

P/S. Last year we announced there would be no prizes for the last ones to get the material back to us. This continues to be our policy. Save us some last minute scurrying by getting your agreement and commitment letter back pronto. Give Bill or me a call if we can be of any help. Thanks!

January 18, 1964

Our Performance in 1963

1963 was a good year. It was not a good year because we had an overall gain of \$3,637,167 or 38.7% on our beginning net assets, pleasant as that experience may be to the pragmatists in our group. Rather it was a good year because our performance was substantially better than that of our fundamental yardstick --the Dow-Jones Industrial Average (hereinafter called the "Dow"). If we had been down 20% and the Dow had been down 30%, this letter would still have begun "1963 was a good year." Regardless of whether we are plus or minus in a particular year, if we can maintain a satisfactory edge on the Dow over an extended period of time, our long term results will be satisfactory -- financially as well as philosophically.

To bring the record up to date, the following summarizes the year-by-year performance of the Dow, the performance of the Partnership before allocation to the general partner, and the limited partners' results for all full years of BPL's and predecessor partnerships' activities:

Year	Overall Results From Dow (1)	Partnership Results (2)	Limited Partners' Results (3)
1957	-8.4%	10.4%	9.3%
1958	38.5%	40.9%	32.2%
1959	20.0%	25.9%	20.9%
1960	-6.2%	22.8%	18.6%
1961	22.4%	45.9%	35.9%
1962	-7.6%	13.9%	11.9%
1963	20.7%	38.7%	30.5%

(1) Based on yearly changes in the value of the Dow plus dividends that would have been received through ownership of the Dow during that year.

(2) For 1957-61 consists of combined results of all predecessor limited partnerships operating throughout the entire year after all expenses but before distributions to partners or allocations to the general partner.

(3) For 1957-61 computed on the basis of the preceding column of partnership results allowing for allocation to the general partner based upon the present partnership agreement.

One wag among the limited partners has suggested I add a fourth column showing the results of the general partner --let's just say he, too, has an edge on the Dow.

The following table shows the cumulative or compounded results based on the preceding table:

Year	Overall Results From Dow	Partnership Results	Limited Partners' Results
1957	-8.4%	10.4%	9.3%
1957 - 58	26.9%	55.6%	44.5%
1957 - 59	52.3%	95.9%	74.7%

1957 – 60	42.9%	140.6%	107.2%
1957 – 61	74.9%	251.0%	181.6%
1957 – 62	61.6%	299.8%	215.1%
1957 – 63	95.1%	454.5%	311.2%
Annual Compounded Rate	10.0%	27.7%	22.3%

It appears that we have completed seven fat years. With apologies to Joseph we shall attempt to ignore the biblical script. (I've never gone overboard for Noah's ideas on diversification either.)

In a more serious vein, I would like to emphasize that, in my judgment; our 17.7 margin over the Dow shown above is unattainable over any long period of time. A ten percentage point advantage would be a very satisfactory accomplishment and even a much more modest edge would produce impressive gains as will be touched upon later. This view (and it has to be guesswork -- informed or otherwise) carries with it the corollary that we must expect prolonged periods of much narrower margins over the Dow as well as at least occasional years when our record will be inferior (perhaps substantially so) to the Dow.

Much of the above sermon is reflected in "The Ground Rules" sent to everyone in November, but it can stand repetition.

Investment Companies

We regularly compare our results with the two largest open-end investment companies (mutual funds) that follow a policy of being, typically, 95 -100% invested in common stocks, and the two largest diversified closed-end investment companies. These four companies, Massachusetts Investors Trust, Investors Stock Fund, Tri-Continental Corp. and Lehman Corp. manage about \$4 billion and are probably typical of most of the \$25 billion investment company industry. My opinion is that their results roughly parallel those of the vast majority or other investment advisory organizations which handle, in aggregate, vastly greater sums.

The purpose of this tabulation, which is shown below, is to illustrate that the Dow is no pushover as an index or investment achievement. The advisory talent managing just the four companies shown commands' annual fees of over \$7 million, and this represents a very small fraction of the industry. The public batting average of this highly-paid talent indicates they achieved results slightly less favorable than the Dow.

Both our portfolio and method of operation differ substantially from the investment companies in the table. However, most partners, as an alternative to their interest in the Partnership would probably have their funds invested in media producing results comparable with investment companies, and I, therefore, feel they offer a meaningful standard of performance.

YEARLY RESULTS

Year	Mass. Inv. Trust (1)	Investors Stock (1)	Lehman (2)	Tri-Cont. (2)	Dow	Limited Partners
1957	-11.4%	-12.4%	-11.4%	-2.4%	-8.4%	9.3%
1958	42.7%	47.5%	40.8%	33.2%	38.5%	32.2%
1959	9.0%	10.3%	8.1%	8.4%	20.0%	20.9%
1960	-1.0%	-0.6%	2.5%	2.8%	-6.2%	18.6%
1961	25.6%	24.9%	23.6%	22.5%	22.4%	35.9%
1962	-9.8%	-13.4%	-14.4%	-10.0%	-7.6%	11.9%
1963	20.0%	16.5%	23.8%	19.5%	20.7%	30.5%

(1) Computed from changes in asset value plus any distributions to holders of record during year.

(2) From 1963 Moody's Bank & Finance Manual for 1957-62; Estimated for 1963.

COMPOUNDED

Year	Mass. Inv. Trust	Investors Stock	Lehman	Tri-Cont.	Dow	Limited Partners
1957	-11.4%	-12.4%	-11.4%	-2.4%	-8.4%	9.3%
1957 – 58	26.4%	29.2%	24.7%	30.0%	26.9%	44.5%
1957 – 59	37.8%	42.5%	34.8%	40.9%	52.3%	74.7%
1957 – 60	36.4%	41.6%	38.2%	44.8%	42.9%	107.2%
1957 – 61	71.3%	76.9%	70.8%	77.4%	74.9%	181.6%
1957 – 62	54.5%	53.2%	46.2%	59.7%	61.6%	215.1%
1957 – 63	85.4%	78.5%	81.0%	90.8%	95.1%	311.2%
Annual Compounded Rate	9.2%	8.6%	8.8%	9.7%	10.0%	22.3%

The Dow, of course, is an unmanaged index, and it may seem strange to the reader to contemplate the high priests of Wall Street striving vainly to surpass or even equal it. However, this is demonstrably the case. Moreover, such a failure cannot be rationalized by the assumption that the investment companies *et al* are handling themselves in a more conservative manner than the Dow. As the table above indicates, and as more extensive studies bear out, the behavior of common stock portfolio managed by this group, on average, have declined in concert with the Dow. By such a test of behavior in declining markets, our own methods of operation have proven to be considerably more conservative than the common stock component of the investment company or investment advisor group. While this has been true in the past, there obviously can be no guarantees about the future.

The above may seem like rather strong medicine, but it is offered as a factual presentation and in no way as criticism. Within their institutional framework and handling the many billions of dollars involved, the results achieved are the only ones attainable. To behave unconventionally within this framework is extremely difficult. Therefore, the collective record of such investment media is necessarily tied to the record of corporate America. Their merits, except in the unusual case, do not lie in superior results or greater resistance to decline in value. Rather, I feel they earn their keep by the ease of handling, the freedom from decision making and the automatic diversification they provide, plus, perhaps most important, the insulation afforded from temptation to practice patently inferior techniques which seem to entice so many world-be investors.

The Joys of Compounding

Now to the pulse-quickenning portion of our essay. Last year, in order to drive home the point on compounding, I took a pot shot at Queen Isabella and her financial advisors. You will remember they were euchred into such an obviously low-compound situation as the discovery of a new hemisphere.

Since the whole subject of compounding has such a crass ring to it, I will attempt to introduce a little class into this discussion by turning to the art world. Francis I of France paid 4,000 ecus in 1540 for Leonardo da Vinci's Mona Lisa. On the off chance that a few of you have not kept track of the fluctuations of the ecu 4,000 converted out to about \$20,000.

If Francis had kept his feet on the ground and he (and his trustees) had been able to find a 6% after-tax

investment, the estate now would be worth something over \$1,000,000,000,000,000.00. That's \$1 quadrillion or over 3,000 times the present national debt, all from 6%. I trust this will end all discussion in our household about any purchase or paintings qualifying as an investment.

However, as I pointed out last year, there are other morals to be drawn here. One is the wisdom of living a long time. The other impressive factor is the swing produced by relatively small changes in the rate of compound.

Below are shown the gains from \$100,000 compounded at various rates:

	4%	8%	12%	16%
10 Years	\$48,024	\$115,892	\$210,584	\$341,143
20 Years	\$119,111	\$366,094	\$864,627	\$1,846,060
30 Years	\$224,337	\$906,260	\$2,895,970	\$8,484,940

It is obvious that a variation of merely a few percentage points has an enormous effect on the success of a compounding (investment) program. It is also obvious that this effect mushrooms as the period lengthens. If, over a meaningful period of time, Buffett Partnership can achieve an edge of even a modest number of percentage points over the major investment media, its function will be fulfilled.

Some of you may be downcast because I have not included in the above table the rate of 22.3% mentioned on page 3. This rate, of course, is before income taxes which are paid directly by you --not the Partnership. Even excluding this factor, such a calculation would only prove the absurdity of the idea of compounding at very high rates -- even with initially modest sums. My opinion is that the Dow is quite unlikely to compound for any important length of time at the rate it has during the past seven years and, as mentioned earlier, I believe our margin over the Dow cannot be maintained at its level to date. The product of these assumptions would be a materially lower average rate of compound for BPL in the future than the rate achieved to date. Injecting a minus 30% year (which is going to happen from time to time) into our tabulation of actual results to date, with, say, a corresponding minus 40% for the Dow brings both the figures on the Dow and BPL more in line with longer range possibilities. As the compounding table above suggests, such a lowered rate can still provide highly satisfactory long term investment results.

Our Method of Operation

At this point I always develop literary schizophrenia. On the one hand, I know that we have in the audience a number of partners to whom details of our business are interesting. We also have a number to whom this whole thing is Greek and who undoubtedly wish I would quit writing and get back to work.

To placate both camps, I am just going to sketch briefly our three categories at this point and those who are interested in getting their doctorate can refer to the appendix for extended treatment of examples.

Our three investment categories are not differentiated by their expected profitability over an extended period of time. We are hopeful that they will each, over a ten or fifteen year period, produce something like the ten percentage point margin over the Dow that is our goal. However, in a given year they will have violently different behavior characteristics, depending primarily on the type of year it turns out to be for the stock market generally. Briefly this is how they shape up:

“Generals” - A category of generally undervalued stocks, determined primarily by quantitative standards, but with considerable attention also paid to the qualitative factor. There is often little or nothing to indicate immediate market improvement. The issues lack glamour or market sponsorship. Their main qualification is a bargain price; that is, an overall valuation on the enterprise substantially below what careful analysis indicates its value to a private owner to be. Again let me emphasize that

while the quantitative comes first and is essential, the qualitative is important. We like good management - we like a decent industry - we like a certain amount of "ferment" in a previously dormant management or stockholder group. But we demand value. The general group behaves very much in sympathy with the Dow and will turn in a big minus result during a year of substantial decline by the Dow. Contrarywise, it should be the star performer in a strongly advancing market. Over the years we expect it, of course, to achieve a satisfactory margin over the Dow.

"Workouts" - These are the securities with a timetable. They arise from corporate activity - sell-outs, mergers, reorganizations, spin-offs, etc. In this category we are not talking about rumors or "inside information" pertaining to such developments, but to publicly announced activities of this sort. We wait until we can read it in the paper. The risk pertains not primarily to general market behavior (although that is sometimes tied in to a degree), but instead to something upsetting the applecart so that the expected development does not materialize. Such killjoys could include anti-trust or other negative government action, stockholder disapproval, withholding of tax rulings, etc. The gross profits in many workouts appear quite small. A friend refers to this as getting the last nickel after the other fellow has made the first ninety-five cents. However, the predictability coupled with a short holding period produces quite decent annual rates of return. This category produces more steady absolute profits from year to year than generals do. In years of market decline, it piles up a big edge for us; during bull markets, it is a drag on performance. On a long term basis, I expect it to achieve the same sort of margin over the Dow attained by generals.

"Controls" - These are rarities, but when they occur they are likely to be of significant size. Unless we start off with the purchase of a sizable block or stock, controls develop from the general category. They result from situations where a cheap security does nothing price-wise for such an extended period of time that we are able to buy a significant percentage of the company's stock. At that point we are probably in a position to assume some degree of, or perhaps complete, control of the company's activities; whether we become active or remain relatively passive at this point depends upon our assessment of the company's future and the management's capabilities. The general we have been buying the most aggressively in recent months possesses excellent management following policies that appear to make very good sense to us. If our continued buying puts us in a controlling position at some point in the future, we will probably remain very passive regarding the operation of this business.

We do not want to get active merely for the sake of being active. Everything else being equal I would much rather let others do the work. However, when an active role is necessary to optimize the employment of capital you can be sure we will not be standing in the wings.

Active or passive, in a control situation there should be a built-in profit. The sine qua non of this operation is an attractive purchase price. Once control is achieved, the value of our investment is determined by the value of the enterprise, not the oftentimes irrationalities of the marketplace.

Our willingness and financial ability to assume a controlling position gives us two-way stretch on many purchases in our group of generals. If the market changes its opinion for the better, the security will advance in price. If it doesn't, we will continue to acquire stock until we can look to the business itself rather than the market for vindication of our judgment.

Investment results in the control category have to be measured on the basis of at least several years. Proper buying takes time. If needed, strengthening management, re-directing the utilization of capital, perhaps effecting a satisfactory sale or merger, etc., are also all factors that make this a business to be measured in years rather than months. For this reason, in controls, we are looking for wide margins of profit-if it looks at all close, we pass.

Controls in the buying stage move largely in sympathy with the Dow. In the later stages their behavior is geared more to that of workouts.

As I have mentioned in the past, the division of our portfolio among the three categories is largely determined by the accident or availability. Therefore, in a minus year for the Dow, whether we are primarily in generals or workouts is largely a matter of luck, but it will have a great deal to do with our performance relative to the Dow. This is one or many reasons why a single year's performance is of minor importance and, good or bad, should never be taken too seriously.

If there is any trend as our assets grow, I would expect it to be toward controls which heretofore have been our smallest category. I may be wrong in this expectation - a great deal depends, of course, on the future behavior of the market on which your guess is as good as mine (I have none). At this writing, we have a majority of our capital in generals, workouts rank second, and controls are third.

Miscellaneous

We are starting off the year with net assets of \$17,454,900. Our rapid increase in assets always raises the question of whether this will result in a dilution of future performance. To date, there is more of a positive than inverse correlation between size of the Partnership and its margin over the Dow. This should not be taken seriously however. Larger sums may be an advantage at some times and a disadvantage at others. My opinion is that our present portfolio could not be improved if our assets were \$1 million or \$5 million. Our idea inventory has always seemed to be 10% ahead of our bank account. If that should change, you can count on hearing from me.

Susie and I have an investment of \$2,392,900 in the Partnership. For the first time I had to withdraw funds in addition to my monthly payments, but it was a choice of this or disappointing the Internal Revenue Service. Susie and I have a few non-marketable (less than 300 holders) securities of nominal size left over from earlier years which in aggregate are worth perhaps 1% of our partnership interest. In addition we have one non-marketable holding of more material size of a local company purchased in 1960 which we expect to hold indefinitely. Aside from this all our eggs are in the BPL basket and they will continue to be. I can't promise results but I can promise a common destiny. In addition, that endless stream of relatives of mine consisting of my three children, mother, father, two sisters, two brothers-in-law, father-in-law, four aunts four cousins and five nieces and nephews, have interests in BPL directly or indirectly totaling \$1,247,190.

Bill Scott is also in with both feet, having an interest along with his wife of \$237,400, the large majority of their net worth. Bill has done an excellent job and on several of our more interesting situations going into 1964, he has done the majority of the contact work. I have also shoved off on him as much as possible of the administrative work so if you need anything done or have any questions, don't hesitate to ask for Bill if I'm not around.

Beth and Donna have kept an increasing work load flowing in an excellent manner. During December and January, I am sure they wish they had found employment elsewhere, but they always manage to keep a mountain of work ship-shape.

Peat, Marwick, Mitchell has done their usual excellent job of meeting a tough timetable. We have instructed them to conduct two surprise checks a year (rather than one as in past years) on our securities, cash, etc., in the future. These are relatively inexpensive, and I think make a good deal of sense in any financial organization.

Within the next week you will receive:

- (1) A tax letter giving you all BPL information needed for your 1963 federal income tax return. This letter

is the only item that counts for tax purposes.

- (2) An audit from Peat, Marwick, Mitchell & Co. for 1963, setting forth the operations and financial position of BPL as well as your own capital account.
- (3) A letter signed by me setting forth the status of your BPL interest on 1/1/64. This is identical with the figure developed in the audit.
- (4) Schedule "A" to the partnership agreement listing all partners.

Let me know if anything needs clarifying. As we grow, there is more chance of missing letters, a name skipped over, a figure transposition, etc., so speak up if it appears we might have erred. Our next letter will be about July 15th summarizing the first half.

Cordially,

Warren E. Buffett

APPENDIX

TEXAS NATIONAL PETROLEUM

This situation was a run-of-the-mill workout arising from the number one source of workouts in recent years -- the sellouts of oil and gas producing companies.

TNP was a relatively small producer with which I had been vaguely familiar for years.

Early in 1962 I heard rumors regarding a sellout to Union Oil of California. I never act on such information, but in this case it was correct and substantially more money would have been made if we had gone in at the rumor stage rather than the announced stage. However, that's somebody else's business, not mine.

In early April, 1962, the general terms of the deal were announced. TNP had three classes of securities outstanding:

- (1) 6 1/2% debentures callable at 104 1/4 which would bear interest until the sale transpired and at that time would be called. There were \$6.5 million outstanding of which we purchased \$264,000 principal amount before the sale closed.
- (2) About 3.7 million shares of common stock of which the officers and directors owned about 40%. The proxy statement estimated the proceeds from the liquidation would produce \$7.42 per share. We purchased 64,035 shares during the six months or so between announcement and closing.
- (3) 650,000 warrants to purchase common stock at \$3.50 per share. Using the proxy statement estimate of \$7.42 for the workout on the common resulted in \$3.92 as a workout on the warrants. We were able to buy 83,200 warrants or about 13% of the entire issue in six months.

The risk of stockholder disapproval was nil. The deal was negotiated by the controlling stockholders, and the price was a good one. Any transaction such as this is subject to title searches, legal opinions, etc., but this risk could also be appraised at virtually nil. There were no anti-trust problems. This absence of legal or anti-trust problems is not always the case, by any means.

The only fly in the ointment was the obtaining of the necessary tax ruling. Union Oil was using a standard ABC production payment method of financing. The University of Southern California was the production payment holder and there was some delay because of their eleemosynary status.

This posed a new problem for the Internal Revenue Service, but we understood USC was willing to waive this status which still left them with a satisfactory profit after they borrowed all the money from a bank. While getting this ironed out created delay, it did not threaten the deal.

When we talked with the company on April 23rd and 24th, their estimate was that the closing would take place in August or September. The proxy material was mailed May 9th and stated the sale "will be consummated during the summer of 1962 and that within a few months thereafter the greater part of the proceeds will be distributed to stockholders in liquidation." As mentioned earlier, the estimate was \$7.42 per share. Bill Scott attended the stockholders meeting in Houston on May 29th where it was stated they still expected to close on September 1st.

The following are excerpts from some of the telephone conversations we had with company officials in ensuing months:

On June 18th the secretary stated "Union has been told a favorable IRS ruling has been formulated but must be passed on by additional IRS people. Still hoping for ruling in July."

On July 24th the president said that he expected the IRS ruling "early next week."

On August 13th the treasurer informed us that the TNP, Union Oil, and USC people were all in Washington attempting to thrash out a ruling.

On September 18th the treasurer informed us "No news, although the IRS says the ruling could be ready by next week."

The estimate on payout was still \$7.42.

The ruling was received in late September, and the sale closed October 31st. Our bonds were called November 13th. We converted our warrants to common stock shortly thereafter and received payments on the common of \$3.50 December 14, 1962, \$3.90 February 4, 1963, and 15 cent on April 24, 1963. We will probably get another 4 cent in a year or two. On 147,235 shares (after exercise of warrants) even 4 cent per share is meaningful.

This illustrates the usual pattern: (1) the deals take longer than originally projected; and (2) the payouts tend to average a little better than estimates. With TNP it took a couple of extra months, and we received a couple of extra percent.

The financial results of TNP were as follows:

- (1) On the bonds we invested \$260,773 and had an average holding period of slightly under five months. We received 6 ½% interest on our money and realized a capital gain of \$14,446. This works out to an overall rate of return of approximately 20% per annum.
- (2) On the stock and warrants we have realized capital gain of \$89,304, and we have stubs presently valued at \$2,946. From an investment of \$146,000 in April, our holdings ran to \$731,000 in October. Based on the time the money was employed, the rate of return was about 22% per annum.

In both cases, the return is computed on an all equity investment. I definitely feel some borrowed money is warranted against a portfolio of workouts, but feel it is a very dangerous practice against generals.

We are not presenting TNP as any earth-shaking triumph. We have had workouts which were much better and some which were poorer. It is typical of our bread-and-butter type of operation. We attempt to obtain all facts possible, continue to keep abreast of developments and evaluate all of this in terms of our experience. We certainly don't go into all the deals that come along -- there is considerable variation in their attractiveness. When a workout falls through, the resulting market value shrink is substantial. Therefore, you cannot afford many errors, although we fully realize we are going to have them occasionally.

DEMPSTER MILL MFG.

This situation started as a general in 1956. At that time the stock was selling at \$18 with about \$72 in book value of which \$50 per share was in current assets (Cash, receivables and inventory) less all liabilities. Dempster had earned good money in the past but was only breaking even currently.

The qualitative situation was on the negative side (a fairly tough industry and unimpressive management), but the figures were extremely attractive. Experience shows you can buy 100 situations like this and have perhaps 70 or 80 work out to reasonable profits in one to three years. Just why any particular one should do so is hard to

say at the time of purchase, but the group expectancy is favorable, whether the impetus is from an improved industry situation, a takeover offer, a change in investor psychology, etc.

We continued to buy the stock in small quantities for five years. During most of this period I was a director and was becoming consistently less impressed with the earnings prospects under existing management. However, I also became more familiar with the assets and operations and my evaluation of the quantitative factors remained very favorable.

By mid-1961 we owned about 30% of Dempster (we had made several tender offers with poor results), but in August and September 1961 made, several large purchases at \$30.25 per share, which coupled with a subsequent tender offer at the same price, brought our holding to over 70%. Our purchases over the previous five years had been in the \$16-\$25 range.

On assuming control, we elevated the executive vice president to president to see what he would do unfettered by the previous policies. The results were unsatisfactory and on April 23, 1962 we hired Harry Bottle as president.

Harry was the perfect man for the job. I have recited his triumphs before and the accompanying comparative balance sheets speak louder than any words in demonstrating the re-employment of capital.

	11/30/61	7/31/63 (unaudited)
Cash	\$166,000	\$89,000
US Gov't Securities – at cost		\$289,000
Other marketable securities – at market (which exceeds cost)		\$2,049,000
Total Cash and Securities	\$166,000	\$2,436,000
Accounts receivable (net)	\$1,040,000	\$864,000
Inventory	\$4,203,000	\$890,000
Prepaid expenses, etc.	\$82,000	\$12,000
Current Assets	\$5,491,000	\$4,202,000
Other Assets	\$45,000	\$62,000
Net Plant and Equipment	\$1,383,000	\$862,000
Total Assets	\$6,919,000	\$5,126,000
Notes Payable	\$1,230,000	
Other Liability	\$1,088,000	\$274,000
Total Liabilities	\$2,318,000	\$274,000
Net worth		
60,146 shs. 11/30/61		
62,146 shs. 7/31/63	\$4,601,000	\$4,852,000
Total liabilities and net worth	\$6,919,000	\$5,126,000

Harry:

- (1) took the inventory from over \$4 million (much of it slow moving) to under \$1 million reducing carrying costs and obsolescence risks tremendously;
- (2) correspondingly freed up capital for marketable security purchases from which we gained over

\$400,000

- (3) cut administration and selling expense from \$150,000 to \$75,000 per month;
- (4) cut factory overhead burden from \$6 to \$4.50 per direct labor hour;
- (5) closed the five branches operating unprofitably (leaving us with three good ones) and replaced them with more productive distributors;
- (6) cleaned up a headache at an auxiliary factory operation at Columbus, Nebraska;
- (7) eliminated jobbed lines tying up considerable money (which could be used profitably in securities) while producing no profits;
- (8) adjusted prices of repair parts, thereby producing an estimated \$200,000 additional profit with virtually no loss of volume; and most important;
- (9) through these and many other steps, restored the earning capacity to a level commensurate with the capital employed.

In 1963, the heavy corporate taxes we were facing (Harry surprised me by the speed with which he had earned up our tax loss carry-forward) coupled with excess liquid funds within the corporation compelled us to either in some way de-incorporate or to sell the business.

We set out to do either one or the other before the end of 1963. De-incorporating had many problems but would have, in effect, doubled earnings for our partners and also eliminated the problem of corporate capital gain tax on Dempster securities.

At virtually the last minute, after several earlier deals had fallen through at reasonably advanced stages, a sale of assets was made. Although there were a good many wrinkles to the sale, the net effect was to bring approximately book value. This, coupled with the gain we have in our portfolio of marketable securities, gives us a realization of about \$80 per share. Dempster (now named First Beatrice Corp. - we sold the name to the new Co.) is down to almost entirely cash and marketable securities now. On BPL's yearend audit, our First Beatrice holdings were valued at asset value (with securities at market) less a \$200,000 reserve for various contingencies.

I might mention that we think the buyers will do very well with Dempster. They impress us as people of ability and they have sound plans to expand the business and its profitability. We would have been quite happy to operate Dempster on an unincorporated basis, but we are also quite happy to sell it for a reasonable price. Our business is making excellent purchases -- not making extraordinary sales.

Harry works the same way I do -- he likes big carrots. He is presently a limited partner of BPL, and the next belt-tightening operation we have, he's our man.

The Dempster saga points up several morals:

- (1) Our business is one requiring patience. It has little in common with a portfolio of high-flying glamour stocks and during periods of popularity for the latter, we may appear quite stodgy.

It is to our advantage to have securities do nothing price wise for months, or perhaps years, why we are buying them. This points up the need to measure our results over an adequate period of time. We

suggest three years as a minimum.

- (2) We cannot talk about our current investment operations. Such an open-mouth policy could never improve our results and in some situations could seriously hurt us. For this reason, should anyone, including partners, ask us whether we are interested in any security, we must plead the “5th Amendment.”

July 8, 1964

First Half Performance

The whole family is leaving for California on June 23rd so I am fudging a bit on this report and writing it June 18th. However, for those of you who set your watches by the receipt of our letters. I will maintain our usual chronological symmetry in reporting, leaving a few blanks which Bill will fill in after the final June 30th figures are available.

During the first half of 1964 the Dow-Jones Industrial Average (hereinafter called the "DOW") advanced from 762.95 to 831.50. If one had owned the Dow during this period, dividends of approximately 14.40 would have been received, bringing the overall return from the Dow during the first half to plus 10.0%. As I write this on June 18th, it appears that our results will differ only insignificantly from those of the Dow. I would feel much better reporting to you that the Dow had broken even, and we had been plus 5%, or better still, that the Dow had been minus 10%, and we had broken even. I have always pointed out, however, that gaining an edge on the Dow is more difficult for us in advancing markets than in static or declining ones.

To bring the record up to date, the following summarizes the performance of the Dow, the performance of the Partnership before allocation to the general partner and the limited partners' results:

Year	Overall Results From Dow (1)	Partnership Results (2)	Limited Partners' Results (3)
1957	-8.4%	10.4%	9.3%
1958	38.5%	40.9%	32.2%
1959	20.0%	25.9%	20.9%
1960	-6.2%	22.8%	18.6%
1961	22.4%	45.9%	35.9%
1962	-7.6%	13.9%	11.9%
1963	20.6%	38.7%	30.5%
1 st half 1964	10.9%	12.0%	10.5%
Cumulative results	116.1%	521.0%	354.4%
Annual compounded rate	10.8%	27.6%	22.2%

(See next page for footnotes to table.)

Footnotes to preceding table:

- (1) Based on yearly changes in the value of the Dow plus dividends that would have been received through ownership of the Dow during that year. The table includes all complete years of partnership activity.
- (2) For 1957-61 consists of combined results of all predecessor limited partnerships operating throughout the entire year after all expenses but before distributions to partners or allocations to the general partner.
- (3) For 1957-61 computed on the basis of the preceding column of partnership results allowing for

allocation to the general partner based up on the present partnership agreement, but before monthly withdrawals by limited partners.

Buying activities during the first half were quite satisfactory. This is of particular satisfaction to me since I consider the buying end to be about 90% of this business. Our General category now includes three companies where B.P.L. is the largest single stockholder. These stocks have been bought and are continuing to be bought at prices considerably below their value to a private owner. We have been buying one of these situations for approximately eighteen months and both of the others for about a year. It would not surprise me if we continue to do nothing but patiently buy these securities week after week for at least another year, and perhaps even two years or more.

What we really like to see in situations like the three mentioned above is a condition where the company is making substantial progress in terms of improving earnings, increasing asset values, etc., but where the market price of the stock is doing very little while we continue to acquire it. This doesn't do much for our short-term performance, particularly relative to a rising market, but it is a comfortable and logical producer of longer-term profits. Such activity should usually result in either appreciation of market prices from external factors or the acquisition by us of a controlling position in a business at a bargain price. Either alternative suits me.

It is important to realize, however, that most of our holdings in the General category continue to be securities which we believe to be considerably undervalued, but where there is not the slightest possibility that we could have a controlling position. We expect the market to justify our analyses of such situations in a reasonable period of time, but we do not have the two strings to our bow mentioned in the above paragraph working for us in these securities.

Investment Companies

We regularly compare our results with the two largest open-end investment companies (mutual funds) that follow a policy of being typically 95%-100% invested in common stocks, and the two largest diversified closed-end investment companies. These four companies, Massachusetts Investors Trust, Investors Stock Fund, Tri-Continental Corp., and Lehman Corp., manage over \$4 billion and are probably typical of most of the \$28 billion investment company industry. Their results are shown below. My opinion is that this performance roughly parallels that of the overwhelming majority of other investment advisory organizations which handle, in aggregate, vastly greater sums.

Year	Mass. Inv. Trust (1)	Investors Stock (1)	Lehman (2)	Tri-Cont. (2)	Dow	Limited Partners
1957	-11.4%	-12.4%	-11.4%	-2.4%	-8.4%	9.3%
1958	42.7%	47.5%	40.8%	33.2%	38.5%	32.2%
1959	9.0%	10.3%	8.1%	8.4%	20.0%	20.9%
1960	-1.0%	-0.6%	2.5%	2.8%	-6.2%	18.6%
1961	25.6%	24.9%	23.6%	22.5%	22.4%	35.9%
1962	-9.8%	-13.4%	-14.4%	-10.0%	-7.6%	11.9%
1963	20.0%	16.5%	23.7%	18.3%	20.6%	30.5%
1 st half 1964	11.0%	9.5%	9.6%	8.6%	10.9%	10.5%
Cumulative Results	105.8%	95.5%	98.2%	105.1%	116.1%	354.4%
Annual Compounded Rate	10.1%	9.4%	9.6%	10.1%	10.8%	22.2%

- (1) Computed from changes in asset value plus any distributions to holders of record during year.
- (2) From 1964 Moody's Bank & Finance Manual for 1957-63. Estimated for first half 1964.

These figures continue to show that the most highly paid and respected investment management has difficulty matching the performance of an unmanaged index of blue chip stocks. The results of these companies in some ways resemble the activity of a duck sitting on a pond. When the water (the market) rises, the duck rises; when it falls, back goes the duck. SPCA or no SPCA, I think the duck can only take the credit (or blame) for his own activities. The rise and fall of the lake is hardly something for him to quack about. The water level has been of great importance to B.P.L.'s performance as the table on page one indicates. However, we have also occasionally flapped our wings.

I would like to emphasize that I am not saying that the Dow is the only way of measuring investment performance in common stocks. However, I do say that all investment managements (including self-management) should be subjected to objective tests, and that the standards should be selected a priori rather than conveniently chosen retrospectively.

The management of money is big business. Investment managers place great stress on evaluating company managements in the auto industry, steel industry, chemical industry, etc. These evaluations take enormous amounts of work, are usually delivered with great solemnity, and are devoted to finding out which companies are well managed and which companies have management weaknesses. After devoting strenuous efforts to objectively measuring the managements of portfolio companies, it seems strange indeed that similar examination is not applied to the portfolio managers themselves. We feel it is essential that investors and investment managements establish standards of performance and, regularly and objectively, study their own results just as carefully as they study their investments.

We will regularly follow this policy wherever it may lead. It is perhaps too obvious to say that our policy of measuring performance in no way guarantees good results--it merely guarantees objective evaluation. I want to stress the points mentioned in the "Ground Rules" regarding application of the standard--namely that it should be applied on at least a three-year basis because of the nature of our operation and also that during a speculative boom we may lag the field. However, one thing I can promise you. We started out with a 36-inch yardstick and we'll keep it that way. If we don't measure up, we won't change yardsticks. In my opinion, the entire field of investment management, involving hundreds of billions of dollars, would be more satisfactorily conducted if everyone had a good yardstick for measurement of ability and sensibly applied it. This is regularly done by most people in the conduct of their own business when evaluating markets, people, machines, methods, etc., and money management is the largest business in the world.

Taxes

We entered 1964 with net unrealized gains of \$2,991,090 which is all attributable to partners belonging during 1963. Through June 30th we have realized capital gains of \$2,826,248.76 (of which 96% are long term) so it appears very likely that at least all the unrealized appreciation attributable to your interest and reported to you in our letter of January 25, 1964, (item 3) will be realized this year. I again want to emphasize that this has nothing to do with how we are doing. It is possible that I could have made the above statement, and the market value of your B.P.L. interest could have shrunk substantially since January 1st, so the fact that we have large realized gains is no cause for exultation. Similarly when our realized gains are very small there is not necessarily any reason to be discouraged. We do not play any games to either accelerate or defer taxes. We make investment decisions based on our evaluation of the most profitable combination of probabilities. If this means paying taxes I'm glad the rates on long-term capital gains are as low as they are.

As previously stated in our most recent tax letter of April 1, 1964 the safe course to follow on interim estimates

is to pay the same estimated tax for 1964 as your actual tax was for 1963. There can be no penalties if you follow this procedure.

The tax liability for partners who entered January 1st will, of course, be quite moderate, as it always is in the first year for any partner. This occurs because realized capital gains are first attributed to old partners having an interest in unrealized appreciation. This, again, of course, has nothing to do with economic performance. All limited partners, new and old, (except for Bill Scott, Ruth Scott and Susan Buffett per paragraph five of the Partnership Agreement) end up with exactly the same results. As usual, net ordinary income for all partners is nominal to date.

As in past years, we will have a letter out about November 1st (to partners and those who have indicated an interest, to us by that time in becoming partners) with the amendment to the Partnership Agreement, Commitment Letter for 1965, estimate or the 1964 tax situation, etc. In the meantime, keep Bill busy this summer clearing up anything in this letter that comes out fuzzy.

January 18, 1965

Our Performance in 1964

Although we had an overall gain of \$4,846,312.37 in 1964, it was not one of our better years as judged by our fundamental yardstick, the Dow-Jones Industrial Average (hereinafter called the "Dow"). The overall result for BPL was plus 27.8% compared to an overall plus 18.7% for the Dow. The overall result for limited partners was plus 22.3%. Both the advantage of 9.1 percentage points on a partnership basis and 3.6 points by the limited partners were the poorest since 1959, which was a year of roughly comparable gains for the Dow.

Nevertheless, I am not depressed. It was a strong year for the general market, and it is always tougher for us to outshine the Dow in such a year. We are certain to have years when the Dow gives us a drubbing and, in some respects, I feel rather fortunate that 1964 wasn't the year. Because of the problems that galloping markets pose for us, a Dow repeat in 1965 of 1964 results would make it most difficult for us to match its performance, let alone surpass it by a decent margin.

To bring the record up to date, the following summarizes the year-by-year performance of the Dow, the performance of the Partnership before allocation to the general partner, and the limited partner's results:

Year	Overall Results From Dow (1)	Partnership Results (2)	Limited Partners' Results (3)
1957	-8.4%	10.4%	9.3%
1958	38.5%	40.9%	32.2%
1959	20.0%	25.9%	20.9%
1960	-6.2%	22.8%	18.6%
1961	22.4%	45.9%	35.9%
1962	-7.6%	13.9%	11.9%
1963	20.6%	38.7%	30.5%
1964	18.7%	27.8%	22.3%

- (1) Based on yearly changes in the value of the Dow plus dividends that would have been received through ownership of the Dow during that year. The table includes all complete years of partnership activity.
- (2) For 1957-61 consists of combined results of all predecessor limited partnerships operating throughout the entire year after all expenses, but before distributions to partners or allocations to the general partner.
- (3) For 1957-61 computed on the basis of the preceding column of partnership results allowing for allocation to the general partner based upon the present partnership agreement, but before monthly withdrawals by limited partners.

On a cumulative or compounded basis, the results are:

Year	Overall Results From Dow	Partnership Results	Limited Partners' Results
1957	-8.4%	10.4%	9.3%
1957 - 58	26.9%	55.6%	44.5%

1957 – 59	52.3%	95.9%	74.7%
1957 – 60	42.9%	140.9%	107.2%
1957 – 61	74.9%	251.0%	181.6%
1957 – 62	61.6%	299.8%	215.1%
1957 – 63	94.9%	454.5%	311.2%
1957 – 64	131.3%	608.7%	402.9%
Annual Compounded Rate	11.1%	27.7%	22.3%

Investment Companies

We regularly compare our results with the two largest open-end investment companies (mutual funds) that follow a policy of being typically 95-100% invested in common stock, and the two largest diversified closed-end investment companies. These four companies, Massachusetts Investors Trust, Investors Stock Fund, Tri-Continental Corporation, and Lehman Corporation, manage about \$4.5 billion, are owned by about 550,000 shareholders, and are probably typical of most of the \$30 billion investment company industry. My opinion is that their results roughly parallel those of the overwhelming majority of other investment advisory organizations which handle, in aggregate, vastly greater sums.

The purpose of this tabulation, which is shown below, is to illustrate that the Dow is no pushover as an index of investment achievement. The advisory talent managing just the four companies shown commands annual fees of over \$8 million and this represents a very small fraction of the professional investment management industry. The public batting average of this highly-paid and widely respected talent indicates performance a shade below that of the Dow, an unmanaged index.

YEARLY RESULTS

Year	Mass. Inv. Trust (1)	Investors Stock (1)	Lehman (2)	Tri-Cont (2)	Dow	Limited Partners
1957	-11.4%	-12.4%	-11.4%	-2.4%	-8.4%	9.3%
1958	42.7%	47.5%	40.8%	33.2%	38.5%	32.2%
1959	9.0%	10.3%	8.1%	8.4%	20.0%	20.9%
1960	-1.0%	-0.6%	2.5%	2.8%	-6.2%	18.6%
1961	25.6%	24.9%	23.6%	22.5%	22.4%	35.9%
1962	-9.8%	-13.4%	-14.4%	-10.0%	-7.6%	11.9%
1963	20.0%	16.5%	23.7%	18.3%	20.6%	30.5%
1964	15.9%	14.3%	13.6%	12.6%	18.7%	22.3%

(1) Computed from changes in asset value plus any distributions to holders of record during year.

(2) From 1964 Moody's Bank & Finance Manual for 1957-63. Estimated for 1964.

Compounded Rate						

The repetition of these tables has caused partners to ask: "Why in the world does this happen to very intelligent managements working with (1) bright, energetic staff people, (2) virtually unlimited resources, (3) the most extensive business contacts, and (4) literally centuries of aggregate investment experience?" (The latter qualification brings to mind the fellow who applied for a job and stated he had twenty years of experience - which was corrected by the former employer to read "one year's experience -twenty times.")

This question is of enormous importance, and you would expect it to be the subject of considerable study by investment managers and substantial investors. After all, each percentage point on \$30 billion is \$300 million per year. Curiously enough, there is practically nothing in the literature of Wall Street attracting this problem, and discussion of it is virtually absent at security analyst society meetings, conventions, seminars, etc. My opinion is that the first job of any investment management organization is to analyze its own techniques and results before pronouncing judgment on the managerial abilities and performance of the major corporate entities of the United States.

In the great majority of cases the lack of performance exceeding or even matching an unmanaged index in no way reflects lack of either intellectual capacity or integrity. I think it is much more the product of: (1) group decisions - my perhaps jaundiced view is that it is close to impossible for outstanding investment management to come from a group of any size with all parties really participating in decisions; (2) a desire to conform to the policies and (to an extent) the portfolios of other large well-regarded organizations; (3) an institutional framework whereby average is "safe" and the personal rewards for independent action are in no way commensurate with the general risk attached to such action; (4) an adherence to certain diversification practices which are irrational; and finally and importantly, (5) inertia.

Perhaps the above comments are unjust. Perhaps even our statistical comparisons are unjust. Both our portfolio and method of operation differ substantially from the investment companies in the table. However, I believe both our partners and their stockholders feel their managements are seeking the same goal - the maximum long-term average return on capital obtainable with the minimum risk of permanent loss consistent with a program of continuous investment in equities. Since we should have common goals, and most partners, as an alternative to their interest in BPL, would probably have their funds invested in media producing results comparable with these investment companies, I feel their performance record is meaningful in judging our own results.

There is no question that an important service is provided to investors by investment companies, investment advisors, trust departments, etc. This service revolves around the attainment of adequate diversification, the preservation of a long-term outlook, the ease of handling investment decisions and mechanics, and most importantly, the avoidance of the patently inferior investment techniques which seem to entice some individuals. All but a few of the organizations do not specifically promise to deliver superior investment performance although it is perhaps not unreasonable for the public to draw such an inference from their advertised emphasis on professional management.

One thing I pledge to you as partners - just as I consider the previously stated performance comparison to be meaningful now, so will I in future years, no, matter what tale unfolds. Correspondingly, I ask that you, if you do not feel such a standard to be relevant, register such disagreement now and suggest other standards which can be applied prospectively rather than retrospectively.

One additional thought - I have not included a column in my table for the most widely-used investment advisor in the world - Bell management. People who watch their weight, golf scores, and fuel bills seem to shun quantitative evaluation of their investment management skills although it involves the most important client in the world - themselves. While it may be of academic interest to evaluate the management accomplishments of Massachusetts Investors Trust or Lehman Corporation, it is of enormous dollars-and-cents importance to evaluate objectively the accomplishments of the fellow who is actually handling your money - even if it's you.

The Question of Conservatism

In looking at the table of investment company performance, the question might be asked: "Yes, but aren't those companies run more conservatively than the Partnership?" If you asked that question of the investment company managements, they, in absolute honesty, would say they were more conservative. If you asked the first hundred security analysts you met, I am sure that a very large majority of them also would answer for the investment companies. I would disagree. I have over 90% of my net worth in BPL, and most of my family have percentages in that area, but of course, that only demonstrates the sincerity of my view - not the validity of it.

It is unquestionably true that the investment companies have their money more conventionally invested than we do. To many people conventionality is indistinguishable from conservatism. In my view, this represents erroneous thinking. Neither a conventional nor an unconventional approach, per se, is conservative.

Truly conservative actions arise from intelligent hypotheses, correct facts and sound reasoning. These qualities may lead to conventional acts, but there have been many times when they have led to unorthodoxy. In some corner of the world they are probably still holding regular meetings of the Flat Earth Society.

We derive no comfort because important people, vocal people, or great numbers of people agree with us. Nor do we derive comfort if they don't. A public opinion poll is no substitute for thought. When we really sit back with a smile on our face is when we run into a situation we can understand, where the facts are ascertainable and clear, and the course of action obvious. In that case - whether other conventional or unconventional - whether others agree or disagree - we feel - we are progressing in a conservative manner.

The above may seem highly subjective. It is. You should prefer an objective approach to the question. I do. My suggestion as to one rational way to evaluate the conservativeness of past policies is to study performance in declining markets. We have only three years of declining markets in our table and unfortunately (for purposes of this test only) they were all moderate declines. In all three of these years we achieved appreciably better investment results than any of the more conventional portfolios.

Specifically, if those three years had occurred in sequence, the cumulative results would have been:

Tri-Continental Corp.	-9.7%
Dow	-20.6%
Mass. Investors Trust	-20.9%
Lehman Corp.	-22.3%
Investors Stock Fund	-24.6%
Limited Partners	+45.0%

We don't think this comparison is all important, but we do think it has some relevance. We certainly think it makes more sense than saying "We own (regardless of price) A.T. &T., General Electric, IBM and General Motors and are therefore conservative." In any event, evaluation of the conservatism of any investment program or management (including self-management) should be based upon rational objective standards, and I suggest performance in declining markets to be at least one meaningful test.

The Joys of Compounding

Readers of our early annual letters registered discontent at a mere recital of contemporary investment experience, but instead hungered for the intellectual stimulation that only could be provided by a depth study of investment strategy spanning the centuries. Hence, this section.

Our last two excursions into the mythology of financial expertise have revealed that purportedly shrewd investments by Isabella (backing the voyage of Columbus) and Francis I (original purchase of Mona Lisa) bordered on fiscal lunacy. Apologists for these parties have presented an array of sentimental trivia. Through it all, our compounding tables have not been dented by attack.

Nevertheless, one criticism has stung a bit. The charge has been made that this column has acquired a negative tone with only the financial incompetents of history receiving comment. We have been challenged to record on these pages a story of financial perspicacity which will be a bench mark of brilliance down through the ages.

One story stands out. This, of course, is the saga of trading acumen etched into history by the Manhattan Indians when they unloaded their island to that notorious spendthrift, Peter Minuit in 1626. My understanding is that they received \$24 net. For this, Minuit received 22.3 square miles which works out to about 621,688,320 square feet. While on the basis of comparable sales, it is difficult to arrive at a precise appraisal, a \$20 per square foot estimate seems reasonable giving a current land value for the island of \$12,433,766,400 (\$12 1/2 billion). To the novice, perhaps this sounds like a decent deal. However, the Indians have only had to achieve a 6 1/2% return (The tribal mutual fund representative would have promised them this.) to obtain the last laugh on Minuit. At 6 1/2%, \$24 becomes \$42,105,772,800 (\$42 billion) in 338 years, and if they just managed to squeeze out an extra half point to get to 7%, the present value becomes \$205 billion.

So much for that.

Some of you may view your investment policies on a shorter term basis. For your convenience, we include our usual table indicating the gains from compounding \$100,000 at various rates:

	4%	8%	12%	16%
10 Years	\$48,024	\$115,892	\$210,584	\$341,143
20 Years	\$119,111	\$366,094	\$864,627	\$1,846,060
30 Years	\$224,337	\$906,260	\$2,895,970	\$8,484,940

This table indicates the financial advantages of:

- (1) A long life (in the erudite vocabulary of the financial sophisticate this is referred to as the Methusalah Technique)
- (2) A high compound rate
- (3) A combination of both (especially recommended by this author)

To be observed are the enormous benefits produced by relatively small gains in the annual earnings rate. This explains our attitude which while hopeful of achieving a striking margin of superiority over average investment results, nevertheless, regards every percentage point of investment return above average as having real meaning.

Our Goal

You will note that there are no columns in the preceding table for the 27.7% average of the Partnership during its eight-year lifespan or the 22.3% average of the limited partners. Such figures are nonsensical for the long term for several reasons: (Don't worry about me "holding back" to substantiate this prophecy.)

- (1) Any significant sums compounded at such rates take on national debt proportions at alarming speed.
- (2) During our eight-year history a general revaluation of securities has produced average annual rates of overall gain from the whole common stock field which I believe unattainable in future decades. Over a span of 20 or 30 years, I would expect something more like 6% - 7% overall annual gain from the Dow instead of the 11.1% during our brief history. This factor alone would tend to knock 4 points or so off of our annual compounding rate. It would only take a minus 20.5% year in 1965 for the Dow to bring it down to a 7% average figure for the nine years. Such years (or worse) should definitely be expected from time to time by those holding equity investments. If a 20% or 30% drop in the market value of your equity holdings (such as BPL) is going to produce emotional or financial distress, you should simply avoid common stock type investments. In the words of the poet - Harry Truman – “If you can't stand the heat, stay out of the kitchen. It is preferable, of course, to consider the problem before you enter the “kitchen.”
- (3) We do not consider it possible on an extended basis to maintain the 16.6 percentage point advantage over the Dow of the Partnership or the 11.2 percentage point edge enjoyed by the limited partners. We have had eight consecutive years in which our pool of money has out-performed the Dow, although the profit allocation arrangement left the limited partners short of Dow results in one of those years. We are certain to have years (note the plural) when the Partnership results fall short of the Dow despite considerable gnashing of teeth by the general partner (I hope not too much by the limited partners). When that happens our average margin of superiority will drop sharply. I might say that I also think we will continue to have some years of very decent margins in our favor. However, to date we have benefited by the fact that we have not had a really mediocre (or worse) year included in our average, and this obviously cannot be expected to be a permanent experience.

So what can we expect to achieve? Of course, anything I might say is largely guesswork, and my own investment philosophy has developed around the theory that prophecy reveals far more of the frailties of the prophet than it reveals of the future.

Nevertheless, you, as partners, are entitled to know my expectations, tenuous as they may be. I am hopeful that our longer term experience will unfold along the following basis:

- (1) An overall gain from the Dow (including dividends, of course) averaging in the area of 7% per annum, exhibiting customarily wide amplitudes in achieving this average -- say, on the order or minus 40% to plus 50% at the extremes with the majority of years in the minus 10% to plus 20% range;
- (2) An average advantage of ten percentage points per annum for BPL before allocation to the general partner - again with large amplitudes in the margin from perhaps 10 percentage points worse than the Dow in a bad year to 25 percentage points better when everything clicks; and
- (3) The product of these two assumptions gives an average of 17% to BPL or about 14% to limited partners. This figure would vary enormously from year to year; the final amplitudes, of course, depending, on the interplay of the extremes hypothesized in (1) and (2).

I would like to emphasize that the above is conjecture, perhaps heavily influenced by self-interest, ego, etc. Anyone with a sense of financial history knows this sort of guesswork is subject to enormous error. It might better be left out of this letter, but it is a question frequently and legitimately asked by partners. Long-range

expectable return is the primary consideration of all of us belonging to BPL, and it is reasonable that I should be put on record, foolish as that may later make me appear. My rather puritanical view is that any investment manager, whether operating as broker, investment counselor, trust department, Investment Company, etc., should be willing to state unequivocally what he is going to attempt to accomplish and how he proposes to measure the extent to which he gets the job done.

Our Method of Operation

In past annual letters I have always utilized three categories to describe investment operations we conduct. I now feel that a four-category division is more appropriate. Partially, the addition of a new section - "Generals Relatively Undervalued" - reflects my further consideration of essential differences that have always existed to a small extent with our "Generals" group. Partially, it reflects the growing importance of what once was a very small sub-category but is now a much more significant part of our total portfolio. This increasing importance has been accompanied by excellent results to date justifying significant time and effort devoted to finding additional opportunities in this area. Finally, it partially reflects the development and implementation of a new and somewhat unique investment technique designed to improve the expectancy and consistency of operations in this category. Therefore, our four present categories are:

1. "Generals -Private Owner Basis" - a category of generally undervalued stocks, determined by quantitative standards, but with considerable attention also paid to the qualitative factor. There is often little or nothing to indicate immediate market improvement. The issues lack glamour or market sponsorship. Their main qualification is a bargain price; that is, an overall valuation of the enterprise substantially below what careful analysis indicates its value to a private owner to be. Again, let me emphasize that while the quantitative comes first and is essential, the qualitative is important. We like good management - we like a decent industry - we like a certain amount of "ferment" in a previously dormant management or stockholder group. But, we demand value.

Many times in this category we have the desirable "two strings to our bow" situation where we should either achieve appreciation of market prices from external factors or from the acquisition of a controlling position in a business at a bargain price. While the former happens in the overwhelming majority of cases, the latter represents an insurance policy most investment operations don't have. We have continued to enlarge the positions in the three companies described in our 1964 midyear report where we are the largest stockholder. All three companies are increasing their fundamental value at a very satisfactory rate, and we are completely passive in two situations and active only on a very minor scale in the third. It is unlikely that we will ever take a really active part in policy-making in any of these three companies, but we stand ready if needed.

2. "Generals -Relatively Undervalued" - this category consists of securities selling at prices relatively cheap compared to securities of the same general quality. We demand substantial discrepancies from current valuation standards, but (usually because of large size) do not feel value to a private owner to be a meaningful concept. It is important in this category, of course, that apples be compared to apples - and not to oranges, and we work hard at achieving that end. In the great majority of cases we simply do not know enough about the industry or company to come to sensible judgments -in that situation we pass.

As mentioned earlier, this new category has been growing and has produced very satisfactory results. We have recently begun to implement a technique, which gives promise of very substantially reducing the risk from an overall change in valuation standards; e.g. I we buy something at 12 times earnings when comparable or poorer quality companies sell at 20 times earnings, but then a major revaluation takes place so the latter only sell at 10 times.

This risk has always bothered us enormously because of the helpless position in which we could be left compared to the "Generals -Private Owner" or "Workouts" types. With this risk diminished, we think this category has a promising future.

3. "Workouts" - these are the securities with a timetable. They arise from corporate activity - sell-outs, mergers, reorganizations, spin-offs, etc. In this category we are not talking about rumors or "inside information" pertaining to such developments, but to publicly announced activities of this sort. We wait until we can read it in the paper. The risk pertains not primarily to general market behavior (although that is sometimes tied in to a degree), but instead to something upsetting the applecart so that the expected development does not materialize. Such killjoys could include anti-trust or other negative government action, stockholder disapproval, withholding of tax rulings, etc. The gross profits in many workouts appear quite small. It's a little like looking for parking meters with some time left on them. However, the predictability coupled with a short holding period produces quite decent average annual rates of return after allowance for the occasional substantial loss. This category produces more steady absolute profits from year to year than generals do. In years of market decline it should usually pile up a big edge for us; during bull markets it will probably be a drag on performance. On a long-term basis, I expect the workouts to achieve the same sort of margin over the Dow attained by generals.

4. "Controls" - these are rarities, but when they occur they are likely to be of significant size. Unless we start off with the purchase of a sizable block of stock, controls develop from the general - private owner category. They result from situations where a cheap security does nothing pricewise for such an extended period of time that we are able to buy a significant percentage of the company's stock. At that point we are probably in a position to assume a degree of or perhaps complete control of the company's activities. Whether we become active or remain relatively passive at this point depends upon our assessment of the company's future and the managements capabilities.

We do not want to get active merely for the sake of being active. Everything else being equal, I would much rather let others do the work. However, when an active role is necessary to optimize the employment of capital, you can be sure we will not be standing in the wings.

Active or passive, in a control situation there should be a built-in profit. The sine qua non of this operation is an attractive purchase price. Once control is achieved, the value of our investment is determined by the value of the enterprise, not the oftentimes irrationalities of the market place.

Any of the three situations where we are now the largest stockholders mentioned under Generals - Private Owner could, by virtue of the two-way stretch they possess, turn into controls. That would suit us fine, but it also suits us if they advance in the market to a price more in line with intrinsic value enabling us to sell them, thereby completing a successful generals - private owner operation.

Investment results in the control category have to be measured on the basis of at least several years. Proper buying takes time. If needed, strengthening management, redirecting the utilization of capital, perhaps effecting a satisfactory sale or merger, etc., are also all factors that make this a business to be measured in years rather than months. For this reason, in controls, we are looking for wide margins of profit -if it appears at all close, we quitclaim.

Controls in the buying stage move largely in sympathy with the Dow. In the later stages their behavior is geared more to that of workouts.

You might be interested to know that the buyers of our former control situation, Dempster Mill Manufacturing, seem to be doing very well with it. This fulfills our expectation and is a source of satisfaction. An investment operation that depends on the ultimate buyer making a bum deal (in Wall Street they call this the "Bigger Fool Theory") is tenuous indeed. How much more satisfactory it is to buy at really bargain prices so that only an average disposition brings pleasant results.

As I have mentioned in the past, the division of our portfolio among categories is largely determined by the

accident of availability. Therefore, in any given year the mix between generals, workouts, or controls is largely a matter of chance, and this fickle factor will have a great deal to do with our performance relative to the Dow. This is one of many reasons why single year's performance is of minor importance and good or bad, should never be taken too seriously.

To give an example of just how important the accident of division between these categories is, let me cite the example of the past three years. Using an entirely different method of calculation than that used to measure the performance of BPL in entirety, whereby the average monthly investment at market value by category is utilized, borrowed money and office operating expenses excluded, etc., (this gives the most accurate basis for intergroup comparisons but does not reflect overall BPL results) the generals (both present categories combined), workouts, and the Dow, shape up as follows:

Year	Generals	Workouts	Dow
1962	-1.0%	14.6%	-8.6%
1963	20.5%	30.6%	18.4%
1964	27.8%	10.3%	16.7%

Obviously the workouts (along with controls) saved the day in 1962, and if we had been light in this category that year, our final result would have been much poorer, although still quite respectable considering market conditions during the year. We could just as well have had a much smaller percentage of our portfolio in workouts that year; availability decided it, not any notion on my part as to what the market was going to do. Therefore, it is important to realize that in 1962 we were just plain lucky regarding mix of categories.

In 1963 we had one sensational workout which greatly influenced results, and generals gave a good account of themselves, resulting in a banner year. If workouts had been normal, (say, more like 1962) we would have looked much poorer compared to the Dow. Here it wasn't our mix that did much for us, but rather excellent situations.

Finally, in 1964 workouts were a big drag on performance. This would be normal in any event during a big plus year for the Dow such as 1964, but they were even a greater drag than expected because of mediocre experience. In retrospect it would have been pleasant to have been entirely in generals, but we don't play the game in retrospect.

I hope the preceding table drives home the point that results in a given year are subject to many variables - some regarding which we have little control or insight. We consider all categories to be good businesses and we are very happy we have several to rely on rather than just one. It makes for more discrimination within each category and reduces the chance we will be put completely out of operation by the elimination of opportunities in a single category.

Taxes

We have had a chorus of groans this year regarding partners' tax liabilities. Of course, we also might have had a few if the tax sheet had gone out blank.

More investment sins are probably committed by otherwise quite intelligent people because of "tax considerations" than from any other cause. One of my friends - a noted West Coast philosopher maintains that a majority of life's errors are caused by forgetting what one is really trying to do. This is certainly the case when an emotionally supercharged element like taxes enters the picture (I have another friend - a noted East Coast philosopher who says it isn't the lack of representation he minds -it's the taxation).

Let's get back to the West Coast. What is one really trying to do in the investment world? Not pay the least

taxes, although that may be a factor to be considered in achieving the end. Means and end should not be confused, however, and the end is to come away with the largest after-tax rate of compound. Quite obviously if two courses of action promise equal rates of pre-tax compound and one involves incurring taxes and the other doesn't the latter course is superior. However, we find this is rarely the case.

It is extremely improbable that 20 stocks selected from, say, 3000 choices are going to prove to be the optimum portfolio both now and a year from now at the entirely different prices (both for the selections and the alternatives) prevailing at that later date. If our objective is to produce the maximum after-tax compound rate, we simply have to own the most attractive securities obtainable at current prices, And, with 3,000 rather rapidly shifting variables, this must mean change (hopefully "tax-generating" change).

It is obvious that the performance of a stock last year or last month is no reason, per se, to either own it or to not own it now. It is obvious that an inability to "get even" in a security that has declined is of no importance. It is obvious that the inner warm glow that results from having held a winner last year is of no importance in making a decision as to whether it belongs in an optimum portfolio this year.

If gains are involved, changing portfolios involves paying taxes. Except in very unusual cases (I will readily admit there are some cases), the amount of the tax is of minor importance if the difference in expectable performance is significant. I have never been able to understand why the tax comes as such a body blow to many people since the rate on long-term capital gain is lower than on most lines of endeavor (tax policy indicates digging ditches is regarded as socially less desirable than shuffling stock certificates).

I have a large percentage of pragmatists in the audience so I had better get off that idealistic kick. There are only three ways to avoid ultimately paying the tax: (1) die with the asset - and that's a little too ultimate for me even the zealots would have to view this "cure" with mixed emotions; (2) give the asset away - you certainly don't pay any taxes this way, but of course you don't pay for any groceries, rent, etc., either; and (3) lose back the gain if your mouth waters at this tax-saver, I have to admire you -you certainly have the courage of your convictions.

So it is going to continue to be the policy of BPL to try to maximize investment gains, not minimize taxes. We will do our level best to create the maximum revenue for the Treasury -at the lowest rates the rules will allow.

An interesting sidelight on this whole business of taxes, vis-à-vis investment management, has appeared in the last few years. This has arisen through the creation of so-called "swap funds" which are investment companies created by the exchange of the investment company's shares for general market securities held by potential investors. The dominant sales argument has been the deferment (deferment, when pronounced by an enthusiastic salesman, sometimes comes very close phonetically to elimination) of capital gains taxes while trading a single security for a diversified portfolio. The tax will only finally be paid when the swap fund's shares are redeemed. For the lucky ones, it will be avoided entirely when any of those delightful alternatives mentioned two paragraphs earlier eventuates.

The reasoning implicit in the swapee's action is rather interesting. He obviously doesn't really want to hold what he is holding or he wouldn't jump at the chance to swap it (and pay a fairly healthy commission - usually up to \$100,000) for a grab-bag of similar hot potatoes held by other tax-numbered investors. In all fairness, I should point out that after all offerees have submitted their securities for exchange and had a chance to review the proposed portfolio they have a chance to back out but I understand a relatively small proportion do so.

There have been twelve such funds (that I know of) established since origination of the idea in 1960, and several more are currently in the works. The idea is not without appeal since sales totaled well over \$600 million. All of the funds retain an investment manager to whom they usually pay 1/2 of 1% of asset value. This investment manager faces an interesting problem; he is paid to manage the fund intelligently (in each of the five largest funds this fee currently ranges from \$250,000 to \$700,000 per year), but because of the low tax basis inherited

from the contributors of securities, virtually his every move creates capital gains tax liabilities. And, of course, he knows that if he incurs such liabilities, he is doing so for people who are probably quite sensitive to taxes or they wouldn't own shares in the swap fund in the first place.

I am putting all of this a bit strongly, and I am sure there are some cases where a swap fund may be the best answer to an individual's combined tax and investment problems. Nevertheless, I feel they offer a very interesting test-tube to measure the ability of some of the most respected investment advisors when they are trying to manage money without paying (significant) taxes.

The three largest swap funds were all organized in 1961, and combined have assets now of about \$300 million. One of these, Diversification Fund, reports on a fiscal year basis which makes extraction of relevant data quite difficult for calendar year comparisons. The other two, Federal Street Fund and Westminster Fund (respectively first and third largest in the group) are managed by investment advisors who oversee at least \$2 billion of institutional money.

Here's how they shape up for all full years of existence:

Year	Federal Street	Westminster	Dow
1962	-19.0%	-22.5%	-7.6%
1963	17.0%	18.7%	20.6%
1964	13.8%	12.3%	18.7%
Annual Compounded Rate	2.6%	1.1%	9.8%

This is strictly the management record. No allowance has been made for the commission in entering and any taxes paid by the fund on behalf of the shareholders have been added back to performance.

Anyone for taxes?

Miscellaneous

In the December 21st issue of AUTOMOTIVE NEWS it was reported that Ford Motor Co. plans to spend \$700 million in 1965 to add 6,742,000 square feet to its facilities throughout the world. Buffett Partnership, Ltd., never far behind, plans to add 227 1/4 square feet to its facilities in the spring of 1965.

Our growth in net assets from \$105,100 (there's no prize for guessing who put in the \$100) on May 5, 1956 when the first predecessor limited partnership.(Buffett Associates, Ltd.) was organized, to \$26,074,000 on 1/1/65 creates the need for an occasional reorganization in internal routine. Therefore, roughly contemporaneously with the bold move from 682 to 909 1/4 square feet, a highly capable is going to join our organization with responsibility for the administrative (and certain other) functions. This move will particularly serve to free up more of Bill Scott's time for security analysis which is his forte. I'll have more to report on this in the midyear letter.

Bill (who continues to do a terrific job) and his wife have an investment in the Partnership of \$298,749, a very large majority of their net worth. Our new associate (his name is being withheld until his present employer has replaced him), along with his wife and children, has made an important investment in the Partnership. Susie and I presently have an interest of \$3,406,700 in BPL which represents virtually our entire net worth, with the exception of our continued holding of Mid-Continent Tab Card Co., a local company into which I bought in 1960 when it had less than 10 stockholders. Additionally, my relatives, consisting of three children, mother, two sisters, two brothers-in-law, father-in-Law, four aunts, four cousins and six nieces and nephews, have interests in BPL, directly or indirectly, totaling \$1,942,592. So we all continue to eat home cooking.

We continue to represent the ultimate in seasonal businesses --open one day a year. This creates real problems in keeping the paper flowing smoothly, but Beth and Donna continue to do an outstanding job of coping with this and other problems.

Peat, Marwick, Mitchell has distinguished itself in its usual vital role of finding out what belongs to whom. We continue to throw impossible deadlines at them --and they continue to perform magnificently. You will note in their certificate this year that they have implemented the new procedure whereby they now pounce on us unannounced twice a year in addition to the regular yearend effort.

Finally -and most sincerely -let me thank you partners who cooperate magnificently in getting things to us promptly and properly and thereby maximize the time we can spend working where we should be -by the cash register. I am extremely fortunate in being able to spend the great majority of my time thinking about where our money should be invested, rather than getting bogged down in the minutiae that seems to overwhelm so many business entities. We have an organizational structure which makes this efficiency a possibility, and more importantly, we have a group of partners that make it a reality. For this, I am most appreciative and we are all wealthier.

Our past policy has been to admit close relatives of present partners without a minimum capital limitation. This year a flood of children, grandchildren, etc., appeared which called this policy into question; therefore, I have decided to institute a \$25,000 minimum on interests of immediate relatives of present partners.

Within the coming two weeks you will receive:

- (1) A tax letter giving you all BPL information needed for your 1964 federal income tax return. This letter is the only item that counts for tax purposes.
- (2) An audit from Peat, Marwick, Mitchell & Co. for 1964, setting forth the operations and financial position of BPL as well as your own capital account.
- (3) A letter signed by me setting forth the status of your BPL interest on 111165. This is identical with the figure developed in the audit.
- (4) Schedule "A" to the partnership agreement listing all partners.

Let Bill or me know if anything needs clarifying. Even with our splendid staff our growth means there is more chance of missing letters, overlooked instructions, a name skipped over, a figure transposition, etc., so speak up if you have any question at all that we might have erred. My next letter will be about July 15th" summarizing the first half of this year.

Cordially,

John M. Harding

First Half Performance:

During the first half of 1965, the Dow Jones Industrial Average (hereinafter call the "Dow") declined from 874.13 to 868.03. This minor change was accomplished in a decidedly non-Euclidian manner. The Dow instead took the scenic route, reaching a high of 939.62 on May 14th. Adding back dividends on the Dow of 13.49 gives an overall gain through ownership of the Dow for the first half of 7.39 or 0.8%.

We had one of our better periods with an overall gain, before allocation to the general partner, of 10.4% or a 9.6 percentage point advantage over the Dow. To bring the record up to date, the following summarizes the year-by-year performance of the Dow, the performance of the Partnership before allocation to the general partner, and the limited partners' results:

Year	<u>Overall Results From Dow (1)</u>	<u>Partnership Results (2)</u>	<u>Limited Partners' Results (3)</u>
1957	-8.4%	10.4%	9.3%
1958	38.5%	40.9%	32.2%
1959	20.0%	25.9%	20.9%
1960	-6.2%	22.8%	18.6%
1961	22.4%	45.9%	35.9%
1962	-7.6%	13.9%	11.9%
1963	20.6%	38.7%	30.5%
1964	18.7%	27.8%	22.3%
1 st half 1965	0.8%	10.4%	9.3%
Cumulative results	133.2%	682.4%	449.7%
Annual compounded rate	10.5%	27.4%	22.2%

- (1) Based on yearly changes in the value of the Dow plus dividends that would have been received through ownership of the Dow during that year. The table includes all complete years of partnership activity.
- (2) For 1957-61 consists of combined results of all predecessor limited partnerships operating throughout the entire year after all expenses but before distributions to partners or allocations to the general partner.
- (3) For 1957-61 computed on the basis of the preceding column of partnership results allowing for allocation to the general partner based upon the present partnership agreement, but before monthly withdrawals by limited partners.

Our constant admonitions have been: (1) that short-term results (less than three years) have little meaning, particularly in reference to an investment operation such as ours that may devote a portion of resources to control situations; and, (2) that our results, relative to the Dow and other common-stock-form media usually will be better in declining markets and may well have a difficult time just matching such media in very strong

markets.

With the latter point in mind, it might be imagined that we struggled during the first four months of the half to stay even with the Dow and then opened up our margin as it declined in May and June. Just the opposite occurred. We actually achieved a wide margin during the upswing and then fell at a rate fully equal to the Dow during the market decline.

I don't mention this because I am proud of such performance – on the contrary, I would prefer it if we had achieved our gain in the hypothesized manner. Rather, I mention it for two reasons: (1) you are always entitled to know when I am wrong as well as right; and, (2) it demonstrates that although we deal with probabilities and expectations, the actual results can deviate substantially from such expectations, particularly on a short-term basis. As mentioned in the most recent annual letter, our long-term goal is to achieve a ten percentage point per annum advantage over the Dow. Our advantage of 9.6 points achieved during the first six months must be regarded as substantially above average. The fortitude demonstrated by our partners in tolerating such favorable variations is commendable. We shall most certainly encounter periods when the variations are in the other direction.

During the first half, a series of purchases resulted in the acquisition of a controlling interest in one of the situations described in the "General Private Owner" section of the last annual letter. When such a controlling interest is acquired, the assets and earning power of the business become the immediate predominant factors in value. When a small minority interest in a company is held, earning power and assets are, of course, very important, but they represent an indirect influence on value which, in the short run, may or may not dominate the factors bearing on supply and demand which result in price.

When a controlling interest is held, we own a business rather than a stock, and a business valuation is appropriate. We have carried our controlling position at a conservative valuation at midyear and will reevaluate it in terms of assets and earning power at yearend. The annual letter, issued in January, 1966, will carry a full story on this current control situation. At this time it is enough to say that we are delighted with both the acquisition cost and the business operation, and even happier about the people we have managing the business.

Investment Companies:

We regularly compare our results with the two largest open-end investment companies (mutual funds) that follow a policy of being, typically, 95-100% invested in common stocks, and the two largest diversified closed-end investment companies. These four companies, Massachusetts Investors Trust, Investors Stock Fund, Tri-Continental Corp., and Lehman Corp., manage over \$4 billion and are probably typical of most of the \$30 billion investment company industry. Their results are shown in the following table. My opinion is that this performance roughly parallels that of the overwhelming majority of other investment advisory organizations which handle, in aggregate, vastly greater sums.

Year	<u>Mass. Inv.</u> <u>Trust (1)</u>	<u>Investors</u> <u>Stock (1)</u>	<u>Lehman (2)</u>	<u>Tri-Cont (2)</u>	<u>Dow</u>	<u>Limited</u> <u>Partners</u>
1957	-11.4%	-12.4%	-11.4%	-2.4%	-8.4%	9.3%
1958	42.7	47.5	40.8	33.2	38.5	32.2
1959	9.0	10.3	8.1	8.4	20.0	20.9
1960	-1.0	-0.6	2.5	2.8	-6.2	18.6
1961	25.6	24.9	23.6	22.5	22.4	35.9
1962	-9.8	-13.4	-14.4	-10.0	-7.6	11.9
1963	20.0	16.5	23.7	18.7	20.6	30.5
1964	15.9	14.3	14.0	13.6	18.7	22.3
1 st half 1965	0.0	-0.6	2.7	0.0	0.8	9.3

Cumulative Results	114.9	102.8	111.7	115.4	133.2	449.7
Annual Compounded Rate	9.4	8.7	9.2	9.5	10.5	22.2

- (1) Computed from changes in asset value plus any distributions to holders of record during year.
- (2) From 1965 Moody's Bank & Finance Manual for 1957-64. Estimated for first half 1965.

Last year I mentioned that the performance of these companies in some ways resembles the activity of a duck sitting on a pond. When the water (the market) rises, the duck rises; when it falls, back goes the duck. The water level was virtually unchanged during the first half of 1965. The ducks, as you can see from the table, are still sitting on the pond.

As I mentioned earlier in the letter, the ebb of the tide in May and June also substantially affected us. Nevertheless, the fact we had flapped our wings a few times in the preceding four months enabled us to gain a little altitude on the rest of the flock. Utilizing a somewhat more restrained lexicon, James H. Lorie, director of the University of Chicago's Center for Research in Security Prices was quoted in the May 25, 1965, WALL STREET JOURNAL as saying: "There is no evidence that mutual funds select stocks better than by the random method."

Of course, the beauty of the American economic scene has been that random results have been pretty darned good results. The water level has been rising. In our opinion, the probabilities are that over a long period of time, it will continue to rise, though, certainly not without important interruptions. It will be our policy, however, to endeavor to swim strongly, with or against the tide. If our performance declines to a level you can achieve by floating on your back, we will turn in our suits.

Advance Payments and Advance Withdrawals:

We accept advance payments from partners and prospective partners at 6% interest from date of receipt until the end of the year. While there is no obligation to convert such advance payments to a partnership interest at the end of the year, this should be the intent at the time it is paid to us.

Similarly, we allow partners to withdraw up to 20% of their partnership account prior to yearend and charge them 6% from date of withdrawal until yearend when it is charged against their capital account. Again, it is not intended that partners use us like a bank, but that they use the withdrawal right for a truly unexpected need for funds. Predictable needs for funds such as quarterly federal tax payments should be handled by a beginning-of-the-year reduction in capital rather than through advance withdrawals from B.P.L. during the year. The withdrawal privilege is to provide for the unanticipated.

The willingness to borrow (through advance payments) and lend (through advance withdrawals) at the same 6% rate may sound downright "un-Buffettlike". (You can be sure it doesn't start my adrenaline flowing.) Certainly such a no-spread arbitrage is devoid of the commercial overtones an observer might impute to the preponderance of our transactions. Nevertheless, we think it makes sense and is in the best interest of all partners.

The partner who has a large investment in indirect ownership of a group of liquid assets should have some liquidity present in his partnership interest other than at yearend. As a practical matter, we are reasonably certain

that advance withdrawals will be far more than covered by advance payments. For example, on June 30, 1965, we had \$98,851 of advance withdrawals and \$652,931 of advance payments.

Why then the willingness to pay 6% for the net of advance payments over advance withdrawals when we can borrow from commercial banks at substantially lower rates? The answer is that we expect on a long-term basis to earn better than 6% (the general partner's allocation is zero unless we do) although it is largely a matter of chance whether we achieve the 6% figure in any short period. Moreover, I can adopt a different attitude regarding the investment of money that can be expected to soon be a part of our equity capital than I can on short-term borrowed money. The advance payments have the added advantage to us of spreading the investment of new money over the year, rather than having it hit us all at once in January. On the other hand, 6% is more than can be obtained in short-term dollar secure investments by our partners, so I consider it mutually profitable.

Miscellaneous:

The bold expansion program to 909 ¼ square feet described in the annual letter was carried off without a hitch (the Pepsi's never even got warm).

John Harding joined us in April and is continuing the record whereby all the actions in the personnel field have been winning ones.

As in past years, we will have a letter out about November 1st (to partners and those who have indicated an interest to me by that time in becoming partners) with the commitment letter for 1966, estimate of the 1965 tax situation, etc.

Cordially,
Warren E. Buffett

BUFFETT PARTNERSHIP, LTD.
810 KIEWIT PLAZA
OMAHA 31, NEBRASKA

November 1, 1965

To My Partners for 1966:

Enclosed are:

- (1) Two copies of the commitment letter for 1966, one to be kept by you and one returned to us. You may amend the commitment letter right up to midnight, December 31st. So get it back to us early, and if it needs to be changed, just let us know by letter or phone. Commitment letters become final on December 31st. Every year I get a number of calls in the first week in January expressing a desire to add to the January 1st capital. THIS CAN'T BE DONE.
- (2) A copy of our ever-popular "The Ground Rules." It is essential that we see eye-to-eye on the matters covered therein. If you have different views - fine, yours may be better - but you shouldn't be in the partnership. Please particularly note Ground Rule 7. This has been added this year reflecting a moderate shift in my attitude over a period of time. It represents a decidedly unconventional (but logical in my opinion when applied to our operation) approach and is therefore specifically called to your attention.

Any withdrawals will be paid January 5th. You may withdraw any amount you desire from \$100 up to your entire equity. Similarly, additions can be for any amount and should reach us by January 10th. In the event you are disposing of anything, this will give you a chance to have the transaction in 1966 if that appears to be advantageous for tax reasons. If additions reach us in November, they take on the status of advance payments and draw 6% interest until yearend. This is not true of additions reaching us in December.

The partnership owns a controlling interest in Berkshire Hathaway Inc., a publicly-traded security. As mentioned in my midyear letter, asset values and earning power are the dominant factors affecting the valuation of a controlling interest in a business. Market price, which governs valuation of minority interest positions, is of little or no importance in valuing a controlling interest. We will value our position in Berkshire Hathaway at yearend at a price halfway between net current asset value and book value. Because of the nature of our receivables and inventory this, in effect, amounts to valuation of our current assets at 100 cents on the dollar and our fixed assets at 50 cents on the dollar. Such a value in my opinion is fair to both adding and withdrawing partners. It may be either of lower than market value at the time.

As I write this, we are orbiting in quite satisfactory fashion. Our margin over the Dow is well above average, and even those Neanderthal partners who utilize such crude yardsticks as net profit would find performance satisfactory. This is all, of course, subject to substantial change by yearend.

If anything needs clarification, call or write John Harding who is in charge of "de-confusing" partners. The tax situation is about as reported in the August letter, but if you would like John to make the calculation for you, he will be glad to do it.

Cordially,

Warren E. Buffett

P/S: We are continuing our "no prize" policy for the last ones to get their commitment letters back to us. It will make things easier for us if you get it back pronto. If you want to make changes later (before January 1st), just give us a call, and we'll amend it for you.

January 20, 1966

Our Performance in 1965

Our War on Poverty was successful in 1965.

Specially, we were \$12,304,060 less poor at the end of the year.

Last year under a section in the annual letter entitled "Our Goal" (please particularly note it was not headed "Our Promise"), I stated we were trying to achieve "... An average advantage (relative to the Dow) of ten percentage points per annum for BPL before allocation to the general partner again with large amplitudes in the margin from perhaps 10 percentage points worse than the Dow in a bad year to 25 percentage points better when everything clicks."

My fallibility as a forecaster was quickly demonstrated when the first year fell outside my parameters. We achieved our widest margin over the Dow in the history of BPL with an overall gain of 47.2% compared to an overall gain (including dividends which would have been received through ownership of the Dow) of 14.2% for the Dow. Naturally, no writer likes to be publicly humiliated by such a mistake. It is unlikely to be repeated.

The following summarizes the year-by-year performance of the Dow, the performance of the Partnership before allocation (one quarter of the excess over 6%) to the general partner, and the results for limited partners:

Year	Overall Results From Dow (1)	Partnership Results (2)	Limited Partners' Results (3)
1957	-8.4%	10.4%	9.3%
1958	38.5%	40.9%	32.2%
1959	20.0%	25.9%	20.9%
1960	-6.2%	22.8%	18.6%
1961	22.4%	45.9%	35.9%
1962	-7.6%	13.9%	11.9%
1963	20.6%	38.7%	30.5%
1964	18.7%	27.8%	22.3%
1965	14.2%	47.2%	36.9%

- (1) Based on yearly changes in the value of the Dow plus dividends that would have been received through ownership of the Dow during that year. The table includes all complete years of partnership activity.
- (2) For 1957-61 consists of combined results of all predecessor limited partnerships operating throughout the entire year after all expenses, but before distributions to partners or allocations to the general partner.
- (3) For 1957-61 computed on the basis of the preceding column of partnership results allowing for allocation to the general partner based upon the present partnership agreement, but before monthly withdrawals by limited partners.

On a cumulative or compounded basis, the results are:

Year	Overall Results From Dow	Partnership Results	Limited Partners' Results
1957	-8.4%	10.4%	9.3%
1957 - 58	26.9%	55.6%	44.5%
1957 - 59	52.3%	95.9%	74.7%
1957 - 60	42.9%	140.6%	107.2%
1957 - 61	74.9%	251.0%	181.6%
1957 - 62	61.6%	299.8%	215.1%
1957 - 63	95.1%	454.5%	311.2%
1957 - 64	131.3%	608.7%	402.9%
1957 - 65	164.1%	943.2%	588.5%
Annual Compounded Rate	11.4%	29.8%	23.9%

After last year the question naturally arises, "What do we do for an encore?" A disadvantage of this business is that it does not possess momentum to any significant degree. If General Motors accounts for 54% of domestic new car registrations in 1965, it is a pretty safe bet that they are going to come fairly close to that figure in 1966 due to owner loyalties, dealer capabilities, productive capacity, consumer image, etc. Not so for BPL. We start from scratch each year with everything valued at market when the gun goes off. Partners in 1966, new or old, benefit to only a very limited extent from the efforts of 1964 and 1965. The success of past methods and ideas does not transfer forward to future ones.

I continue to hope, on a longer-range basis, for the sort of achievement outlined in the "Our Goal" section of last year's letter (copies still available). However, those who believe 1965 results can be achieved with any frequency are probably attending weekly meetings of the Halley's Comet Observers Club. We are going to have loss years and are going to have years inferior to the Dow - no doubt about it. But I continue to believe we can achieve average performance superior to the Dow in the future. If my expectation regarding this should change, you will hear immediately.

Investment Companies

We regularly compare our results with the two largest open-end investment companies (mutual funds) that follow a policy of being typically 95% - 100% invested in common stocks, and the two largest diversified closed-end investment companies. These four companies, Massachusetts Investors Trust, Investors Stock Fund, Tri-Continental Corp., and Lehman Corp. manage over \$5 billion, are owned by about 600,000 shareholders, and are probably typical of most of the \$35 billion investment company industry. My opinion is that their results roughly parallel those of the overwhelming majority of other investment advisory organizations which handle, in aggregate, vastly greater sums.

The purpose of this tabulation is to illustrate that the Dow is no pushover as an index of investment achievement. The advisory talent managing just the four companies shown commands annual fees of about \$10 million and this represents a very small fraction of the professional investment management industry. The public batting average of this highly paid and widely respected talent indicates performance a shade below that of the Dow, an unmanaged index.

YEARLY RESULTS

Year	Mass. Inv.	Investors	Lehman (2)	Tri-Cont	Dow	Limited
-------------	-------------------	------------------	-------------------	-----------------	------------	----------------

	Trust (1)	Stock (1)		(2)		Partners
1957	-11.4%	-12.4%	-11.4%	-2.4%	-8.4%	9.3%
1958	42.7%	47.5%	40.8%	33.2%	38.5%	32.2%
1959	9.0%	10.3%	8.1%	8.4%	20.0%	20.9%
1960	-1.0%	-0.6%	2.5%	2.8%	-6.2%	18.6%
1961	25.6%	24.9%	23.6%	22.5%	22.4%	35.9%
1962	-9.8%	-13.4%	-14.4%	-10.0%	-7.6%	11.9%
1963	20.0%	16.5%	23.7%	18.3%	20.6%	30.5%
1964	15.9%	14.3%	13.6%	12.6%	18.7%	22.3%
1965	10.2%	9.8%	19.0%	10.7%	14.2%	36.9%

(1) Computed from changes in asset value plus any distributions to holders of record during year.

(2) From 1965 Moody's Bank & Finance Manual for 1957-64. Estimated for 1965.

A number of the largest investment advisory operations (managing, in some cases, well into the billions of dollars) also manage investment companies partly as a convenience for smaller clients and partly as a public showcase. The results of these funds roughly parallel those of the four funds on which we report.

I strongly believe in measurement. The investment managers mentioned above utilize measurement constantly in their activities. They constantly study changes in market shares, profit margins, return on capital, etc. Their entire decision-making process is geared to measurement - of managements, industries, comparative yields, etc. I am sure they keep score on their new business efforts as well as the profitability of their advisory operation. What then can be more fundamental than the measurement, in turn, of investment ideas and decisions? I certainly do not believe the standards I utilize (and wish my partners to utilize) in measuring my performance are the applicable ones for all money managers. But I certainly do believe anyone engaged in the management of money should have a standard of measurement, and that both he and the party whose money is managed should have a clear understanding why it is the appropriate standard, what time period should be utilized, etc.

Frank Block put it very well in the November-December 1965 issue of the Financial Analysts Journal. Speaking of measurement of investment performance he said, " ...However, the fact is that literature suffers a yawning hiatus in this subject. If investment management organizations sought always the best performance, there would be nothing unique in careful measurement of investment results. It does not matter that the customer has failed to ask for a formal presentation of the results. Pride alone should be sufficient to demand that each or us determine objectively the quality of his recommendations. This can hardly be done without precise knowledge

of the outcome. Once this knowledge is in hand, it should be possible to extend the analysis to some point at which patterns of weakness and strength begin to assert themselves. We criticize a corporate management for failure to use the best of tools to keep it aware of the progress of a complicated industrial organization. We can hardly be excused for failure to provide ourselves with equal tools to show the efficiency of our own efforts to handle other people's money. ...Thus, it is our dreary duty to report that systems of performance measurement are not automatically included in the data processing programs of most investment management organizations. The sad fact is that some seem to prefer not to know how well or poorly they are doing.

Frankly, I have several selfish reasons for insisting that we apply a yardstick and that we both utilize the same yardstick. Naturally, I get a kick out of beating par - in the lyrical words of Casey Stengel, "Show me a good loser, and I'll show you a loser." More importantly, I insure that I will not get blamed for the wrong reason (having losing years) but only for the right reason (doing poorer than the Dow). Knowing partners will grade me on the right basis helps me do a better job. Finally, setting up the relevant yardsticks ahead of time insures that we will all get out of this business if the results become mediocre (or worse). It means that past successes cannot cloud judgment of current results. It should reduce the chance of ingenious rationalizations of inept performance. (Bad lighting has been bothering me at the bridge table lately.) While this masochistic approach to measurement may not sound like much of an advantage, I can assure you from my observations of business entities that such evaluation would have accomplished a great deal in many investment and industrial organizations.

So if you are evaluating others (or yourself!) in the investment field, think out some standards - apply them - interpret them. If you do not feel our standard (a minimum of a three-year test versus the Dow) is an applicable one, you should not be in the Partnership. If you do feel it is applicable, you should be able to take the minus years with equanimity in the visceral regions as well as the cerebral regions -as long as we are surpassing the results of the Dow.

The Sorrows of Compounding

Usually, at this point in my letter, I have paused to modestly attempt to set straight the historical errors of the last four or five hundred years. While it might seem difficult to accomplish this in only a few paragraphs a year, I feel I have done my share to reshape world opinion on Columbus, Isabella, Francis I, Peter Minuit and the Manhattan Indians. A by-product of this endeavor has been to demonstrate the overwhelming power of compound interest. To insure reader attention I have entitled these essays "The Joys of Compounding." The sharp-eyed may notice a slight change this year.

A decent rate (better we have an indecent rate) of compound -plus the addition of substantial new money has brought our beginning capital this year to \$43,645,000. Several times in the past I have raised the question whether increasing amounts of capital would harm our investment performance. Each time I have answered negatively and promised you that if my opinion changed, I would promptly report it.

I do not feel that increased capital has hurt our operation to date. As a matter of fact, I believe that we have done somewhat better during the past few years with the capital we have had in the Partnership than we would have done if we had been working with a substantially smaller amount. This was due to the partly fortuitous development of several investments that were just the right size for us -big enough to be significant and small enough to handle.

I now feel that we are much closer to the point where increased size may prove disadvantageous. I don't want to ascribe too much precision to that statement since there are many variables involved. What may be the optimum size under some market and business circumstances can be substantially more or less than optimum under other circumstances. There have been a few times in the past when on a very short-term basis I have felt it would have been advantageous to be smaller but substantially more times when the converse was true.

Nevertheless, as circumstances presently appear, I feel substantially greater size is more likely to harm future results than to help them. This might not be true for my own personal results, but it is likely to be true for your results.

Therefore, unless it appears that circumstances have changed (under some conditions added capital would improve results) or unless new partners can bring some asset to the Partnership other than simply capital, I intend to admit no additional partners to BPL.

The only way to make this effective is to apply it across-the-board and I have notified Susie that if we have any more children, it is up to her to find some other partnership for them.

Because I anticipate that withdrawals (for taxes, among other reasons) may well approach additions by present partners and also because I visualize the curve of expectable performance sloping only very mildly as capital increases, I presently see no reason why we should restrict capital additions by existing partners.

The medically oriented probably will interpret this entire section as conclusive evidence that an effective antithyroid pill has been developed.

Trends in Our Business

Last year I discussed our various categories of investments. Knowing the penalties for cruel and unusual punishments, I will skip a rehash of the characteristics of each category, but merely refer you to last year's letter. However, a few words should be said to bring you up to date on the various segments of the business, and perhaps to give you a better insight into their strengths and weaknesses.

The "Workout" business has become very spasmodic. We were able to employ an average of only about \$6 million during the year in the Workout section, and this involved only a very limited number of situations. Although we earned about \$1,410,000 or about 23 ½% on average capital employed (this is calculated on an all equity basis - borrowed money is appropriate in most Workout situations, and we utilize it, which improves our rate of return above this percentage), over half of this was earned from one situation. I think it unlikely that a really interesting rate of return can be earned consistently on large sums of money in this business under present conditions. Nevertheless, we will continue to try to remain alert for the occasional important opportunity and probably continue to utilize a few of the smaller opportunities where we like the probabilities.

The "Generals-Private Owner Basis" category was very good to us in 1965. Opportunities in this area have become more scarce with a rising Dow, but when they come along, they are often quite significant. I mentioned at the start of last year that we were the largest stockholder of three companies in this category. Our largest yearend 1964 investment in this category was disposed of in 1965 pursuant to a tender offer resulting in a realized gain for BPL of \$3,188,000. At yearend 1964 we had unrealized appreciation in this investment of \$451,000. Therefore, the economic gain attributable to 1965 for this transaction was only \$2,737,000 even though the entire tax effect fell in that year. I mention these figures to illustrate how our realized gain for tax purposes in any year bears no necessary relationship to our economic gain.

The fundamental concept underlying the Generals-Private Owner category is demonstrated by the above case. A private owner was quite willing (and in our opinion quite wise) to pay a price for control of the business which isolated stock buyers were not willing to pay for very small fractions of the business. This has been a quite common condition in the securities markets over many years, and although purchases in this category work out satisfactorily in terms of just general stock market behavior, there is the occasional dramatic profit due to corporate action such as the one above.

The "Control" section of our business received a transfer member from our "Private Owner" category. Shares in Berkshire Hathaway had been acquired since November 1962 on much the same line of reasoning as prevailed in the security mentioned above. In the case of Berkshire, however, we ended up purchasing enough stock to assume a controlling position ourselves rather than the more usual case of either selling our stock in the market or to another single buyer.

Our purchases of Berkshire started at a price of \$7.60 per share in 1962. This price partially reflected large losses incurred by the prior management in closing some of the mills made obsolete by changing conditions within the textile business (which the old management had been quite slow to recognize). In the postwar period the company had slid downhill a considerable distance, having hit a peak in 1948 when about \$29 1/2 million was earned before tax and about 11,000 workers were employed. This reflected output from 11 mills.

At the time we acquired control in spring of 1965, Berkshire was down to two mills and about 2,300 employees. It was a very pleasant surprise to find that the remaining units had excellent management personnel, and we have not had to bring a single man from the outside into the operation. In relation to our beginning acquisition cost of \$7.60 per share (the average cost, however, was \$14.86 per share, reflecting very heavy purchases in early 1965), the company on December 31, 1965, had net working capital alone (before placing any value on the plants and equipment) of about \$19 per share.

Berkshire is a delight to own. There is no question that the state of the textile industry is the dominant factor in determining the earning power of the business, but we are most fortunate to have Ken Chace running the business in a first-class manner, and we also have several of the best sales people in the business heading up this end of their respective divisions.

While a Berkshire is hardly going to be as profitable as a Xerox, Fairchild Camera or National Video in a hypertensed market, it is a very comfortable sort of thing to own. As my West Coast philosopher says, "It is well to have a diet consisting of oatmeal as well as cream puffs."

Because of our controlling interest, our investment in Berkshire is valued for our audit as a business, not as a marketable security. If Berkshire advances \$5 per share in the market, it does BPL no good - our holdings are not going to be sold. Similarly, if it goes down \$5 per share, it is not meaningful to us. The value of our holding is determined directly by the value of the business. I received no divine inspiration in that valuation of our holdings. (Maybe the owners of the three wonder stocks mentioned above do receive such a message in respect to their holdings - I feel I would need something at least that reliable to sleep well at present prices.) I attempt to apply a conservative valuation based upon my knowledge of assets, earning power, industry conditions, competitive position, etc. We would not be a seller of our holdings at such a figure, but neither would we be a seller of the other items in our portfolio at yearend valuations - otherwise, we would already have sold them.

Our final category is "Generals-Relatively Undervalued." This category has been growing in relative importance as opportunities in the other categories become less frequent.

Frankly, operating in this field is somewhat more ethereal than operating in the other three categories, and I'm just not an ethereal sort. Therefore, I feel accomplishments here are less solid and perhaps less meaningful for future projections than in the other categories. Nevertheless, our results in 1965 were quite good in the "Relatively Undervalued" group, partly due to implementation of the technique referred to in last year's letter which serves to reduce risk and potentially augment gains. It should reduce risk in any year, and it definitely augmented the gains in 1965. It is necessary to point out that results in this category were greatly affected for the better by only two investments.

Candor also demands I point out that during 1965 we had our worst single investment experience in the history of BPL on one idea in this group.

Overall, we had more than our share of good breaks in 1965. We did not have a great quantity of ideas, but the quality, with the one important exception mentioned above, was very good and circumstances developed which accelerated the timetable in several. I do not have a great flood of good ideas as I go into 1966, although again I believe I have at least several potentially good ideas of substantial size. Much depends on whether market conditions are favorable for obtaining a larger position.

All in all, however, you should recognize that more came out of the pipeline in 1965 than went in.

Diversification

Last year in commenting on the inability of the overwhelming majority of investment managers to achieve performance superior to that of pure chance, I ascribed it primarily to the product of: "(1) group decisions - my perhaps jaundiced view is that it is close to impossible for outstanding investment management to come from a group of any size with all parties really participating in decisions; (2) a desire to conform to the policies and (to an extent) the portfolios of other large well-regarded organizations; (3) an institutional framework whereby average is "safe" and the personal rewards for independent action are in no way commensurate with the general risk attached to such action; (4) an adherence to certain diversification practices which are irrational; and finally and importantly, (5) inertia."

This year in the material which went out in November, I specifically called your attention to a new Ground Rule reading, "7. We diversify substantially less than most investment operations. We might invest up to 40% of our net worth in a single security under conditions coupling an extremely high probability that our facts and reasoning are correct with a very low probability that anything could drastically change the underlying value of the investment."

We are obviously following a policy regarding diversification which differs markedly from that of practically all public investment operations. Frankly, there is nothing I would like better than to have 50 different investment opportunities, all of which have a mathematical expectation (this term reflects the range of all possible relative performances, including negative ones, adjusted for the probability of each - no yawning, please) of achieving performance surpassing the Dow by, say, fifteen percentage points per annum. If the fifty individual expectations were not intercorelated (what happens to one is associated with what happens to the other) I could put 2% of our capital into each one and sit back with a very high degree of certainty that our overall results would be very close to such a fifteen percentage point advantage.

It doesn't work that way.

We have to work extremely hard to find just a very few attractive investment situations. Such a situation by definition is one where my expectation (defined as above) of performance is at least ten percentage points per annum superior to the Dow. Among the few we do find, the expectations vary substantially. The question always is, "How much do I put in number one (ranked by expectation of relative performance) and how much do I put in number eight?" This depends to a great degree on the wideness of the spread between the mathematical expectation of number one versus number eight." It also depends upon the probability that number one could turn in a really poor relative performance. Two securities could have equal mathematical expectations, but one might have .05 chance of performing fifteen percentage points or more worse than the Dow, and the second might have only .01 chance of such performance. The wider range of expectation in the first case reduces the desirability of heavy concentration in it.

The above may make the whole operation sound very precise. It isn't. Nevertheless, our business is that of ascertaining facts and then applying experience and reason to such facts to reach expectations. Imprecise and emotionally influenced as our attempts may be, that is what the business is all about. The results of many years

of decision-making in securities will demonstrate how well you are doing on making such calculations - whether you consciously realize you are making the calculations or not. I believe the investor operates at a distinct advantage when he is aware of what path his thought process is following.

There is one thing of which I can assure you. If good performance of the fund is even a minor objective, any portfolio encompassing one hundred stocks (whether the manager is handling one thousand dollars or one billion dollars) is not being operated logically. The addition of the one hundredth stock simply can't reduce the potential variance in portfolio performance sufficiently to compensate for the negative effect its inclusion has on the overall portfolio expectation.

Anyone owning such numbers of securities after presumably studying their investment merit (and I don't care how prestigious their labels) is following what I call the Noah School of Investing - two of everything. Such investors should be piloting arks. While Noah may have been acting in accord with certain time-tested biological principles, the investors have left the track regarding mathematical principles. (I only made it through plane geometry, but with one exception, I have carefully screened out the mathematicians from our Partnership.)

Of course, the fact that someone else is behaving illogically in owning one hundred securities doesn't prove our case. While they may be wrong in overdiversifying, we have to affirmatively reason through a proper diversification policy in terms of our objectives.

The optimum portfolio depends on the various expectations of choices available and the degree of variance in performance which is tolerable. The greater the number of selections, the less will be the average year-to-year variation in actual versus expected results. Also, the lower will be the expected results, assuming different choices have different expectations of performance.

I am willing to give up quite a bit in terms of leveling of year-to-year results (remember when I talk of "results," I am talking of performance relative to the Dow) in order to achieve better overall long-term performance. Simply stated, this means I am willing to concentrate quite heavily in what I believe to be the best investment opportunities recognizing very well that this may cause an occasional very sour year - one somewhat more sour, probably, than if I had diversified more. While this means our results will bounce around more, I think it also means that our long-term margin of superiority should be greater.

You have already seen some examples of this. Our margin versus the Dow has ranged from 2.4 percentage points in 1958 to 33.0 points in 1965. If you check this against the deviations of the funds listed on page three, you will find our variations have a much wider amplitude. I could have operated in such a manner as to reduce our amplitude, but I would also have reduced our overall performance somewhat although it still would have substantially exceeded that of the investment companies. Looking back, and continuing to think this problem through, I feel that if anything, I should have concentrated slightly more than I have in the past. Hence, the new Ground Rule and this long-winded explanation.

Again let me state that this is somewhat unconventional reasoning (this doesn't make it right or wrong - it does mean you have to do your own thinking on it), and you may well have a different opinion - if you do, the Partnership is not the place for you. We are obviously only going to go to 40% in very rare situations - this rarity, of course, is what makes it necessary that we concentrate so heavily, when we see such an opportunity. We probably have had only five or six situations in the nine-year history of the Partnership where we have exceeded 25%. Any such situations are going to have to promise very significantly superior performance relative to the Dow compared to other opportunities available at the time. They are also going to have to possess such superior qualitative and/or quantitative factors that the chance of serious permanent loss is minimal (anything can happen on a short-term quotational basis which partially explains the greater risk of widened year-to-year variation in results). In selecting the limit to which I will go in anyone investment, I attempt to reduce to a tiny figure the probability that the single investment (or group, if there is intercorrelation) can produce a result

for our total portfolio that would be more than ten percentage points poorer than the Dow.

We presently have two situations in the over 25% category - one a controlled company, and the other a large company where we will never take an active part. It is worth pointing out that our performance in 1965 was overwhelmingly the product of five investment situations. The 1965 gains (in some cases there were also gains applicable to the same holding in prior years) from these situations ranged from about \$800,000 to about \$3 1/2 million. If you should take the overall performance of our five smallest general investments in 1965, the results are lackluster (I chose a very charitable adjective).

Interestingly enough, the literature of investment management is virtually devoid of material relative to deductive calculation of optimal diversification.

All texts counsel "adequate" diversification, but the ones who quantify "adequate" virtually never explain how they arrive at their conclusion. Hence, for our summation on overdiversification, we turn to that eminent academician Billy Rose, who says, "You've got a harem of seventy girls; you don't get to know any of them very well."

Miscellaneous

Last year we boldly announced an expansion move, encompassing an additional 227 1/4 square feet. Older partners shook their heads. I feel that our gain from operations in 1965 of \$12,304,060 indicates that we did not overextend ourselves. Fortunately, we didn't sign a percentage lease. Operationally, things have never been running more smoothly, and I think our present setup unquestionably lets me devote a higher percentage of my time to thinking about the investment process than virtually anyone else in the money management business. This, of course, is the result of really outstanding personnel and cooperative partners.

John Harding has taken complete charge of all administrative operations with splendid results. Bill Scott continues to develop detailed information on investments which substantially enhances our net profit figure. Beth Feehan, Donna Walter and Elizabeth Hanon (who joined us in November) have all handled large work loads (secretary's note -Amen!) accurately and efficiently.

The above people, their spouses (one apiece) and children have a combined investment in the Partnership of over \$600,000. Susie and I have an investment of \$6,849,936, which should keep me from slipping away to the movies in the afternoon. This represents virtually our entire net worth, with the exception of our continued holding of Mid-Continent Tab Card, a local company into which I bought in 1960 when it had less than 10 stockholders.

Additionally, my relatives, consisting of three children, mother, two sisters, two brothers-in-law, father-in-law, three aunts, two uncles, five cousins, and six nieces and nephews have interests in BPL, directly or indirectly, totaling \$2,708,233. So don't get any ideas about voting a change in the Partnership name.

Peat, Marwick, Mitchell & Co. has done the customary excellent job of expediting the audit and tax information. This requires great effort and ability, and they supply both. This year a computer was brought to bear on our problems, and naturally, I was a little worried someone else would come out as the general partner. However, it all worked quite smoothly.

Within the coming two weeks you will receive:

1. A tax letter giving you all BPL information needed for your 1965 federal income tax return. This letter is the only item that counts for tax purposes.
2. An audit from Peat, Marwick, Mitchell & Co. for 1965, setting forth the operations and financial

position of BPL, as well as your own capital account.

3. A letter signed by me setting forth the status of your BPL interest on 1/1/66. This is identical with the figures developed in the audit.

Let me know if anything in this letter or that occurs during the year needs clarifying. It is difficult to anticipate all of the questions you may have and if there is anything that is confusing, I want to hear about it. For instance, we received an excellent suggestion last year from a partner regarding the presentation of the reconciliation of personal capital accounts.

My next letter will be about July 15th, summarizing the first half of this year.

Cordially,

Warren E. Buffett

BUFFETT PARTNERSHIP, LTD.

July 12, 1966

First Half Performance

During the first half of 1966, the Dow-Jones Industrial Average (hereinafter called the "Dow") declined from 969.26 to 870.10. If one had owned the Dow during this period, dividends of approximately 14.70 would have been received, reducing the overall loss of the Dow to about 8.7%.

It is my objective and my hope (but not my prediction!) that we achieve over a long period of time, an average yearly advantage of ten percentage points relative to the Dow. During the first half we did considerably better than expected with an overall gain of approximately 8.2%. Such results should be regarded as decidedly abnormal. I have previously complimented partners on the good-natured tolerance they display in shrugging off such unexpected positive variances. The nature of our business is such that over the years, we will not disappoint the many of you who must also desire a test of your capacity for tolerance of negative variances.

The following summarizes the year-by-year performance of the Dow, the performance of the Partnership before allocation to the general partner, and the results for limited partners:

Year	Overall Results From Dow (1)	Partnership Results (2)	Limited Partners' Results (3)
1957	-8.4%	10.4%	9.3%
1958	38.5%	40.9%	32.2%
1959	20.0%	25.9%	20.9%
1960	-6.2%	22.8%	18.6%
1961	22.4%	45.9%	35.9%
1962	-7.6%	13.9%	11.9%
1963	20.6%	38.7%	30.5%
1964	18.7%	27.8%	22.3%
1965	14.2%	47.2%	36.9%
First half of 1966	-8.7%	8.2%	7.7%
Cumulative Results	141.1%	1028.7%	641.5%
Annual Compounded Rate	9.7%	29.0%	23.5%

1. Based on yearly changes in the value of the Dow plus dividends that would have been received through ownership of the Dow during that year. The table includes all complete years of partnership activity.
2. For 1957-61 consists of combined results of all predecessor limited partnerships operating throughout the entire year after all expenses but before distributions to partners or allocations to the general partner.
3. For 1957-61 computed on the basis of the preceding column of partnership results allowing for allocation to the general partner based upon the present partnership agreement, but before monthly withdrawals by limited partners.

Even Samson gets clipped occasionally. If you had invested \$100,000 on January 1 equally among -

- a. the world's largest auto company (General Motors);
- b. the world's largest oil company (Standard of New Jersey);
- c. the world's largest retailing company (Sears Roebuck);
- d. the world's largest chemical company (Dupont);
- e. the world's largest steel company (U.S. Steel);
- f. the world's largest stockholder-owned insurance company (Aetna);
- g. the world's largest public utility (American Telephone & Telegraph);
- h. the world's largest bank (Bank of America);

your total portfolio (including dividends received) would have been worth \$83,370 on June 30 for a loss of 16.6%. The total market value on January 1 of these eight giants was well over \$100 billion. Everyone of them was selling lower on June 30.

Investment Companies

On the next page we bring up to date our regular comparison with the results of the two largest open-end investment companies (mutual funds) that follow a policy of being, typically, 95-100% invested in common stocks, and the two largest diversified closed-end investment companies.

YEARLY RESULTS

Year	Mass. Inv. Trust (1)	Investors Stock (1)	Lehman (2)	Tri-Cont (2)	Dow	Limited Partners
1957	-11.4%	-12.4%	-11.4%	-2.4%	-8.4%	9.3%
1958	42.7%	47.5%	40.8%	33.2%	38.5%	32.2%
1959	9.0%	10.3%	8.1%	8.4%	20.0%	20.9%
1960	-1.0%	-0.6%	2.5%	2.8%	-6.2%	18.6%
1961	25.6%	24.9%	23.6%	22.5%	22.4%	35.9%
1962	-9.8%	-13.4%	-14.4%	-10.0%	-7.6%	11.9%
1963	20.0%	16.5%	23.7%	18.3%	20.6%	30.5%
1964	15.9%	14.3%	13.6%	12.6%	18.7%	22.3%
1965	10.2%	9.8%	19.0%	10.7%	14.2%	36.9%
First half 1966	-7.9%	-7.9%	-1.0%	-5.2%	-8.7%	7.7%
Cumulative Results	118.1%	106.3%	142.8%	126.9%	141.1%	641.5%
Annual Compounded Rate	8.6%	7.9%	9.8%	9.0%	9.7%	23.5%

(1) Computed from changes in asset value plus any distributions to holders of record during year.

(2) From 1966 Moody's Bank & Finance Manual for 1957-1965. Estimated for first half of 1966.

Proponents of institutional investing frequently cite its conservative nature. If "conservative" is interpreted to mean "productive of results varying only slightly from average experience" I believe the characterization is proper. Such results are almost bound to flow from wide diversification among high grade securities. Since, over a long period, "average experience" is likely to be good experience, there is nothing wrong with the typical investor utilizing this form of investment medium.

However, I believe that conservatism is more properly interpreted to mean "subject to substantially less temporary or permanent shrinkage in value than total experience". This simply has not been achieved, as the record of the four largest funds (presently managing over \$5 billion) illustrates. Specifically, the Dow declined in 1957, 1960, 1962 and the first half of 1966. Cumulating the shrinkage in the Dow during the three full year periods produces a decline of 20.6%. Following a similar technique for the four largest funds produces declines of 9.7%, 20.9%, 22.3% and 24.6%. Including the interim performance for the first half of 1966 results in a decline in the Dow of 27.5% and for the funds declines of 14.4%, 23.1%, 27.1% and 30.6%. Such funds (and I believe their results are quite typical of institutional experience in common stocks) seem to meet the first definition of conservatism but not the second one.

Most investors would climb a rung intellectually if they clearly delineated between the above two interpretations of conservatism. The first might be better labeled "conventionalism" - what it really says is that "when others are making money in the general run of securities, so will we and to about the same degree; when they are losing money, we'll do it at about the same rate." This is not to be equated with "when others are making it, we'll make as much and when they are losing it, we will lose less." Very few investment programs accomplish the latter - we certainly don't promise it but we do intend to keep trying. (I have always felt our objectives should be somewhat loftier than those Herman Hickman articulated during the desperate years when Yale was losing eight games a season. Said Herman, "I see my job as one of keeping the alumni sullen but not mutinous.")

Hochschild, Kohn & Co.

During the first half we, and two 10% partners, purchased all of the stock of Hochschild, Kohn & Co., a privately owned Baltimore department store. This is the first time in the history of the Partnership that an entire business has been purchased by negotiation, although we have, from time to time, negotiated purchase of specific important blocks of marketable securities. However, no new principles are involved. The quantitative and qualitative aspects of the business are evaluated and weighed against price, both on an absolute basis and relative to other investment opportunities. HK (learn to call it that - I didn't find out how to pronounce it until the deal was concluded) stacks up fine in all respects.

We have topnotch people (both from a personal and business standpoint) handling the operation. Despite the edge that my extensive 75 cents an hour experience at the Penney's store in Omaha some years back gives us (I became an authority on the Minimum Wage Act), they will continue to run the business as in the past. Even if the price had been cheaper but the management had been run-of-the-mill, we would not have bought the business.

It is impossible to avoid some public notice when a business with several thousand employees is acquired. However, it is important that you do not infer the degree of financial importance to BPL from its news value to the public. We have something over \$50 million invested, primarily in marketable securities, of which only about 10% is represented by our net investment in HK. We have an investment of over three times this much in a marketable security where our ownership will never come to public attention. This is not to say an HK is not important - a 10% holding definitely is. However, it is not as significant relative to our total operation as it would be easy to think. I still prefer the iceberg approach toward investment disclosure.

It is my intention to value HK at yearend at cost plus our share of retained earnings since purchase. This policy will be followed in future years unless there is a demonstrable change in our position relative to other department stores or in other objective standards of value. Naturally we wouldn't have purchased HK unless we felt the price was quite attractive. Therefore, a valuation policy based upon cost may somewhat undervalue our holdings. Nevertheless, it seems the most objective figure to apply. All of our investments usually appear undervalued to me - otherwise we wouldn't own them.

Market Forecasting

Ground Rule No.6 (from our November packet) says: "I am not in the business of predicting general stock market or business fluctuations. If you think I can do this, or think it is essential to an investment program, you should not be in the partnership."

Of course, this rule can be attacked as fuzzy, complex, ambiguous, vague, etc. Nevertheless, I think the point is well understood by the great majority of our partners. We don't buy and sell stocks based upon what other people think the stock market is going to do (I never have an opinion) but rather upon what we think the company is going to do. The course of the stock market will determine, to a great degree, when we will be right, but the accuracy of our analysis of the company will largely determine whether we will be right. In other words, we tend to concentrate on what should happen, not when it should happen.

In our department store business I can say with considerable assurance that December will be better than July. (Notice how sophisticated I have already become about retailing.) What really counts is whether December is better than last December by a margin greater than our competitors' and what we are doing to set the stage for future Decembers. However, in our partnership business I not only can't say whether December will be better than July, but I can't even say that December won't produce a very large loss. It sometimes does. Our investments are simply not aware that it takes 365-1/4 days for the earth to make it around the sun. Even worse, they are not aware that your celestial orientation (and that of the IRS) requires that I report to you upon the conclusion of each orbit (the earth's - not ours). Therefore, we have to use a standard other than the calendar to measure our progress. This yardstick is obviously the general experience in securities as measured by the Dow. We have a strong feeling that this competitor will do quite decently over a period of years (Christmas will come even if it's in July) and if we keep beating our competitor we will have to do something better than "quite decently". It's something like a retailer measuring his sales gains and profit margins against Sears' - beat them every year and somehow you'll see daylight.

I resurrect this "market-guessing" section only because after the Dow declined from 995 at the peak in February to about 865 in May, I received a few calls from partners suggesting that they thought stocks were going a lot lower. This always raises two questions in my mind: (1) if they knew in February that the Dow was going to 865 in May, why didn't they let me in on it then; and, (2) if they didn't know what was going to happen during the ensuing three months back in February, how do they know in May? There is also a voice or two after any hundred point or so decline suggesting we sell and wait until the future is clearer. Let me again suggest two points: (1) the future has never been clear to me (give us a call when the next few months are obvious to you - or, for that matter the next few hours); and, (2) no one ever seems to call after the market has gone up one hundred points to focus my attention on how unclear everything is, even though the view back in February doesn't look so clear in retrospect.

If we start deciding, based on guesses or emotions, whether we will or won't participate in a business where we should have some long run edge, we're in trouble. We will not sell our interests in businesses (stocks) when they are attractively priced just because some astrologer thinks the quotations may go lower even though such forecasts are obviously going to be right some of the time. Similarly, we will not buy fully priced securities because "experts" think prices are going higher. Who would think of buying or selling a private business because of someone's guess on the stock market? The availability of a question for your business interest (stock) should always be an asset to be utilized if desired. If it gets silly enough in either direction, you take advantage of it. Its availability should never be turned into a liability whereby its periodic aberrations in turn formulate your judgments. A marvelous articulation of this idea is contained in chapter two (The Investor and Stock Market Fluctuations) of Benjamin Graham's "The Intelligent Investor". In my opinion, this chapter has more investment importance than anything else that has been written.

We will have a letter out about November 1 with the Commitment Letter for 1967 and an estimate of the 1966 tax situation.

Cordially,

Warren Buffett

January 25, 1967

The First Decade

The Partnership had its tenth anniversary during 1966. The celebration was appropriate -an all-time record (both past and future) was established for our performance margin relative to the Dow. Our advantage was 36 points which resulted from a plus 20.4% for the Partnership and a minus 15.6% for the Dow.

This pleasant but non-repeatable experience was partially due to a lackluster performance by the Dow. Virtually all investment managers outperformed it during the year. The Dow is weighted by the dollar price of the thirty stocks involved. Several of the highest priced components, which thereby carry disproportionate weight (Dupont, General Motors), were particularly poor performers in 1966. This, coupled with the general aversion to conventional blue chips, caused the Dow to suffer relative to general investment experience, particularly during the last quarter.

The following summarizes the year-by-year performance of the Dow, the performance of the Partnership before allocation (one quarter of the excess over 6%) to the general partner, and the results for limited partners:

Year	Overall Results From Dow (1)	Partnership Results (2)	Limited Partners' Results (3)
1957	-8.4%	10.4%	9.3%
1958	38.5%	40.9%	32.2%
1959	20.0%	25.9%	20.9%
1960	-6.2%	22.8%	18.6%
1961	22.4%	45.9%	35.9%
1962	-7.6%	13.9%	11.9%
1963	20.6%	38.7%	30.5%
1964	18.7%	27.8%	22.3%
1965	14.2%	47.2%	36.9%
1966	-15.6%	20.4%	16.8%
Cumulative Results Annual Compounded Rate	141.1% 9.7%	1028.7% 29.0%	641.5% 23.5%

- (1) Based on yearly changes in the value of the Dow plus dividends that would have been received through ownership of the Dow during that year. The table includes all complete years of partnership activity.
- (2) For 1957-61 consists of combined results of all predecessor limited partnerships operating throughout the entire year after all expenses, but before distributions to partners or allocations to the general partner.
- (3) For 1957-61 computed on the basis of the preceding column of partnership results allowing for allocation to the general partner based upon the present partnership agreement. but before monthly withdrawals by limited partners.

On a cumulative or compounded basis, the results are:

Year	Overall Results From Dow	Partnership Results	Limited Partners' Results
1957	-8.4%	10.4%	9.3%
1957 – 58	26.9%	55.6%	44.5%
1957 – 59	52.3%	95.9%	74.7%
1957 – 60	42.9%	140.6%	107.2%
1957 – 61	74.9%	251.0%	181.6%
1957 – 62	61.6%	299.8%	215.1%
1957 – 63	95.1%	454.5%	311.2%
1957 – 64	131.3%	608.7%	402.9%
1957 – 65	164.1%	943.2%	588.5%
1957 – 66	122.9%	1156.0%	704.2%
Annual Compounded Rate	11.4%	29.8%	23.9%

Investment Companies

On the following page is the usual tabulation showing the results of the two largest open-end investment companies (mutual funds) that follow a policy of being, typically, 95-100% invested in common stocks, and the two largest diversified closed-end investment companies.

Year	Mass. Inv. Trust (1)	Investors Stock (1)	Lehman (2)	Tri-Cont (2)	Dow	Limited Partners
1957	-11.4%	-12.4%	-11.4%	-2.4%	-8.4%	9.3%
1958	42.7%	47.5%	40.8%	33.2%	38.5%	32.2%
1959	9.0%	10.3%	8.1%	8.4%	20.0%	20.9%
1960	-1.0%	-0.6%	2.5%	2.8%	-6.2%	18.6%
1961	25.6%	24.9%	23.6%	22.5%	22.4%	35.9%
1962	-9.8%	-13.4%	-14.4%	-10.0%	-7.6%	11.9%
1963	20.0%	16.5%	23.7%	18.3%	20.6%	30.5%
1964	15.9%	14.3%	13.6%	12.6%	18.7%	22.3%
1965	10.2%	9.8%	19.0%	10.7%	14.2%	36.9%
1966	-7.7%	-10.0%	-2.6%	-6.9%	-15.6%	16.8%
Cumulative Results	118.1%	106.3%	142.8%	126.9%	141.1%	641.5%
Annual Compounded Rate	8.6%	7.9%	9.8%	9.0%	9.7%	23.5%

(1) Computed from changes in asset value plus any distributions to holders of record during year.

(2) From 1966 Moody's Bank & Finance Manual for 1957-1965. Estimated for 1966.

These investment company performance figures have been regularly reported here to show that the now is no patsy as an investment standard. It should again be emphasized that the companies were not selected on the basis of comparability to Buffett Partnership, Ltd. There are important differences including: (1) investment companies operate under both internally and externally imposed restrictions on their investment actions that are not applicable to us; (2) investment companies diversify far more than we do and, in all probability, thereby

have less chance for a really bad performance relative to the now in a single year; and (3) their managers have considerably less incentive for abnormal performance and greater incentive for conventionality.

However, the records above do reveal what well-regarded, highly paid, full-time professional investment managers have been able to accomplish while working with common stocks. These managers have been favorites of American investors (more than 600,000) making free choices among many alternatives in the investment management field. It is probable that their results are typical of the overwhelming majority of professional investment managers.

It is not true, however, that these are the best records achieved in the investment field. A few mutual funds and some private investment operations have compiled records vastly superior to the Dow and, in some cases, substantially superior to Buffett Partnership, Ltd. Their investment techniques are usually very dissimilar to ours and not within my capabilities. However, they are generally managed by very bright, motivated people and it is only fair that I mention the existence of such superior results in this general discussion of the record of professional investment management.

Trends in Our Business

A keen mind working diligently at interpreting the figures on page one could come to a lot of wrong conclusions.

The results of the first ten years have absolutely no chance of being duplicated or even remotely approximated during the next decade. They may well be achieved by some hungry twenty-five year old working with \$105,100 initial partnership capital and operating during a ten year business and market environment which is frequently conducive to successful implementation of his investment philosophy.

They will not be achieved by a better fed thirty-six year old working with our \$54,065,345 current partnership capital who presently finds perhaps one-fifth to one-tenth as many really good ideas as previously to implement his investment philosophy.

Buffett Associates, Ltd. (predecessor to Buffett Partnership, Ltd.) was founded on the west banks of the Missouri. May 5, 1956 by a hardy little band consisting of four family members, three close friends and \$105,100. (I tried to find some brilliant flash of insight regarding our future or present conditions from my first page and a half annual letter of January, 1957 to insert as a quote here. However, someone evidently doctored my file copy so as to remove the perceptive remarks I must have made.)

At that time, and for some years subsequently, there were substantial numbers of securities selling at well below the "value to a private owner" criterion we utilized for selection of general market investments. We also experienced a flow of "workout" opportunities where the percentages were very much to our liking. The problem was always which, not what. Accordingly, we were able to own fifteen to twenty-five issues and be enthusiastic about the probabilities inherent in all holdings.

In the last few years this situation has changed dramatically. We now find very few securities that are understandable to me, available in decent size, and which offer the expectation of investment performance meeting our yardstick of ten percentage points per annum superior to the Dow. In the last three years we have come up with only two or three new ideas a year that have had such an expectancy of superior performance. Fortunately, in some cases, we have made the most of them. However, in earlier years, a lesser effort produced literally dozens of comparable opportunities. It is difficult to be objective about the causes for such diminution of one's own productivity. Three factors that seem apparent are: (1) a somewhat changed market environment; (2) our increased size; and (3) substantially more competition.

It is obvious that a business based upon only a trickle of fine ideas has poorer prospects than one based upon a steady flow of such ideas. To date the trickle has provided as much financial nourishment as the flow. This is true because there is only so much one can digest (million dollar ideas are of no great benefit to thousand dollar bank accounts - this was impressed on me in my early days) and because a limited number of ideas causes one to utilize those available more intensively. The latter factor has definitely been operative with us in recent years. However, a trickle has considerably more chance of drying up completely than a flow.

These conditions will not cause me to attempt investment decisions outside my sphere of understanding (I don't go for the "If you can't lick 'em, join 'em" philosophy - my own leaning is toward "If you can't join 'em, lick 'em"). We will not go into businesses where technology which is away over my head is crucial to the investment decision. I know about as much about semi-conductors or integrated circuits as I do of the mating habits of the chrzaszcz. (That's a Polish May bug, students - if you have trouble pronouncing it, rhyme it with thrzaszcz.)

Furthermore, we will not follow the frequently prevalent approach of investing in securities where an attempt to anticipate market action overrides business valuations. Such so-called "fashion" investing has frequently produced very substantial and quick profits in recent years (and currently as I write this in January). It represents an investment technique whose soundness I can neither affirm nor deny. It does not completely satisfy my intellect (or perhaps my prejudices), and most definitely does not fit my temperament. I will not invest my own money based upon such an approach hence, I will most certainly not do so with your money.

Finally, we will not seek out activity in investment operations, even if offering splendid profit expectations, where major human problems appear to have a substantial chance of developing.

What I do promise you, as partners, is that I will work hard to maintain the trickle of ideas and try to get the most out of it that is possible – but if it should dry up completely, you will be informed honestly and promptly so that we may all take alternative action.

Analysis of 1966 Results

All four main categories of our investment operation worked out well in 1966. Specifically, we had a total overall gain of \$8,906,701 derived as follows:

Category	Average Investment	Overall Gain
Controls	\$17,259,342	\$1,566,302
Generals – Private Owner	\$1,359,340	\$1,004,362
Generals – Relatively Undervalued	\$21,847,045	\$5,124,254
Workouts	\$7,666,314	\$1,714,181
Miscellaneous, including US Treasury Bills	\$1,332,609	<u>\$(18,422)</u>
Total Income		\$9,390,677
Less: General Expense		\$483,976
Overall Gain		\$8,906,701

A few caveats are necessary before we get on with the main discussion:

1. An explanation of the various categories listed above was made in the January 18, 1965 letter. If your memory needs refreshing and your favorite newsstand does not have the pocketbook edition, we'll be glad to give you a copy.

2. The classifications are not iron-clad. Nothing is changed retroactively but the initial decision as to category is sometimes arbitrary.
3. Percentage returns calculated on the average investment base by category would be understated relative to partnership percentage returns which are calculated on a beginning investment base. In the above figures, a security purchased by us at 100 on January 1 which appreciated at an even rate to 150 on December 31 would have an average investment of 125 producing a 40% result contrasted to a 50% result by the customary approach. In other words, the above figures use a monthly average of market values in calculating the average investment.
4. All results are based on a 100% ownership, non-leverage, basis. Interest and other general expenses are deducted from total performance and not segregated by category. Expenses directly related to specific investment operations, such as dividends paid on short stock, are deducted by category. When securities are borrowed directly and sold short, the net investment (longs minus shorts) is shown for the applicable average investment category.
5. The above table has only limited use. The results applicable to each category are dominated by one or two investments. They do not represent a collection of great quantities of stable data (mortality rates of all American males or something of the sort) from which conclusions can be drawn and projections made. Instead, they represent infrequent, non-homogeneous phenomena leading to very tentative suggestions regarding various courses of action and are so used by us.
6. Finally, these calculations are not made with the same loving care we apply to counting the money and are subject to possible clerical or mathematical error since they are not entirely self-checking.

Controls

There were three main sources of gain during 1966 in respect to controlled companies. These arose through: (1) retained business earnings applicable to our holdings in 1966; (2) open market purchases of additional stock below our controlling interest valuation and; (3) unrealized appreciation in marketable securities held by the controlled companies. The total of all positive items came to \$2,600,838 in 1966.

However, due to factors mentioned in my November 1, 1966 letter, specific industry conditions, and other relevant valuation items, this gain was reduced by \$1,034,780 in arriving at our fair valuation applicable to controlling interests as of December 31, 1966. Thus the overall gain in the control category was reduced to \$1,566,058 for the year.

We were undoubtedly fortunate that we had a relatively high percentage of net assets invested in businesses and not stocks during 1966. The same money in general market holdings would probably have produced a loss, perhaps substantial, during the year. This was not planned and if the stock market had advanced substantially during the year, this category would have been an important drag on overall performance. The same situation will prevail during 1967.

Generals -Private Owner

Our performance here falls in the "twenty-one dollars a day, once a month" category. In the middle of 1965 we started purchasing a very attractive widely held security which was selling far below its value to a private owner. Our hope was that over a two or three year period we could get \$10 million or more invested at the favorable prices prevailing. The various businesses that the company operated were understandable and we could check out competitive strengths and weaknesses thoroughly with competitors, distributors, customers,

suppliers, ex-employees, etc. Market conditions peculiar to the stock gave us hope that, with patience, we could buy substantial quantities of the stock without disturbing the price.

At yearend 1965 we had invested \$1,956,980 and the market value of our holding was \$2,358,412 so that \$401,432 was contributed to performance during 1965. We would have preferred, of course, to have seen the market below cost since our interest was in additional buying, not in selling. This would have dampened Buffett Partnerships Ltd.'s 1965 performance and perhaps reduced the euphoria experienced by limited partners (psychically, the net result to all partners would have been a standoff since the general partner would have been floating) but would have enhanced long term performance. The fact that the stock had risen somewhat above our cost had already slowed down our buying program and thereby reduced ultimate profit.

An even more dramatic example of the conflict between short term performance and the maximization of long term results occurred in 1966. Another party, previously completely unknown to me, issued a tender offer which foreclosed opportunities for future advantageous buying. I made the decision that the wisest course (it may not have been) for us to follow was to dispose of our holdings and we thus realized a total profit of \$1,269,181 in February, of which \$867,749 was applicable to 1966.

While any gains looked particularly good in the market environment that intimately developed in 1966, you can be sure I don't delight in going round making molehills out of mountains. The molehill, of course, was reflected in 1966 results. However, we would have been much better off from a long range standpoint if 1966 results had been five percentage points worse and we were continuing to buy substantial quantities of the stock at the depressed prices that might have been expected to prevail in this year's market environment.

Good ideas were a dime a dozen, such a premature ending would not be unpleasant. There is something to be said, of course, for a business operation where some of the failures produce moderate profits. However, you can see how hard it is to develop replacement ideas by examining our average investment in the Private Owner category - we came up with nothing during the remainder of the year despite lower stock prices, which should have been conducive to finding such opportunities.

Generals - Relatively Undervalued

Our relative performance in this category was the best we have ever had - due to one holding which was our largest investment at yearend 1965 and also yearend 1966. This investment has substantially out-performed the general market for us during each year (1964, 1965, 1966) that we have held it. While any single year's performance can be quite erratic, we think the probabilities are highly favorable for superior future performance over a three or four year period. The attractiveness and relative certainty of this particular security are what caused me to introduce Ground Rule 7 in November, 1965 to allow individual holdings of up to 40% of our net assets. We spend considerable effort continuously evaluating every facet of the company and constantly testing our hypothesis that this security is superior to alternative investment choices. Such constant evaluation and comparison at shifting prices is absolutely essential to our investment operation.

It would be much more pleasant (and indicate a more favorable future) to report that our results in the Generals -Relatively Undervalued category represented fifteen securities in ten industries, practically all of which outperformed the market. We simply don't have that many good ideas. As mentioned above, new ideas are continually measured against present ideas and we will not make shifts if the effect is to downgrade expectable performance. This policy has resulted in limited activity in recent years when we have felt so strongly about the relative merits of our largest holding. Such a condition has meant that realized gains have been a much smaller portion of total performance than in earlier years when the flow of good ideas was more substantial.

The sort of concentration we have in this category is bound to produce wide swings in short term performance - some, most certainly, unpleasant. There have already been some of these applicable to shorter time spans than I

use in reporting to partners. This is one reason I think frequent reporting to be foolish and potentially misleading in a long term oriented business such as ours.

Personally, within the limits expressed in last year's letter on diversification, I am willing to trade the pains (forget about the pleasures) of substantial short term variance in exchange for maximization of long term performance. However, I am not willing to incur risk of substantial permanent capital loss in seeking to better long term performance. To be perfectly clear - under our policy of concentration of holdings, partners should be completely prepared for periods of substantial underperformance (far more likely in sharply rising markets) to offset the occasional over performance such as we have experienced in 1965 and 1966, and as a price we pay for hoped-for good long term performance.

All this talk about the long pull has caused one partner to observe that "even five minutes is a long time if one's head is being held under water." This is the reason, of course, that we use borrowed money very sparingly in our operation. Average bank borrowings during 1966 were well under 10% of average net worth.

One final word about the Generals - Relatively Undervalued category. In this section we also had an experience which helped results in 1966 but hurt our long term prospects. We had just one really important new idea in this category in 1966. Our purchasing started in late spring but had only come to about \$1.6 million (it could be bought steadily but at only a moderate pace) when outside conditions drove the stock price up to a point where it was not relatively attractive. Though our overall gain was \$728,141 on an average holding period of six and a half months in 1966, it would have been much more desirable had the stock done nothing for a long period of time while we accumulated a really substantial position.

Workouts

In last year's letter I forecast reduced importance for workouts. While they were not of the importance of some past years. I was pleasantly surprised by our experience in 1966 during which we kept an average of \$7,666,314 employed in this category. Furthermore, we tend to ascribe borrowings to the workout section so that our net equity capital employed was really something under this figure and our return was somewhat better than the 22.4% indicated on page six. Here, too, we ran into substantial variation. At June 30, our overall profit on this category was \$16,112 on an average investment of \$7,870,151 so that we really had a case of an extraordinarily good second half offsetting a poor first half.

In past years, sometimes as much as 30-40% of our net worth has been invested in workouts, but it is highly unlikely that this condition will prevail in the future. Nevertheless, they may continue to produce some decent returns on the moderate amount of capital employed.

Miscellaneous

Operationally, we continue to function well above rated capacity with Bill, John, Elizabeth and Donna all contributing excellent performances. At Buffett Partnership, Ltd. we have never had to divert investment effort to offset organizational shortcomings and this has been an important ingredient in the performance over the years.

Peat, Marwick, Mitchell & Co., aided for the second year by their computer, turned in the usual speedy, efficient and comprehensive job.

We all continue to maintain more than an academic interest in the Partnership. The employees and I, our spouses and children, have a total of over \$10 million invested at January 1, 1967. In the case of my family, our Buffett Partnership, Ltd. investment represents well over 90% of our net worth.

Within the coming two weeks you will receive:

1. A tax letter giving you all BPL information needed for your 1966 federal income tax return. This letter is the only item that counts for tax purposes.
2. An audit from Peat, Marwick, Mitchell & Co. for 1966, setting forth the operations and financial position of BPL, as well as your own capital account.
3. A letter signed by me setting forth the status of your BPL interest on January 1, 1967. This is identical with the figures developed in the audit.

Let me know if anything in this letter or that occurs during the year needs clarifying. My next letter will be about July 15 summarizing the first half of this year.

Cordially,

Warren E. Buffett

First Half Performance

Again, this is being written in late June prior to the family's trip to California. To maintain the usual chronological symmetry (I try to sublimate my aesthetic urges when it comes to creating symmetry in the profit and loss statement), I will leave a few blanks and trust that the conclusions look appropriate when the figures are entered.

We began 1967 on a traumatic note with January turning out to be one of the worst months we have experienced with a plus 3.3% for BPL versus a plus 8.5% for the Dow. Despite this sour start, we finished the half about plus 21% for an edge of 9.6 percentage points over the Dow. Again, as throughout 1966, the Dow was a relatively easy competitor (it won't be every year, prevailing thinking to the contrary notwithstanding) and a large majority of investment managers outdid this yardstick. The following table summarizes performance to date on the usual basis:

Year	Overall Results From Dow (1)	Partnership Results (2)	Limited Partners' Results (3)
1957	-8.4%	10.4%	9.3%
1958	38.5%	40.9%	32.2%
1959	20.0%	25.9%	20.9%
1960	-6.2%	22.8%	18.6%
1961	22.4%	45.9%	35.9%
1962	-7.6%	13.9%	11.9%
1963	20.6%	38.7%	30.5%
1964	18.7%	27.8%	22.3%
1965	14.2%	47.2%	36.9%
1966	-15.6%	20.4%	16.8%
First half 1967	11.4%	21.0%	17.3%
Cumulative Results	148.3%	1419.8%	843.3%
Annual Compounded Rate	9.1%	29.6%	23.8%

- (1) Based on yearly changes in the value of the Dow plus dividends that would have been received through ownership of the Dow during that year. The table includes all complete years of partnership activity.
- (2) For 1957-61 consists of combined results of all predecessor limited partnerships operating throughout the entire year after all expenses but before distributions to partners or allocations to the general partner.
- (3) For 1957-61 computed on the basis of the preceding column of partnership results allowing for allocation to the general partner based upon the present partnership agreement, but before monthly withdrawals by limited partners.

BPL's performance during the first half reflects no change in valuation of our controlled companies and was thus achieved solely by the 63.3% of our net assets invested in marketable securities at the beginning of the year.

Any revaluation of Diversified Retailing Company (DRC) and Berkshire Hathaway Inc. (B-H) will be made in December prior to the time the commitment letters become final and will be based upon all relevant criteria (including current operating, market and credit conditions) at that time.

Both DRC and B-H made important acquisitions during the first half. The overall progress of DRC (80% owned) and both of its subsidiaries (Hochschild Kohn and Associated Cotton Shops) is highly satisfactory. However, B-H is experiencing and faces real difficulties in the textile business, while I don't presently foresee any loss in underlying values. I similarly see no prospect of a good return on the assets employed in the textile business. Therefore, this segment of our portfolio will be a substantial drag on our relative performance (as it has been during the first half) if the Dow continues to advance. Such relative performance with controlled companies is expected in a strongly advancing market, but is accentuated when the business is making no progress. As a friend of mine says. "Experience is what you find when you're looking for something else."

Investment Companies

The usual comparison follows showing the results of the two largest open-end and two largest closed-end investment companies which pursue a policy of 95-100% investment in common stocks.

Year	Mass. Inv. Trust (1)	Investors Stock (1)	Lehman (2)	Tri-Cont (2)	Dow	Limited Partners
1957	-11.4%	-12.4%	-11.4%	-2.4%	-8.4%	9.3%
1958	42.7%	47.5%	40.8%	33.2%	38.5%	32.2%
1959	9.0%	10.3%	8.1%	8.4%	20.0%	20.9%
1960	-1.0%	-0.6%	2.5%	2.8%	-6.2%	18.6%
1961	25.6%	24.9%	23.6%	22.5%	22.4%	35.9%
1962	-9.8%	-13.4%	-14.4%	-10.0%	-7.6%	11.9%
1963	20.0%	16.5%	23.7%	18.3%	20.6%	30.5%
1964	15.9%	14.3%	13.6%	12.6%	18.7%	22.3%
1965	10.2%	9.8%	19.0%	10.7%	14.2%	36.9%
1966	-7.7%	-10.0%	-2.6%	-6.9%	-15.6%	16.8%
First half 1967	11.3%	12.3%	19.3%	14.4%	11.4%	17.3%
Cumulative Results	143.3%	126.4%	185.4%	156.8%	148.3%	843.3%
Annual Compounded Rate	8.9%	8.1%	10.5%	9.4%	9.1%	23.8%

(1) Computed from changes in asset value plus any distributions to holders of record during year.

(2) From 1967 Moody's Bank & Finance Manual for 1957-1966. Estimated for first half of 1967.

The tide continues to be far more important than the swimmers.

Taxes

We entered 1967 with unrealized gains of \$16,361,974. Through June 30 we have realized net capital gains of \$7,084,104 so it appears likely that we will realize in 1967 a fairly substantial portion of the unrealized gain attributable to your interest at the beginning of the year. This amount was reported to you as Item 3 of our February 2, 1967 letter. A copy of that letter, along with a tax letter, will be mailed to you in November giving a rough idea of the tax situation at that time.

As I regularly suggest, the safe course to follow on interim estimates is to pay the same estimated tax for 1967 as your actual tax was for 1966. There can be no penalties if you follow this procedure.

Whatever our final figure, it looks now as if it will be very largely long term capital gain with only minor amounts, if any, of short term gain and ordinary income. (I consider the whole Income-Principal Myth fair game for one of my soft-spoken gently worded critiques. As I told Susie in the early days of our marriage, "Don't worry about the income; just the outcome.")

Miscellaneous

During the first half, Stan Perimeter resigned from the Dissolution Committee because of his present full-time involvement in investment management. Fred Stanback, Jr., a long time partner and experienced investor, was elected by the remaining members to fill the vacancy.

As in past years, we will have a report out about November 11 along with the Commitment Letter, and the rough estimate of the 1967 tax situation, etc.

However, there will be a special letter (to focus your attention upon it) in October. The subject matter will not relate to change in the Partnership Agreement, but will involve some evolutionary changes in several "Ground Rules" which I want you to have ample time to contemplate before making your plans for 1968. Whereas the Partnership Agreement represents the legal understanding among us, the "Ground Rules" represent the personal understanding and in some ways is the more important document. I consider it essential that any changes be clearly set forth and explained prior to their effect on partnership activity or performance – hence, the October letter.

October 9, 1967

To My Partners:

Over the past eleven years, I have consistently set forth as the BPL investment goal an average advantage in our performance of ten percentage points per annum in comparison with the Dow Jones Industrial Average. Under the environment that existed during that period. I have considered such an objective difficult but obtainable.

The following conditions now make a change in yardsticks appropriate:

1. The market environment has changed progressively over the past decade, resulting in a sharp diminution in the number of obvious quantitatively based investment bargains available;
2. Mushrooming interest in investment performance (which has its ironical aspects since I was among a lonely few preaching the importance of this some years ago) has created a hyper-reactive pattern of market behavior against which my analytical techniques have limited value;
3. The enlargement of our capital base to about \$65 million when applied against a diminishing trickle of good investment ideas has continued to present the problems mentioned in the January, 1967 letter; and
4. My own personal interests dictate a less compulsive approach to superior investment results than when I was younger and leaner.

Let's look at each of these factors in more detail.

The evaluation of securities and businesses for investment purposes has always involved a mixture of qualitative and quantitative factors. At the one extreme, the analyst exclusively oriented to qualitative factors would say, "Buy the right company (with the right prospects, inherent industry conditions, management, etc.) and the price will take care of itself." On the other hand, the quantitative spokesman would say, "Buy at the right price and the company (and stock) will take care of itself." As is so often the pleasant result in the securities world, money can be made with either approach. And, of course, any analyst combines the two to some extent - his classification in either school would depend on the relative weight he assigns to the various factors and not to his consideration of one group of factors to the exclusion of the other group.

Interestingly enough, although I consider myself to be primarily in the quantitative school (and as I write this no one has come back from recess - I may be the only one left in the class), the really sensational ideas I have had over the years have been heavily weighted toward the qualitative side where I have had a "high-probability insight". This is what causes the cash register to really sing. However, it is an infrequent occurrence, as insights usually are, and, of course, no insight is required on the quantitative side - the figures should hit you over the head with a baseball bat. So the really big money tends to be made by investors who are right on qualitative decisions but, at least in my opinion, the more sure money tends to be made on the obvious quantitative decisions.

Such statistical bargains have tended to disappear over the years. This may be due to the constant combing and recombining of investments that has occurred during the past twenty years, without an economic convulsion such as that of the '30s to create a negative bias toward equities and spawn hundreds of new bargain securities. It may

be due to the new growing social acceptance, and therefore usage (or maybe it's vice versa - I'll let the behaviorists figure it out) of takeover bids which have a natural tendency to focus on bargain issues. It may be due to the exploding ranks of security analysts bringing forth an intensified scrutiny of issues far beyond what existed some years ago. Whatever the cause, the result has been the virtual disappearance of the bargain issue as determined quantitatively - and thereby of our bread and butter. There still may be a few from time to time. There will also be the occasional security where I am really competent to make an important qualitative judgment. This will offer our best chance for large profits. Such instances will, however, be rare. Much of our good performance during the past three years has been due to a single idea of this sort.

The next point of difficulty is the intensified interest in investment performance. For years I have preached the importance of measurement. Consistently I have told partners that unless our performance was better than average, the money should go elsewhere. In recent years this idea has gained momentum throughout the investment (or more importantly, the investing) community. In the last year or two it has started to look a bit like a tidal wave. I think we are witnessing the distortion of a sound idea.

I have always cautioned partners that I considered three years a minimum in determining whether we were "performing". Naturally, as the investment public has taken the bit in its teeth, the time span of expectations has been consistently reduced to the point where investment performance by large aggregates of money is being measured yearly, quarterly, monthly, and perhaps sometimes even more frequently (leading to what is known as "instant research"). The payoff for superior short term performance has become enormous, not only in compensation for results actually achieved, but in the attraction of new money for the next round. Thus a self-generating type of activity has set in which leads to larger and larger amounts of money participating on a shorter and shorter time span. A disturbing corollary is that the vehicle for participation (the particular companies or stocks) becomes progressively less important - at times virtually incidental - as the activity accelerates.

In my opinion what is resulting is speculation on an increasing scale. This is hardly a new phenomenon; however, a dimension has been added by the growing ranks of professional (in many cases formerly quite docile) investors who feel they must "get aboard". The game is dignified, of course, by appropriate ceremonies, personages and lexicon. To date it has been highly profitable. It may also be that this is going to be the standard nature of the market in the future. Nevertheless, it is an activity at which I am sure I would not do particularly well. As I said on page five of my last annual letter,

"Furthermore, we will not follow the frequently prevalent approach of investing in securities where an attempt to anticipate market action overrides business valuations. Such so-called 'fashion' investing has frequently produced very substantial and quick profits in recent years (and currently as I write this in January). It represents an investment technique whose soundness I can neither affirm nor deny. It does not completely satisfy my intellect (or perhaps my prejudices), and most definitely does not fit my temperament. I will not invest my own money based upon such an approach - hence, I will most certainly not do so with your money."

Any form of hyper-activity with large amounts of money in securities markets can create problems for all participants. I make no attempt to guess the action of the stock market and haven't the foggiest notion as to whether the Dow will be at 600, 900 or 1200 a year from now. Even if there are serious consequences resulting from present and future speculative activity, experience suggests estimates of timing are meaningless. However, I do believe certain conditions that now exist are likely to make activity in markets more difficult for us for the intermediate future.

The above may simply be "old-fogeyism" (after all, I am 37). When the game is no longer being played your way, it is only human to say the new approach is all wrong, bound to lead to trouble, etc. I have been scornful of such behavior by others in the past. I have also seen the penalties incurred by those who evaluate conditions as

they were - not as they are. Essentially I am out of step with present conditions. On one point, however, I am clear. I will not abandon a previous approach whose logic I understand (although I find it difficult to apply) even though it may mean foregoing large and apparently easy, profits to embrace an approach which I don't fully understand, have not practiced successfully and which, possibly, could lead to substantial permanent loss of capital.

The third point of difficulty involves our much greater base of capital. For years my investment ideas were anywhere from 110% to 1000% of our capital. It was difficult for me to conceive that a different condition could ever exist. I promised to tell partners when it did and in my January, 1967 letter had to make good on that promise. Largely because of the two conditions previously mentioned, our greater capital is now something of a drag on performance. I believe it is the least significant factor of the four mentioned, and that if we were operating with one-tenth of our present capital our performance would be little better. However, increased funds are presently a moderately negative factor.

The final, and most important, consideration concerns personal motivation. When I started the partnership I set the motor that regulated the treadmill at "ten points better than the DOW". I was younger, poorer and probably more competitive. Even without the three previously discussed external factors making for poorer performance. I would still feel that changed personal conditions make it advisable to reduce the speed of the treadmill. I have observed many cases of habit patterns in all activities of life, particularly business, continuing (and becoming accentuated as years pass) long after they ceased making sense. Bertrand Russell has related the story of two Lithuanian girls who lived at his manor subsequent to World War I. Regularly each evening after the house was dark, they would sneak out and steal vegetables from the neighbors for hoarding in their rooms; this despite the fact that food was bountiful at the Russell table. Lord Russell explained to the girls that while such behavior may have made a great deal of sense in Lithuania during the war, it was somewhat out of place in the English countryside. He received assenting nods and continued stealing.

He finally contented himself with the observation that their behavior, strange as it might seem to the neighbors, was really not so different from that of the elder Rockefeller.

Elementary self-analysis tells me that I will not be capable of less than all-out effort to achieve a publicly proclaimed goal to people who have entrusted their capital to me. All-out effort makes progressively less sense. I would like to have an economic goal which allows for considerable non-economic activity. This may mean activity outside the field of investments or it simply may mean pursuing lines within the investment field that do not promise the greatest economic reward. An example of the latter might be the continued investment in a satisfactory (but far from spectacular) controlled business where I liked the people and the nature of the business even though alternative investments offered an expectable higher rate of return. More money would be made buying businesses at attractive prices, then reselling them. However, it may be more enjoyable (particularly when the personal value of incremental capital is less) to continue to own them and hopefully improve their performance, usually in a minor way, through some decisions involving financial strategy.

Thus, I am likely to limit myself to things which are reasonably easy, safe, profitable and pleasant. This will not make our operation more conservative than in the past since I believe, undoubtedly with some bias, that we have always operated with considerable conservatism. The long-term downside risk will not be less; the upside potential will merely be less.

Specifically, our longer term goal will be to achieve the lesser of 9% per annum or a five percentage point advantage over the Dow. Thus, if the Dow averages -2% over the next five years, I would hope to average +3% but if the Dow averages +12%, I will hope to achieve an average of only +9%. These may be limited objectives, but I consider it no more likely that we will achieve even these more modest results under present conditions than I formerly did that we would achieve our previous goal of a ten percentage point average annual edge over the Dow. Furthermore, I hope limited objectives will make for more limited effort (I'm quite sure the converse is

true).

I will incorporate this new goal into the Ground Rules to be mailed you about November 1, along with the 1968 Commitment Letter. I wanted to get this letter off to you prior to that mailing so you would have ample time to consider your personal situation, and if necessary get in touch with me to clear up some of the enclosed, before making a decision on 1968. As always, I intend to continue to leave virtually all of my capital (excluding Data Documents stock), along with that of my family, in BPL. What I consider satisfactory and achievable may well be different from what you consider so. Partners with attractive alternative investment opportunities may logically decide that their funds can be better employed elsewhere, and you can be sure I will be wholly in sympathy with such a decision.

I have always found behavior most distasteful which publicly announces one set of goals and motivations when actually an entirely different set of factors prevails. Therefore, I have always tried to be 100% candid with you about my goals and personal feelings so you aren't making important decisions pursuant to phony proclamations (I've run into a few of these in our investment experience). Obviously all the conditions enumerated in this letter haven't appeared overnight. I have been thinking about some of the points involved for a long period of time. You can understand, I am sure, that I wanted to pick a time when past goals had been achieved to set forth a reduction in future goals. I would not want to reduce the speed of the treadmill unless I had fulfilled my objectives to this point.

Please let me know if I can be of any help in deciphering any portion of this letter.

January 24, 1968

Our Performance in 1967

By most standards, we had a good year in 1967. Our overall performance was plus 35.9% compared to plus 19.0% for the Dow, thus surpassing our previous objective of performance ten points superior to the Dow. Our overall gain was \$19,384,250 which, even under accelerating inflation, will buy a lot of Pepsi. And, due to the sale of some longstanding large positions in marketable securities, we had realized taxable income of \$27,376,667 which has nothing to do with 1967 performance but should give all of you a feeling of vigorous participation in The Great Society on April 15th.

The minor thrills described above are tempered by any close observation of what really took place in the stock market during 1967. Probably a greater percentage of participants in the securities markets did substantially better than the Dow last year than in virtually any year in history. In 1967, for many, it rained gold and it paid to be out playing the bass tuba. I don't have a final tabulation at this time but my guess is that at least 95% of investment companies following a common stock program achieved better results than the Dow - in many cases by very substantial amounts. It was a year when profits achieved were in inverse proportion to age - and I am in the geriatric ward, philosophically.

The following summarizes the year-by-year performance of the Dow, the Partnership before allocation (one quarter of the excess over 6%) to the general partner, and the results for limited partners:

Year	Overall Results From Dow (1)	Partnership Results (2)	Limited Partners' Results (3)
1957	-8.4%	10.4%	9.3%
1958	38.5%	40.9%	32.2%
1959	20.0%	25.9%	20.9%
1960	-6.2%	22.8%	18.6%
1961	22.4%	45.9%	35.9%
1962	-7.6%	13.9%	11.9%
1963	20.6%	38.7%	30.5%
1964	18.7%	27.8%	22.3%
1965	14.2%	47.2%	36.9%
1966	-15.6%	20.4%	16.8%
1967	19.0%	35.9%	28.4%

- (1) Based on yearly changes in the value of the Dow plus dividends that would have been received through ownership of the Dow during that year. The table includes all complete years of partnership activity.
- (2) For 1957-61 consists of combined results of all predecessor limited partnerships operating throughout the entire year after all expenses, but before distributions to partners or allocations to the general partner.
- (3) For 1957-61 computed on the basis of the preceding column of partnership results allowing for allocation to the general partner based upon the present partnership agreement, but before monthly

withdrawals by limited partners.

On a cumulative or compounded basis, the results are:

Year	Overall Results From Dow	Partnership Results	Limited Partners' Results
1957	-8.4%	10.4%	9.3%
1957 – 58	26.9%	55.6%	44.5%
1957 – 59	52.3%	95.9%	74.7%
1957 – 60	42.9%	140.6%	107.2%
1957 – 61	74.9%	251.0%	181.6%
1957 – 62	61.6%	299.8%	215.1%
1957 – 63	95.1%	454.5%	311.2%
1957 – 64	131.3%	608.7%	402.9%
1957 – 65	164.1%	943.2%	588.5%
1957 – 66	122.9%	1156.0%	704.2%
1957 – 67	165.3%	1606.9%	932.6%
Annual Compounded Rate	9.3%	29.4%	23.6%

Investment Companies

On the following page is the usual tabulation showing the results of what were the two largest mutual funds (they have stood at the top in size since BPL was formed - this year, however, Dreyfus Fund overtook them) that follow a policy of being, typically, 95-100% invested in common stocks, and the two largest diversified closed-end investment companies.

Year	Mass. Inv. Trust (1)	Investors Stock (1)	Lehman (2)	Tri-Cont (2)	Dow	Limited Partners
1957	-11.4%	-12.4%	-11.4%	-2.4%	-8.4%	9.3%
1958	42.7%	47.5%	40.8%	33.2%	38.5%	32.2%
1959	9.0%	10.3%	8.1%	8.4%	20.0%	20.9%
1960	-1.0%	-0.6%	2.5%	2.8%	-6.2%	18.6%
1961	25.6%	24.9%	23.6%	22.5%	22.4%	35.9%
1962	-9.8%	-13.4%	-14.4%	-10.0%	-7.6%	11.9%
1963	20.0%	16.5%	23.7%	18.3%	20.6%	30.5%
1964	15.9%	14.3%	13.6%	12.6%	18.7%	22.3%
1965	10.2%	9.8%	19.0%	10.7%	14.2%	36.9%
1966	-7.7%	-10.0%	-2.6%	-6.9%	-15.6%	16.8%
1967	20.0%	22.8%	28.0%	25.4%	19.0%	28.4%
Cumulative Results	162.3%	147.6%	206.2%	181.5%	165.3%	932.6%
Annual Compounded Rate	9.2%	8.6%	10.7%	9.9%	9.3%	23.6%

(1) Computed from changes in asset value plus any distributions to holders of record during year.

(2) From 1967 Moody's Bank & Finance Manual for 1957-1966. Estimated for 1967.

Last year I said:

“A few mutual funds and some private investment operations have compiled records vastly superior to the Dow and, in some cases, substantially superior to Buffett Partnership, Ltd. Their investment techniques are usually very dissimilar to ours and not within my capabilities.”

In 1967 this condition intensified. Many investment organizations performed substantially better than BPL, with gains ranging to over 100%. Because of these spectacular results, money, talent and energy are converging in a maximum effort for the achievement of large and quick stock market profits. It looks to me like greatly intensified speculation with concomitant risks -but many of the advocates insist otherwise.

My mentor, Ben Graham, used to say. “Speculation is neither illegal, immoral nor fattening (financially).” During the past year, it was possible to become fiscally flabby through a steady diet of speculative bonbons. We continue to eat oatmeal but if indigestion should set in generally, it is unrealistic to expect that we won’t have some discomfort.

Analysis of 1967 Results

The overall figures given earlier conceal vast differences in profitability by portfolio category during 1967.

We had our worst performance in history in the “Workout” section. In the 1965 letter, this category was defined as,

“...securities with a timetable. They arise from corporate activity -- sell-outs, mergers, reorganizations, spin-offs, etc. In this category, we are not talking about rumors or inside information pertaining to such developments, but to publicly announced activities of this sort. We wait until we can read it in the paper. The risk does not pertain primarily to general market behavior (although that is sometimes tied in. to a degree). but instead to something upsetting the applecart so that the expected corporate development does not materialize.”

The streets were filled with upset applecarts - our applecarts - during 1967. Thus, on an average investment of \$17,246,879, our overall gain was \$153,273. For those of you whose slide rule does not go to such insulting depths, this represents a return of .89 of 1%. While I don't have complete figures. I doubt that we have been below 10% in any past year. As in other categories, we tend to concentrate our investments in the workout category in just a few situations per year. This technique gives more variation in yearly results than would be the case if we used an across-the-board approach. I believe our approach will result in as great (or greater) profitability on a long-term basis, but you can't prove it by 1967.

Our investment in controlled companies was a similar drag on relative performance in 1967, but this is to be expected in strong markets. On an average investment of \$20,192,776 we had an overall gain of \$2,894,571. I am pleased with this sort of performance, even though this category will continue to underperform if the market continues strong during 1968. Through our two controlled companies (Diversified Retailing and Berkshire Hathaway), we acquired two new enterprises in 1967. Associated Cotton Shops and National Indemnity (along with National Fire & Marine, an affiliated company). These acquisitions couldn't be more gratifying. Everything was as advertised or better. The principal selling executives, Ben Rosner and Jack Ringwalt, have continued to do a superb job (the only kind they know), and in every respect have far more than lived up to their end of the bargain.

The satisfying nature of our activity in controlled companies is a minor reason for the moderated investment objectives discussed in the October 9th letter. When I am dealing with people I like, in businesses I find stimulating (what business isn't ?), and achieving worthwhile overall returns on capital employed (say, 10 -12%), it seems foolish to rush from situation to situation to earn a few more percentage points. It also does not seem sensible to me to trade known pleasant personal relationships with high grade people, at a decent rate of

return, for possible irritation, aggravation or worse at potentially higher returns. Hence, we will continue to keep a portion of our capital (but not over 40% because of the possible liquidity requirements arising from the nature of our partnership agreement) invested in controlled operating businesses at an expected rate of return below that inherent in an aggressive stock market operation.

With a combined total of \$37,439,655 in workouts and controls producing an overall gain of only \$3,047,844, the more alert members of the class will have already concluded we had a whale of a year in the "Generals - Relatively Undervalued" category. On a net average investment of \$19,487,996, we had an overall gain of \$14,096,593, or 72%. Last year I referred to one investment which substantially outperformed the general market in 1964, 1965 and 1966 and because of its size (the largest proportion we have ever had in anything - we hit our 40% limit) had a very material impact on our overall results and, even more so, this category. This excellent performance continued throughout 1967 and a large portion of total gain was again accounted for by this single security. Our holdings of this security have been very substantially reduced and we have nothing in this group remotely approaching the size or potential which formerly existed in this investment.

The "Generals - Private Owner" section produced good results last year (\$1,297,215 on \$5,141,710 average investment), and we have some mildly interesting possibilities in this area at present.

Miscellaneous

We begin the new year with net assets of \$68,108,088. We had partners with capital of about \$1,600,000 withdraw at yearend, primarily because of the reduced objectives announced in the October 9th letter. This makes good sense for them, since most of them have the ability and motivation to surpass our objectives and I am relieved from pushing for results that I probably can't attain under present conditions.

Some of those who withdrew (and many who didn't) asked me, "What do you really mean?" after receiving the October 9th letter. This sort of a question is a little bruising to any author, but I assured them I meant exactly what I had said. I was also asked whether this was an initial stage in the phasing out of the partnership. The answer to this is, "Definitely, no". As long as partners want to put up their capital alongside of mine and the business is operationally pleasant (and it couldn't be better), I intend to continue to do business with those who have backed me since tennis shoes.

Gladys Kaiser has joined us and is doing the same sort of top-notch job that we have long received from Donna, Bill and John. The office group, spouses and children have over \$15 million invested in BPL on January 1, 1968, so we have not had a need for NoDoz during business hours.

Within a few days, you will receive:

1. A tax letter giving you all BPL information needed for your 1967 federal income tax return. This letter is the only item that counts for tax purposes.
2. An audit from Peat, Marwick, Mitchell & Co. (they have again done an excellent job) for 1967, setting forth the operations and financial position of BPL, as well as your own capital account.
3. A letter signed by me setting forth the status of your BPL interest on January 1, 1968. This is identical with the figures developed in the audit.

Let me know if anything in this letter or that occurs during the year needs clarifying. My next letter will be about July 15th, summarizing the first half of this year.

Cordially,

First Half Performance

During the first half of 1968, the Dow-Jones Industrial Average declined fractionally from 905 to 898. Ownership of the Dow would also have produced dividends of about \$15 during the half, resulting in an overall gain of 0.9% for that Average. The Dow, once again, was an anemic competitor for most investment managers, although it was not surpassed by anything like the margins of 1967.

Our own performance was unusually good during the first half, with an overall gain of 16% excluding any change in valuation for controlled companies (which represented slightly over one-third of net assets at the beginning of the year). However, any release of adrenalin is unwarranted. Our marketable security investments are heavily concentrated in a few situations, making relative performance potentially more volatile than in widely diversified investment vehicles. Our long term performance goals are as stated in the revised "Ground Rules" and I will be quite happy if we achieve those limited objectives over a period of years. The following table summarizes performance to date on the usual basis:

Year	Overall Results From Dow (1)	Partnership Results (2)	Limited Partners' Results (3)
1957	-8.4%	10.4%	9.3%
1958	38.5%	40.9%	32.2%
1959	20.0%	25.9%	20.9%
1960	-6.2%	22.8%	18.6%
1961	22.4%	45.9%	35.9%
1962	-7.6%	13.9%	11.9%
1963	20.6%	38.7%	30.5%
1964	18.7%	27.8%	22.3%
1965	14.2%	47.2%	36.9%
1966	-15.6%	20.4%	16.8%
1967	19.0%	35.9%	28.4%
First Half 1968	0.9%	16.0%	13.5%
Cumulative Results	167.7%	1880.0%	1072.0%
Annual Compounded Rate	8.9%	29.6%	23.8%

- (1) Based on yearly changes in the value of the Dow plus dividends that would have been received through ownership of the Dow during that year. The table includes all complete years of partnership activity.
- (2) For 1957-61 consists of combined results of all predecessor limited partnerships operating throughout the entire year after all expenses but before distributions to partners or allocations to the general partner.
- (3) For 1957-61 computed on the basis of the preceding column of partnership results allowing for allocation to the general partner based upon the present partnership agreement, but before monthly withdrawals by limited partners.

Although we revise valuations of our controlled companies only at yearend, it presently appears that our share of their 1968 earnings will be something over \$3 million. Those with primary responsibility for their operations, Ken Chace at Berkshire Hathaway, Louis Kohn at Hochschild Kohn, Jack Ringwalt at National Indemnity and Ben Rosner at Associated Cotton Shops, continue to meld effort and ability into results.

This year, Diversified Retailing Company (owner of Hochschild Kohn and Associated Cotton Shops) issued its first published annual report. This was occasioned by the public sale of debentures to approximately 1,000 investors last December. Thus, DRC is in the rather unusual position of being a public company from a creditors' viewpoint, but a private one (there are three stockholders -BPL owns 80%) for ownership purposes. I am enclosing the DRC report with this letter (except where duplicates go to one house hold) and plan to continue to send them along with future mid-year letters.

As I have mentioned before, we cannot make the same sort of money out of permanent ownership of controlled businesses that can be made from buying and reselling such businesses, or from skilled investment in marketable securities. Nevertheless, they offer a pleasant long term form of activity (when conducted in conjunction with high grade, able people) at satisfactory rates of return.

Investment Companies

On the following page is the form sheet on the usual investment companies:

Year	Mass. Inv. Trust (1)	Investors Stock (1)	Lehman (2)	Tri-Cont (2)	Dow	Limited Partners
1957	-11.4%	-12.4%	-11.4%	-2.4%	-8.4%	9.3%
1958	42.7%	47.5%	40.8%	33.2%	38.5%	32.2%
1959	9.0%	10.3%	8.1%	8.4%	20.0%	20.9%
1960	-1.0%	-0.6%	2.5%	2.8%	-6.2%	18.6%
1961	25.6%	24.9%	23.6%	22.5%	22.4%	35.9%
1962	-9.8%	-13.4%	-14.4%	-10.0%	-7.6%	11.9%
1963	20.0%	16.5%	23.7%	18.3%	20.6%	30.5%
1964	15.9%	14.3%	13.6%	12.6%	18.7%	22.3%
1965	10.2%	9.8%	19.0%	10.7%	14.2%	36.9%
1966	-7.7%	-10.0%	-2.6%	-6.9%	-15.6%	16.8%
1967	20.0%	22.8%	28.0%	25.4%	19.0%	28.4%
First Half 1968	5.1%	2.8%	4.4%	2.0%	0.9%	13.5%
Cumulative Results	175.7%	154.5%	218.6%	186.7%	167.7%	1072.0%
Annual Compounded Rate	9.2%	8.5%	10.6%	9.6%	8.9%	23.8%

(1) Computed from changes in asset value plus any distributions to holders of record during year.

(2) From 1968 Moody's Bank & Finance Manual for 1957 -1967. Estimated for first half of 1968.

Due to a sluggish performance by the Dow in the last few years, the four big funds now have, on average, about a one-half point per annum advantage over the Dow for the full period.

The Present Environment

I make no effort to predict the course of general business or the stock market. Period. However, currently there are practices snowballing in the security markets and business world which, while devoid of short term predictive value, bother me as to possible long term consequences.

I know that some of you are not particularly interested (and shouldn't be) in what is taking place on the financial stage. For those who are, I am enclosing a reprint of an unusually clear and simple article which lays bare just what is occurring on a mushrooming scale. Spectacular amounts of money are being made by those participating (whether as originators, top employees, professional advisors, investment bankers, stock speculators, etc...) in the chain-letter type stock-promotion vogue. The game is being played by the gullible, the self-hypnotized, and the cynical. To create the proper illusions, it frequently requires accounting distortions (one particularly progressive entrepreneur told me he believed in "bold, imaginative accounting"), tricks of capitalization and camouflage of the true nature of the operating businesses involved. The end product is popular, respectable and immensely profitable (I'll let the philosophers figure in which order those adjectives should be placed).

Quite candidly, our own performance has been substantially improved on an indirect basis because of the fall-out from such activities. To create an ever widening circle of chain letters requires increasing amounts of corporate raw material and this has caused many intrinsically cheap (and not so cheap) stocks to come to life. When we have been the owners of such stocks, we have reaped market rewards much more promptly than might otherwise have been the case. The appetite for such companies, however, tends to substantially diminish the number of fundamentally attractive investments which remain.

I believe the odds are good that, when the stock market and business history of this period is being written, the phenomenon described in Mr. May's article will be regarded as of major importance, and perhaps characterized as a mania. You should realize, however, that his "The Emperor Has No Clothes" approach is at odds (or dismissed with a "SO What?" or an "Enjoy, Enjoy") with the views of most investment banking houses and currently successful investment managers. We live in an investment world, populated not by those who must be logically persuaded to believe, but by the hopeful, credulous and greedy, grasping for an excuse to believe.

Finally, for a magnificent account of the current financial scene, you should hurry out and get a copy of "The Money Game" by Adam Smith. It is loaded with insights and supreme wit. (Note: Despite my current "Support Your Local Postmaster" drive, I am not enclosing the book with this letter - it retails for \$6.95.)

Taxes

Several unusual factors make the tax figure even more difficult than usual to estimate this year. We will undoubtedly have an above average amount of ordinary income. The picture on short term and long term capital gain is subject to unusually substantial variance. At the beginning of the year, I suggested that you use an 8% ordinary income factor (it won't come in this manner but this figure embodies an adjustment for long term capital gain) applied to your BPL capital account on an interim basis to compute quarterly tax estimates. If a figure different from 8% seems more appropriate for your September 15th quarterly estimate. I will let you know by September 5th. If no change is necessary, you will next hear from me on November 1st with the Commitment Letter for 1969.

Cordially,

Our Performance in 1968

Everyone makes mistakes.

At the beginning of 1968, I felt prospects for BPL performance looked poorer than at any time in our history. However, due in considerable measure to one simple but sound idea whose time had come (investment ideas, like women are often more exciting than punctual), we recorded an overall gain of \$40,032,691.

Naturally, you all possess sufficient intellectual purity to dismiss the dollar result and demand an accounting of performance relative to the Dow-Jones Industrial Average. We established a new mark at plus 58.8% versus an overall plus 7.7 % for the Dow, including dividends which would have been received through ownership of the Average throughout the year. This result should be treated as a freak like picking up thirteen spades in a bridge game. You bid the slam, make it look modest, pocket the money and then get back to work on the part scores. We will also have our share of hands when we go set.

The following summarizes the year-by-year performance of the Dow, the Partnership before allocation (one quarter of the excess over 6%) to the General Partner and the results for limited partners:

Year	Overall Results From Dow (1)	Partnership Results (2)	Limited Partners' Results (3)
1957	-8.4%	10.4%	9.3%
1958	38.5%	40.9%	32.2%
1959	20.0%	25.9%	20.9%
1960	-6.2%	22.8%	18.6%
1961	22.4%	45.9%	35.9%
1962	-7.6%	13.9%	11.9%
1963	20.6%	38.7%	30.5%
1964	18.7%	27.8%	22.3%
1965	14.2%	47.2%	36.9%
1966	-15.6%	20.4%	16.8%
1967	19.0%	35.9%	28.4%
1968	7.7%	58.8%	45.6%

- (1) Based on yearly changes in the value of the Dow plus dividends that would have been received through ownership of the Dow during that year. The table includes all complete years of Partnership activity.
- (2) For 1957-61 consists of combined results of all predecessor limited partnerships operating throughout the entire year after all expenses, but before distributions to partners or allocations to the General Partner.
- (3) For 1957-61 computed on the basis of the preceding column of Partnership results allowing for allocation to the General Partner based upon the present Partnership Agreement, but before monthly withdrawals by limited partners.

On a cumulative or compounded basis, the results are:

Year	Overall Results From Dow	Partnership Results	Limited Partners' Results
1957	-8.4%	10.4%	9.3%
1957 – 58	26.9%	55.6%	44.5%
1957 – 59	52.3%	95.9%	74.7%
1957 – 60	42.9%	140.6%	107.2%
1957 – 61	74.9%	251.0%	181.6%
1957 – 62	61.6%	299.8%	215.1%
1957 – 63	95.1%	454.5%	311.2%
1957 – 64	131.3%	608.7%	402.9%
1957 – 65	164.1%	943.2%	588.5%
1957 – 66	122.9%	1156.0%	704.2%
1957 – 67	165.3%	1606.9%	932.6%
1957 – 68	185.7%	2610.6%	1403.5%
Annual Compounded Rate	9.1%	31.6%	25.3%

Investment Companies

On the following page is the usual tabulation showing the results of what were the two largest mutual funds (they stood at the top in size from 1957 through 1966 - they are still number two and three) that follow a policy of being, typically, 95 -100% invested in common stocks, and the two largest diversified closed-end investment companies.

Year	Mass. Inv. Trust (1)	Investors Stock (1)	Lehman (2)	Tri-Cont (2)	Dow	Limited Partners
1957	-11.4%	-12.4%	-11.4%	-2.4%	-8.4%	9.3%
1958	42.7%	47.5%	40.8%	33.2%	38.5%	32.2%
1959	9.0%	10.3%	8.1%	8.4%	20.0%	20.9%
1960	-1.0%	-0.6%	2.5%	2.8%	-6.2%	18.6%
1961	25.6%	24.9%	23.6%	22.5%	22.4%	35.9%
1962	-9.8%	-13.4%	-14.4%	-10.0%	-7.6%	11.9%
1963	20.0%	16.5%	23.7%	18.3%	20.6%	30.5%
1964	15.9%	14.3%	13.6%	12.6%	18.7%	22.3%
1965	10.2%	9.8%	19.0%	10.7%	14.2%	36.9%
1966	-7.7%	-10.0%	-2.6%	-6.9%	-15.6%	16.8%
1967	20.0%	22.8%	28.0%	25.4%	19.0%	28.4%
1968	10.3%	8.1%	6.7%	6.8%	7.7%	45.6%
Cumulative Results	189.3%	167.7%	225.6%	200.2%	185.7%	1403.5%
Annual Compounded Rate	9.3%	8.6%	10.3%	9.6%	9.1%	25.3%

(1) Computed from changes in asset value plus any distributions to holders of record during year.

(2) From 1968 Moody's Bank & Finance Manual for 1957-1967. Estimated for 1968.

It is interesting that after twelve years these four funds (which presently aggregate well over \$5 billion and account for over 10% of the investment company industry) have averaged only a fraction of one percentage point annually better than the Dow.

Some of the so-called “go-go” funds have recently been re-christened “no-go” funds. For example, Gerald Tsai's Manhattan Fund, perhaps the world's best-known aggressive investment vehicle, came in at minus 6.9% for 1968. Many smaller investment entities continued to substantially outperform the general market in 1968, but in nothing like the quantities of 1966 and 1967.

The investment management business, which I used to severely chastise in this section for excessive lethargy, has now swung in many quarters to acute hypertension. One investment manager, representing an organization (with an old established name you would recognize) handling mutual funds aggregating well over \$1 billion, said upon launching a new advisory service in 1968:

“The complexities of national and international economics make money management a full-time job. A good money manager cannot maintain a study of securities on a week-by-week or even a day-by-day basis. Securities must be studied in a minute-by-minute program.”

Wow!

This sort of stuff makes me feel guilty when I go out for a Pepsi. When practiced by large and increasing numbers of highly motivated people with huge amounts of money on a limited quantity of suitable securities, the result becomes highly unpredictable. In some ways it is fascinating to watch and in other ways it is appalling.

Analysis of 1968 Results

All four main categories of our investment operation worked out well in 1968. Our total overall gain of \$40,032,691 was divided as follows:

Category	Average Investment	Overall Gain
Controls	\$24,996,998	\$5,886,109
Generals – Private Owner	\$16,363,100	\$21,994,736
Generals – Relatively	\$8,766,878	\$4,271,825
Undervalued		
Workouts	\$18,980,602	\$7,317,128
Miscellaneous, primarily US	\$12,744,973	<u>\$839,496</u>
Treasury Bills		
Total Income		\$40,309,294
Less – General Expense, including Interest		<u>\$276,603</u>
Overall Gain		\$40,032,691

A few caveats, as mentioned in my letter two years ago, are again in order (non-doctoral candidates may proceed to next section):

1. An explanation of the various categories listed above was made in the January 18, 1965 letter. If your memory needs refreshing and your favorite newsstand does not have the pocketbook edition. We'll be glad to give you a copy.
2. The classifications are not iron clad. Nothing is changed retroactively, but the initial decision as to

category is sometimes arbitrary. Sometimes later classification proves difficult; e.g. a workout that falls through but that I continue to hold for reasons unrelated or only partially related to the original decision (like stubbornness).

3. Percentage returns calculated on the average investment base by category would be significantly understated relative to Partnership percentage returns which are calculated on a beginning investment base. In the foregoing figures, a security purchased by us at 100 on January 1 which appreciated at an even rate to 200 on December 31 would have an average investment of 150 producing a 66-2/3% result contrasted to a 100% result by the customary approach. In other words, the foregoing figures use a monthly average of market values in calculating the average investment.
4. All results are based on a 100% ownership, non-leverage basis. Interest and other general expenses are deducted from total performance and not segregated by category. Expenses directly related to specific investment operations, such as dividends paid on short stock, are deducted by category. When securities are borrowed directly and sold short, the net investment (longs minus shorts) is shown for the applicable category's average investment.
5. The foregoing table has only limited use. The results applicable to each category are dominated by one or two investments. They do not represent a collection of great quantities of stable data (mortality rates of all American males or something of the sort) from which conclusions can be drawn and projections made. Instead, they represent infrequent, non-homogeneous phenomena leading to very tentative suggestions regarding various courses of action and are so used by us.
6. Finally, these calculations are not made with the same loving care we apply to counting the money and are subject to possible clerical or mathematical error since they are not entirely self-checking.

Controls

Overall, the controlled companies turned in a decent performance during 1968. Diversified Retailing Company Inc. (80% owned) and Berkshire Hathaway Inc. (70% owned) had combined after-tax earnings of over \$5 million.

Particularly outstanding performances were turned in by Associated Cotton Shops, a subsidiary of DRC run by Ben Rosner, and National Indemnity Company, a subsidiary of B-H run by Jack Ringwalt. Both of these companies earned about 20% on capital employed in their businesses. Among Fortune's "500" (the largest manufacturing entities in the country, starting with General Motors), only 37 companies achieved this figure in 1967, and our boys outshone such mildly better-known (but not better appreciated) companies as IBM, General Electric, General Motors, Procter & Gamble, DuPont, Control Data, Hewlett-Packard, etc...

I still sometimes get comments from partners like: "Say, Berkshire is up four points - that's great!" or "What's happening to us, Berkshire was down three last week?" Market price is irrelevant to us in the valuation of our controlling interests. We valued B-H at 25 at yearend 1967 when the market was about 20 and 31 at yearend 1968 when the market was about 37. We would have done the same thing if the markets had been 15 and 50 respectively. ("Price is what you pay. value is what you get"). We will prosper or suffer in controlled investments in relation to the operating performances of our businesses - we will not attempt to profit by playing various games in the securities markets.

Generals -Private Owner

Over the years this has been our best category, measured by average return, and has also maintained by far the best percentage of profitable transactions. This approach was the way I was taught the business, and it formerly

accounted for a large proportion of all our investment ideas. Our total individual profits in this category during the twelve year BPL history are probably fifty times or more our total losses. The cash register really rang on one simple industry idea (implemented in several ways) in this area in 1968. We even received a substantial fee (included in Other Income in the audit) for some work in this field.

Our total investment in this category (which is where I feel by far the greatest certainty regarding consistently decent results) is presently under \$2 million and I have nothing at all in the hopper to bolster this. What came through like the Johnstown flood in 1968 looks more like a leaky faucet in Altoona for 1969.

Generals - Relatively Undervalued

This category produced about two-thirds of the overall gain in 1966 and 1967 combined. I mentioned last year that the great two-year performance here had largely come from one idea. I also said, "We have nothing in this group remotely approaching the size or potential which formerly existed in this investment." It gives me great pleasure to announce that this statement was absolutely correct. It gives me somewhat less pleasure to announce that it must be repeated this year.

Workouts

This category, which was a disaster in 1967, did well during 1968. Our relatively heavy concentration in just a few situations per year (some of the large arbitrage houses may become involved in fifty or more workouts per annum) gives more variation in yearly results than an across-the-board approach. I feel the average profitability will be as good with our policy and 1968 makes me feel better about that conclusion than 1967 did.

It should again be stated that our results in the Workout area (as well as in other categories) are somewhat understated compared to the more common method of determining results computed on an initial base figure and utilizing borrowed money (which is often a sensible part of the Workout business).

I can't emphasize too strongly that the quality and quantity of ideas is presently at an all time low - the product of the factors mentioned in my October 9th, 1967 letter, which have largely been intensified since then.

Sometimes I feel we should have a plaque in our office like the one at the headquarters of Texas Instruments in Dallas which reads: "We don't believe in miracles, we rely on them." It is possible for an old, overweight ball player, whose legs and batting eye are gone, to tag a fast ball on the nose for a pinch-hit home run, but you don't change your line-up because of it.

We have a number of important negatives operating on our future and, while they shouldn't add up to futility, they certainly don't add up to more than an average of quite moderate profitability.

Memorabilia

As one of my older friends says, "Nostalgia just isn't what it used to be." Let's take a stab at it, anyway.

Buffett Associates, Ltd., the initial predecessor partnership, was formed May 5, 1956 with seven limited partners (four family, three close friends), contributing \$105,000, and the General Partner putting his money where his mouth was by investing \$100. Two additional single-family limited partnerships were formed during 1956, so that on January 1, 1957 combined net assets were \$303,726. During 1957, we had a gain of \$31,615.97, leading to the 10.4% figure shown on page one. During 1968 I would guess that the New York Stock Exchange

was open around 1,200 hours, giving us a gain of about \$33,000 per hour (sort of makes you wish they had stayed with the 5-1/2 hour, 5 day week, doesn't it), or roughly the same as the full year gain in 1957.

On January 1, 1962 we consolidated the predecessor limited partnerships moved out of the bedroom and hired our first full-time employees. Net assets at that time were \$7,178,500. From that point to our present net assets of \$104,429,431 we have added one person to the payroll. Since 1963 (Assets \$9,405,400) rent has gone from \$3,947 to \$5,823 (Ben Rosner would never have forgiven me if I had signed a percentage lease) travel from \$3,206 to \$3,603, and dues and subscriptions from \$900 to \$994. If one of Parkinson's Laws is operating, at least the situation hasn't gotten completely out of control.

In making our retrospective survey of our financial assets, our conclusion need not parallel that of Gypsy Rose Lee who opined, when reviewing her physical assets on her fifty-fifth birthday: "I have everything I had twenty years ago - it's just that it's all lower."

Miscellaneous

Although the investment environment is difficult, the office environment is superb. With Donna, Gladys, Bill and John, we have an organization that functions speedily, efficiently and pleasantly. They are the best.

The office group, along with spouses (one apiece - I still haven't figured out how I should handle that plural) and children have over \$27 million invested in BPL on January 1, 1969. Assorted sizes and shapes of aunts, uncles, parents, in-laws, brothers, sisters and cousins make the BPL membership list read like "Our Crowd" - which, so far as I am concerned, is exactly what it is.

Within a few days, you will receive:

1. A tax letter giving you all BPL information needed for your 1968 federal income tax return. This letter is the only item that counts for tax purposes.
2. An audit from Peat Marwick, Mitchell & Co. (they have again done an excellent job) for 1968, setting forth the operations and financial position of BPL, as well as your own capital account.
3. A letter signed by me setting forth the status of your BPL interest on January 1, 1969. This is identical with the figures developed in the audit.

Let me know if anything in this letter or that occurs during the year needs clarifying. My next letter will be about July 10th, summarizing the first half of this year.

Cordially,

Warren E. Buffett

BUFFETT PARTNERSHIP. LTD.
610 KIEWIT PLAZA
OMAHA, NEBRASKA 68131
TELEPHONE 042-4110

May 29th, 1969

To My Partners:

About eighteen months ago I wrote to you regarding changed environmental and personal factors causing me to modify our future performance objectives.

The investing environment I discussed at that time (and on which I have commented in various other letters has generally become more negative and frustrating as time has passed. Maybe I am merely suffering from a lack of mental flexibility. (One observer commenting on security analysts over forty stated: "They know too many things that are no longer true.")

However, it seems to me that: (1) opportunities for investment that are open to the analyst who stresses quantitative factors have virtually disappeared, after rather steadily drying up over the past twenty years; (2) our \$100 million of assets further eliminates a large portion of this seemingly barren investment world, since commitments of less than about \$3 million cannot have a real impact on our overall performance, and this virtually rules out companies with less than about \$100 million of common stock at market value; and (3) a swelling interest in investment performance has created an increasingly short-term oriented and (in my opinion) more speculative market.

The October 9th, 1967 letter stated that personal considerations were the most important factor among those causing me to modify our objectives. I expressed a desire to be relieved of the (self-imposed) necessity of focusing 100% on BPL. I have flunked this test completely during the last eighteen months. The letter said: I hope limited objectives will make for more limited effort. It hasn't worked out that way. As long as I am "on stage", publishing a regular record and assuming responsibility for management of what amounts to virtually 100% of the net worth of many partners, I will never be able to put sustained effort into any non-BPL activity. If I am going to participate publicly. I can't help being competitive. I know I don't want to be totally occupied with out-pacing an investment rabbit all my life. The only way to slow down is to stop.

Therefore, before yearend. I intend to give all limited partners the required formal notice of my intention to retire. There are, of course, a number of tax and legal problems in connection with liquidating the Partnership, but overall, I am concerned with working out a plan that attains the following objectives:

1. The most important item is that I have an alternative regarding money management to suggest to the many partners who do not want to handle this themselves. Some partners of course, have alternatives of their own in which they have confidence and find quite acceptable. To the others, however, I will not hand over their money with a "good luck". I intend to suggest an alternative money manager to whom I will entrust funds of my relatives and others for whom I have lifetime financial responsibility. This manager has integrity and ability and will probably perform as well or better than I would in the future (although nowhere close to what he or I have achieved in the past). He will be available to any partner, so that no minimum size for accounts will cause any of you a problem. I intend, in the future, to keep in general touch with what he is doing, but only on an infrequent basis with any advice on my part largely limited to a negative type.
2. I want all partners to have the option of receiving cash and possibly readily marketable securities (there will probably be only one where this will apply) where I like both the prospects and price but which

partners will be able to freely convert to cash if they wish.

3. However, I also want all partners to have the option of maintaining their proportional interests in our two controlled companies (Diversified Retailing Company Inc. and Berkshire Hathaway Inc.) and one other small "restricted" holding. Because these securities will be valued unilaterally by me at fair value, I feel it is essential that, if you wish, you can maintain your proportionate interest at such valuation.

However, these securities are not freely marketable (various SEC restrictions apply to "control" stock and non-registered stock) and they will probably be both non-transferable and non-income-producing for a considerable period of time. Therefore, I want you to be able to go either way in our liquidation - either stick with the restricted securities or take cash equivalent. I strongly like all of the people running our controlled businesses (joined now by the Illinois National Bank and Trust Company of Rockford, Illinois, a \$100 million plus, extremely well-run bank, purchased by Berkshire Hathaway earlier this year), and want the relationship to be life long. I certainly have no desire to sell a good controlled business run by people I like and admire, merely to obtain a fancy price. However, specific conditions may cause the sale of one operating unit at some point.

I believe we will have a liquidation program which will accomplish the above objectives. Our activities in this regard should cause no change in your tax planning for 1969.

One final objective, I would like very much to achieve (but which just isn't going to happen) is to go out with a bang. I hate to end with a poor year, but we are going to have one in 1969. My best guess is that at yearend, allowing for a substantial increase in value of controlled companies (against which all partners except me will have the option of taking cash), we will show a breakeven result for 1969 before any monthly payments to partners. This will be true even if the market should advance substantially between now and yearend, since we will not be in any important position which will expose us to much upside potential.

Our experience in workouts this year has been atrocious - during this period I have felt like the bird that inadvertently flew into the middle of a badminton game. We are not alone in such experience, but it came at a time when we were toward the upper limit of what has been our historical range of percentage commitment in this category.

Documenting one's boners is unpleasant business. I find "selective reporting" even more distasteful. Our poor experience this year is 100% my fault. It did not reflect bad luck, but rather an improper assessment of a very fast-developing governmental trend. Paradoxically, I have long believed the government should have been doing (in terms of the problem attacked - not necessarily the means utilized) what it finally did - in other words, on an overall basis, I believe the general goal of the activity which has cost us substantial money is socially desirable and have so preached for some time. Nevertheless, I didn't think it would happen. I never believe in mixing what I think should happen (socially) with what I think will happen in making decisions - in this case, we would be some millions better off if I had.

Quite frankly, in spite of any factors set forth on the earlier pages. I would continue to operate the Partnership in 1970, or even 1971, if I had some really first class ideas. Not because I want to, but simply because I would so much rather end with a good year than a poor one. However, I just don't see anything available that gives any reasonable hope of delivering such a good year and I have no desire to grope around, hoping to "get lucky" with other people's money. I am not attuned to this market environment and I don't want to spoil a decent record by trying to play a game I don't understand just so I can go out a hero.

Therefore, we will be liquidating holdings throughout the year, working toward a residual of the controlled companies, the one "investment letter" security, the one marketable security with favorable long-term prospects,

and the miscellaneous "stubs", etc. of small total value which will take several years to clean up in the Workout category.

I have written this letter a little early in lieu of the mid-year letter. Once I made a decision, I wanted you to know. I also wanted to be available in Omaha for a period after you received this letter to clear up anything that may be confusing in it. In July, I expect to be in California.

Some of you are going to ask, "What do you plan to do?" I don't have an answer to that question. I do know that when I am 60, I should be attempting to achieve different personal goals than those which had priority at age 20. Therefore, unless I now divorce myself from the activity that has consumed virtually all of my time and energies during the first eighteen years of my adult life, I am unlikely to develop activities that will be appropriate to new circumstances in subsequent years.

We will have a letter out in the Fall, probably October, elaborating on the liquidation procedure, the investment advisor suggestion, etc...

Cordially,

Warren E. Buffett

October 9th, 1969

To My Partners:

Here is my present estimate of the BPL calendar for the months to come:

- (1) This letter - to tell you something of Bill Ruane, the money manager within my knowledge who ranks the highest when combining the factors of integrity, ability and continued availability to all partners. I also want to comment upon the present range of expectations involved in deciding on a bond-stock mix.
- (2) Late November - the required thirty days formal notice of my intent to retire from the Partnership at the end of the year.
- (3) Early December - a package of publicly available material, as well as some general comments by me relating to our controlled companies. Berkshire Hathaway Inc. (owning the textile business, Illinois National Bank and Trust Company of Rockford, Illinois, National Indemnity Company and National Fire and Marine Insurance Company and Sun Newspapers) and Diversified Retailing Company (owning Hochschild, Kohn & Co. and Associated Cotton Shops). I want you to have ample time to study the material relating to such companies before you make any decision to hold, sell or buy such securities after distribution to you in early January. I will solicit written questions from partners (I don't want to talk to you individually about such companies, as I want all partners to obtain exactly the same information) and then have a further mailing late in December, giving all questions received relating to these companies along with my answers, if possible. I still anticipate having a plan enabling partners to promptly convert such controlled company holdings to cash, if they wish.
- (4) About January 5th - (a) a cash distribution amounting to at least 56% (probably more - depending upon what percentage of our remaining holdings are sold before yearend) of your January 1, 1969 capital, less any distributions (the regular monthly payments many of you receive) or borrowings by you during 1969, (b) your proportional share of our holdings in Diversified Retailing Company Inc. and Berkshire Hathaway Inc. I which, if you dispose of them, will bring 30% - 35% (my estimate of value will be made at yearend) of your January 1, 1969 capital.

We may make substantial additional sales before yearend - if so, the early January cash distribution will be somewhat larger than the 56% mentioned above. If we don't, such sales will be made during the first half of 1970 and an interim distribution made. Residual assets will be sold at appropriate times and I believe not more than 10% of our present asset value will remain after June 30th, 1970 pending a final distribution when all assets and liabilities have been cleaned up.

Unless there is a further substantial decline in the market. I still expect about a breakeven performance before any monthly payments for 1969. We were lucky - if we had not been in liquidation this year, our results would have been significantly worse. Ideas that looked potentially interesting on a "continuing" basis have on balance performed poorly to date. We have only two items of real size left - one we are selling as I write this and the other is a holding of limited marketability representing about 7-1/2% of the outstanding stock of Blue Chip Stamps which we may sell via a registered public offering around yearend, depending upon market conditions and other factors.

- (5) March 1st, 1970 - John Harding expects to leave Buffett Partnership, Ltd. and open a branch office in Omaha for Ruane, Cunniff & Stires. Bill Scott and I will be available at BPL offices to help any partners who are desirous of purchasing bonds, tax-free or taxable. We will set aside the month of March to make our services available without cost to those who want to acquire bonds. Because of some experience we have in analysis and purchasing, as well as the access we have to wholesale markets. I think it is likely we can save material elements of cost as well as help select better relative values for those of you who wish to invest in bonds. After April 1st, however, we want to be out of any form of personal advisory activity.
- (6) After March, 1970 - Bill and I will continue to office in Kiewit Plaza, spending a very minor portion of our time completing the wind-up of BPL. This will mean filing tax returns for 1970 and probably 1971 resolving minor assets and liabilities etc.

Now, to Bill Ruane - we met in Ben Graham's class at Columbia University in 1951 and I have had considerable opportunity to observe his qualities of character, temperament and intellect since that time. If Susie and I were to die while our children are minors, he is one of three trustees who have carte blanche on investment matters - the other two are not available for continuous investment management for all partners, large or small.

There is no way to eliminate the possibility of error when judging humans particularly in regard to future behavior in an unknown environment. However, decisions have to be made - whether actively or passively - and I consider Bill to be an exceptionally high probability decision on character and a high probability one on investment performance. I also consider it likely that Bill will continue as a money manager for many years to come.

Bill has recently formed a New York Stock Exchange firm, Ruane, Cunniff & Stires, Inc., 85 Broad Street, New York, N.Y. 10004, telephone number (212) 344-6700. John Harding presently plans to establish an office for the firm in Omaha about March 1st, 1970. Bill manages accounts individually on a fee basis and also executes brokerage for the accounts - presently with some portion of the brokerage commissions used to offset a portion of the investment advisory fee. His method of operation allows monthly withdrawals on a basis similar to BPL - as a percentage of capital and unrelated to realized or unrealized gain or loss. It is possible he may form some sort of pooled account but such determinations will be made between him and those of you who elect to go with him. I, of course, will not be involved with his operation. I am making my list of partners available to him and he will be writing you fairly soon regarding a trip he plans to make before yearend to Omaha, Los Angeles and Chicago, so that those of you who wish to meet him may do so. Any of you who are going to be in New York during the next few months can contact him directly.

Bill's overall record has been very good-averaging fairly close to BPL's, but with considerably greater variation. From 1956-1961 and from 1964-1968, a composite of his individual accounts averaged over 40% per annum. However, in 1962, undoubtedly somewhat as a product of the euphoric experience of the earlier years, he was down about 50%. As he re-oriented his thinking, 1963 was about breakeven.

While two years may sound like a short time when included in a table of performance, it may feel like a long time when your net worth is down 50%. I think you run this sort of short-term risk with virtually any money manager operating in stocks and it is a factor to consider in deciding the portion of your capital to commit to equities. To date in 1969, Bill is down about 15%, which I believe to be fairly typical of most money managers. Bill, of course, has not been in control situations or workouts, which have usually tended to moderate the swings in BPL year-to-year performance. Even excluding these factors, I believe his performance would have been somewhat more volatile (but not necessarily poorer by any means) than mine - his style is different, and while his typical portfolio (under most conditions) would tend to have a mild overlap with mine, there would always be very significant differences.

Bill has achieved his results working with an average of \$5 to \$10 million. I consider the three most likely negative factors in his future to be: (1) the probability of managing significantly larger sums - this is a problem you are going to have rather quickly with any successful money manager, and it will tend to moderate performance; I believe Bill's firm is now managing \$20 - \$30 million and, of course, they will continue to add accounts; (2) the possibility of Bill's becoming too involved in the detail of his operation rather than spending all of his time simply thinking about money management. The problems of being the principal factor in a NYSE firm as well as handling many individual accounts can mean that he, like most investment advisors, will be subject to pressures to spend much of his time in activities that do nothing to lead to superior investment performance. In this connection, I have asked Bill to make his services available to all BPL partners - large or small and he will, but I have also told him he is completely a free agent if he finds particular clients diverting him from his main job; (3) the high probability that even excellent investment management during the next decade will only produce limited advantages over passive management. I will comment on this below.

The final point regarding the negatives listed above is that they are not the sort of drawbacks leading to horrible performance, but more likely the sort of things that lead to average performance. I think this is the main risk you run with Bill - and average performance is just not that terrible a risk.

In recommending Bill, I am engaging in the sort of activity I have tried to avoid in BPL portfolio activities - a decision where there is nothing to gain (personally) and considerable to lose. Some of my friends who are not in the Partnership have suggested that I make no recommendation since, if results were excellent it would do me no good and, if something went wrong, I might well get a portion of the blame. If you and I had just had a normal commercial relationship, such reasoning might be sound. However, the degree of trust partners have extended to me and the cooperation manifested in various ways precludes such a "hands off" policy. Many of you are professional investors or close thereto and need no advice from me on managers - you may well do better yourself. For those partners who are financially inexperienced. I feel it would be totally unfair for me to assume a passive position and deliver you to the most persuasive salesman who happened to contact you early in 1970.

Finally, a word about expectations. A decade or so ago was quite willing to set a target of ten percentage points per annum better than the Dow, with the expectation that the Dow would average about 7%. This meant an expectancy for us of around 17%, with wide variations and no guarantees, of course - but, nevertheless, an expectancy. Tax-free bonds at the time yielded about 3%. While stocks had the disadvantage of irregular performance, overall they seemed much the more desirable option. I also stressed this preference for stocks in teaching classes, participating in panel discussions, etc...

For the first time in my investment lifetime. I now believe there is little choice for the average investor between professionally managed money in stocks and passive investment in bonds. If correct. this view has important implications. Let me briefly (and in somewhat oversimplified form) set out the situation as I see it:

- (1) I am talking about the situation for, say, a taxpayer in a 40% Federal Income Tax bracket who also has some State Income Tax to pay. Various changes are being proposed in the tax laws, which may adversely affect net results from presently tax-exempt income, capital gains, and perhaps other types of investment income. More proposals will probably come in the future. Overall, I feel such changes over the years will not negate my relative expectations about after-tax income from presently tax-free bonds versus common stocks, and may well even mildly reinforce them.
- (2) I am talking about expectations over the next ten years - not the next weeks or months. I find it much easier to think about what should develop over a relatively long period of time than what is likely in any short period. As Ben Graham said: "In the long run, the market is a weighing machine - in the short run, a voting machine." I have always found it easier to evaluate weights dictated by fundamentals than votes dictated by psychology.

- (3) Purely passive investment in tax-free bonds will now bring about 6-1/2%. This yield can be achieved with excellent quality and locked up for just about any period for which the investor wishes to contract. Such conditions may not exist in March when Bill and I will be available to assist you in bond purchases, but they exist today.
- (4) The ten year expectation for corporate stocks as a group is probably not better than 9% overall. say 3% dividends and 6% gain in value. I would doubt that Gross National Product grows more than 6% per annum - I don't believe corporate profits are likely to grow significantly as a percentage of GNP - and if earnings multipliers don't change (and with these assumptions and present interest rates they shouldn't) the aggregate valuation of American corporate enterprise should not grow at a long-term compounded rate above 6% per annum. This typical experience in stocks might produce (for the taxpayer described earlier) 1-3/4% after tax from dividends and 4-3/4% after tax from capital gain, for a total after-tax return of about 6-1/2%. The pre-tax mix between dividends and capital gains might be more like 4% and 5%, giving a slightly lower aftertax result. This is not far from historical experience and overall, I believe future tax rules on capital gains are likely to be stiffer than in the past.
- (5) Finally, probably half the money invested in stocks over the next decade will be professionally managed. Thus, by definition virtually, the total investor experience with professionally managed money will be average results (or 6-1/2% after tax if my assumptions above are correct).

My judgment would be that less than 10% of professionally managed money (which might imply an average of \$40 billion just for this superior segment) handled consistently for the decade would average 2 points per annum over group expectancy. So-called "aggressively run" money is unlikely to do significantly better than the general run of professionally managed money. There is probably \$50 billion in various gradations of this "aggressive" category now - maybe 100 times that of a decade ago - and \$50 billion just can't "perform".

If you are extremely fortunate and select advisors who achieve results in the top 1% to 2% of the country (but who will be working with material sums of money because they are that good), I think it is unlikely you will do much more than 4 points per annum better than the group expectancy. I think the odds are good that Bill Ruane is in this select category. My estimate, therefore, is that over the next decade the results of really excellent management for our "typical taxpayer" after tax might be 1-3/4% from dividends and 7-3/4% from capital gain. or 9 -1.2% overall.

- (6) The rather startling conclusion is that under today's historically unusual conditions, passive investment in tax-free bonds is likely to be fully the equivalent of expectations from professionally managed money in stocks, and only modestly inferior to extremely well-managed equity money.
- (7) A word about inflation - it has very little to do with the above calculation except that it enters into the 6% assumed growth rate in GNP and contributes to the causes producing 6-1/2% on tax-free bonds. If stocks should produce 8% after tax and bonds 4%, stocks are better to own than bonds, regardless of whether prices go up, down or sideways. The converse is true if bonds produce 6-1/2% after tax. and stocks 6%. The simple truth, of course, is that the best expectable after-tax rate of return makes the most sense - given a rising, declining or stable dollar.

All of the above should be viewed with all the suspicion properly accorded to assessments of the future. It does seem to me to be the most realistic evaluation of what is always an uncertain future - I present it with no great feeling regarding its approximate accuracy, but only so you will know what I think at this time.

You will have to make your own decision as between bonds and stocks and, if the latter, who advises you on

such stocks. In many cases, I think the decision should largely reflect your tangible and intangible (temperamental) needs for regularity of income and absence of large principal fluctuation, perhaps balanced against psychic needs for some excitement and the fun associated with contemplating and perhaps enjoying really juicy results. If you would like to talk over the problem with me, I will be very happy to help.

Sincerely,

Warren E. Buffett

December 5th, 1969

To My Partners:

This letter is to supply you with some published information relating to our two controlled companies (and their four principal operating components), as well as to give you my general views regarding their operations. My comments are not designed to give you loads of detailed information prospectus-style, but only my general "slant" as I see the businesses at this time.

At yearend, BPL will own 800,000 of 1,000,000 shares outstanding of Diversified Retailing Company. First Manhattan Company and Wheeler, Munger & Company will each own 100,000 shares. DRC previously owned 100% of Hochschild, Kohn & Company of Baltimore, and currently owns 100% of Associated Retail Stores (formerly named Associated Cotton Shops). On December 1st, DRC sold its entire interest in H-K to Supermarkets General Corp. for \$5,045,205 of cash plus non-interest bearing SGC notes for \$2 million due 2-1-70, and \$4,540,000 due 2-1-71. The present value of these notes approximates \$6.0 million so, effectively, DRC received about \$11 million on the sale. Various warranties were made by DRC in connection with the sale, and, while we expect no claims pursuant to the contract, a remote contingent liability always exists while warranties are in force.

Associated Retail Stores has a net worth of about \$7.5 million. It is an excellent business with a strong financial position, good operating margins and a record of increasing sales and earnings in recent years. Last year, sales were about \$37.5 million and net income about \$1 million. This year should see new records in sales and earnings, with my guess on the latter to be in the area of \$1.1 million after full taxes.

DRC has \$6.6 million in debentures outstanding (prospectus with full description of the business as of December 18th, 1967 and the debenture terms will be sent you upon request) which have one unusual feature in that if I, or an entity controlled by me, is not the largest shareholder of DRC, the debentureholders have the right to present their debentures for payment by the company at par.

Thus, DRC has tangible net assets of about \$11.50 - \$12.00 per share, an excellent operating business and substantial funds available for reinvestment in other operating businesses. On an interim basis, such funds will be employed in marketable securities.

Berkshire Hathaway Inc. has 983,582 shares outstanding, of which BPL owns 691,441. B-H has three main operating businesses, the textile operation, the insurance operation (conducted by National Indemnity Company and National Fire & Marine Insurance Company, which will be collectively called the insurance company) and the Illinois National Bank and Trust Company of Rockford, Illinois. It also owns Sun Newspapers Inc, Blacker Printing Company and 70% of Gateway Underwriters, but these operations are not financially significant relative to the total.

The textile operation presently employs about \$16 per share in capital and, while I think it has made some progress relative to the textile industry generally, cannot be judged a satisfactory business. Its return on capital has not been sufficient to support the assets employed in the business and, realistically, an adequate return has less than an even chance of being averaged in the future. It represents the best segments of the business that existed when we purchased control four and one-half years ago. Capital from the other segments has been

successfully redeployed - first, on an interim basis into marketable securities and, now on a permanent basis into insurance and banking. I like the textile operating people - they have worked hard to improve the business under difficult conditions - and, despite the poor return, we expect to continue the textile operation as long as it produces near current levels.

The insurance operation (of which B-H owns virtually 100%) and the bank (where B-H owns 97.7%) present a much happier picture. Both are first-class businesses, earning good returns on capital and stacking up well on any absolute or comparative analysis of operating statistics. The bank has about \$17 per share of net tangible assets applicable to B-H, and the insurance company approximately \$15. I would estimate their normal current earning power to be about \$4 per share (compared to about \$3.40 from operations pro-forma in 1968), with good prospects for future growth on the combined \$32 of tangible net assets in the bank and insurance company. Adding in the textile business and miscellaneous assets, and subtracting parent company bank debt of about \$7 million, gives a tangible net asset value of about \$43 per share for B-H, or about \$45 stated book value, allowing for the premium over tangible assets paid for the bank.

One caveat - when I talk above of tangible net assets. I am valuing the \$75 million of bonds held by the insurance company and bank at amortized cost. This is in accord with standard accounting procedures used in those industries and also in accord with the realities of their business operations where it is quite unlikely that bonds will have to be sold before maturity. At today's historically low bond prices, however, our bonds have a market value substantially below carrying value, probably on the order of \$10 per share of B-H stock.

Between DRC and B-H, we have four main operating businesses with three of them in my opinion, definitely first class by any of the usual standards of evaluation. The three excellent businesses are all run by men over sixty who are largely responsible for building each operation from scratch. These men are hard working, wealthy, and good – extraordinarily good. Their age is a negative, but it is the only negative applicable to them. One of the reasons I am happy to have a large segment of my capital in B-H and DRC is because we have such excellent men in charge of the operating businesses.

We have various annual reports, audits, interim reports, proxy materials prospectuses, etc... applicable to our control holdings and we will be glad to supply you with any item you request. I also solicit your written questions and will send to all partners the questions and answers shortly before yearend. Don't hesitate to ask any question at all that comes to mind - if it isn't clear to you, it probably isn't clear to others - and there is no reason for any of you to be wondering about something that I might clear up.

DRC and B-H presently pay no dividends and will probably pay either no dividends or very modest dividends for some years to come. There are a number of reasons for this. Both parent companies have borrowed money - we want to maintain a good level of protection for depositors at the bank and policyholders at the insurance company - some of the operating companies have very satisfactory ways to utilize additional capital - and we are hopeful of finding new businesses to both diversify and augment our earning power.

My personal opinion is that the intrinsic value of DRC and B-H will grow substantially over the years. While no one knows the future, I would be disappointed if such growth wasn't at a rate of approximately 10% per annum. Market prices for stocks fluctuate at great amplitudes around intrinsic value but, over the long term, intrinsic value is virtually always reflected at some point in market price. Thus, I think both securities should be very decent long-term holdings and I am happy to have a substantial portion of my net worth invested in them. You should be unconcerned about short-term price action when you own the securities directly, just as you were unconcerned when you owned them indirectly through BPL. I think about them as businesses, not "stocks", and if the business does all right over the long term, so will the stock.

I want to stress that I will not be in a managerial or partnership status with you regarding your future holdings of such securities. You will be free to do what you wish with your stock in the future and so, of course, will I. I

think that there is a very high probability that I will maintain my investment in DRC and B-H for a very long period, but I want no implied moral commitment to do so nor do I wish to advise others over an indefinite future period regarding their holdings. The companies, of course, will keep all shareholders advised of their activities and you will receive reports as issued by them, probably on a semi-annual basis. Should I continue to hold the securities, as I fully expect to do, my degree of involvement in their activities may vary depending upon my other interests. The odds are that I will take an important position on matters of policy, but I want no moral obligation to be other than a passive shareholder, should my interests develop elsewhere.

We presently plan to make the initial BPL cash distribution on January 5th, which will now come to at least 64% of January 1, 1969 capital less any distributions (including monthly payments) you have received from us since January 1, 1969. There is now pending a public offering, headed by Merrill, Lynch, Pierce, Fenner & Smith, of our Blue Chip Stamps holdings which, if completed this month as expected, should bring the figure to at least 70%.

If you wish Bill and me to give you our ideas regarding bonds in March, you should purchase U.S. Treasury Bills maturing in late March with the applicable portion of the January 5th distribution. Then advise us in the last week of February of the amount you wish to invest in bonds and we will let you know our thoughts.

About the middle of January (as soon as the exact amounts are figured and shares are received from the Transfer Agent after having been registered in your name) we will distribute the DRC and B-H stock applicable to your partnership interest and subsequently advise you of your tax basis and acquisition date attributable to the stock. Such shares will be "legended" as described in the enclosed letter from Monen, Seidler & Ryan. These stock certificates are valuable and should be kept in a safe place.

In past letters I had expressed the hope that BPL could supply a mechanism whereby you could, if you wished, automatically convert your DRC and B-H to cash. I have had two law firms consider extensively the status of these shares in your hands following the liquidation and the accompanying letters (which should be saved and kept with the shares) give their conclusions. As you can see, it is not an area that produces simple, clear-cut guidelines. I see no prudent way to implement the alternatives I had previously been considering. Therefore, you must follow the guidelines they set forth if you wish to dispose of your shares. As you probably realize, the restrictions on subsequent sale apply more severely to Susie and me (because of my continued "insider" position) than they probably do to you. Substantial quantities of securities often are sold via the "private sale" option described in paragraph (3) of the opinion. If the rules become clearer or more simplified in the future, I will be sure to let you know.

At the time of distribution of DRC and B-H, I will advise you of the values applied to such shares at 1969 yearend. You will receive our audit and tax letter about the end of January. It presently appears that sale of our Blue Chip shares and a substantial increase in value of DRC and B- H will bring our overall gain for the year to slightly over 6%.

My next letter will be in late December, summarizing the questions and answers regarding DRC and B-H. and also supplying a final estimate on the January 5th cash distribution.

December 26, 1969

To My Partners:

Our plans regarding the initial cash distribution have been finalized and we expect to mail to you on January 3rd a check dated January 5th, 1970 for approximately 64% of your January 1st, 1969 capital, less any distributions made to you (including monthly payments) since January 1st, 1969. If you have taken no monthly payments during 1969, there will be a small interest adjustment in your favor; if you have had loans from BPL, there will be an interest charge. I couldn't be more delighted about the action of the bond and stock markets from the standpoint of the timing of our liquidation. I believe practically all partners - whether they would have invested in bonds or stocks - will be far better off receiving the cash now than if we had liquidated at the end of last year. Those seeking income will receive about 40% more after tax on the same principal investment than they would have achieved only a year ago at what then seemed like generous yields.

Our tax picture is virtually complete and it appears that you will have ordinary income (dividends plus interest income less ordinary loss) for Federal tax purposes of about 3 - 3/4% of your January 1st, 1969 capital (item 1 in enclosed letter), no significant long-term capital gain or loss, and a short-term capital loss of about 8-1/2% of your January 1st, 1969 unrealized appreciation (item 3). These estimates are just rough approximations - definitive figures will reach you in early February.

The sale of our 371,400 shares of Blue Chip Stamps was not completed in 1969. When the stock went into registration, it was selling at about \$24 per share. The underwriters indicated a range where they expected to offer our shares (along with others) with heavy weight placed on a comparison with Sperry & Hutchinson. Shortly before the stock was to be offered, with the Dow-Jones Industrials much lower but S & H virtually unchanged, they indicated a price below their former range. We reluctantly agreed and felt we had a deal but, on the next business day, they stated that our agreed price was not feasible. We then withdrew and a much smaller offering was done.

I intend to hold our block of Blue Chip Stamps in BPL for a more advantageous disposal or eventual distribution to our partners. The odds are decent that we will do better in this manner - even if it takes a year or two - than if we had participated in a very large sale into a somewhat distressed market. Unless there is a material change in the market in the next few days, I plan to value our Blue Chip holdings at yearend at the price received by selling shareholders on the public offering after underwriting discount and expenses.

Various questions have been asked pursuant to the last letter:

1. If we are not getting a good return on the textile business of Berkshire Hathaway Inc., why do we continue to operate it?

Pretty much for the reasons outlined in my letter. I don't want to liquidate a business employing 1100 people when the Management has worked hard to improve their relative industry position, with reasonable results, and as long as the business does not require substantial additional capital investment. I have no desire to trade severe human dislocations for a few percentage points additional return per annum. Obviously, if we faced material compulsory additional investment or sustained operating losses, the decision might have to be different, but I don't anticipate such alternatives.

2. How large is our investment in Sun Newspapers, etc., and do we intend to expand in the newspaper, radio and TV business?

The combined investment in Sun, Blacker Printing and Gateway Underwriters is a little over \$1 per share of Berkshire Hathaway, and earns something less than 10 cent per share. We have no particular plans to expand in the communication field.

3. What does Gateway Underwriters do?

Gateway Underwriters serves primarily as a General Agent for National Indemnity Company in the State of Missouri.

4. Are there good "second men" to take over from the men running the three excellent operating businesses?

In any company where the founder and chief driving force behind the enterprise is still active, it is very difficult to evaluate "second men". The only real way to see how someone is going to do when running a company is to let him run it. Some of our businesses have certainly been more "one-man shows" than the typical corporation. Subject to the foregoing caveat, I think that we do have some good "second men" coming along.

5. In what area do you plan to invest the cash in Diversified Retailing Company and do you intend to stick primarily to the retailing field?

While we prefer the retailing field, we do not preclude anything that will make sense. We have been looking without success for two years for an intelligent acquisition for DRC, so we are not about to rule out any industry, if the business looks good. Pending such time as we find one or more operating businesses to buy, the money will be invested in marketable securities.

6. Why didn't DRC payout the money it received on the sale of Hochschild, Kohn & Company?

In addition to the fact that such a payment would constitute a dividend, taxable in significant part as ordinary income, there are restrictions in the bond indenture which prevent such a pay-out without turning over control of the company to the bondholders.

7. Will distribution of the DRC stock cause the DRC debentures to be called?

After distribution of the stock, I will be the largest stockholder in DRC and, hence, the call provision will not apply.

8. How would we know if the DRC debentures were called?

All stockholders and debenture holders would find out directly from the company through regular or special reports that the company issues to its security holders. There is no intention at all of calling the debentures.

9. Why did you not register our Berkshire Hathaway and Diversified Retailing shares so that the stock, when received by the partners, would be freely marketable?

We considered this possibility but rejected it for both practical and legal considerations. I will just discuss the practicalities, since they would independently dictate the decision we made.

There is presently no existing market for Diversified Retailing, and our holdings of Berkshire Hathaway are probably four or five times the present floating supply of this stock. An attempt to quickly buy or sell a few thousand shares can easily move BH stock several points or more. We own 691,441 shares. Were we to distribute these stocks to you via a registration without an underwriting, and with the possibility that a substantial portion would be offered for sale by many sellers operating individually but virtually simultaneously, there is a real likelihood, particularly in a stock market environment such as we have seen recently, that the market for these two stocks would be little short of chaotic. It has not seemed to me that this was the kind of situation with which I should leave you, both from the standpoint of the price level which might prevail, as well as for the reason that different partners might well have to liquidate at widely varying price levels. The more sophisticated partners might have an important edge on the less sophisticated ones, and I believe many partner's might have no chance to realize the prices I anticipate using for yearend valuation. This would rightly seem most unfair to you, since I would have received some allocation of 1969 BPL profits based upon these yearend valuations. If the markets were to become distressed, I would probably come in for criticism, whether I personally bought at lower prices or, perhaps more so, if I refrained from buying.

Were we to attempt to sponsor an underwriting in connection with a registration for those partners who might wish to sell, there would be, in my opinion, the likelihood that the result would still be far less than satisfactory. We have just been around this track with our holdings of Blue Chip Stamps, where we watched the price of our stock go from 24 to 16-1/2 after announcement of the underwriting, of which we originally were to be a part. I did not want this sort of result for the partners with respect to their holdings of Berkshire and Diversified.

It is my belief that, by confining sales to private placements, those partners who wish to sell will realize more for their stock (with the sophisticated partners having no marketing edge on the less knowledgeable) than would be achieved, through an underwriting at this time. Also, the stock should be more likely to find its way into the hands of long-term investment-minded holders, which should mean less volatile markets in the future. We have had several phone calls from persons indicating that they wish to make private sales - we anticipate there will be no difficulty in effectuating such sales at prices related to our yearend valuations.

Those partners who would prefer an underwritten distribution always have the option of having a registration of their own. I will be glad to facilitate this by placing all partners in touch with each other who indicate to me their desire to sell via a registered underwriting, at their expense and through an underwriter of their choice. In this way the expense of an underwriting, which can be considerable, would be borne by the selling partners and not by the partners as a whole.

I have also had partners ask if they could participate in a registered offering in the future if I should sell shares in this manner. I think it is almost certain I will never sell stock via public offering but, should it ever happen, I will be glad to let any of you participate in any underwritten offering in which I might be involved. In all probability, if it ever did happen, your stock would already be "free", although mine would still be restricted. I cannot make the same commitment to you regarding any private sale I might make in the future, just as I can't expect you to restrict any sale options you might have in order to include me.

10. Will you let us know if you sell your holdings of BH or DRC?

You would undoubtedly know from corporate communications, reports in the press and reports to Government agencies if I disposed of my holdings. I have no intention at all of doing so in the foreseeable future - I merely make no commitment not to. However, former BPL partners will have no priority over other BH or DRC security holders in obtaining information relating to their corporate activities.

11. Should I hold my BH or DRC stock?

I can't give you the answer on this one. All I can say is that I'm going to do so and I plan to buy more. I am very happy to have a material portion of my net worth invested in these companies on a long term basis. Obviously, I think they will be worth significantly more money five or ten years hence. Compared to most stocks, I think there is a low risk of loss. I hope their price patterns follow a rather moderate range related to business results rather than behaving in a volatile manner related to speculative enthusiasm or depression. Obviously, I cannot control the latter phenomena, but there is no intent to "promote" the stocks a la much of the distasteful general financial market activity of recent years.

12. Can I give either BH or DRC shares to my wife or children?

We are advised by counsel that this is permissible but, of course the same restrictions on transfer that applied to you would apply to the donee of the gift.

13. Why are you waiting until March to give us your suggestions regarding bonds?

January and February promise to be very busy months. Many partners may want to talk to me about their questions and objectives regarding bonds. I want to have all important BPL matters out of the way before I talk with any of them on an individual basis. I make no forecasts regarding the bond market (or stock market) - it may be higher or lower in March than now. After my October letter, several partners became very eager to buy bonds immediately - to date they are much better off by waiting. The excellent quality tax-free bonds I talked about at that time with yields of 6 -1/2% can now be bought to yield about 7%.

Cordially,

February 25th, 1970

To My Partners:

This letter will attempt to provide a very elementary education regarding tax-exempt bonds with emphasis on the types and maturities of bonds which we expect to help partners in purchasing next month. If you expect to use our help in the purchase of bonds, it is important that you carefully read (and, if necessary, reread) this letter as it will serve as background for the specific purchases I suggest. If you disagree with me as to conclusions regarding types of bonds or maturities (and you would have been right and I would have been wrong if you had disagreed with me on the latter point either one or two years ago), you may well be correct, but we cannot be of assistance to you in the purchase of bonds outside our area. We will simply have our hands full concentrating in our recommended area, so will be unavailable to assist or advise in the purchase of convertible bonds, corporate bonds or short term issues.

I have tried to boil this letter down as much as possible. Some of it will be a little weighty - some a little oversimplified. I apologize for the shortcomings in advance. I have a feeling I am trying to put all the meat of a 100 page book in 10 pages - and have it read like the funny papers.

I am sure you understand that our aid in the purchase of bonds will involve no future assistance regarding either these specific bonds or general investment decisions. I want to be available at this time to be of help because of the unusual amount of cash you have received in one distribution from us. I have no desire to be in the investment counseling business, directly or indirectly, and will not be available for discussion of financial matters after March 31st.

The mechanics of Tax-Free Bonds.

For those who wish our help, we will arrange the purchase of bonds directly from municipal bond dealers throughout the country and have them confirm sale of the bonds directly to you. The confirmation should be saved as a basic document for tax purposes. You should not send a check to the bond dealer since he will deliver the bonds to your bank, along with a draft which the bank will pay by charging your account with them. In the case of bonds purchased in the secondary market (issues already outstanding), this settlement date will usually be about a week after confirmation date whereas, on new issues, the settlement date may be as much as a month later. The settlement date is shown plainly on the confirmation ticket (in the case of new issues this will be the second and final ticket rather than the preliminary "when issued" ticket), and you should have the funds at your bank ready to pay for the bonds on the settlement date. If you presently own Treasury Bills, they can be sold on a couple of days notice by your bank upon your instructions, so you should experience no problems in having the money available on time. Interest begins to accrue to you on the settlement date, even if the bond dealer is late in getting them delivered to your bank.

Bonds will be delivered in negotiable form (so-called "bearer" form which makes them like currency) with

coupons attached. Usually the bonds are in \$5,000 denominations and frequently they can be exchanged for registered bonds (sometimes at considerable expense and sometimes free-it depends upon the terms). Bonds in registered form are nonnegotiable without assignment by you, since you are the registered owner on the Transfer Agent's books. Bonds trade almost exclusively on a bearer basis and it is virtually impossible to sell registered bonds without converting them back into bearer form. Thus, unless you are going to own great physical quantities of bonds. I recommend keeping bonds in bearer form. This means keeping them in a very safe place and clipping the coupons every six months. Such coupons, when clipped, can be deposited in your bank account just like checks. If you have \$250,000 in bonds, this probably means about fifty separate pieces of paper (\$5,000 denominations) and perhaps six or eight trips a year to the safe deposit section to cut and deposit coupons.

It is also possible to open a custody account with a bank where, for a fairly nominal cost, they will keep the bonds, collect the interest and preserve your records for you. For example, a bank will probably perform the custodial service for you for about \$200 a year on a \$250,000 portfolio. If you are interested in a custodial account, you should talk to a Trust Officer at your commercial bank as to the nature of their services and cost. Otherwise, you should have a safe deposit box.

Taxation

The interest received upon the deposit of coupons from tax-free bonds is, of course, free from Federal Income Taxes. This means if you are at a 30% top Federal Income Tax bracket, a 6% return from tax-free bonds is equivalent to about 8-1/2% from taxable bonds. Thus, for most of our partners, excluding minors or some retired people, tax-free bonds will be more attractive than taxable bonds. For people with little or no income from wages or dividends, but with substantial capital, it is possible that a combination of taxable bonds (to bring taxable income up to about the 25% or 30% bracket) plus tax-free bonds will bring the highest total after-tax income. Where appropriate, we will work with you to achieve such a balance.

The situation in respect to State Income Taxes is more complicated. In Nebraska, where the State Income Tax is computed as a percentage of the Federal Income Tax, the effect is that there is no state tax on interest from tax-free bonds. My understanding of both the New York and California law is that tax-free bonds of entities within the home state are not subject to State Income Tax, but tax-free bonds from other states are subject to the local State Income Tax. I also believe that the New York City Income Tax exempts tax-free bonds of entities based within the State of New York, but taxes those from other states. I am no expert on state income taxes and make no attempt to post myself on changes taking place within the various states or cities. Therefore, I defer to your local tax advisor, but simply mention these few general impressions so that you will be alert to the existence of a potential problem. In Nebraska there is no need to have any local considerations enter into the after-tax calculation. Where out-of-state issues are subject to local taxation, the effective cost of your State or Municipal Income Tax is reduced by the benefit received from deducting it on your Federal Income Tax return. This, of course, varies with the individual. Additionally, in some states there are various taxes on intangible property which may apply to all tax-free bonds or just those of out-of-state entities. There are none of these in Nebraska, but I cannot advise on the other states.

When bonds are bought at a discount from par and later are sold or mature (come due and get paid), the difference between the proceeds and cost is subject to capital gain or loss treatment. (There are minor exceptions to this statement as, unfortunately, there are to most general statements on investments and taxes but they will be pointed out to you should they affect any securities we recommend). This reduces the net after-tax yield by a factor involving the general rate of future capital gains taxes and the specific future tax position of the individual. Later on, we will discuss the impact of such capital gains taxes in calculating the relative attractiveness of discount bonds versus "full coupon" bonds.

Finally, one most important point. Although the law is not completely clear, you should probably not contemplate owning tax-free bonds if you have, or expect to have, general purpose bank or other indebtedness.

The law excludes the deductibility of interest on loans incurred or continued to purchase or carry tax-free bonds, and the interpretation of this statute will probably tend to be broadened as the years pass. For example, my impression is that you have no problem if you have a mortgage against real property (unless the debt was incurred in order to acquire municipal bonds) in deducting the mortgage interest on your Federal Tax return, even though you own tax-free bonds at the same time. However, I believe that if you have a general bank loan, even though the proceeds were directly used to purchase stocks, a handball court, etc. and the tax-free bonds are not used for security for the loan, you are asking for trouble if you deduct the interest and, at the same time, are the owner of tax-free bonds. Therefore, I would pay off bank loans before owning tax-free bonds, but I leave detailed examination of this question to you and your tax advisor. I merely mention it to make you aware of the potential problem.

Marketability

Tax-free bonds are materially different from common stocks or corporate bonds in that there are literally hundreds of thousands of issues, with the great majority having very few holders. This substantially inhibits the development of close, active markets. Whenever the City of New York or Philadelphia wants to raise money it sells perhaps twenty, thirty or forty non-identical securities, since it will offer an issue with that many different maturities. A 6% bond of New York coming due in 1980 is a different animal from a 6% bond of New York coming due in 1981. One cannot be exchanged for the other, and a seller has to find a buyer for the specific item he holds. When you consider that New York may offer bonds several times a year, it is easy to see why just this one city may have somewhere in the neighborhood of 1,000 issues outstanding. Grand Island, Nebraska may have 75 issues outstanding. The average amount of each issue might be \$100,000 and the average number of holders may be six or eight per issue. Thus, it is absolutely impossible to have quoted markets at all times for all issues and spreads between bids and offers may be very wide. You can't set forth in the morning to buy a specific Grand Island issue of your choosing. It may not be offered at any price, anywhere, and if you do find one seller, there is no reason why he has to be realistic compared to other offerings of similar quality. On the other hand, there are single issues such as those of the Ohio Turnpike, Illinois Turnpike, etc. that amount to \$200 million or more and have thousands of bondholders owning a single entirely homogeneous and interchangeable issue. Obviously, here you get a high degree of marketability.

My impression is that marketability is generally a function of the following three items, in descending order of importance: (1) the size of the particular issue; (2) the size of the issuer (a \$100,000 issue of the State of Ohio will be more marketable than a \$100,000 issue of Podunk, Ohio); and (3) the quality of the issuer. By far the most sales effort goes into the selling of new issues of bonds. An average of over \$200 million per week of new issues comes up for sale, and the machinery of bond distribution is geared to get them sold, large or small. In my opinion, there is frequently insufficient differential in yield at time of issue for the marketability differences that will exist once the initial sales push is terminated. We have frequently run into markets in bonds where the spread between bid and asked prices may get to 15%. There is no need to buy bonds with the potential for such grotesque markets (although the profit spread to the dealer who originally offers them is frequently wider than on more marketable bonds) and we will not be buying them for you. The bonds we expect to buy will usually tend to have spreads (reflecting the difference between what you would pay net for such bonds on purchase and receive net on sale at the same point in time) of from 2% to 5%. Such a spread would be devastating if you attempted to trade in such bonds, but I don't believe it should be a deterrent for a long-term investor. The real necessity is to stay away from bonds of very limited marketability - which frequently are the type local bond dealers have the greatest monetary incentive to push.

Specific Areas of Purchase

We will probably concentrate our purchases in the following general areas:

- (1) Large revenue-producing public entities such as toll roads, electric power districts, water districts, etc.

Many of these issues possess high marketability, are subject to quantitative analysis, and sometimes have favorable sinking fund or other factors which tend not to receive full valuation in the market place.

- (2) Industrial Development Authority bonds which arise when a public entity holds title to property leased to a private corporation. For example, Lorain, Ohio holds title to an \$80 million project for U.S. Steel Corp. The Development Authority Board issued bonds to pay for the project and has executed a net and absolute lease with U.S. Steel to cover the bond payments. The credit of the city or state is not behind the bonds and they are only as good as the company that is on the lease. Many top-grade corporations stand behind an aggregate of several billion dollars of these obligations, although new ones are being issued only in small amounts (\$5 million per project or less) because of changes in the tax laws. For a period of time there was a very substantial prejudice against such issues, causing them to sell at yields considerably higher than those commensurate with their inherent credit standing. This prejudice has tended to diminish, reducing the premium yields available, but I still consider it a most attractive field. Our insurance company owns a majority of its bonds in this category.
- (3) Public Housing Authority Issues for those of you who wish the very highest grade of tax-free bonds. In effect, these bonds bear the guarantee of the U.S. Government, so they are all rated AAA. In states where local taxes put a premium on buying in-state issues, and I can't fill your needs from (1) and (2), my tendency would be to put you into Housing Authority issues rather than try to select from among credits that I don't understand. If you direct me to buy obligations of your home state, you should expect substantial quantities of Housing Authority issues. There is no need to diversify among such issues, as they all represent the top credit available.
- (4) State obligations of a direct or indirect nature.

You will notice I am not buying issues of large cities. I don't have the faintest idea how to analyze a New York City, Chicago, Philadelphia, etc. (a friend mentioned the other day when Newark was trying to sell bonds at a very fancy rate that the Mafia was getting very upset because Newark was giving them a bad name). Your analysis of a New York City - and I admit it is hard to imagine them not paying their bills for any extended period of time - would be as good as mine. My approach to bonds is pretty much like my approach to stocks. If I can't understand something, I tend to forget it. Passing an opportunity which I don't understand - even if someone else is perceptive enough to analyze it and get paid well for doing it - doesn't bother me. All I want to be sure of is that I get paid well for the things I do feel capable of handling - and that I am right when I make affirmative decisions.

We will probably tend to purchase somewhere between five and ten issues for most of you. However, if you wish to limit me to your home state, it may be fewer issues - and perhaps those will only be Housing Authorities. We will try not to buy in smaller than \$25,000 pieces and will prefer larger amounts where appropriate. Smaller lots of bonds are usually penalized upon resale, sometimes substantially. The bond salesman doesn't usually explain this to you when you buy the \$10,000 of bonds from him, but it gets explained when you later try to sell the \$10,000 to him. We may make exceptions where we are buying secondary market issues in smaller pieces - but only if we are getting an especially good price on the buy side because of the small size of the offering.

Callable Bonds

We will not buy bonds where the issuer of the bonds has a right to call (retire) the bonds on a basis which substantially loads the contract in his favor. It is amazing to me to see people buy bonds which are due in forty years, but where the issuer has the right to call the bonds at a tiny premium in five or ten years. Such a contract essentially means that you have made a forty year deal if it is advantageous to the issuer (and disadvantageous to you) and a five year deal if the initial contract turns out to be advantageous to you (and disadvantageous to the

issuer). Such contracts are really outrageous and exist because bond investors can't think through the implications of such a contract form and bond dealers don't insist on better terms for their customers. One extremely interesting fact is that bonds with very unattractive call features sell at virtually the same yield as otherwise identical bonds which are noncallable.

It should be pointed out that most Nebraska bonds carry highly unfair call provisions. Despite this severe contractual disadvantage, they do not offer higher yields than bonds with more equitable terms.

One way to avoid this problem is to buy bonds which are totally noncallable. Another way is to buy discount bonds where the right of the issuer to call the bond is at a price so far above your cost as to render the possible call inconsequential. If you buy a bond at 60 which is callable at 103, the effective cost to you of granting the issuer the right to prematurely terminate the contract (which is a right you never have) is insignificant. But to buy a bond of the Los Angeles Department of Water and Power at 100 to come due at 100 in 1999 or to come due at

104 in 1974, depending on which is to the advantage of the issuer and to your disadvantage, is the height of foolishness when comparable yields are available on similar credits without such an unfair contract.

Nevertheless, just such a bond was issued in October, 1969 and similar bonds continue to be issued every day. I only write at such length about an obvious point, since it is apparent from the continual sale of such bonds that many investors haven't the faintest notion how this loads the dice against them and many bond salesmen aren't about to tell them.

Maturity and the Mathematics of Bonds

Many people, in buying bonds, select maturities based on how long they think they are going to want to hold bonds, how long they are going to live, etc. While this is not a silly approach, it is not necessarily the most logical. The primary determinants in selection of maturity should probably be (1) the shape of the yield curve; (2) your expectations regarding future levels of interest rates and (3) the degree of quotational fluctuation you are willing to endure or hope to possibly profit from. Of course, (2) is the most important but by far the most difficult upon which to comment intelligently.

Let's tackle the yield curve first. When other aspects of quality are identical, there will be a difference in interest rates paid based upon the length of the bond being offered. For example, a top grade bond being offered now might have a yield of 4.75% if it came due in six or nine months, 5.00% in two years, 5.25% in five years, 5.50% in ten years and 6.25% in twenty years. When long rates are substantially higher than short rates, the curve is said to be strongly positive. In the U. S. Government bond market, rates recently have tended to produce a negative yield curve; that is, a long term Government bond over the last year or so has consistently yielded less than a short term one. Sometimes the yield curve has been very flat, and sometimes it is positive out to a given point, such as ten years, and then flattens out. What you should understand is that it varies, often very substantially, and that on an historical basis the present slope tends to be in the high positive range. This doesn't mean that long bonds are going to be worth more but it does mean that you are being paid more to extend maturity than in many periods. If yields remained constant for several years, you would do better with longer bonds than shorter bonds, regardless of how long you intended to hold them.

The second factor in determining maturity selection is expectations regarding future rate levels. Anyone who has done much predicting in this field has tended to look very foolish very fast. I did not regard rates as unattractive one year ago, and I was proved very wrong almost immediately. I believe present rates are not unattractive and I may look foolish again. Nevertheless, a decision has to be made and you can make just as great a mistake if you buy short term securities now and rates available on reinvestment in a few years are much lower.

The final factor involves your tolerance for quotational fluctuation. This involves the mathematics of bond investment and may be a little difficult for you to understand. Nevertheless, it is important that you get a general

grasp of the principles. Let's assume for the moment a perfectly flat yield curve and a non-callable bond. Further assume present rates are 5% and that you buy two bonds, one due in two years and one due in twenty years. Now assume one year later that yields on new issues have gone to 3% and that you wish to sell your bonds. Forgetting about market spreads, commissions, etc. , you will receive \$1,019.60 for the original two year \$1,000 bond (now with one year to run) and \$1,288.10 for the nineteen year bond (originally twenty years). At these prices, a purchaser will get exactly 3% on his money after amortizing the premium he has paid and cashing the stream of 5% coupons attached to each bond. It is a matter of indifference to him whether to buy your nineteen year 5% bond at \$1,288.10 or a new 3% bond (which we have assumed is the rate current - one year later) at \$1,000.00. On the other hand, let's assume rates went to 7%. Again we will ignore commissions, capital gains taxes on the discount, etc. Now the buyer will only pay \$981.00 for the bond with one year remaining until maturity and \$791.60 for the bond with nineteen years left. Since he can get 7% on new issues, he is only willing to buy your bond at a discount sufficient so that accrual of this discount will give him the same economic benefits from your 5% coupon that a 7% coupon at \$1,000.00 would give him.

The principle is simple. The wider the swings in interest rates and the longer the bond, the more the value of a bond can go up or down on an interim basis before maturity. It should be pointed out in the first example where rates went to 3%, our long term bond would only have appreciated to about \$1,070.00 if it had been callable in five years at par, although it would have gone down just as much if 7% rates had occurred. This just illustrates the inherent unfairness of call provisions.

For over two decades, interest rates on tax-free bonds have almost continuously gone higher and buyers of long term bonds have continuously suffered. This does not mean it is bad now to buy long term bonds - it simply means that the illustration in the above paragraph has worked in only one direction for a long period of time and people are much more conscious of the downside risks from higher rates than the upside potential from lower ones.

If it is a 50-50 chance as to the future general level of interest rates and the yield curve is substantially positive, then the odds are better in buying long term non-callable bonds than shorter term ones. This reflects my current conclusion and, therefore, I intend to buy bonds within the ten to twenty-five year range. If you have any preferences within that range, we will try to select bonds reflecting such preferences, but if you are interested in shorter term bonds, we will not be able to help you as we are not searching out bonds in this area.

Before you decide to buy a twenty year bond, go back and read the paragraph showing how prices change based upon changes in interest rates. Of course, if you hold the bond straight through, you are going to get the contracted rate of interest, but if you sell earlier, you are going to be subject to the mathematical forces described in that paragraph, for better or for worse. Bond prices also change because of changes in quality over the years but, in the tax-free area, this has tended to be - and probably will continue to be - a relatively minor factor compared to the impact of changes in the general structure of interest rates.

Discount Versus Full Coupon Bonds

You will have noticed in the above discussion that if you now wanted to buy a 7% return on a nineteen year bond, you had a choice between buying a new nineteen year bond with a 7% coupon rate or buying a bond with a 5% coupon at \$791.60, which would pay you \$1,000.00 in nineteen years. Either purchase would have yielded exactly 7% compounded semi-annually to you. Mathematically, they are the same. In the case of tax-free bonds the equation is complicated, however, by the fact that the \$70.00 coupon is entirely tax-free to you, whereas the bond purchased at a discount gives you tax-free income of \$50.00 per year but a capital gain at the end of the nineteenth year of \$208.40. Under the present tax law, you would owe anything from a nominal tax, if the gain from realization of the discount was your only taxable income in the nineteenth year, up to a tax of over \$70.00 if it came on top of very large amounts of capital gain at that time (the new tax law provides for capital gain rates of 35%, and even slightly higher on an indirect basis in 1972 and thereafter for those realizing very large

gains.) In addition to this, you might have some state taxes to pay on the capital gain.

Obviously, under these circumstances you are not going to pay the \$791.60 for the 5% coupon and feel you are equally as well off as with the 7% coupon at \$1,000.00. Neither is anyone else. Therefore, identical quality securities with identical maturities sell at considerably higher gross yields when they have low coupons and are priced at discounts than if they bear current high coupons.

Interestingly enough, for most taxpayers, such higher gross yields over-compensate for the probable tax to be paid. This is due to several factors. First, no one knows what the tax law will be when the bonds mature and it is both natural and probably correct to assume the tax rate will be stiffer at that time than now. Second, even though a 5% coupon on a \$1,000.00 bond purchased at \$791.60 due in nineteen years is the equivalent of a 7% coupon on a \$1,000.00 bond purchased at par with the same maturity, people prefer to get the higher current return in their pocket. The owner of the 5% coupon bond is only getting around 6.3% current yield on his \$791.60 with the balance necessary to get him up to 7% coming from the extra \$208.40 he picks up at the end. Finally, the most important factor affecting prices currently on discount bonds (and which will keep affecting them) is that banks have been taken out of the market as buyers of discount tax-free bonds by changes brought about in bank tax treatment through the 1969 Tax Reform Act. Banks have historically been the largest purchasers and owners of tax-free bonds and anything that precludes them from one segment of the market has dramatic effects on the supply-demand situation in that segment. This may tend to give some edge to individuals in the discount tax-free market, particularly those who are not likely to be in a high tax bracket when the bonds mature or are sold.

If I can get a significantly higher effective after-tax yield (allowing for sensible estimates of your particular future tax rate possibilities), I intend to purchase discount bonds for you. I know some partners prefer full coupon bonds, even though their effective yield is less, since they prefer to maximize the current cash yield and if they will so advise me, we will stick to full coupon issues (or very close thereto) in their cases.

Procedure

I intend to be in the office solidly through March (including every Saturday except March 7th) and will be glad to see any partner or talk with him by phone. To aid in scheduling, please make an appointment with Gladys (or me). The only request I make is that you absorb as much as possible of this letter before we talk. As you can see, it would be an enormous problem if I had to explain each item to all of you.

If you decide you want us to help you in buying bonds, you should let us know:

- (1) Whether you want to restrict purchases to your home state for local tax reasons;
- (2) Whether you want to restrict us to full coupon issues or let us use our judgment as to where you get the best value;
- (3) Your preference as to maturity in the ten to twenty-five year range or if you prefer to let us use our judgment in that area;
- (4) How much you want to invest - we may end up several per cent short of the figure you name, but we will never go over;
- (5) On what bank the bonds should be drafted.

We will advise you by phone or letter as we buy bonds. Bill and John will be doing much of the mechanical work. Needless to say, none of us will have any financial interest in any transaction. Should you have any

questions regarding the mechanics, please direct them to John or Bill as I will probably be swamped and they will be more familiar with specific transactions. After March 31st, I don't expect to be around the office for several months. Therefore, if you want to talk things over, come in by then. The completion of all purchases may go into April, but Bill will be taking care of this and the mechanics will all be set up.

You should realize that because of the enormous diversity of issues mentioned earlier, it is impossible to say just what will be bought. Sometimes the tax-free bond market has more similarities to real estate than to stocks. There are hundreds of thousands of items of varying comparability, some with no sellers, some with reluctant sellers and some with eager sellers. Which may be the best buy depends on the quality of what is being offered, how well it fits your needs and the eagerness of the seller. The standard of comparison is always new issues where an average of several hundred million dollars worth have to be sold each week - however, specific secondary market opportunities (issues already outstanding) may be more attractive than new issues and we can only find out how attractive they are when we are ready to make bids.

Although markets can change, it looks as if we will have no difficulty in getting in the area of 6-1/2% after tax (except from Housing Authority issues) on bonds in the twenty-year maturity range.

Cordially,

Warren E. Buffett

WEBI glk

April 3, 1970

To the Stockholders of Berkshire Hathaway Inc.:

Four years ago your management committed itself to the development of more substantial and more consistent earning power than appeared possible if capital continued to be invested exclusively in the textile industry. The funds for this program were temporarily utilized in marketable securities, pending the acquisition of operating businesses meeting our investment and management criteria.

This policy has proved reasonably successful—particularly when contrasted with results achieved by firms which have continued to commit large sums to textile expansion in the face of totally inadequate returns. We have been able to conclude two major purchases of operating businesses, and their successful operations enabled Berkshire Hathaway to achieve an over-all return of more than 10% on average stockholders' equity last year in the face of less than a 5% return from the portion of our capital employed in the textile business. We have liquidated our entire holdings of marketable securities over the last two years at a profit of more than \$5 million after taxes. These gains provided important funds to facilitate our major purchase of 1969, when borrowed money to finance acquisitions was generally most difficult to obtain.

We anticipate no further purchases of marketable securities, but our search for desirable acquisitions continues. Any acquisition will, of course, be dependent upon obtaining appropriate financing.

Textile Operations

Dollar sales volume in 1969 was approximately 12% below 1968. Net earnings were slightly higher despite substantial operating losses incurred in the termination of our Box Loom Division. Earnings on capital employed improved modestly but still remain unsatisfactory despite strenuous efforts toward improvement.

We are presently in the midst of a textile recession of greater intensity than we have seen for some years. There is an over-all lack of demand for textile products in a great many end uses. This lack of demand has required curtailment of production to avoid inventory build-up. Both our Menswear Lining Division and Home Fabrics Division have been forced to schedule two-week shutdowns during the first quarter of 1970, but inventories remain on the high side. The

slowdown in demand appears even greater than that normally occurring in the cyclical textile market. Recovery from this cycle will probably be dependent upon Federal Government action on economic factors they can control.

We have concentrated our textile operations in those areas that appear, from historical performance and from our market projections, to be potentially satisfactory businesses. Improvements have been made in our mill operations which, under better industry conditions, should produce substantial cost reductions. However, the present picture is for lower profits in this business during 1970.

Insurance Operations

Jack Ringwalt and his outstanding management group turned in new records in just about every department during 1969. During another year in which the fire and casualty insurance industry experienced substantial underwriting losses, our insurance subsidiaries achieved significant adjusted underwriting profits. Since establishment of the business in 1941, Mr. Ringwalt has held to the principle of underwriting for a profit—a policy which is frequently talked about within the industry but much less frequently achieved.

Our new surety department, although small, made good progress during the year. We are entering the workmen's compensation market in California through the establishment of a branch office in Los Angeles. Our new reinsurance division seems to be off to a strong start, although the nature of this business is such that it takes at least several years to render an intelligent verdict as to operating results. We also have interesting plans for a new "home state" insurance operation.

Phil Liesche—over 20 years a major contributor to outstanding results in the production and underwriting departments—was elected Executive Vice President early this year.

Expectations are for continued growth in our insurance operations.

Banking Operations

The most significant event of 1969 for Berkshire Hathaway was the acquisition of 97.7% of the stock of The Illinois National Bank and Trust Co. of Rockford, Illinois. This bank had been built by Eugene Abegg, without addition of outside capital, from \$250,000 of net worth and \$400,000 of deposits in 1931 to \$17 million of net worth and \$100 million of deposits in 1969. Mr. Abegg

has continued as Chairman and produced record operating earnings (before security losses) of approximately \$2 million in 1969. Such earnings, as a percentage of either deposits or total assets, are close to the top among larger commercial banks in the country which are not primarily trust department operations. It will not be easy to achieve greater earnings in 1970 because (1) our bank is already a highly efficient business, and (2) the unit banking law of Illinois makes more than modest deposit growth difficult for a major downtown bank.

After almost a year of ownership, we are delighted with our investment in Illinois National Bank, and our association with Mr. Abegg.

Kenneth V. Chace *President*

1971 Letter

To the Stockholders of Berkshire Hathaway Inc.:

It is a pleasure to report that operating earnings in 1971, excluding capital gains, amounted to more than 14% of beginning shareholders' equity. This result—considerably above the average of American industry—was achieved in the face of inadequate earnings in our textile operation, making clear the benefits of redeployment of capital inaugurated five years ago. It will continue to be the objective of management to improve return on total capitalization (long term debt plus equity), as well as the return on equity capital. However, it should be realized that merely maintaining the present relatively high rate of return may well prove more difficult than was improvement from the very low levels of return which prevailed throughout most of the 1960's.

Textile Operations

We, in common with most of the textile industry, continued to struggle throughout 1971 with inadequate gross margins. Strong efforts to hammer down costs and a continuous search for less price-sensitive fabrics produced only marginal profits. However, without these efforts we would have operated substantially in the red. Employment was more stable throughout the year as our program to improve control of inventories achieved reasonable success.

As mentioned last year, Ken Chace and his management group have been swimming against a strong industry tide. This negative environment has only caused them to intensify their efforts. Currently we are witnessing a mild industry pickup which we intend to maximize with our greatly strengthened sales force. With the improvement now seen in volume and mix of business, we would expect better profitability—although not of a dramatic nature—from our textile operation in 1972.

Insurance Operations

An unusual combination of factors—reduced auto accident frequency, sharply higher effective rates in large volume lines, and the absence of major catastrophes—produced an extraordinarily good year for the property and casualty insurance industry. We shared in these benefits, although they are not without their negative connotations.

Our traditional business—and still our largest segment—is in the specialized policy or non-standard insured. When standard markets become tight because of unprofitable industry underwriting, we experience substantial volume increases as producers look to us. This was the condition several years ago, and largely accounts for the surge of direct volume experienced in 1970 and 1971. Now that underwriting has turned very profitable on an industry-wide basis, more companies are seeking the insureds they were rejecting a short while back and rates are being cut in some areas. We continue to have underwriting profitability as our primary goal and this may well mean a substantial decrease in National Indemnity's direct volume during 1972. Jack Ringwalt and Phil Liesche continue to guide this operation in a manner matched by very few in the business.

Our reinsurance business, which has been developed to a substantial operation in just two years by the outstanding efforts of George Young, faces much the same situation. We entered the reinsurance business late in 1969 at a time when rates had risen substantially and capacity was tight. The reinsurance industry was exceptionally profitable in 1971, and we are now seeing rate-cutting as well as the formation of well-capitalized aggressive new competitors. These lower rates are frequently accompanied by greater exposure. Against this background we expect to see our business curtailed somewhat in 1972. We set no volume goals in our insurance business generally—and certainly not in reinsurance—as virtually any volume can be achieved if profitability standards are ignored. When catastrophes occur and underwriting experience sours, we plan to have the resources available to handle the increasing volume which we will then expect to be available at proper prices.

We inaugurated our “home-state” insurance operation in 1970 by the formation of Cornhusker Casualty Company. To date, this has worked well from both a marketing and an underwriting standpoint. We have therefore further developed this approach by the formation of Lakeland Fire & Casualty Company in Minnesota during 1971, and Texas United Insurance in 1972. Each of these companies will devote its entire efforts to a single state seeking to bring the agents and insureds of its area a combination of large company capability and small company accessibility and sensitivity. John Ringwalt has been in overall charge of this operation since inception. Combining hard work with imagination and intelligence, he has transformed an idea into a well-

organized business. The “home-state” companies are still very small, accounting for a little over \$1.5 million in premium volume during 1971. It looks as though this volume will more than double in 1972 and we will develop a more creditable base upon which to evaluate underwriting performance.

A highlight of 1971 was the acquisition of Home & Automobile Insurance Company, located in Chicago. This company was built by Victor Raab from a small initial investment into a major auto insurer in Cook County, writing about \$7.5 million in premium volume during 1971. Vic is cut from the same cloth as Jack Ringwalt and Gene Abegg, with a talent for operating profitably accompanied by enthusiasm for his business. These three men have built their companies from scratch and, after selling their ownership position for cash, retain every bit of the proprietary interest and pride that they have always had.

While Vic has multiplied the original equity of Home & Auto many times since its founding, his ideas and talents have always been circumscribed by his capital base. We have added capital funds to the company, which will enable it to establish branch operations extending its highly-concentrated and on-the-spot marketing and claims approach to other densely populated areas.

All in all, it is questionable whether volume added by Home & Auto, plus the “home-state” business in 1972, will offset possible declines in direct and reinsurance business of National Indemnity Company. However, our large volume gains in 1970 and 1971 brought in additional funds for investment at a time of high interest rates, which will be of continuing benefit in future years. Thus, despite the unimpressive prospects regarding premium volume, the outlook for investment income and overall earnings from insurance in 1972 is reasonably good.

Banking Operations

Our banking subsidiary, The Illinois National Bank & Trust Company, continued to lead its industry as measured by earnings as a percentage of deposits. In 1971, Illinois National earned well over 2% after tax on average deposits while (1) not using borrowed funds except for very occasional reserve balancing transactions; (2) maintaining a liquidity position far above average; (3) recording loan losses far below average; and (4) utilizing a mix of over 50% time deposits

with all consumer savings accounts receiving maximum permitted interest rates throughout the year. This reflects a superb management job by Gene Abegg and Bob Kline.

Interest rates received on loans and investments were down substantially throughout the banking industry during 1971. In the last few years, Illinois National's mix of deposits has moved considerably more than the industry average away from demand money to much more expensive time money. For example, interest paid on deposits has gone from under \$1.7 million in 1969 to over \$2.7 million in 1971. Nevertheless, the unusual profitability of the Bank has been maintained. Marketing efforts were intensified during the year, with excellent results.

With interest rates even lower now than in 1971, the banking industry is going to have trouble achieving gains in earnings during 1972. Our deposit gains at Illinois National continue to come in the time money area, which produces only very marginal incremental income at present. It will take very close cost control to enable Illinois National to maintain its 1971 level of earnings during 1972.

Financial

Because of the volume gains being experienced by our insurance subsidiaries early in 1971, we re-cast Berkshire Hathaway's bank loan so as to provide those companies with additional capital funds. This financing turned out to be particularly propitious when the opportunity to purchase Home & Auto occurred later in the year.

Our insurance and banking subsidiaries possess a fiduciary relationship with the public. We retain a fundamental belief in operating from a very strongly financed position so as to be in a position to unquestionably fulfill our responsibilities. Thus, we will continue to map our financial future for maximum financial strength in our subsidiaries as well as at the parent company level.

Warren E. Buffett *Chairman of the Board* March 13, 1972

1972 Letter

To the Stockholders of Berkshire Hathaway Inc.:

Operating earnings of Berkshire Hathaway during 1972 amounted to a highly satisfactory 19.8% of beginning shareholders' equity. Significant improvement was recorded in all of our major lines of business, but the most dramatic gains were in insurance underwriting profit. Due to an unusual convergence of favorable factors—diminishing auto accident frequency, moderating accident severity, and an absence of major catastrophes—underwriting profit margins achieved a level far above averages of the past or expectations of the future.

While we anticipate a modest decrease in operating earnings during 1973, it seems clear that our diversification moves of recent years have established a significantly higher base of normal earning power. Your present management assumed policy control of the company in May, 1965. Eight years later, our 1972 operating earnings of \$11,116,256 represent a return many-fold higher than would have been produced had we continued to devote our resources entirely to the textile business. At the end of the 1964 fiscal year, shareholders' equity totaled \$22,138,753. Since that time, no additional equity capital has been introduced into the business, either through cash sale or through merger. On the contrary, some stock has been reacquired, reducing outstanding shares by 14%. The increase in book value per share from \$19.46 at fiscal year-end 1964 to \$69.72 at 1972 year-end amounts to about 16.5% compounded annually.

Our three major acquisitions of recent years have all worked out exceptionally well—from both the financial and human standpoints. In all three cases, the founders were major sellers and received significant proceeds in cash—and, in all three cases, the same individuals, Jack Ringwalt, Gene Abegg and Vic Raab, have continued to run the businesses with undiminished energy and imagination which have resulted in further improvement of the fine records previously established.

We will continue to search for logical extensions of our present operations, and also for new operations which will allow us to continue to employ our capital effectively.

Textile Operations

As predicted in last year's annual report, the textile industry experienced a pickup in 1972. In recent years, Ken Chace and Ralph Rigby have developed an outstanding sales organization enjoying a growing reputation for service and reliability. Manufacturing capabilities have been restructured to complement our sales strengths.

Helped by the industry recovery, we experienced some payoff from these efforts in 1972. Inventories were controlled, minimizing close-out losses in addition to minimizing capital requirements; product mix was greatly improved. While the general level of profitability of the industry will always be the primary factor in determining the level of our textile earnings, we believe that our relative position within the industry has noticeably improved. The outlook for 1973 is good.

Insurance Underwriting

Our exceptional underwriting profits during 1972 in the large traditional area of our insurance business at National Indemnity present a paradox. They served to swell substantially total corporate profits for 1972, but the factors which produced such profits induced exceptional amounts of new competition at what we believe to be a non-compensatory level of rates. Overall, we probably would have retained better prospects for the next five years if profits had not risen so dramatically this year.

Substantial new competition was forecast in our annual report for last year and we experienced in 1972 the decline in premium volume that we stated such competition implied. Our belief is that industry underwriting profit margins will narrow substantially in 1973 or 1974 and, in time, this may produce an environment in which our historical growth can be resumed. Unfortunately, there is a lag between deterioration of underwriting results and tempering of competition. During this period we expect to continue to have negative volume comparisons in our traditional operation. Our seasoned management, headed by Jack Ringwalt and Phil Liesche, will continue to underwrite to produce a profit, although not at the level of 1972, and base our rates on long-term expectations rather than short-term hopes. Although this approach has meant dips in volume from time to time in the past, it has produced excellent long-term results.

Also as predicted in last year's report, our reinsurance division experienced many of the same competitive factors in 1972. A multitude of new organizations entered what has historically been a rather small field, and rates were often cut substantially, and we believe unsoundly, particularly in the catastrophe area. The past year turned out to be unusually free of catastrophes and our underwriting experience was good.

George Young has built a substantial and profitable reinsurance operation in just a few years. In the longer term we plan to be a very major factor in the reinsurance field, but an immediate expansion of volume is not sensible against a background of deteriorating rates. In our view, underwriting exposures are greater than ever. When the loss potential inherent in such exposures becomes an actuality, repricing will take place which should give us a chance to expand significantly.

In the "home state" operation, our oldest and largest such company, Cornhusker Casualty Company, operating in Nebraska only, achieved good underwriting results. In the second full year, the home state marketing appeal has been proven with the attainment of volume on the order of one-third of that achieved by "old line" giants who have operated in the state for many decades.

Our two smaller companies, in Minnesota and Texas, had unsatisfactory loss ratios on very small volume. The home state managements understand that underwriting profitably is the yardstick of success and that operations can only be expanded significantly when it is clear that we are doing the right job in the underwriting area. Expense ratios at the new companies are also high, but that is to be expected when they are in the development stage.

John Ringwalt has done an excellent job of launching this operation, and plans to expand into at least one additional state during 1973. While there is much work yet to be done, the home state operation appears to have major long-range potential.

Last year it was reported that we had acquired Home and Automobile Insurance Company of Chicago. We felt good about the acquisition at the time, and we feel even better now. Led by Vic Raab, this company continued its excellent record in 1972. During 1973 we expect to enter the Florida (Dade County) and California (Los Angeles) markets with the same sort of specialized urban auto coverage which Home and Auto has practiced so successfully in Cook County. Vic

has the managerial capacity to run a much larger operation. Our expectation is that Home and Auto will expand significantly within a few years.

Insurance Investment Results

We were most fortunate to experience dramatic gains in premium volume from 1969 to 1971 coincidental with virtually record-high interest rates. Large amounts of investable funds were thus received at a time when they could be put to highly advantageous use. Most of these funds were placed in tax-exempt bonds and our investment income, which has increased from \$2,025,201 in 1969 to \$6,755,242 in 1972, is subject to a low effective tax rate.

Our bond portfolio possesses unusually good call protection, and we will benefit for many years to come from the high average yield of the present portfolio. The lack of current premium growth, however, will moderate substantially the growth in investment income during the next several years.

Banking Operations

Our banking subsidiary, The Illinois Bank and Trust Co. of Rockford, maintained its position of industry leadership in profitability. After-tax earnings of 2.2% on average deposits in 1972 are the more remarkable when evaluated against such moderating factors as: (1) a mix of 50% time deposits heavily weighted toward consumer savings instruments, all paying the maximum rates permitted by law; (2) an unvaryingly strong liquid position and avoidance of money-market borrowings; (3) a loan policy which has produced a net charge-off ratio in the last two years of about 5% of that of the average commercial bank. This record is a direct tribute to the leadership of Gene Abegg and Bob Kline who run a bank where the owners and the depositors can both eat well and sleep well.

During 1972, interest paid to depositors was double the amount paid in 1969. We have aggressively sought consumer time deposits, but have not pushed for large "money market" certificates of deposit although, during the past several years, they have generally been a less costly source of time funds.

During the past year, loans to our customers expanded approximately 38%. This is considerably more than indicated by the enclosed balance sheet which includes \$10.9 million in short-term commercial paper in the 1971 loan total, but which has no such paper included at the end of

1972. Our position as "Rockford's Leading Bank" was enhanced during 1972. Present rate structures, a decrease in investable funds due to new Federal Reserve collection procedures, and a probable increase in already substantial non-federal taxes make it unlikely that Illinois National will be able to increase its earnings during 1973.

Financial

On March 15, 1973, Berkshire Hathaway borrowed \$20 million at 8% from twenty institutional lenders. This loan is due March 1, 1993, with principal repayments beginning March 1, 1979. From the proceeds, \$9 million was used to repay our bank loan and the balance is being invested in insurance subsidiaries. Periodically, we expect that there will be opportunities to achieve significant expansion in our insurance business and we intend to have the financial resources available to maximize such opportunities.

Our subsidiaries in banking and insurance have major fiduciary responsibilities to their customers. In these operations we maintain capital strength far above industry norms, but still achieve a good level of profitability on such capital. We will continue to adhere to the former objective and make every effort to continue to maintain the latter.

Warren E. Buffett Chairman of the Board March 16, 1973

1973 Letter

To the Stockholders of Berkshire Hathaway Inc.:

Our financial results for 1973 were satisfactory, with operating earnings of \$11,930,592, producing a return of 17.4% on beginning stockholders' equity. Although operating earnings improved from \$11.43 to \$12.18 per share, earnings on equity decreased from the 19.8% of 1972. This decline occurred because the gain in earnings was not commensurate with the increase in shareholders' investment. We had forecast in last year's report that such a decline was likely. Unfortunately, our forecast proved to be correct.

Our textile, banking, and most insurance operations had good years, but certain segments of the insurance business turned in poor results. Overall, our insurance business continues to be a most attractive area in which to employ capital.

Management's objective is to achieve a return on capital over the long term which averages somewhat higher than that of American industry generally—while utilizing sound accounting and debt policies. We have achieved this goal in the last few years, and are trying to take those steps which will enable us to maintain this performance in the future. Prospects for 1974 indicate some further decline in rate of return on our enlarged capital base.

Textile Operations

Textile demand remained unusually strong throughout 1973. Our main problems revolved around shortages of fiber, which complicated operations and resulted in something less than full utilization of loom capacity. Prices of some fibers skyrocketed during the year.

Cost of Living Council regulations prevented the pricing of many finished products at levels of some of our competitors. However, profits were reasonably commensurate with our capital investment, although below those that apparently might have been achieved had we been able to price at market levels. The textile business has been highly cyclical and price controls may have served to cut down some of the hills while still leaving us with the inevitable valleys.

Because of the extraordinary price rises in raw materials during 1973, which show signs of continuing in 1974, we have elected to adopt the "lifo" method of inventory pricing. This

method more nearly matches current costs against current revenues, and minimizes inventory “profits” included in reported earnings. Further information on this change is included in the footnotes to our financial statements.

Insurance Operations

During 1973, Jack Ringwalt retired as President of National Indemnity Company after an absolutely brilliant record since founding the business in 1940. He was succeeded by Phil Liesche who, fortunately for us, possesses the same underwriting and managerial philosophy that worked so well for Jack.

Our traditional business, specialized auto and general liability lines conducted through National Indemnity Company and National Fire and Marine Insurance Company, had an exceptionally fine underwriting year during 1973. We again experienced a decline in volume. Competition was intense, and we passed up the chance to match rate-cutting by more optimistic underwriters. There currently are faint indications that some of these competitors are learning of the inadequacy of their rates (and also of their loss reserves) which may result in easing of market pressures as the year develops. If so, we may again experience volume increases.

Our reinsurance operation had a somewhat similar year—good underwriting experience, but difficulty in maintaining previous volume levels. This operation, guided by the tireless and well-directed efforts of George Young, has been a major profit producer since its inception in 1969.

Our “home state” insurance companies made excellent progress in Nebraska and Minnesota, with both good growth in volume and acceptable loss ratios. We began operations late in the year in Iowa. To date, our big problem has been Texas. In that state we virtually had to start over during 1973 as the initial management we selected proved incapable of underwriting successfully. The Texas experience has been expensive, and we still have our work cut out for us. Overall, however, the home state operation appears to have a promising potential.

Our specialized urban auto operation, Home and Automobile Insurance Company, experienced very poor underwriting in Chicago during 1973. It would appear that rates are inadequate in our primary Cook County marketing area, although the current energy situation confuses the picture. The question is whether possible lowered accident frequency because of reduced driving will more than offset continuing inflation in medical and repair costs, as well as jury

awards. We believe that inflation will hurt us more than reduced driving will help us, but some of our competitors appear to believe otherwise.

Home and Auto expanded into Florida and California during the year, but it is too early to know how these moves will prove out financially.

A contributing factor in our unsatisfactory earnings at Home and Auto during 1973 was an accounting system which was not bringing information to management on a sufficiently timely basis.

On the investment side of our insurance operation, we made substantial additional commitments in common stocks during 1973. We had significant unrealized depreciation—over \$12 million—in our common stock holdings at year-end, as indicated in our financial statements. Nevertheless, we believe that our common stock portfolio at cost represents good value in terms of intrinsic business worth. In spite of the large unrealized loss at year-end, we would expect satisfactory results from the portfolio over the longer term.

Banking Operations

The Illinois National Bank & Trust Co. of Rockford again had a record year in 1973. Average deposits were approximately \$130 million, of which approximately 60% were time deposits.

Interest rates were increased substantially in the important consumer savings area when regulatory maximums were raised at mid-year.

Despite this mix heavily weighted toward interest bearing deposits, our operating earnings after taxes (including a new Illinois state income tax) were again over 2.1% of average deposits.

We continue to be the largest bank in Rockford. We continue to maintain unusual liquidity. We continue to meet the increasing loan demands of our customers. And we continue to maintain our unusual profitability. This is a direct tribute to the abilities of Gene Abegg, Chairman, who has been running the Bank since it opened its doors in 1931, and Bob Kline, our President.

Merger With Diversified Retailing Company, Inc.

Your Directors have approved the merger of Diversified Retailing Company, Inc. into Berkshire Hathaway Inc. on terms involving issuance of 195,000 shares of Berkshire stock for the 1,000,000 shares of Diversified stock outstanding. Because Diversified and its subsidiaries own 109,551 shares of Berkshire, the net increase in the number of shares of Berkshire outstanding

after giving effect to this transaction will not exceed 85,449. Various regulatory approvals must be obtained before this merger can be completed, and proxy material will be submitted to you later this year so that you may vote upon it.

Diversified Retailing Company, Inc., through subsidiaries, operates a chain of popular-priced women's apparel stores and also conducts a reinsurance business. In the opinion of management, its most important asset is 16% of the stock of Blue Chip Stamps.

Blue Chip Stamps

Our holdings of stock in Blue Chip Stamps at year-end amounted to approximately 19% of that company's outstanding shares. Since year-end, we have increased our holdings so that they now represent approximately 22.5%: implementation of the proposed merger with Diversified Retailing Company, Inc. would increase this figure to about 38.5%.

Our equity in earnings of Blue Chip Stamps became significant for the first time in 1973, and posed an accounting question as to just what period's earnings should be recognized by Berkshire Hathaway Inc. as applicable to the financial statements covered by this annual report. Blue Chip's fiscal year ends on the Saturday closest to February 28, or two months after the fiscal year-end of Berkshire Hathaway Inc. Or, viewed alternatively, their year ends ten months prior to Berkshire Hathaway's. An acceptable accounting choice for us, and one which, if made, would not have required an auditor's disclaimer as to scope, was to recognize in our 1973 income an equity of \$632,000 in Blue Chip's earnings for their year ended March 3, 1973 with regard to the fewer shares of Blue Chip we owned during this earlier period. But such an approach seemed at odds with reality, and would have meant a ten month lag each year in the future. Therefore, we chose to reflect as 1973 income our equity of \$1,008,000 in Blue Chip's earnings based upon unaudited interim earnings through November as publicly reported by Blue Chip Stamps and with regard to our shareholdings during 1973. Because we made this choice of unaudited but current figures, as opposed to the alternative of audited but far from current figures, Peat, Marwick, Mitchell & Co. were unable to express an opinion on our 1973 earnings attributable to Blue Chip Stamps.

The annual report of Blue Chip Stamps, which will contain financial statements for the year ending March 2, 1974 audited by Price, Waterhouse and Company, will be available in early

May. Any shareholder of Berkshire Hathaway Inc. who desires an annual report of Blue Chip Stamps may obtain it at that time by writing Mr. Robert H. Bird, Secretary, Blue Chip Stamps, 5801 South Eastern Avenue, Los Angeles, California 90040.

Blue Chip's trading stamp business has declined drastically over the past year or so, but it has important sources of earning power in its See's Candy Shops subsidiary as well as Wesco Financial Corporation, a 54% owned subsidiary engaged in the savings and loan business. We expect Blue Chip Stamps to achieve satisfactory earnings in future years related to capital employed, although certainly at a much lower level than would have been achieved if the trading stamp business had been maintained at anything close to former levels.

Your Chairman is on the Board of Directors of Blue Chip Stamps, as well as Wesco Financial Corporation, and is Chairman of the Board of See's Candy Shops Incorporated. Operating management of all three entities is in the hands of first-class, able, experienced executives.

Sun Newspapers, Inc.

In the 1969 annual report we commented on the purchase of Sun Newspapers Inc., a group of weekly papers published in the metropolitan Omaha area. Since that time we have not commented on their operations in the text of our annual reports, nor have we consolidated their financial results since the operation, because of the small investment involved, has been "financially insignificant."

During 1973 it was made quite apparent that such insignificance did not extend to publishing quality. On May 7th Sun Newspapers was awarded a Pulitzer Prize for local investigative reporting (the first time in history that a weekly had won in this category) for its special section of March 30, 1972 relating to Boys Town. We reported the extraordinary contrast between decreasing services and mounting wealth that had taken place since Father Flanagan's death in 1948.

In addition to the Pulitzer Prize, the reporting job also won the Public Service Award of Sigma Delta Chi, the national society of professional journalists, as well as seven other national awards.

Our congratulations go to Paul Williams, Editor, and Stan Lipsey, Publisher, as well as the entire editorial staff of Sun Newspapers for their achievement, which vividly illustrated that size need not be equated with significance in publishing.

Warren E. Buffett Chairman of the Board March 29, 1974

1974 Letter

To the Stockholders of Berkshire Hathaway Inc.:

Operating results for 1974 overall were unsatisfactory due to the poor performance of our insurance business. In last year's annual report some decline in profitability was predicted but the extent of this decline, which accelerated during the year, was a surprise. Operating earnings for 1974 were \$8,383,576, or \$8.56 per share, for a return on beginning shareholders' equity of 10.3%. This is the lowest return on equity realized since 1970. Our textile division and our bank both performed very well, turning in improved results against the already good figures of 1973. However, insurance underwriting, which has been mentioned in the last several annual reports as running at levels of unsustainable profitability, turned dramatically worse as the year progressed.

The outlook for 1975 is not encouraging. We undoubtedly will have sharply negative comparisons in our textile operation and probably a moderate decline in banking earnings. Insurance underwriting is a large question mark at this time—it certainly won't be a satisfactory year in this area, and could be an extremely poor one. Prospects are reasonably good for an improvement in both insurance investment income and our equity in earnings of Blue Chip Stamps. During this period we plan to continue to build financial strength and liquidity, preparing for the time when insurance rates become adequate and we can once again aggressively pursue opportunities for growth in this area.

Textile Operations

During the first nine months of 1974 textile demand was exceptionally strong, resulting in very firm prices. However, in the fourth quarter significant weaknesses began to appear, which have continued into 1975.

We currently are operating at about one-third of capacity. Obviously, at such levels operating losses must result. As shipments have fallen, we continuously have adjusted our level of operations downward so as to avoid building inventory.

Our products are largely in the curtain goods area. During a period of consumer uncertainty, curtains may well be high on the list of deferrable purchases. Very low levels of housing starts also serve to dampen demand. In addition, retailers have been pressing to cut inventories generally, and we probably are feeling some effect from these efforts. These negative trends should reverse in due course, and we are attempting to minimize losses until that time comes.

Insurance Underwriting

In the last few years we consistently have commented on the unusual profitability in insurance underwriting. This seemed certain eventually to attract unintelligent competition with consequent inadequate rates. It also has been apparent that many insurance organizations, major as well as minor, have been guilty of significant underreserving of losses, which inevitably produces faulty information as to the true cost of the product being sold. In 1974, these factors, along with a high rate of inflation, combined to produce a rapid erosion in underwriting results. The costs of the product we deliver (auto repair, medical payments, compensation benefits, etc.) are increasing at a rate we estimate to be in the area of 1% per month. Of course, this increase doesn't proceed in an even flow but, inexorably, inflation grinds very heavily at the repair services—to humans and to property—that we provide. However, rates virtually have been unchanged in the property and casualty field for the last few years. With costs moving forward rapidly and prices remaining unchanged, it was not hard to predict what would happen to profit margins.

Best's, the authoritative voice of the insurance industry, estimates that in 1974 all auto insurance premiums in the United States increased only about 2%. Such a growth in the pool of dollars available to pay insured losses and expenses was woefully inadequate. Obviously, medical costs applicable to people injured during the year, jury awards for pain and suffering, and body shop charges for repairing damaged cars increased at a dramatically greater rate during the year. Since premiums represent the sales dollar and the latter items represent the cost of goods sold, profit margins turned sharply negative.

As this report is being written, such deterioration continues. Loss reserves for many giant companies still appear to be understated by significant amounts, which means that these competitors continue to underestimate their true costs. Not only must rates be increased

sufficiently to match the month-by-month increase in cost levels, but the existed expense-revenue gap must be overcome. At this time it appears that insurers must experience even more devastating underwriting results before they take appropriate pricing action.

All major areas of insurance operations, except for the "home state" companies, experienced significantly poorer results for the year.

The direct business of National Indemnity Company, our largest area of insurance activity, produced an underwriting loss of approximately 4% after several years of high profitability. Volume increased somewhat, but we are not encouraging such increases until rates are more adequate. At some point in the cycle, after major insurance companies have had their fill of red ink, history indicates that we will experience an inflow of business at compensatory rates. This operation, headed by Phil Liesche, a most able underwriter, is staffed by highly profit-oriented people and we believe it will provide excellent earnings in most future years, as it has in the past.

Intense competition in the reinsurance business has produced major losses for practically every company operating in the area. We have been no exception. Our underwriting loss was something over 12%—a horrendous figure, but probably little different from the average of the industry. What is even more frightening is that, while about the usual number of insurance catastrophes occurred during 1974, there really was no "super disaster" which might have accounted for the poor figures of the industry. Rather, a condition of inadequate rates prevails, particularly in the casualty area where we have significant exposure. Our reinsurance department is run by George Young, an exceptionally competent and hardworking manager. He has cancelled a great many contracts where prices are totally inadequate, and is making no attempt to increase volume except in areas where premiums are commensurate with risk. Based upon present rate levels, it seems highly unlikely that the reinsurance industry generally, or we, specifically, will have a profitable year in 1975.

Our "home state" companies, under the leadership of John Ringwalt, made good progress in 1974. We appear to be developing a sound agency group, capable of producing business with acceptable loss ratios. Our expense ratios still are much too high, but will come down as the operation develops into units of economic size. The Texas problem which was commented

upon in last year's report seems to be improving. We consider the "home state" operation one of our most promising areas for the future.

Our efforts to expand Home and Automobile Insurance Company into Florida proved disastrous. The underwriting loss from operations in that market will come to over \$2 million, a very large portion of which was realized in 1974. We made the decision to drop out of the Florida market in the middle of 1974, but losses in substantial amounts have continued since that time because of the term nature of insurance contracts, as well as adverse development of outstanding claims. We can't blame external insurance industry conditions for this mistake. In retrospect, it is apparent that our management simply did not have the underwriting information and the pricing knowledge necessary to be operating in the area. In Cook County, where Home and Auto's volume traditionally has been concentrated, evidence also became quite clear during 1974 that rates were inadequate. Therefore, rates were increased during the middle of the year but competition did not follow; consequently, our volume has dropped significantly in this area as competitors take business from us at prices that we regard as totally unrealistic.

While the tone of this section is pessimistic as to 1974 and 1975, we consider the insurance business to be inherently attractive. Our overall return on capital employed in this area—even including the poor results of 1974—remains high. We have made every effort to be realistic in the calculation of loss and administrative expense. Because of accruals, this had a double effect at both the bank and corporate level in 1974.

Under present money market conditions, we expect bank earnings to be down somewhat in 1975 although we believe they still are likely to compare favorably with those of practically any banking institution in the country.

Blue Chip Stamps

During 1974 we increased our holdings of Blue Chip Stamps to approximately 25.5% of the outstanding shares of that company. Overall, we are quite happy about the results of Blue Chip and its prospects for the future. Stamp sales continue at a greatly reduced level, but the Blue Chip management has done an excellent job of adjusting operating costs. The See's Candy Shops, Inc. subsidiary had an outstanding year, and has excellent prospects for the future.

Your Chairman is on the Board of Directors of Blue Chip Stamps, as well as Wesco Financial Corporation, a 64% owned subsidiary, and is Chairman of the Board of See's Candy Shops, Inc. We expect Blue Chip Stamps to be a source of continued substantial earning power for Berkshire Hathaway Inc.

The annual report of Blue Chip Stamps, which will contain financial statements for the year ended March 1, 1975 audited by Price, Waterhouse and Company, will be available in May. Any shareholder of Berkshire Hathaway Inc. who desires an annual report of Blue Chip Stamps may obtain it at any time by writing Mr. Robert H. Bird, Secretary, Blue Chip Stamps, 5801 South Eastern Avenue, Los Angeles, California 90040.

Merger with Diversified Retailing Company, Inc.

As you previously have been informed, the proposed merger with Diversified Retailing Company, Inc. was terminated by the respective Boards of Directors on January 28, 1975. We continue to view such a merger as eventually desirable, and hope to reopen the subject at some future time.

Warren E. Buffett Chairman of the Board March 31, 1975

1975 Letter

To the Stockholders of Berkshire Hathaway Inc.:

Last year, when discussing the prospects for 1975, we stated “the outlook for 1975 is not encouraging.” This forecast proved to be distressingly accurate. Our operating earnings for 1975 were \$6,713,592, or \$6.85 per share, producing a return on beginning shareholders’ equity of 7.6%. This is the lowest return on equity experienced since 1967. Furthermore, as explained later in this letter, a large segment of these earnings resulted from Federal income tax refunds which will not be available to assist performance in 1976.

On balance, however, current trends indicate a somewhat brighter 1976. Operations and prospects will be discussed in greater detail below, under specific industry titles. Our expectation is that significantly better results in textiles, earnings added from recent acquisitions, an increase in equity in earnings of Blue Chip Stamps resulting from an enlarged ownership interest, and at least a moderate improvement in insurance underwriting results will more than offset other possible negatives to produce greater earnings in 1976. The major variable—and by far the most difficult to predict with any feeling of confidence—is the insurance underwriting result. Present *very tentative* indications are that underwriting improvement is in prospect. If such improvement is moderate, our overall gain in earnings in 1976 likewise will prove moderate. More significant underwriting improvement could give us a major gain in earnings.

Textile Operations

During the first half of 1975 sales of textile products were extremely depressed, resulting in major production curtailments. Operations ran at a significant loss, with employment down as much as 53% from a year earlier.

In contrast with previous cyclical slumps, however, most textile producers quickly reduced production to match incoming orders, thus preventing massive industry-wide accumulation of inventories. Such cutbacks caused quite prompt reflection at the mill operating level when demand revived at retail. As a result, beginning about midyear business rebounded at a fairly

rapid rate. This “V” shaped textile depression, while one of the sharpest on record, also became one of the shortest ones in our experience. The fourth quarter produced an excellent profit for our textile division, bringing results for the year into the black.

On April 28, 1975 we acquired Waumbec Mills Incorporated and Waumbec Dyeing and Finishing Co., Inc. located in Manchester, New Hampshire. These companies have long sold woven goods into the drapery and apparel trade. Such drapery materials complement and extend the line already marketed through the Home Fabrics Division of Berkshire Hathaway. In the period prior to our acquisition, the company had run at a very substantial loss, with only about 55% of looms in operation and the finishing plant operating at about 50% of capacity. Losses continued on a reduced basis for a few months after acquisition. Outstanding efforts by our manufacturing, administrative and sales people now have produced major improvements, which, coupled with the general revival in textiles, have moved Waumbec into a significant profit position.

We expect a good level of profits from textiles in 1976. Continued progress is being made in the movement of Waumbec goods into areas of traditional marketing strength of Berkshire Hathaway, productivity should improve in both the weaving and finishing areas at Manchester, and textile demand continues to firm at decent prices.

We have great confidence in the ability of Ken Chace and his team to maximize our strengths in textiles. Therefore, we continue to look for ways to increase further our scale of operations while avoiding major capital investment in new fixed assets which we consider unwise, considering the relatively low returns historically earned on large scale investment in new textile equipment.

Insurance Underwriting

The property and casualty insurance industry had its worst year in history during 1975. We did our share—unfortunately, even somewhat more. Really disastrous results were concentrated in auto and long-tail (contracts where settlement of loss usually occurs long after the loss event) lines.

Economic inflation, with the increase in cost of repairing humans and property far outstripping the general rate of inflation, produced ultimate loss costs which soared beyond premium levels

established in a different cost environment. "Social" inflation caused the liability concept to be expanded continuously, far beyond limits contemplated when rates were established—in effect, adding coverage beyond what was paid for. Such social inflation increased significantly both the propensity to sue and the possibility of collecting mammoth jury awards for events not previously considered statistically significant in the establishment of rates. Furthermore, losses to policyholders which otherwise would result from mushrooming insolvencies of companies inadequately reacting to these problems are divided through Guaranty Funds among remaining solvent insurers. These trends will continue, and should moderate any optimism which otherwise might be justified by the sharply increased rates now taking effect.

Berkshire Hathaway's insurance subsidiaries have a disproportionate concentration of business in precisely the lines which produced the worst underwriting results in 1975. Such lines produce unusually high investment income and, therefore, have been particularly attractive to us under previous underwriting conditions. However, our "mix" has been very disadvantageous during the past two years and it well may be that we will remain positioned in the more difficult part of the insurance spectrum during the inflationary years ahead.

The only segment to show improved results for us during 1975 was the "home state" operation, which has made continuous progress under the leadership of John Ringwalt. Although still operating at a significant underwriting loss, the combined ratio improved from 1974. Adjusted for excess costs attributable to operations still in the start-up phase, underwriting results are satisfactory. Texas United Insurance Company, a major problem a few years ago, has made outstanding progress since George Billing has assumed command. With an almost totally new agency force, Texas United was the winner of the "Chairman's Cup" for achievement of the lowest loss ratio among the home state companies. Cornhusker Casualty Company, oldest and largest of the home state companies, continues its outstanding operation with major gains in premium volume and a combined ratio slightly under 100. Substantial premium growth is expected at the home state operation during 1976; the measurement of success, however, will continue to be the achievement of a low combined ratio.

Our traditional business at National Indemnity Company, representing well over half of our insurance volume, had an extraordinarily bad underwriting year in 1975. Although rates were

increased frequently and significantly, they continually lagged loss experience throughout the year. Several special programs instituted in the early 1970s have caused significant losses, as well as a heavy drain on managerial time and energies. Present indications are that premium volume will show a major increase in 1976, and we hope that underwriting results will improve. Reinsurance suffered the same problems as our direct business during 1975. The same remedial efforts were attempted. Because reinsurance contract settlements lag those of direct business, it well may be that any upturn in results from our direct insurance business will precede those of the reinsurance segment.

At our Home and Automobile Insurance Company subsidiary, now writing auto business only in the Cook County area of Illinois, experience continued very bad in 1975 resulting in a management change in October. John Seward was made President at that time, and has energetically and imaginatively implemented a completely revamped underwriting approach.

Overall, our insurance operation will produce a substantial gain in premium volume during 1976. Much of this will reflect increased rates rather than more policies. Under normal circumstances such a gain in volume would be welcome, but our emotions are mixed at present. Underwriting experience *should* improve—and we expect it to—but our confidence level is not high. While our efforts will be devoted to obtaining a combined ratio below 100, it is unlikely to be attained during 1976.

Insurance Investments

Gains in investment income were moderate during 1975 because premium volume remained flat and underwriting losses reduced funds available for investment. Invested assets, measured at cost at yearend, were close to identical with the level at the beginning of the year.

At the end of 1974 the net unrealized loss in the stock section of our portfolio amounted to about \$17 million, but we expressed the opinion, nevertheless, that this portfolio overall represented good value at its carrying value of cost. During 1975 a net capital loss of \$2,888,000 before tax credits was realized, but our present expectation is that 1976 will be a year of realized capital gain. On March 31, 1976 our net unrealized gains applicable to equities amounted to about \$15 million. Our equity investments are heavily concentrated in a few companies which are selected based on favorable economic characteristics, competent and

honest management, and a purchase price attractive when measured against the yardstick of value to a private owner.

When such criteria are maintained, our intention is to hold for a long time; indeed, our largest equity investment is 467,150 shares of Washington Post "B" stock with a cost of \$10.6 million, which we expect to hold permanently.

With this approach, stock market fluctuations are of little importance to us—except as they may provide buying opportunities—but business performance is of major importance. On this score we have been delighted with progress made by practically all of the companies in which we now have significant investments.

We have continued to maintain a strong liquid position in our insurance companies. In last year's annual report we explained how variations of 1/10 of 1% in interest rates result in million dollar swings in market value of our bonds. We consider such market fluctuation of minor importance as our liquidity and general financial strength make it highly improbable that bonds will have to be sold at times other than those of our choice.

Banking

It is difficult to find adjectives to describe the performance of Eugene Abegg, Chief Executive of Illinois National Bank and Trust of Rockford, Illinois, our banking subsidiary.

In a year when many banking operations experienced major troubles, Illinois National continued its outstanding record. Against average loans of about \$65 million, net loan losses were \$24,000, or .04%. Unusually high liquidity is maintained with obligations of the U. S. Government and its agencies, all due within one year, at yearend amounting to about 75% of demand deposits. Maximum rates of interest are paid on all consumer savings instruments which make up more than \$2 million, it consistently has generated favorable earnings. Positioned as we now are with respect to income taxes, the addition of a solid source of taxable income is particularly welcome.

General Review

Your present management assumed responsibility at Berkshire Hathaway in May, 1965. At the end of the prior fiscal year (September, 1964) the net worth of the Company was \$22.1 million, and 1,137,778 common shares were outstanding, with a resulting book value of \$19.46 per

share. Ten years earlier, Berkshire Hathaway's net worth had been \$53.4 million. Dividends and stock repurchases accounted for over \$21 million of the decline in company net worth, but aggregate net losses of \$9.8 million had been incurred on sales of \$595 million during the decade.

In 1965, two New England textile mills were the company's only sources of earning power and, before Ken Chace assumed responsibility for the operation, textile earnings had been erratic and, cumulatively, something less than zero subsequent to the merger of Berkshire Fine Spinning and Hathaway Manufacturing. Since 1964, net worth has been built to \$92.9 million, or \$94.92 per share. We have acquired total, or virtually total ownership of six businesses through negotiated purchases for cash (or cash and notes) from private owners, started four others, purchased a 31.5% interest in a large affiliate enterprise and reduced the number of outstanding shares of Berkshire Hathaway to 979,569. Overall, equity per share has compounded at an annual rate of slightly over 15%.

While 1975 was a major disappointment, efforts will continue to develop growing and diversified sources of earnings. Our objective is a conservatively financed and highly liquid business—possessing extra margins of balance sheet strength consistent with the fiduciary obligations inherent in the banking and insurance industries—which will produce a long term rate of return on equity capital exceeding that of American industry as a whole.

Warren E. Buffett, Chairman

1976 Letter

To the Stockholders of Berkshire Hathaway Inc.:

After two dismal years, operating results in 1976 improved significantly. Last year we said the degree of progress in insurance underwriting would determine whether our gain in earnings would be “moderate” or “major.” As it turned out, earnings exceeded even the high end of our expectations. In large part, this was due to the outstanding efforts of Phil Liesche’s managerial group at National Indemnity Company.

In dollar terms, operating earnings came to \$16,073,000, or \$16.47 per share. While this is a record figure, we consider return on shareholders’ equity to be a much more significant yardstick of economic performance. Here our result was 17.3%, moderately above our long-term average and even further above the average of American industry, but well below our record level of 19.8% achieved in 1972.

Our present estimate, subject to all the caveats implicit in forecasting, is that dollar operating earnings are likely to improve somewhat in 1977, but that return on equity may decline a bit from the 1976 figure.

Textile Operations

Our textile division was a significant disappointment during 1976. Earnings, measured either by return on sales or by return on capital employed, were inadequate. In part, this was due to industry conditions which did not measure up to expectations of a year ago. But equally important were our own shortcomings. Marketing efforts and mill capabilities were not properly matched in our new Waumbec operation. Unfavorable manufacturing cost variances were produced by improper evaluation of machinery and personnel capabilities. Ken Chace, as always, has been candid in reporting problems and has worked diligently to correct them. He is a pleasure to work with—even under difficult operating conditions.

While the first quarter outlook is for red ink, our quite tentative belief is that textile earnings in 1977 will equal, or exceed modestly, those of 1976. Despite disappointing current results, we continue to look for ways to build our textile operation and presently have one moderate-size

acquisition under consideration. It should be recognized that the textile business does not offer the expectation of high returns on investment. Nevertheless, we maintain a commitment to this division—a very important source of employment in New Bedford and Manchester—and believe reasonable returns on average are possible.

Insurance Underwriting

Casualty insurers enjoyed some rebound from the disaster levels of 1975 as rate increases finally outstripped relentless cost increases. Preliminary figures indicate that the stockholder owned portion of the property and casualty industry had a combined ratio of 103.0 in 1976, compared to 108.3 in 1975. (100 represents a break-even position on underwriting—and higher figures represent underwriting losses.) We are unusually concentrated in auto lines where stock companies had an improvement from 113.5 to 107.4. Our own overall improvement was even more dramatic, from 115.4 to 98.7.

Our major insurance sector in insurance, the traditional auto and general liability business of National Indemnity Company, had an outstanding year, achieving profit levels significantly better than the industry generally. Credit for this performance must be given to Phil Liesche, aided particularly by Roland Miller in Underwriting and Bill Lyons in Claims.

Volume at National Indemnity Company grew rapidly during 1976 as competitors finally reacted to the inadequacy of past rates. But, as mentioned in last year's annual report, we are concentrated heavily in lines that are particularly susceptible to both economic and social inflation. Thus present rates, which are adequate for today, will not be adequate tomorrow. Our opinion is that before long, perhaps in 1978, the industry will fall behind on rates as temporary prosperity produces unwise competition. If this happens, we must be prepared to meet the next wave of inadequate pricing by a significant reduction in volume.

Reinsurance underwriting has lagged the improvement in direct business. When mistakes are made in the pricing of reinsurance, the effects continue for even longer than when similar mistakes are made in direct underwriting. George Young, an outstanding manager, has worked tirelessly to achieve his goal of profitable underwriting, and has cancelled a great many contracts where appropriate rate adjustments were not obtainable. Here, as in the direct

business, we have had a concentration in casualty lines which have been particularly hard hit by inflationary conditions. The near term outlook still is not good for our reinsurance business.

Our "home state" operation continues to make substantial progress under the management of John Ringwalt. The combined ratio improved from 108.4 in 1975 to 102.7 in 1976. There still are some excess costs reflected in the combined ratio which result from the small size of several operations. Cornhusker Casualty Company, oldest and largest of the home state companies, was the winner of the Chairman's Cup in 1976 for achievement of the lowest loss ratio among the home state companies. Cornhusker also achieved the lowest combined ratio in its history at 94.4, marking the fifth time in its six full years of existence that a ratio below 100 has been recorded. Premium growth was 78% at the home state companies in 1976, as market position improved significantly. We presently plan a new home state operation later this year.

Our Home and Automobile Insurance Company subsidiary, writing primarily automobile business in the Cook County area of Illinois, experienced a strong recovery in 1976. This is directly attributable to John Seward who, in his first full year, has revamped significantly both rating methods and marketing. The auto business has been shifted to a six month direct bill policy, which permits a faster reaction time to underwriting trends. Our general liability business at Home and Automobile has been expanded significantly with good results. While it remains to be proven that we can achieve sustained underwriting profitability at Home and Auto, we are delighted with the progress John Seward has achieved.

Overall, we expect a good year in insurance in 1977. Volume is high and present rate levels should allow profitable underwriting. Longer term, however, there are significant negatives in the insurance picture. Auto lines, in particular, seem highly vulnerable to pricing and regulatory problems produced by political and social factors beyond the control of individual companies.

Insurance Investments

Pre-tax investment income in 1976 improved to \$10,820,000 from \$8,918,000 as invested assets built up substantially, both from better levels of profitability and from gains in premium volume.

In recent reports we have noted the unrealized depreciation in our bond account, but stated that we considered such market fluctuations of minor importance as our liquidity and general

financial strength made it improbable that bonds would have to be sold at times other than those of our choice. The bond market rallied substantially in 1976, giving us moderate net unrealized gains at yearend in the bond portfolios of both our bank and insurance companies. This, too, is of minor importance since our intention is to hold a large portion of our bonds to maturity. The corollary to higher bond prices is that lower earnings are produced by the new funds generated for investment. On balance, we prefer a situation where our bond portfolio has a current market value less than carrying value, but more attractive rates are available on issues purchased with newly-generated funds.

Last year we stated that we expected 1976 to be a year of realized capital gains and, indeed, gains of \$9,962,000 before tax, primarily from stocks, were realized during the year. It presently appears that 1977 also will be a year of net realized capital gains. We now have a substantial unrealized gain in our stock portfolio as compared to a substantial unrealized loss several years ago. Here again we consider such market fluctuations from year to year relatively unimportant; unrealized appreciation in our equity holdings, which amounted to \$45.7 million at yearend, has declined by about \$5 million as this is written on March 21st.

However, we consider the yearly business progress of the companies in which we own stocks to be very important. And here, we have been delighted by the 1976 business performance achieved by most of our portfolio companies. If the business results continue excellent over a period of years, we are certain eventually to achieve good financial results from our stock holdings, regardless of wide year-to-year fluctuations in market values.

Our equity holdings with a market value of over \$3 million on December 31, 1976 were as follows:

No. of Shares	Company	Cost
141,987	California Water Service Company	\$3,608,711
1,986,953	Government Employees Insurance Company Convertible Preferred	19,416,635
1,294,308	Government Employees Insurance Company Common Stock	4,115,670
395,100	Interpublic Group of Companies	4,530,615
562,900	Kaiser Industries, Inc.	8,270,871
188,900	Munsingwear, Inc.	3,398,404
83,400	National Presto Industries, Inc.	1,689,896
170,800	Ogilvy & Mather International	2,762,433
934,300	The Washington Post Company Class B	10,627,604

1977 Letter

BERKSHIRE HATHAWAY INC.

To the Stockholders of Berkshire Hathaway Inc.:

Operating earnings in 1977 of \$21,904,000, or \$22.54 per share, were moderately better than anticipated a year ago. Of these earnings, \$1.43 per share resulted from substantial realized capital gains by Blue Chip Stamps which, to the extent of our proportional interest in that company, are included in our operating earnings figure. Capital gains or losses realized directly by Berkshire Hathaway Inc. or its insurance subsidiaries are not included in our calculation of operating earnings. While too much attention should not be paid to the figure for any single year, over the longer term the record regarding aggregate capital gains or losses obviously is of significance.

Textile operations came in well below forecast, while the results of the Illinois National Bank as well as the operating earnings attributable to our equity interest in Blue Chip Stamps were about as anticipated. However, insurance operations, led again by the truly outstanding results of Phil Liesche's managerial group at National Indemnity Company, were even better than our optimistic expectations.

Most companies define "record" earnings as a new high in earnings per share. Since businesses customarily add from year to year to their equity base, we find nothing particularly noteworthy in a management performance combining, say, a 10% increase in equity capital and a 5% increase in earnings per share. After all, even a totally dormant savings account will produce steadily rising interest earnings each year because of compounding.

Except for special cases (for example, companies with unusual debt-equity ratios or those with important assets carried at unrealistic balance sheet values), we believe a more appropriate measure of managerial economic performance to be return on equity capital. In 1977 our operating earnings on beginning equity capital amounted to 19%, slightly better than

last year and above both our own long-term average and that of American industry in aggregate. But, while our operating earnings per share were up 37% from the year before, our beginning capital was up 24%, making the gain in earnings per share considerably less impressive than it might appear at first glance.

We expect difficulty in matching our 1977 rate of return during the forthcoming year. Beginning equity capital is up 23% from a year ago, and we expect the trend of insurance underwriting profit margins to turn down well before the end of the year. Nevertheless, we expect a reasonably good year and our present estimate, subject to the usual caveats regarding the frailties of forecasts, is that operating earnings will improve somewhat on a per share basis during 1978.

Textile Operations

The textile business again had a very poor year in 1977. We have mistakenly predicted better results in each of the last two years. This may say something about our forecasting abilities, the nature of the textile industry, or both. Despite strenuous efforts, problems in marketing and manufacturing have persisted. Many difficulties experienced in the marketing area are due primarily to industry conditions, but some of the problems have been of our own making.

A few shareholders have questioned the wisdom of remaining in the textile business which, over the longer term, is unlikely to produce returns on capital comparable to those available in many other businesses. Our reasons are several: (1) Our mills in both New Bedford and Manchester are among the largest employers in each town, utilizing a labor force of high average age possessing relatively non-transferable skills. Our workers and unions have exhibited unusual understanding and effort in cooperating with management to achieve a cost structure and product mix which might allow us to maintain a viable operation. (2) management also has been energetic and straightforward in its approach to our textile problems. In particular, Ken Chace's efforts after the change in corporate control took place in 1965 generated capital from the textile division needed to finance the acquisition and expansion of our profitable insurance operation. (3) With hard work and some imagination regarding manufacturing and marketing configurations, it seems reasonable that at least

modest profits in the textile division can be achieved in the future.

Insurance Underwriting

Our insurance operation continued to grow significantly in 1977. It was early in 1967 that we made our entry into this industry through the purchase of National Indemnity Company and National Fire and Marine Insurance Company (sister companies) for approximately \$8.6 million. In that year their premium volume amounted to \$22 million. In 1977 our aggregate insurance premium volume was \$151 million. No additional shares of Berkshire Hathaway stock have been issued to achieve any of this growth.

Rather, this almost 600% increase has been achieved through large gains in National Indemnity's traditional liability areas plus the starting of new companies (Cornhusker Casualty Company in 1970, Lakeland Fire and Casualty Company in 1971, Texas United Insurance Company in 1972, The Insurance Company of Iowa in 1973, and Kansas Fire and Casualty Company in late 1977), the purchase for cash of other insurance companies (Home and Automobile Insurance Company in 1971, Kerkling Reinsurance Corporation, now named Central Fire and Casualty Company, in 1976, and Cypress Insurance Company at yearend 1977), and finally through the marketing of additional products, most significantly reinsurance, within the National Indemnity Company corporate structure.

In aggregate, the insurance business has worked out very well. But it hasn't been a one-way street. Some major mistakes have been made during the decade, both in products and personnel. We experienced significant problems from (1) a surety operation initiated in 1969, (2) the 1973 expansion of Home and Automobile's urban auto marketing into the Miami, Florida area, (3) a still unresolved aviation "fronting" arrangement, and (4) our Worker's Compensation operation in California, which we believe retains an interesting potential upon completion of a reorganization now in progress. It is comforting to be in a business where some mistakes can be made and yet a quite satisfactory overall performance can be achieved. In a sense, this is the opposite case from our textile business where even very good management probably can average only modest results. One of the lessons your management has learned - and, unfortunately, sometimes re-learned - is the importance of being in businesses where tailwinds prevail rather than headwinds.

In 1977 the winds in insurance underwriting were squarely behind us. Very large rate increases were effected throughout the industry in 1976 to offset the disastrous underwriting results of 1974 and 1975. But, because insurance policies typically are written for one-year periods, with pricing mistakes capable of correction only upon renewal, it was 1977 before the full impact was felt upon earnings of those earlier rate increases.

The pendulum now is beginning to swing the other way. We estimate that costs involved in the insurance areas in which we operate rise at close to 1% per month. This is due to continuous monetary inflation affecting the cost of repairing humans and property, as well as "social inflation", a broadening definition by society and juries of what is covered by insurance policies. Unless rates rise at a comparable 1% per month, underwriting profits must shrink. Recently the pace of rate increases has slowed dramatically, and it is our expectation that underwriting margins generally will be declining by the second half of the year.

We must again give credit to Phil Liesche, greatly assisted by Roland Miller in Underwriting and Bill Lyons in Claims, for an extraordinary underwriting achievement in National Indemnity's traditional auto and general liability business during 1977. Large volume gains have been accompanied by excellent underwriting margins following contraction or withdrawal by many competitors in the wake of the 1974-75 crisis period. These conditions will reverse before long. In the meantime, National Indemnity's underwriting profitability has increased dramatically and, in addition, large sums have been made available for investment. As markets loosen and rates become inadequate, we again will face the challenge of philosophically accepting reduced volume. Unusual managerial discipline will be required, as it runs counter to normal institutional behavior to let the other fellow take away business - even at foolish prices.

Our reinsurance department, managed by George Young, improved its underwriting performance during 1977. Although the combined ratio (see definition on page 12) of 107.1 was unsatisfactory, its trend was downward throughout the year. In addition, reinsurance generates unusually high funds for investment as a percentage of premium volume.

At Home and Auto, John Seward continued to make progress on all fronts. John was a battlefield promotion several years ago when Home and Auto's underwriting was awash in red

ink and the company faced possible extinction. Under his management it currently is sound, profitable, and growing.

John Ringwalt's homestate operation now consists of five companies, with Kansas Fire and Casualty Company becoming operational late in 1977 under the direction of Floyd Taylor. The homestate companies had net premium volume of \$23 million, up from \$5.5 million just three years ago. All four companies that operated throughout the year achieved combined ratios below 100, with Cornhusker Casualty Company, at 93.8, the leader. In addition to actively supervising the other four homestate operations, John Ringwalt manages the operations of Cornhusker which has recorded combined ratios below 100 in six of its seven full years of existence and, from a standing start in 1970, has grown to be one of the leading insurance companies operating in Nebraska utilizing the conventional independent agency system. Lakeland Fire and Casualty Company, managed by Jim Stodolka, was the winner of the Chairman's Cup in 1977 for achieving the lowest loss ratio among the homestate companies. All in all, the homestate operation continues to make excellent progress.

The newest addition to our insurance group is Cypress Insurance Company of South Pasadena, California. This Worker's Compensation insurer was purchased for cash in the final days of 1977 and, therefore, its approximate \$12.5 million of volume for that year was not included in our results. Cypress and National Indemnity's present California Worker's Compensation operation will not be combined, but will operate independently utilizing somewhat different marketing strategies. Milt Thornton, President of Cypress since 1968, runs a first-class operation for policyholders, agents, employees and owners alike. We look forward to working with him.

Insurance companies offer standardized policies which can be copied by anyone. Their only products are promises. It is not difficult to be licensed, and rates are an open book. There are no important advantages from trademarks, patents, location, corporate longevity, raw material sources, etc., and very little consumer differentiation to produce insulation from competition. It is commonplace, in corporate annual reports, to stress the difference that people make. Sometimes this is true and sometimes it isn't. But there is no question that the nature of

the insurance business magnifies the effect which individual managers have on company performance. We are very fortunate to have the group of managers that are associated with us.

Insurance Investments

During the past two years insurance investments at cost (excluding the investment in our affiliate, Blue Chip Stamps) have grown from \$134.6 million to \$252.8 million. Growth in insurance reserves, produced by our large gain in premium volume, plus retained earnings, have accounted for this increase in marketable securities. In turn, net investment income of the Insurance Group has improved from \$8.4 million pre-tax in 1975 to \$12.3 million pre-tax in 1977.

In addition to this income from dividends and interest, we realized capital gains of \$6.9 million before tax, about one-quarter from bonds and the balance from stocks. Our unrealized gain in stocks at yearend 1977 was approximately \$74 million but this figure, like any other figure of a single date (we had an unrealized loss of \$17 million at the end of 1974), should not be taken too seriously. Most of our large stock positions are going to be held for many years and the scorecard on our investment decisions will be provided by business results over that period, and not by prices on any given day. Just as it would be foolish to focus unduly on short-term prospects when acquiring an entire company, we think it equally unsound to become mesmerized by prospective near term earnings or recent trends in earnings when purchasing small pieces of a company; i.e., marketable common stocks.

A little digression illustrating this point may be interesting. Berkshire Fine Spinning Associates and Hathaway

Manufacturing were merged in 1955 to form Berkshire Hathaway Inc. In 1948, on a pro forma combined basis, they had earnings after tax of almost \$18 million and employed 10,000 people at a dozen large mills throughout New England. In the business world of that period they were an economic powerhouse. For example, in that same year earnings of IBM were \$28 million (now \$2.7 billion), Safeway Stores, \$10 million, Minnesota Mining, \$13 million, and Time, Inc., \$9 million. But, in the decade following the 1955 merger aggregate sales of \$595 million

produced an aggregate loss for Berkshire Hathaway of \$10 million. By 1964 the operation had been reduced to two mills and net worth had shrunk to \$22 million, from \$53 million at the time of the merger. So much for single year snapshots as adequate portrayals of a business.

Equity holdings of our insurance companies with a market value of over \$5 million on December 31, 1977 were as follows:

No. of Shares	Company	Cost (000's omitted)	Market (000's omitted)
220,000	Capital Cities Communications, Inc	\$10,909	\$13,228
1,986,953	Government Employees Insurance Company Convertible Preferred	\$19,417	\$33,033
1,294,308	Government Employees Insurance Company Common Stock	\$4,116	\$10,516
592,650	Interpublic Group of Companies	\$4,531	\$17,187
324,580	Kaiser Aluminum & Chemical Corporation	\$11,218	\$9,981
1,305,800	Kaiser Industries, Inc.	\$778	\$6,039
226,900	Knight-Ridder Newspapers, Inc	\$7,534	\$8,736
170,800	Ogilvy & Mather International, Inc.	\$2,762	\$6,960
934,300	The Washington Post Company Class B	\$10,628	\$33,401
	Total	\$71,893	\$139,081
	All Other Holdings	\$34,996	\$41,992
	Total Equities	\$106,889	\$181,073

We select our marketable equity securities in much the same way we would evaluate a business for acquisition in its entirety. We want the business to be (1) one that we can understand, (2) with favorable long-term prospects, (3) operated by honest and competent people, and (4) available at a very attractive price. We ordinarily make no attempt to buy equities for anticipated favorable stock price behavior in the short term. In fact, if

their business experience continues to satisfy us, we welcome lower market prices of stocks we own as an opportunity to acquire even more of a good thing at a better price.

Our experience has been that pro-rata portions of truly outstanding businesses sometimes sell in the securities markets at very large discounts from the prices they would command in negotiated transactions involving entire companies. Consequently, bargains in business ownership, which simply are not available directly through corporate acquisition, can be obtained indirectly through stock ownership. When prices are appropriate, we are willing to take very large positions in selected companies, not with any intention of taking control and not foreseeing sell-out or merger, but with the expectation that excellent business results by corporations will translate over the long term into correspondingly excellent market value and dividend results for owners, minority as well as majority.

Such investments initially may have negligible impact on our operating earnings. For example, we invested \$10.9 million in Capital Cities Communications during 1977. Earnings attributable to the shares we purchased totaled about \$1.3 million last year. But only the cash dividend, which currently provides \$40,000 annually, is reflected in our operating earnings figure.

Capital Cities possesses both extraordinary properties and extraordinary management. And these management skills extend equally to operations and employment of corporate capital. To purchase, directly, properties such as Capital Cities owns would cost in the area of twice our cost of purchase via the stock market, and direct ownership would offer no important advantages to us. While control would give us the opportunity - and the responsibility - to manage operations and corporate resources, we would not be able to provide management in either of those respects equal to that now in place. In effect, we can obtain a better management result through non-control than control. This is an unorthodox view, but one we believe to be sound.

Banking

In 1977 the Illinois National Bank continued to achieve a rate of earnings on assets about three times that of most large banks. As usual, this record was achieved while the bank paid

maximum rates to savers and maintained an asset position combining low risk and exceptional liquidity. Gene Abegg formed the bank in 1931 with \$250,000. In its first full year of operation, earnings amounted to \$8,782. Since that time, no new capital has been contributed to the bank; on the contrary, since our purchase in 1969, dividends of \$20 million have been paid. Earnings in 1977 amounted to \$3.6 million, more than achieved by many banks two or three times its size.

Late last year Gene, now 80 and still running a banking operation without peer, asked that a successor be brought in. Accordingly, Peter Jeffrey, formerly President and Chief Executive Officer of American National Bank of Omaha, has joined the Illinois National Bank effective March 1st as President and Chief Executive Officer.

Gene continues in good health as Chairman. We expect a continued successful operation at Rockford's leading bank.

Blue Chip Stamps

We again increased our equity interest in Blue Chip Stamps, and owned approximately 36 1/2% at the end of 1977. Blue Chip had a fine year, earning approximately \$12.9 million from operations and, in addition, had realized securities gains of \$4.1 million. Both Wesco Financial Corp., an 80% owned subsidiary of Blue Chip Stamps, managed by Louis Vincenti, and See's Candies, a 99% owned subsidiary, managed by Chuck Huggins, made good progress in 1977. Since See's was purchased by Blue Chip Stamps at the beginning of 1972, pre-tax operating earnings have grown from \$4.2 million to \$12.6 million with little additional capital investment. See's achieved this record while operating in an industry experiencing practically no unit growth. Shareholders of Berkshire Hathaway Inc. may obtain the annual report of Blue Chip Stamps by requesting it from Mr. Robert H. Bird, Blue Chip Stamps, 5801 South Eastern Avenue, Los Angeles, California 90040.

1978 Letter

BERKSHIRE HATHAWAY INC.

To the Shareholders of Berkshire Hathaway Inc.:

First, a few words about accounting. The merger with Diversified Retailing Company, Inc. at yearend adds two new complications in the presentation of our financial results. After the merger, our ownership of Blue Chip Stamps increased to approximately 58% and, therefore, the accounts of that company must be fully consolidated in the Balance Sheet and Statement of Earnings presentation of Berkshire. In previous reports, our share of the net earnings only of Blue Chip had been included as a single item on Berkshire's Statement of Earnings, and there had been a similar one-line inclusion on our Balance Sheet of our share of their net assets.

This full consolidation of sales, expenses, receivables, inventories, debt, etc. produces an aggregation of figures from many diverse businesses - textiles, insurance, candy, newspapers, trading stamps - with dramatically different economic characteristics. In some of these your ownership is 100% but, in those businesses which are owned by Blue Chip but fully consolidated, your ownership as a Berkshire shareholder is only 58%. (Ownership by others of the balance of these businesses is accounted for by the large minority interest item on the liability side of the Balance Sheet.) Such a grouping of Balance Sheet and Earnings items - some wholly owned, some partly owned - tends to obscure economic reality more than illuminate it. In fact, it represents a form of presentation that we never prepare for internal use during the year and which is of no value to us in any management activities.

For that reason, throughout the report we provide much separate financial information and commentary on the various segments of the business to help you evaluate Berkshire's performance and prospects. Much of this segmented information is mandated by SEC disclosure rules and covered in "Management's Discussion" on pages 29 to 34. And in this letter we try to present to you a view of our various operating entities from the same perspective that we view them managerially.

A second complication arising from the merger is that the 1977 figures shown in this report are different from the 1977 figures shown in the report we mailed to you last year. Accounting convention requires that when two entities such as Diversified and Berkshire are merged, all financial data subsequently must be presented as if the companies had been merged at the time they were formed rather than just recently. So the enclosed financial statements, in effect, pretend that in 1977 (and earlier years) the Diversified-Berkshire merger already had taken place, even though the actual merger date was December 30, 1978. This shifting base makes comparative commentary confusing and, from time to time in our narrative report, we will talk of figures and performance for Berkshire shareholders as historically reported to you rather than as restated after the Diversified merger.

With that preamble it can be stated that, with or without restated figures, 1978 was a good year. Operating earnings, exclusive of capital gains, at 19.4% of beginning shareholders' investment were within a fraction of our 1972 record. While we believe it is improper to include capital gains or losses in evaluating the performance of a single year, they are an important component of the longer term record. Because of such gains, Berkshire's long-term growth in equity per share has been greater than would be indicated by compounding the returns from operating earnings that we have reported annually.

For example, over the last three years - generally a bonanza period for the insurance industry, our largest profit producer - Berkshire's per share net worth virtually has doubled, thereby compounding at about 25% annually through a combination of good operating earnings and fairly substantial capital gains. Neither this 25% equity gain from all sources nor the 19.4% equity gain from operating earnings in 1978 is sustainable. The insurance cycle has turned downward in 1979, and it is almost certain that operating earnings measured by return on equity will fall this year. However, operating earnings measured in dollars are likely to increase on the much larger shareholders' equity now employed in the business.

In contrast to this cautious view about near term return from operations, we are optimistic about prospects for long term return from major equity investments held by our insurance companies. We make no attempt to predict how security markets will behave; successfully forecasting short term stock price movements is something we think neither we nor anyone

else can do. In the longer run, however, we feel that many of our major equity holdings are going to be worth considerably more money than we paid, and that investment gains will add significantly to the operating returns of the insurance group.

Sources of Earnings

To give you a better picture of just where Berkshire's earnings are produced, we show below a table which requires a little explanation. Berkshire owns close to 58% of Blue Chip which, in addition to 100% ownership of several businesses, owns 80% of Wesco Financial Corporation. Thus, Berkshire's equity in Wesco's earnings is about 46%. In aggregate, businesses that we control have about 7,000 full-time employees and generate revenues of over \$500 million.

The table shows the overall earnings of each major operating category on a pre-tax basis (several of the businesses have low tax rates because of significant amounts of tax-exempt interest and dividend income), as well as the share of those earnings belonging to Berkshire both on a pre-tax and after-tax basis. Significant capital gains or losses attributable to any of the businesses are not shown in the operating earnings figure, but are aggregated on the "Realized Securities Gain" line at the bottom of the table. Because of various accounting and tax intricacies, the figures in the table should not be treated as holy writ, but rather viewed as close approximations of the 1977 and 1978 earnings contributions of our constituent businesses.

Blue Chip and Wesco are public companies with reporting requirements of their own. Later in this report we are reproducing the narrative reports of the principal executives of both companies, describing their 1978 operations. Some of the figures they utilize will not match to the penny the ones we use in this report, again because of accounting and tax complexities. But their comments should be helpful to you in understanding the underlying economic characteristics of these important partly-owned businesses. A copy of the full annual report of either company will be mailed to any shareholder of Berkshire upon request to Mr. Robert H. Bird for Blue Chips Stamps, 5801 South Eastern Avenue, Los Angeles, California 90040, or to Mrs. Bette Deckard for Wesco Financial Corporation, 315 East Colorado Boulevard, Pasadena, California 91109.

Textiles

Earnings of \$1.3 million in 1978, while much improved from 1977, still represent a low return on the \$17 million of capital employed in this business. Textile plant and equipment are on the books for a very small fraction of what it would cost to replace such equipment today. And, despite the age of the equipment, much of it is functionally similar to new equipment being installed by the industry. But despite this “bargain cost” of fixed assets, capital turnover is relatively low reflecting required high investment levels in receivables and inventory compared to sales. Slow capital turnover, coupled with low profit margins on sales, inevitably produces inadequate returns on capital. Obvious approaches to improved profit margins involve differentiation of product, lowered manufacturing costs through more efficient equipment or better utilization of people, redirection toward fabrics enjoying stronger market trends, etc. Our management is diligent in pursuing such objectives. The problem, of course, is that our competitors are just as diligently doing the same thing.

The textile industry illustrates in textbook style how producers of relatively undifferentiated goods in capital intensive businesses must earn inadequate returns except under conditions of tight supply or real shortage. As long as excess productive capacity exists, prices tend to reflect direct operating costs rather than capital employed. Such a supply-excess condition appears likely to prevail most of the time in the textile industry, and our expectations are for profits of relatively modest amounts in relation to capital.

We hope we don't get into too many more businesses with such tough economic characteristics. But, as we have stated before: (1) our textile businesses are very important employers in their communities, (2) management has been straightforward in reporting on problems and energetic in attacking them, (3) labor has been cooperative and understanding in facing our common problems, and (4) the business should average modest cash returns relative to investment. As long as these conditions prevail - and we expect that they will - we intend to continue to support our textile business despite more attractive alternative uses for capital.

Insurance Underwriting

The number one contributor to Berkshire's overall excellent results in 1978 was the segment of National Indemnity Company's insurance operation run by Phil Liesche. On about \$90 million of earned premiums, an underwriting profit of approximately \$11 million was realized, a truly extraordinary achievement even against the background of excellent industry conditions. Under Phil's leadership, with outstanding assistance by Roland Miller in Underwriting and Bill Lyons in Claims, this segment of National Indemnity (including National Fire and Marine Insurance Company, which operates as a running mate) had one of its best years in a long history of performances which, in aggregate, far outshine those of the industry. Present successes reflect credit not only upon present managers, but equally upon the business talents of Jack Ringwalt, founder of National Indemnity, whose operating philosophy remains etched upon the company.

Home and Automobile Insurance Company had its best year since John Seward stepped in and straightened things out in 1975. Its results are combined in this report with those of Phil Liesche's operation under the insurance category entitled "Specialized Auto and General Liability".

Worker's Compensation was a mixed bag in 1978. In its first year as a subsidiary, Cypress Insurance Company, managed by Milt Thornton, turned in outstanding results. The worker's compensation line can cause large underwriting losses when rapid inflation interacts with changing social concepts, but Milt has a cautious and highly professional staff to cope with

these problems. His performance in 1978 has reinforced our very good feelings about this purchase.

Frank DeNardo came with us in the spring of 1978 to straighten out National Indemnity's California Worker's Compensation business which, up to that point, had been a disaster. Frank has the experience and intellect needed to correct the major problems of the Los Angeles office. Our volume in this department now is running only about 25% of what it was eighteen months ago, and early indications are that Frank is making good progress.

George Young's reinsurance department continues to produce very large sums for investment relative to premium volume, and thus gives us reasonably satisfactory overall results. However, underwriting results still are not what they should be and can be. It is very easy to fool yourself regarding underwriting results in reinsurance (particularly in casualty lines involving long delays in settlement), and we believe this situation prevails with many of our competitors. Unfortunately, self-delusion in company reserving almost always leads to inadequate industry rate levels. If major factors in the market don't know their true costs, the competitive "fall-out" hits all - even those with adequate cost knowledge. George is quite willing to reduce volume significantly, if needed, to achieve satisfactory underwriting, and we have a great deal of confidence in the long term soundness of this business under his direction.

The homestate operation was disappointing in 1978. Our unsatisfactory underwriting, even though partially explained by an unusual incidence of Midwestern storms, is particularly worrisome against the backdrop of very favorable industry results in the conventional lines written by our homestate group. We have confidence in John Ringwalt's ability to correct this situation. The bright spot in the group was the performance of Kansas Fire and Casualty in its first full year of business. Under Floyd Taylor, this subsidiary got off to a truly remarkable start. Of course, it takes at least several years to evaluate underwriting results, but the early signs are encouraging and Floyd's operation achieved the best loss ratio among the homestate companies in 1978.

Although some segments were disappointing, overall our insurance operation had an excellent year. But of course we should expect a good year when the industry is flying high, as

in 1978. It is a virtual certainty that in 1979 the combined ratio (see definition on page 31) for the industry will move up at least a few points, perhaps enough to throw the industry as a whole into an underwriting loss position. For example, in the auto lines - by far the most important area for the industry and for us - CPI figures indicate rates overall were only 3% higher in January 1979 than a year ago. But the items that make up loss costs - auto repair and medical care costs - were up over 9%. How different than yearend 1976 when rates had advanced over 22% in the preceding twelve months, but costs were up 8%.

Margins will remain steady only if rates rise as fast as costs. This assuredly will not be the case in 1979, and conditions probably will worsen in 1980. Our present thinking is that our underwriting performance relative to the industry will improve somewhat in 1979, but every other insurance management probably views its relative prospects with similar optimism - someone is going to be disappointed. Even if we do improve relative to others, we may well have a higher combined ratio and lower underwriting profits in 1979 than we achieved last year.

We continue to look for ways to expand our insurance operation. But your reaction to this intent should not be unrestrained joy. Some of our expansion efforts - largely initiated by your Chairman have been lackluster, others have been expensive failures. We entered the business in 1967 through purchase of the segment which Phil Liesche now manages, and it still remains, by a large margin, the best portion of our insurance business. It is not easy to buy a good insurance business, but our experience has been that it is easier to buy one than create one. However, we will continue to try both approaches, since the rewards for success in this field can be exceptional.

Insurance Investments

We confess considerable optimism regarding our insurance equity investments. Of course, our enthusiasm for stocks is not unconditional. Under some circumstances, common stock investments by insurers make very little sense.

We get excited enough to commit a big percentage of insurance company net worth to equities only when we find (1) businesses we can understand, (2) with favorable long-term

prospects, (3) operated by honest and competent people, and (4) priced very attractively. We usually can identify a small number of potential investments meeting requirements (1), (2) and (3), but (4) often prevents action. For example, in 1971 our total common stock position at Berkshire's insurance subsidiaries amounted to only \$10.7 million at cost, and \$11.7 million at market. There were equities of identifiably excellent companies available - but very few at interesting prices. (An irresistible footnote: in 1971, pension fund managers invested a record 122%

of net funds available in equities - at full prices they couldn't buy enough of them. In 1974, after the bottom had fallen out, they committed a then record low of 21% to stocks.)

The past few years have been a different story for us. At the end of 1975 our insurance subsidiaries held common equities with a market value exactly equal to cost of \$39.3 million. At the end of 1978 this position had been increased to equities (including a convertible preferred) with a cost of \$129.1 million and a market value of \$216.5 million. During the intervening three years we also had realized pre-tax gains from common equities of approximately \$24.7 million. Therefore, our overall unrealized and realized pre-tax gains in equities for the three year period came to approximately \$112 million. During this same interval the Dow-Jones Industrial Average declined from 852 to 805. It was a marvelous period for the value-oriented equity buyer.

We continue to find for our insurance portfolios small portions of really outstanding businesses that are available, through the auction pricing mechanism of security markets, at prices dramatically cheaper than the valuations inferior businesses command on negotiated sales.

This program of acquisition of small fractions of businesses (common stocks) at bargain prices, for which little enthusiasm exists, contrasts sharply with general corporate acquisition activity, for which much enthusiasm exists. It seems quite clear to us that either corporations are making very significant mistakes in purchasing entire businesses at prices prevailing in negotiated transactions and takeover bids, or that we eventually are going to make considerable sums of money buying small portions of such businesses at the greatly discounted valuations prevailing in the stock market. (A second footnote: in 1978 pension managers, a

group that logically should maintain the longest of investment perspectives, put only 9% of net available funds into equities - breaking the record low figure set in 1974 and tied in 1977.)

We are not concerned with whether the market quickly revalues upward securities that we believe are selling at bargain prices. In fact, we prefer just the opposite since, in most years, we expect to have funds available to be a net buyer of securities. And consistent attractive purchasing is likely to prove to be of more eventual benefit to us than any selling opportunities provided by a short-term run up in stock prices to levels at which we are unwilling to continue buying.

Our policy is to concentrate holdings. We try to avoid buying a little of this or that when we are only lukewarm about the business or its price. When we are convinced as to attractiveness, we believe in buying worthwhile amounts.

Equity holdings of our insurance companies with a market value of over \$8 million on December 31, 1978 were as follows:

No. of Shares	Company	Cost (000's omitted)	Market (000's omitted)
246,450	American Broadcasting Companies, Inc	\$6,082	\$8,626
1,294,308	Government Employees Insurance Company Common Stock	\$4,116	\$9,060
1,986,953	Government Employees Insurance Company Preferred	\$19,417	\$28,314
592,650	Interpublic Group of Companies	\$4,531	\$19,039
1,066,934	Kaiser Aluminum & Chemical Corporation	\$18,085	\$18,671
453,800	Knight-Ridder Newspapers, Inc	\$7,534	\$10,267
953,750	SAFECO Corporation	\$23,867	\$26,467
934,300	The Washington Post Company Class B	\$10,628	\$43,445
	Total	\$94,260	\$163,889
	All Other Holdings	\$39,506	\$57,040
	Total Equities	\$133,766	\$220,929

In some cases our indirect interest in earning power is becoming quite substantial. For example, note our holdings of 953,750 shares of SAFECO Corp. SAFECO probably is the best run large property and casualty insurance company in the United States. Their underwriting abilities are simply superb, their loss reserving is conservative, and their investment policies make great sense.

SAFECO is a much better insurance operation than our own (although we believe certain segments of ours are much better than average), is better than one we could develop and, similarly, is far better than any in which we might negotiate purchase of a controlling interest. Yet our purchase of SAFECO was made at substantially under book value. We paid less than 100 cents on the dollar for the best company in the business, when far more than 100 cents on the dollar is being paid for mediocre companies in corporate transactions. And there is no way to start a new operation - with necessarily uncertain prospects - at less than 100 cents on the dollar.

Of course, with a minor interest we do not have the right to direct or even influence management policies of SAFECO. But why should we wish to do this? The record would indicate that they do a better job of managing their operations than we could do ourselves. While there may be less excitement and prestige in sitting back and letting others do the work, we think that is all one loses by accepting a passive participation in excellent management. Because, quite clearly, if one controlled a company run as well as SAFECO, the proper policy also would be to sit back and let management do its job.

Earnings attributable to the shares of SAFECO owned by Berkshire at yearend amounted to \$6.1 million during 1978, but only the dividends received (about 18% of earnings) are reflected in our operating earnings. We believe the balance, although not reportable, to be just as real in terms of eventual benefit to us as the amount distributed. In fact, SAFECO's retained earnings (or those of other well-run companies if they have opportunities to employ additional capital advantageously) may well eventually have a value to shareholders greater than 100 cents on the dollar.

We are not at all unhappy when our wholly-owned businesses retain all of their earnings if they can utilize internally those funds at attractive rates. Why should we feel differently about

retention of earnings by companies in which we hold small equity interests, but where the record indicates even better prospects for profitable employment of capital? (This proposition cuts the other way, of course, in industries with low capital requirements, or if management has a record of plowing capital into projects of low profitability; then earnings should be paid out or used to repurchase shares - often by far the most attractive option for capital utilization.)

The aggregate level of such retained earnings attributable to our equity interests in fine companies is becoming quite substantial. It does not enter into our reported operating earnings, but we feel it well may have equal long-term significance to our shareholders. Our hope is that conditions continue to prevail in securities markets which allow our insurance companies to buy large amounts of underlying earning power for relatively modest outlays. At some point market conditions undoubtedly will again preclude such bargain buying but, in the meantime, we will try to make the most of opportunities.

Banking

Under Gene Abegg and Pete Jeffrey, the Illinois National Bank and Trust Company in Rockford continues to establish new records. Last year's earnings amounted to approximately 2.1% of average assets, about three times the level averaged by major banks. In our opinion, this extraordinary level of earnings is being achieved while maintaining significantly less asset risk than prevails at most of the larger banks.

We purchased the Illinois National Bank in March 1969. It was a first-class operation then, just as it had been ever since Gene Abegg opened the doors in 1931. Since 1968, consumer time deposits have quadrupled, net income has tripled and trust department income has more than doubled, while costs have been closely controlled.

Our experience has been that the manager of an already high-cost operation frequently is uncommonly resourceful in finding new ways to add to overhead, while the manager of a tightly-run operation usually continues to find additional methods to curtail costs, even when his costs are already well below those of his competitors. No one has demonstrated this latter ability better than Gene Abegg.

We are required to divest our bank by December 31, 1980. The most likely approach is to spin it off to Berkshire shareholders sometime in the second half of 1980.

Retailing

Upon merging with Diversified, we acquired 100% ownership of Associated Retail Stores, Inc., a chain of about 75 popular priced women's apparel stores. Associated was launched in Chicago on March 7, 1931 with one store, \$3200, and two extraordinary partners, Ben Rosner and Leo Simon. After Mr. Simon's death, the business was offered to Diversified for cash in 1967. Ben was to continue running the business - and run it, he has.

Associated's business has not grown, and it consistently has faced adverse demographic and retailing trends. But Ben's combination of merchandising, real estate and cost-containment skills has produced an outstanding record of profitability, with returns on capital necessarily employed in the business often in the 20% after-tax area.

Ben is now 75 and, like Gene Abegg, 81, at Illinois National and Louie Vincenti, 73, at Wesco, continues daily to bring an almost passionately proprietary attitude to the business. This group of top managers must appear to an outsider to be an overreaction on our part to an OEO bulletin on age discrimination. While unorthodox, these relationships have been exceptionally rewarding, both financially and personally. It is a real pleasure to work with managers who enjoy coming to work each morning and, once there, instinctively and unerringly think like owners. We are associated with some of the very best.

Warren E. Buffett, Chairman

March 26, 1979

1979 Letter

BERKSHIRE HATHAWAY INC.

To the Shareholders of Berkshire Hathaway Inc.:

Again, we must lead off with a few words about accounting. Since our last annual report, the accounting profession has decided that equity securities owned by insurance companies must be carried on the balance sheet at market value. We previously have carried such equity securities at the lower of aggregate cost or aggregate market value. Because we have large unrealized gains in our insurance equity holdings, the result of this new policy is to increase substantially both the 1978 and 1979 yearend net worth, even after the appropriate liability is established for taxes on capital gains that would be payable should equities be sold at such market valuations.

As you know, Blue Chip Stamps, our 60% owned subsidiary, is fully consolidated in Berkshire Hathaway's financial statements. However, Blue Chip still is required to carry its equity investments at the lower of aggregate cost or aggregate market value, just as Berkshire Hathaway's insurance subsidiaries did prior to this year. Should the same equities be purchased at an identical price by an insurance subsidiary of Berkshire Hathaway and by Blue Chip Stamps, present accounting principles often would require that they end up carried on our consolidated balance sheet at two different values. (That should keep you on your toes.) Market values of Blue Chip Stamps' equity holdings are given in footnote 3 on page 18.

1979 Operating Results

We continue to feel that the ratio of operating earnings (before securities gains or losses) to shareholders' equity *with all securities valued at cost* is the most appropriate way to measure any single year's operating performance.

Measuring such results against shareholders' equity with securities valued at market could significantly distort the operating performance percentage because of wide year-to-year market value changes in the net worth figure that serves as the denominator. For example, a large decline in securities values could result in a very low "market value" net worth that, in turn, could cause mediocre operating earnings to look unrealistically good. Alternatively, the more successful that equity investments have been, the larger the net worth base becomes and the poorer the operating performance figure appears. Therefore, we will continue to report operating performance measured against beginning net worth, with securities valued at cost.

On this basis, we had a reasonably good operating performance in 1979 - but not quite as good as that of 1978 - with operating earnings amounting to 18.6% of beginning net worth. Earnings per share, of course, increased somewhat (about 20%) but we regard this as an improper figure upon which to focus. We had substantially more capital to work within 1979 than in 1978, and our performance in utilizing that capital fell short of the earlier year, even though per-share earnings rose. "Earnings per share" will rise constantly on a dormant savings account or on a U.S. Savings Bond bearing a fixed rate of return simply because "earnings" (the stated interest rate) are continuously plowed back and added to the capital base. Thus, even a "stopped clock" can look like a growth stock if the dividend payout ratio is low.

The primary test of managerial economic performance is the achievement of a high earnings rate on equity capital employed (without undue leverage, accounting gimmickry, etc.) and not the achievement of consistent gains in earnings per share. In our view, many businesses would be better understood by their shareholder owners, as well as the general public, if managements and financial analysts modified the primary emphasis they place upon earnings per share, and upon yearly changes in that figure.

Long Term Results

In measuring long term economic performance - in contrast to yearly performance - we believe it is appropriate to recognize fully any realized capital gains or losses as well as

extraordinary items, and also to utilize financial statements presenting equity securities at market value. Such capital gains or losses, either realized or unrealized, are fully as important to shareholders over a period of years as earnings realized in a more routine manner through operations; it is just that their impact is often extremely capricious in the short run, a characteristic that makes them inappropriate as an indicator of single year managerial performance.

The book value per share of Berkshire Hathaway on September 30, 1964 (the fiscal yearend prior to the time that your present management assumed responsibility) was \$19.46 per share. At yearend 1979, book value with equity holdings carried at market value was \$335.85 per share. The gain in book value comes to 20.5% compounded annually. This figure, of course, is far higher than any average of our yearly operating earnings calculations, and reflects the importance of capital appreciation of insurance equity investments in determining the overall results for our shareholders. It probably also is fair to say that the quoted book value in 1964 somewhat overstated the intrinsic value of the enterprise, since the assets owned at that time on either a going concern basis or a liquidating value basis were not worth 100 cents on the dollar. (The liabilities were solid, however.)

We have achieved this result while utilizing a low amount of leverage (both financial leverage measured by debt to equity, and operating leverage measured by premium volume to capital funds of our insurance business), and also without significant issuance or repurchase of shares. Basically, we have worked with the capital with which we started. From our textile base we, or our Blue Chip and Wesco subsidiaries, have acquired total ownership of thirteen businesses through negotiated purchases from private owners for cash, and have started six others. (It's worth a mention that those who have sold to us have, almost without exception, treated us with exceptional honor and fairness, both at the time of sale and subsequently.)

But before we drown in a sea of self-congratulation, a further - and crucial - observation must be made. A few years ago, a business whose per-share net worth compounded at 20% annually would have guaranteed its owners a highly successful real investment return. Now such an outcome seems less certain. For the inflation rate, coupled with individual tax rates, will be the ultimate determinant as to whether our internal operating performance produces

successful investment results - i.e., a reasonable gain in purchasing power from funds committed - for you as shareholders.

Just as the original 3% savings bond, a 5% passbook savings account or an 8% U.S. Treasury Note have, in turn, been transformed by inflation into financial instruments that chew up, rather than enhance, purchasing power over their investment lives, a business earning 20% on capital can produce a negative real return for its owners under inflationary conditions not much more severe than presently prevail.

If we should continue to achieve a 20% compounded gain - not an easy or certain result by any means - and this gain is translated into a corresponding increase in the market value of Berkshire Hathaway stock as it has been over the last fifteen years, your after-tax purchasing power gain is likely to be very close to zero at a 14% inflation rate. Most of the remaining six percentage points will go for income tax any time you wish to convert your twenty percentage points of nominal annual gain into cash.

That combination - the inflation rate plus the percentage of capital that must be paid by the owner to transfer into his own pocket the annual earnings achieved by the business (i.e., ordinary income tax on dividends and capital gains tax on retained earnings) - can be thought of as an "investor's misery index". When this index exceeds the rate of return earned on equity by the business, the investor's purchasing power (real capital) shrinks even though he consumes nothing at all. *We have no corporate solution to this problem; high inflation rates will not help us earn higher rates of return on equity.*

One friendly but sharp-eyed commentator on Berkshire has pointed out that our book value at the end of 1964 would have bought about one-half ounce of gold and, fifteen years later, after we have plowed back all earnings along with much blood, sweat and tears, the book value produced will buy about the same half ounce. A similar comparison could be drawn with Middle Eastern oil. The rub has been that government has been exceptionally able in printing money and creating promises, but is unable to print gold or create oil.

We intend to continue to do as well as we can in managing the internal affairs of the business. But you should understand that external conditions affecting the stability of currency

may very well be the most important factor in determining whether there are any real rewards from your investment in Berkshire Hathaway.

Sources of Earnings

We again present a table showing the sources of Berkshire's earnings. As explained last year, Berkshire owns about 60% of Blue Chip Stamps which, in turn, owns 80% of Wesco Financial Corporation. The table shows both aggregate earnings of the various business entities, as well as Berkshire's share. All of the significant capital gains or losses attributable to any of the business entities are aggregated in the realized securities gain figure at the bottom of the table, and are not included in operating earnings.

	Earnings Total	Before Total	Income Berkshire	Taxes Share	Net Earnings Berkshire	After Tax Share

Blue Chip and Wesco are public companies with reporting requirements of their own. On pages 37-43 of this report, we have reproduced the narrative reports of the principal executives of both companies, in which they describe 1979 operations. Some of the numbers they mention in their reports are not precisely identical to those in the above table because of accounting and tax complexities. (The Yanomamo Indians employ only three numbers: one, two, and more than two. Maybe their time will come.) However, the commentary in those reports should be helpful to you in understanding the underlying economic characteristics and future prospects of the important businesses that they manage.

A copy of the full annual report of either company will be mailed to any shareholder of Berkshire upon request to Mr. Robert H. Bird for Blue Chip Stamps, 5801 South Eastern Avenue, Los Angeles, California 90040, or to Mrs. Bette Deckard for Wesco Financial Corporation, 315 East Colorado Boulevard, Pasadena, California 91109.

Textiles and Retailing

The relative significance of these two areas has diminished somewhat over the years as our insurance business has grown dramatically in size and earnings. Ben Rosner, at Associated Retail Stores, continues to pull rabbits out of the hat - big rabbits from a small hat. Year after year, he produces very large earnings relative to capital employed - realized in cash and not in increased receivables and inventories as in many other retail businesses - in a segment of the market with little growth and unexciting demographics. Ben is now 76 and, like our other "up-and-comers", Gene Abegg, 82, at Illinois National and Louis Vincenti, 74, at Wesco, regularly achieves more each year.

Our textile business also continues to produce some cash, but at a low rate compared to capital employed. This is not a reflection on the managers, but rather on the industry in which they operate. In some businesses - a network TV station, for example - it is virtually impossible to avoid earning extraordinary returns on tangible capital employed in the business. And assets in such businesses sell at equally extraordinary prices, one thousand cents or more on the dollar, a valuation reflecting the splendid, almost unavoidable, economic results obtainable. Despite a fancy price tag, the "easy" business may be the better route to go.

We can speak from experience, having tried the other route. Your Chairman made the decision a few years ago to purchase Waumbec Mills in Manchester, New Hampshire, thereby expanding our textile commitment. By any statistical test, the purchase price was an extraordinary bargain; we bought well below the working capital of the business and, in effect, got very substantial amounts of machinery and real estate for less than nothing. But the purchase was a mistake. While we labored mightily, new problems arose as fast as old problems were tamed.

Both our operating and investment experience cause us to conclude that “turnarounds” seldom turn, and that the same energies and talent are much better employed in a good business purchased at a fair price than in a poor business purchased at a bargain price. Although a mistake, the Waumbec acquisition has not been a disaster. Certain portions of the operation are proving to be valuable additions to our decorator line (our strongest franchise) at New Bedford, and it’s possible that we may be able to run profitably on a considerably reduced scale at Manchester. However, our original rationale did not prove out.

Insurance Underwriting

We predicted last year that the combined underwriting ratio (see definition on page 36) for the insurance industry would “move up at least a few points, perhaps enough to throw the industry as a whole into an underwriting loss position”. That is just about the way it worked out. The industry underwriting ratio rose in 1979 over three points, from roughly 97.4% to 100.7%. We also said that we thought our underwriting performance relative to the industry would improve somewhat in 1979 and, again, things worked out as expected. Our own underwriting ratio actually decreased from 98.2% to 97.1%. Our forecast for 1980 is similar in one respect; again we feel that the industry’s performance will worsen by at least another few points. However, this year we have no reason to think that our performance relative to the industry will further improve. (Don’t worry - we won’t hold back to try to validate that forecast.)

Really extraordinary results were turned in by the portion of National Indemnity Company’s insurance operation run by Phil Liesche. Aided by Roland Miller in Underwriting and Bill Lyons

in Claims, this section of the business produced an underwriting profit of \$8.4 million on about \$82 million of earned premiums. Only a very few companies in the entire industry produced a result comparable to this.

You will notice that earned premiums in this segment were down somewhat from those of 1978. We hear a great many insurance managers talk about being willing to reduce volume in order to underwrite profitably, but we find that very few actually do so. Phil Liesche is an exception: if business makes sense, he writes it; if it doesn't, he rejects it. It is our policy not to lay off people because of the large fluctuations in work load produced by such voluntary volume changes. We would rather have some slack in the organization from time to time than keep everyone terribly busy writing business on which we are going to lose money. Jack Ringwalt, the founder of National Indemnity Company, instilled this underwriting discipline at the inception of the company, and Phil Liesche never has wavered in maintaining it. We believe such strong-mindedness is as rare as it is sound - and absolutely essential to the running of a first-class casualty insurance operation.

John Seward continues to make solid progress at Home and Automobile Insurance Company, in large part by significantly expanding the marketing scope of that company in general liability lines. These lines can be dynamite, but the record to date is excellent and, in John McGowan and Paul Springman, we have two cautious liability managers extending our capabilities.

Our reinsurance division, led by George Young, continues to give us reasonably satisfactory overall results after allowing for investment income, but underwriting performance remains unsatisfactory. We think the reinsurance business is a very tough business that is likely to get much tougher. In fact, the influx of capital into the business and the resulting softer price levels for continually increasing exposures may well produce disastrous results for many entrants (of which they may be blissfully unaware until they are in over their heads; much reinsurance business involves an exceptionally "long tail", a characteristic that allows catastrophic current loss experience to fester undetected for many years). It will be hard for us to be a whole lot smarter than the crowd and thus our reinsurance activity may decline substantially during the projected prolonged period of extraordinary competition.

The Homestate operation was disappointing in 1979. Excellent results again were turned in by George Billings at Texas United Insurance Company, winner of the annual award for the low loss ratio among Homestate companies, and Floyd Taylor at Kansas Fire and Casualty Company. But several of the other operations, particularly Cornhusker Casualty Company, our first and largest Homestate operation and historically a winner, had poor underwriting results which were accentuated by data processing, administrative and personnel problems. We have made some major mistakes in reorganizing our data processing activities, and those mistakes will not be cured immediately or without cost. However, John Ringwalt has thrown himself into the task of getting things straightened out and we have confidence that he, aided by several strong people who recently have been brought aboard, will succeed.

Our performance in Worker's Compensation was far, far better than we had any right to expect at the beginning of 1979. We had a very favorable climate in California for the achievement of good results but, beyond this, Milt Thornton at Cypress Insurance Company and Frank DeNardo at National Indemnity's California Worker's Compensation operation both performed in a simply outstanding manner. We have admitted - and with good reason - some mistakes on the acquisition front, but the Cypress purchase has turned out to be an absolute gem. Milt Thornton, like Phil Liesche, follows the policy of sticking with business that he understands and wants, without giving consideration to the impact on volume. As a result, he has an outstanding book of business and an exceptionally well-functioning group of employees. Frank DeNardo has straightened out the mess he inherited in Los Angeles in a manner far beyond our expectations, producing savings measured in seven figures. He now can begin to build on a sound base.

At yearend we entered the specialized area of surety reinsurance under the management of Chet Noble. At least initially, this operation will be relatively small since our policy will be to seek client companies who appreciate the need for a long term "partnership" relationship with their reinsurers. We are pleased by the quality of the insurers we have attracted, and hope to add several more of the best primary writers as our financial strength and stability become better known in the surety field.

The conventional wisdom is that insurance underwriting overall will be poor in 1980, but that rates will start to firm in a year or so, leading to a turn in the cycle some time in 1981. We disagree with this view. Present interest rates encourage the obtaining of business at underwriting loss levels formerly regarded as totally unacceptable. Managers decry the folly of underwriting at a loss to obtain investment income, but we believe that many will. Thus we expect that competition will create a new threshold of tolerance for underwriting losses, and that combined ratios will average higher in the future than in the past.

To some extent, the day of reckoning has been postponed because of marked reduction in the frequency of auto accidents - probably brought on in major part by changes in driving habits induced by higher gas prices. In our opinion, if the habits hadn't changed, auto insurance rates would have been very little higher and underwriting results would have been much worse. This dosage of serendipity won't last indefinitely.

Our forecast is for an average combined ratio for the industry in the 105 area over the next five years. While we have a high degree of confidence that certain of our operations will do considerably better than average, it will be a challenge to us to operate below the industry figure. You can get a lot of surprises in insurance.

Nevertheless, we believe that insurance can be a very good business. It tends to magnify, to an unusual degree, human managerial talent - or the lack of it. We have a number of managers whose talent is both proven and growing. (And, in addition, we have a very large indirect interest in two truly outstanding management groups through our investments in SAFECO and GEICO.) Thus we expect to do well in insurance over a period of years. However, the business has the potential for really terrible results in a single specific year. If accident frequency should turn around quickly in the auto field, we, along with others, are likely to experience such a year.

Insurance Investments

In recent years we have written at length in this section about our insurance equity investments. In 1979 they continued to perform well, largely because the underlying companies in which we have invested, in practically all cases, turned in outstanding performances. Retained earnings applicable to our insurance equity investments, not reported

in our financial statements, continue to mount annually and, in aggregate, now come to a very substantial number. We have faith that the managements of these companies will utilize those retained earnings effectively and will translate a dollar retained by them into a dollar or more of subsequent market value for us. In part, our unrealized gains reflect this process.

Below we show the equity investments which had a yearend market value of over \$5 million:

No. of Shares	Company	Cost (000's omitted)	Market (000's omitted)
289,700	Affiliated Publications, Inc.	\$2,821	\$8,800
112,545	Amerada Hess	\$2,861	\$5,487
246,450	American Broadcasting Companies, Inc	\$6,082	\$9,673
5,730,114	GEICO Corp. (Common Stock)	\$28,288	\$68,045
328,700	General Foods, Inc.	\$11,437	\$11,053
1,007,500	Handy & Harman	\$21,825	\$38,537
711,180	Interpublic Group of Companies	\$4,531	\$23,736
1,211,834	Kaiser Aluminum& Chemical Corporation	\$20,629	\$23,328
282,500	Media General, Inc.	\$4,545	\$7,345
391,400	Ogilvy & Mather International	\$3,709	\$7,828
953,750	SAFECO Corporation	\$23,867	\$35,527
1,868,000	The Washington Post Company Class B	\$10,628	\$39,241
771,900	F. W. Woolworth Company	\$15,515	\$19,394
	Total	\$156,738	\$297,994
	All Other Holdings	\$28,675	\$38,686
	Total Equities	\$185,413	\$336,680

We currently believe that equity markets in 1980 are likely to evolve in a manner that will result in an underperformance by our portfolio for the first time in recent years. We very much like the companies in which we have major investments, and plan no changes to try to attune ourselves to the markets of a specific year.

Since we have covered our philosophy regarding equities extensively in recent annual reports, a more extended discussion of bond investments may be appropriate for this one, particularly in light of what has happened since yearend. An extraordinary amount of money has been lost by the insurance industry in the bond area - notwithstanding the accounting convention that allows insurance companies to carry their bond investments at amortized cost, regardless of impaired market value. Actually, that very accounting convention may have contributed in a major way to the losses; had management been forced to recognize market values, its attention might have been focused much earlier on the dangers of a very long-term bond contract.

Ironically, many insurance companies have decided that a one-year auto policy is inappropriate during a time of inflation, and six-month policies have been brought in as replacements. "How," say many of the insurance managers, "can we be expected to look forward twelve months and estimate such imponderables as hospital costs, auto parts prices, etc.?" But, having decided that one year is too long a period for which to set a fixed price for insurance in an inflationary world, they then have turned around, taken the proceeds from the sale of that six-month policy, and sold the money at a fixed price for thirty or forty years.

The very long-term bond contract has been the last major fixed price contract of extended duration still regularly initiated in an inflation-ridden world. The buyer of money to be used between 1980 and 2020 has been able to obtain a firm price now for each year of its use while the buyer of auto insurance, medical services, newsprint, office space - or just about any other product or service - would be greeted with laughter if he were to request a firm price now to apply through 1985. For in virtually all other areas of commerce, parties to long-term contracts now either index prices in some manner, or insist on the right to review the situation every year or so.

A cultural lag has prevailed in the bond area. The buyers (borrowers) and middlemen (underwriters) of money hardly could be expected to raise the question of whether it all made sense, and the sellers (lenders) slept through an economic and contractual revolution.

For the last few years our insurance companies have not been a net purchaser of any straight long-term bonds (those without conversion rights or other attributes offering profit

possibilities). There have been some purchases in the straight bond area, of course, but they have been offset by sales or maturities. Even prior to this period, we never would buy thirty or forty-year bonds; instead we tried to concentrate in the straight bond area on shorter issues with sinking funds and on issues that seemed relatively undervalued because of bond market inefficiencies.

However, the mild degree of caution that we exercised was an improper response to the world unfolding about us. You do not adequately protect yourself by bring half awake while others are sleeping. It was a mistake to buy fifteen-year bonds, and yet we did; we made an even more serious mistake in not selling them (at losses, if necessary) when our present views began to crystallize. (Naturally, those views are much clearer and definite in retrospect; it would be fair for you to ask why we weren't writing about this subject last year.)

Of course, we must hold significant amounts of bonds or other fixed dollar obligations in conjunction with our insurance operations. In the last several years our net fixed dollar commitments have been limited to the purchase of convertible bonds. We believe that the conversion options obtained, in effect, give that portion of the bond portfolio a far shorter average life than implied by the maturity terms of the issues (i.e., at an appropriate time of our choosing, we can terminate the bond contract by conversion into stock).

This bond policy has given us significantly lower unrealized losses than those experienced by the great majority of property and casualty insurance companies. We also have been helped by our strong preference for equities in recent years that has kept our overall bond segment relatively low. Nevertheless, we are taking our lumps in bonds and feel that, in a sense, our mistakes should be viewed less charitably than the mistakes of those who went about their business unmindful of the developing problems.

Harking back to our textile experience, we should have realized the futility of trying to be very clever (via sinking funds and other special type issues) in an area where the tide was running heavily against us.

We have severe doubts as to whether a very long-term fixed-interest bond, denominated in dollars, remains an appropriate business contract in a world where the value of dollars seems

almost certain to shrink by the day. Those dollars, as well as paper creations of other governments, simply may have too many structural weaknesses to appropriately serve as a unit of long term commercial reference. If so, really long bonds may turn out to be obsolete instruments and insurers who have bought those maturities of 2010 or 2020 could have major and continuing problems on their hands. We, likewise, will be unhappy with our fifteen-year bonds and will annually pay a price in terms of earning power that reflects that mistake.

Some of our convertible bonds appear exceptionally attractive to us, and have the same sort of earnings retention factor (applicable to the stock into which they may be converted) that prevails in our conventional equity portfolio. We expect to make money in these bonds (we already have, in a few cases) and have hopes that our profits in this area may offset losses in straight bonds.

And, of course, there is the possibility that our present analysis is much too negative. The chances for very low rates of inflation are not nil. Inflation is man-made; perhaps it can be man-mastered. The threat which alarms us may also alarm legislators and other powerful groups, prompting some appropriate response.

Furthermore, present interest rates incorporate much higher inflation projections than those of a year or two ago. Such rates may prove adequate or more than adequate to protect bond buyers. We even may miss large profits from a major rebound in bond prices. However, our unwillingness to fix a price now for a pound of See's candy or a yard of Berkshire cloth to be delivered in 2010 or 2020 makes us equally unwilling to buy bonds which set a price on money now for use in those years. Overall, we opt for Polonius (slightly restated): "Neither a short-term borrower nor a long-term lender be."

Banking

This will be the last year that we can report on the Illinois National Bank and Trust Company as a subsidiary of Berkshire Hathaway. Therefore, it is particularly pleasant to report that, under Gene Abegg's and Pete Jeffrey's management, the bank broke all previous records and earned approximately 2.3% on average assets last year, a level again over three times that achieved by the average major bank, and more than double that of banks regarded as outstanding. The record is simply extraordinary, and the shareholders of Berkshire Hathaway

owe a standing ovation to Gene Abegg for the performance this year and every year since our purchase in 1969.

As you know, the Bank Holding Company Act of 1969 requires that we divest the bank by December 31, 1980. For some years we have expected to comply by effecting a spin-off during 1980. However, the Federal Reserve Board has taken the firm position that if the bank is spun off, no officer or director of Berkshire Hathaway can be an officer or director of the spun-off bank or bank holding company, even in a case such as ours in which one individual would own over 40% of both companies.

Under these conditions, we are investigating the possible sale of between 80% and 100% of the stock of the bank. We will be most choosy about any purchaser, and our selection will not be based solely on price. The bank and its management have treated us exceptionally well and, if we have to sell, we want to be sure that they are treated equally as well. A spin-off still is a possibility if a fair price along with a proper purchaser cannot be obtained by early fall.

However, you should be aware that we do not expect to be able to fully, or even in very large part, replace the earning power represented by the bank from the proceeds of the sale of the bank. You simply can't buy high quality businesses at the sort of price/earnings multiple likely to prevail on our bank sale.

Financial Reporting

During 1979, NASDAQ trading was initiated in the stock of Berkshire Hathaway. This means that the stock now is quoted on the Over-the-Counter page of the Wall Street journal under "Additional OTC Quotes". Prior to such listing, the Wall Street journal and the Dow-Jones news ticker would not report our earnings, even though such earnings were one hundred or more times the level of some companies whose reports they regularly picked up.

Now, however, the Dow-Jones news ticker reports our quarterly earnings promptly after we release them and, in addition, both the ticker and the Wall Street journal report our annual earnings. This solves a dissemination problem that had bothered us.

In some ways, our shareholder group is a rather unusual one, and this affects our manner of reporting to you. For example, at the end of each year about 98% of the shares outstanding are held by people who also were shareholders at the beginning of the year. Therefore, in our

annual report we build upon what we have told you in previous years instead of restating a lot of material. You get more useful information this way, and we don't get bored.

Furthermore, perhaps 90% of our shares are owned by investors for whom Berkshire is their largest security holding, very often far and away the largest. Many of these owners are willing to spend a significant amount of time with the annual report, and we attempt to provide them with the same information we would find useful if the roles were reversed.

In contrast, we include no narrative with our quarterly reports. Our owners and managers both have very long time-horizons in regard to this business, and it is difficult to say anything new or meaningful each quarter about events of long-term significance.

But when you do receive a communication from us, it will come from the fellow you are paying to run the business. Your Chairman has a firm belief that owners are entitled to hear directly from the CEO as to what is going on and how he evaluates the business, currently and prospectively. You would demand that in a private company; you should expect no less in a public company. A once-a-year report of stewardship should not be turned over to a staff specialist or public relations consultant who is unlikely to be in a position to talk frankly on a manager-to-owner basis.

We feel that you, as owners, are entitled to the same sort of reporting by your manager as we feel is owed to us at Berkshire Hathaway by managers of our business units. Obviously, the degree of detail must be different, particularly where information would be useful to a business competitor or the like. But the general scope, balance, and level of candor should be similar. We don't expect a public relations document when our operating managers tell us what is going on, and we don't feel you should receive such a document.

In large part, companies obtain the shareholder constituency that they seek and deserve. If they focus their thinking and communications on short-term results or short-term stock market consequences they will, in large part, attract shareholders who focus on the same factors. And if they are cynical in their treatment of investors, eventually that cynicism is highly likely to be returned by the investment community.

Phil Fisher, a respected investor and author, once likened the policies of the corporation in attracting shareholders to those of a restaurant attracting potential customers. A restaurant

could seek a given clientele - patrons of fast foods, elegant dining, Oriental food, etc. - and eventually obtain an appropriate group of devotees. If the job were expertly done, that clientele, pleased with the service, menu, and price level offered, would return consistently. But the restaurant could not change its character constantly and end up with a happy and stable clientele. If the business vacillated between French cuisine and take-out chicken, the result would be a revolving door of confused and dissatisfied customers.

So it is with corporations and the shareholder constituency they seek. You can't be all things to all men, simultaneously seeking different owners whose primary interests run from high current yield to long-term capital growth to stock market pyrotechnics, etc.

The reasoning of managements that seek large trading activity in their shares puzzles us. In effect, such managements are saying that they want a good many of the existing clientele continually to desert them in favor of new ones - because you can't add lots of new owners (with new expectations) without losing lots of former owners.

We much prefer owners who like our service and menu and who return year after year. It would be hard to find a better group to sit in the Berkshire Hathaway shareholder "seats" than those already occupying them. So we hope to continue to have a very low turnover among our owners, reflecting a constituency that understands our operation, approves of our policies, and shares our expectations. And we hope to deliver on those expectations.

Prospects

Last year we said that we expected operating earnings in dollars to improve but return on equity to decrease. This turned out to be correct. Our forecast for 1980 is the same. If we are wrong, it will be on the downside. In other words, we are virtually certain that our operating earnings expressed as a percentage of the new equity base of approximately \$236 million, valuing securities at cost, will decline from the 18.6% attained in 1979. There is also a fair chance that operating earnings in aggregate dollars will fall short of 1979; the outcome depends partly upon the date of disposition of the bank, partly upon the degree of slippage in insurance underwriting profitability, and partly upon the severity of earnings problems in the savings and loan industry.

We continue to feel very good about our insurance equity investments. Over a period of years, we expect to develop very large and growing amounts of underlying earning power attributable to our fractional ownership of these companies. In most cases they are splendid businesses, splendidly managed, purchased at highly attractive prices.

Your company is run on the principle of centralization of financial decisions at the top (the very top, it might be added), and rather extreme delegation of operating authority to a number of key managers at the individual company or business unit level. We could just field a basketball team with our corporate headquarters group (which utilizes only about 1500 square feet of space).

This approach produces an occasional major mistake that might have been eliminated or minimized through closer operating controls. But it also eliminates large layers of costs and dramatically speeds decision-making. Because everyone has a great deal to do, a very great deal gets done. Most important of all, it enables us to attract and retain some extraordinarily talented individuals - people who simply can't be hired in the normal course of events - who find working for Berkshire to be almost identical to running their own show.

We have placed much trust in them - and their achievements have far exceeded that trust.

Warren E. Buffett, Chairman

March 3, 1980

1980 Letter

BERKSHIRE HATHAWAY INC.

To the Shareholders of Berkshire Hathaway Inc.:

Operating earnings improved to \$41.9 million in 1980 from \$36.0 million in 1979, but return on beginning equity capital (with securities valued at cost) fell to 17.8% from 18.6%. We believe the latter yardstick to be the most appropriate measure of single-year managerial economic performance. Informed use of that yardstick, however, requires an understanding of many factors, including accounting policies, historical carrying values of assets, financial leverage, and industry conditions.

In your evaluation of our economic performance, we suggest that two factors should receive your special attention - one of a positive nature peculiar, to a large extent, to our own operation, and one of a negative nature applicable to corporate performance generally. Let's look at the bright side first.

Non-Controlled Ownership Earnings

When one company owns part of another company, appropriate accounting procedures pertaining to that ownership interest must be selected from one of three major categories. The percentage of voting stock that is owned, in large part, determines which category of accounting principles should be utilized.

Generally accepted accounting principles require (subject to exceptions, naturally, as with our former bank subsidiary) full consolidation of sales, expenses, taxes, and earnings of business holdings more than 50% owned. Blue Chip Stamps, 60% owned by Berkshire Hathaway Inc., falls into this category. Therefore, all Blue Chip income and expense items are included in full in Berkshire's Consolidated Statement of Earnings, with the 40% ownership interest of others in Blue Chip's net earnings reflected in the Statement as a deduction for "minority interest".

Full inclusion of underlying earnings from another class of holdings, companies owned 20% to 50% (usually called “investees”), also normally occurs. Earnings from such companies - for example, Wesco Financial, controlled by Berkshire but only 48% owned - are included via a one-line entry in the owner’s Statement of Earnings. Unlike the over-50% category, all items of revenue and expense are omitted; just the proportional share of net income is included. Thus, if Corporation A owns one-third of Corporation B, one-third of B’s earnings, whether or not distributed by B, will end up in A’s earnings. There are some modifications, both in this and the over-50% category, for intercorporate taxes and purchase price adjustments, the explanation of which we will save for a later day. (We know you can hardly wait.)

Finally come holdings representing less than 20% ownership of another corporation’s voting securities. In these cases, accounting rules dictate that the owning companies include in their earnings only dividends received from such holdings. Undistributed earnings are ignored. Thus, should we own 10% of Corporation X with earnings of \$10 million in 1980, we would report in our earnings (ignoring relatively minor taxes on intercorporate dividends) either (a) \$1 million if X declared the full \$10 million in dividends; (b) \$500,000 if X paid out 50%, or \$5 million, in dividends; or (c) zero if X reinvested all earnings.

We impose this short - and over-simplified - course in accounting upon you because Berkshire’s concentration of resources in the insurance field produces a corresponding concentration of its assets in companies in that third (less than 20% owned) category. Many of these companies pay out relatively small proportions of their earnings in dividends. This means that only a small proportion of their current earning power is recorded in our own current operating earnings. But, while our reported operating earnings reflect only the dividends received from such companies, our economic well-being is determined by their earnings, not their dividends.

Our holdings in this third category of companies have increased dramatically in recent years as our insurance business has prospered and as securities markets have presented particularly attractive opportunities in the common stock area. The large increase in such holdings, plus the growth of earnings experienced by those partially-owned companies, has produced an

unusual result; the part of “our” earnings that these companies retained last year (the part not paid to us in dividends) exceeded the total reported annual operating earnings of Berkshire Hathaway. Thus, conventional accounting only allows less than half of our earnings “iceberg” to appear above the surface, in plain view. Within the corporate world such a result is quite rare; in our case it is likely to be recurring.

Our own analysis of earnings reality differs somewhat from generally accepted accounting principles, particularly when those principles must be applied in a world of high and uncertain rates of inflation. (But it’s much easier to criticize than to improve such accounting rules. The inherent problems are monumental.) We have owned 100% of businesses whose reported earnings were not worth close to 100 cents on the dollar to us even though, in an accounting sense, we totally controlled their disposition. (The “control” was theoretical. Unless we reinvested all earnings, massive deterioration in the value of assets already in place would occur. But those reinvested earnings had no prospect of earning anything close to a market return on capital.) We have also owned small fractions of businesses with extraordinary reinvestment possibilities whose retained earnings had an economic value to us far in excess of 100 cents on the dollar.

The value to Berkshire Hathaway of retained earnings is not determined by whether we own 100%, 50%, 20% or 1% of the businesses in which they reside. Rather, the value of those retained earnings is determined by the use to which they are put and the subsequent level of earnings produced by that usage. This is true whether we determine the usage, or whether managers we did not hire - but did elect to join - determine that usage. (It’s the act that counts, not the actors.) And the value is in no way affected by the inclusion or non-inclusion of those retained earnings in our own reported operating earnings. If a tree grows in a forest partially owned by us, but we don’t record the growth in our financial statements, we still own part of the tree.

Our view, we warn you, is non-conventional. But we would rather have earnings for which we did not get accounting credit put to good use in a 10%-owned company by a management we did not personally hire, than have earnings for which we did get credit put into projects of more dubious potential by another management - even if we are that management.

(We can't resist pausing here for a short commercial. One usage of retained earnings we often greet with special enthusiasm when practiced by companies in which we have an investment interest is repurchase of their own shares. The reasoning is simple: if a fine business is selling in the market place for far less than intrinsic value, what more certain or more profitable utilization of capital can there be than significant enlargement of the interests of all owners at that bargain price? The competitive nature of corporate acquisition activity almost guarantees the payment of a full - frequently more than full price when a company buys the entire ownership of another enterprise. But the auction nature of security markets often allows finely-run companies the opportunity to purchase portions of their own businesses at a price under 50% of that needed to acquire the same earning power through the negotiated acquisition of another enterprise.)

Long-Term Corporate Results

As we have noted, we evaluate single-year corporate performance by comparing operating earnings to shareholders' equity with securities valued at cost. Our long-term yardstick of performance, however, includes all capital gains or losses, realized or unrealized. We continue to achieve a long-term return on equity that considerably exceeds the average of our yearly returns. The major factor causing this pleasant result is a simple one: the retained earnings of those non-controlled holdings we discussed earlier have been translated into gains in market value.

Of course, this translation of retained earnings into market price appreciation is highly uneven (it goes in reverse some years), unpredictable as to timing, and unlikely to materialize on a precise dollar-for-dollar basis. And a silly purchase price for a block of stock in a corporation can negate the effects of a decade of earnings retention by that corporation. But when purchase prices are sensible, some long-term market recognition of the accumulation of retained earnings almost certainly will occur. Periodically you even will receive some frosting on the cake, with market appreciation far exceeding post-purchase retained earnings.

In the sixteen years since present management assumed responsibility for Berkshire, book value per share with insurance-held equities valued at market has increased from \$19.46 to \$400.80, or 20.5% compounded annually. (You've done better: the value of the mineral content

in the human body compounded at 22% annually during the past decade.) It is encouraging, moreover, to realize that our record was achieved despite many mistakes. The list is too painful and lengthy to detail here. But it clearly shows that a reasonably competitive corporate batting average can be achieved in spite of a lot of managerial strikeouts.

Our insurance companies will continue to make large investments in well-run, favorably-situated, non-controlled companies that very often will pay out in dividends only small proportions of their earnings. Following this policy, we would expect our long-term returns to continue to exceed the returns derived annually from reported operating earnings. Our confidence in this belief can easily be quantified: if we were to sell the equities that we hold and replace them with long-term tax-free bonds, our reported operating earnings would rise immediately by over \$30 million annually. Such a shift tempts us not at all.

So much for the good news.

Results for Owners

Unfortunately, earnings reported in corporate financial statements are no longer the dominant variable that determines whether there are any real earnings for you, the owner. For only gains in purchasing power represent real earnings on investment. If you (a) forego ten hamburgers to purchase an investment; (b) receive dividends which, after tax, buy two hamburgers; and (c) receive, upon sale of your holdings, after-tax proceeds that will buy eight hamburgers, then (d) you have had no real income from your investment, no matter how much it appreciated in dollars. You may feel richer, but you won't eat richer.

High rates of inflation create a tax on capital that makes much corporate investment unwise - at least if measured by the criterion of a positive real investment return to owners. This "hurdle rate" the return on equity that must be achieved by a corporation in order to produce any real return for its individual owners - has increased dramatically in recent years.

The average tax-paying investor is now running up a down escalator whose pace has accelerated to the point where his upward progress is nil.

For example, in a world of 12% inflation a business earning 20% on equity (which very few manage consistently to do) and distributing it all to individuals in the 50% bracket is chewing

up their real capital, not enhancing it. (Half of the 20% will go for income tax; the remaining 10% leaves the owners of the business with only 98% of the purchasing power they possessed at the start of the year - even though they have not spent a penny of their "earnings"). The investors in this bracket would actually be better off with a combination of stable prices and corporate earnings on equity capital of only a few per cent.

Explicit income taxes alone, unaccompanied by any implicit inflation tax, never can turn a positive corporate return into a negative owner return. (Even if there were 90% personal income tax rates on both dividends and capital gains, some real income would be left for the owner at a zero inflation rate.) But the inflation tax is not limited by reported income. Inflation rates not far from those recently experienced can turn the level of positive returns achieved by a majority of corporations into negative returns for all owners, including those not required to pay explicit taxes. (For example, if inflation reached 16%, owners of the 60% plus of corporate America earning less than this rate of return would be realizing a negative real return - even if income taxes on dividends and capital gains were eliminated.)

Of course, the two forms of taxation co-exist and interact since explicit taxes are levied on nominal, not real, income. Thus you pay income taxes on what would be deficits if returns to stockholders were measured in constant dollars.

At present inflation rates, we believe individual owners in medium or high tax brackets (as distinguished from tax-free entities such as pension funds, eleemosynary institutions, etc.) should expect no real long-term return from the average American corporation, even though these individuals reinvest the entire after-tax proceeds from all dividends they receive. The average return on equity of corporations is fully offset by the combination of the implicit tax on capital levied by inflation and the explicit taxes levied both on dividends and gains in value produced by retained earnings.

As we said last year, Berkshire has no corporate solution to the problem. (We'll say it again next year, too.) Inflation does not improve our return on equity.

Indexing is the insulation that all seek against inflation. But the great bulk (although there are important exceptions) of corporate capital is not even partially indexed. Of course,

earnings and dividends per share usually will rise if significant earnings are “saved” by a corporation; i.e., reinvested instead of paid as dividends. But that would be true without inflation. A thrifty wage earner, likewise, could achieve regular annual increases in his total income without ever getting a pay increase - *if* he were willing to take only half of his paycheck in cash (his wage “dividend”) and consistently add the other half (his “retained earnings”) to a savings account. Neither this high-saving wage earner nor the stockholder in a high-saving corporation whose annual dividend rate increases while its rate of return on equity remains flat is truly indexed.

For capital to be truly indexed, return on equity must rise, i.e., business earnings consistently must increase in proportion to the increase in the price level *without any need for the business to add to capital - including working capital - employed*. (Increased earnings produced by increased investment don’t count.) Only a few businesses come close to exhibiting this ability. And Berkshire Hathaway isn’t one of them.

We, of course, have a corporate policy of reinvesting earnings for growth, diversity and strength, which has the incidental effect of minimizing the current imposition of explicit taxes on our owners. However, on a day-by-day basis, you will be subjected to the implicit inflation tax, and when you wish to transfer your investment in Berkshire into another form of investment, or into consumption, you also will face explicit taxes.

Sources of Earnings

The table below shows the sources of Berkshire’s reported earnings. Berkshire owns about 60% of Blue Chip Stamps, which in turn owns 80% of Wesco Financial Corporation. The table shows aggregate earnings of the various business entities, as well as Berkshire’s share of those earnings. All of the significant capital gains and losses attributable to any of the business entities are aggregated in the realized securities gains figure at the bottom of the table, and are not included in operating earnings. Our calculation of operating earnings also excludes the gain from sale of Mutual’s branch offices. In this respect it differs from the presentation in our audited financial statements that includes this item in the calculation of “Earnings Before Realized Investment Gain”.

	Earnings Total	Before Total	Income Berkshire	Taxes Share	Net Earnings Berkshire	After Tax Share

Blue Chip Stamps and Wesco are public companies with reporting requirements of their own. On pages 40 to 53 of this report we have reproduced the narrative reports of the principal executives of both companies, in which they describe 1980 operations. We recommend a careful reading, and suggest that you particularly note the superb job done by Louie Vincenti and Charlie Munger in repositioning Mutual Savings and Loan. A copy of the full annual report of either company will be mailed to any Berkshire shareholder upon request to Mr. Robert H. Bird for Blue Chip Stamps, 5801 South Eastern Avenue, Los Angeles, California 90040, or to Mrs. Bette Deckard for Wesco Financial Corporation, 315 East Colorado Boulevard, Pasadena, California 91109.

As indicated earlier, undistributed earnings in companies we do not control are now fully as important as the reported operating earnings detailed in the preceding table. The distributed portion, of course, finds its way into the table primarily through the net investment income section of Insurance Group earnings.

We show below Berkshire's proportional holdings in those non-controlled businesses for which only distributed earnings (dividends) are included in our own earnings.

No. of Shares	Company	Cost (000's omitted)	Market (000's omitted)
434,550 (a)	Affiliated Publications, Inc.	\$2,821	\$12,222
464,317 (a)	Aluminum Company of America	\$25,577	\$27,685
475,217 (b)	Cleveland-Cliffs Iron Company	\$12,942	\$15,894
1,983,812 (b)	General Foods, Inc.	\$62,507	\$59,889
7,200,000 (a)	GEICO Corporation	\$47,138	\$105,300
2,015,000 (a)	Handy & Harman	\$21,825	\$58,435
711,180 (a)	Interpublic Group of Companies	\$4,531	\$22,135
1,211,834 (a)	Kaiser Aluminum & Chemical Corporation	\$20,629	\$27,569
282,500 (a)	Media General, Inc.	\$4,545	\$8,334
247,039 (b)	National Detroit Corporation	\$5,930	\$6,299
881,500 (a)	National Student Marketing	\$5,128	\$5,895
391,400 (a)	Ogilvy & Mather Int'l. Inc.	\$3,709	\$9,981
370,088 (b)	Pinkerton's, Inc.	\$12,144	\$16,489
245,700 (b)	R. J. Reynolds Industries	\$8,702	\$11,228
1,250,525 (b)	SAFECO Corporation	\$32,062	\$45,177
151,104 (b)	The Times Mirror Company	\$4,447	\$6,271
1,868,600 (a)	The Washington Post Company Class B	\$10,628	\$42,277
667,124 (b)	E. W. Woolworth Company	\$13,583	\$16,511
Total		\$298,848	\$497,591
All Other Common Stockholdings		\$26,313	\$32,096
Total Common Stocks		\$325,161	\$529,687

(a) All owned by Berkshire or its insurance subsidiaries.

(b) Blue Chip and/or Wesco own shares of these companies. All numbers represent Berkshire's net interest in the larger gross holdings of the group.

From this table, you can see that our sources of underlying earning power are distributed far differently among industries than would superficially seem the case. For example, our

insurance subsidiaries own approximately 3% of Kaiser Aluminum, and 1 1/4% of Alcoa. Our share of the 1980 earnings of those companies amounts to about \$13 million. (If translated dollar for dollar into a combination of eventual market value gain and dividends, this figure would have to be reduced by a significant, but not precisely determinable, amount of tax; perhaps 25% would be a fair assumption.) Thus, we have a much larger economic interest in the aluminum business than in practically any of the operating businesses we control and on which we report in more detail. If we maintain our holdings, our long-term performance will be more affected by the future economics of the aluminum industry than it will by direct operating decisions we make concerning most companies over which we exercise managerial control.

GEICO Corp.

Our largest non-controlled holding is 7.2 million shares of GEICO Corp., equal to about a 33% equity interest. Normally, an interest of this magnitude (over 20%) would qualify as an "investee" holding and would require us to reflect a proportionate share of GEICO's earnings in our own. However, we purchased our GEICO stock pursuant to special orders of the District of Columbia and New York Insurance Departments, which required that the right to vote the stock be placed with an independent party. Absent the vote, our 33% interest does not qualify for investee treatment. (Pinkerton's is a similar situation.)

Of course, whether or not the undistributed earnings of GEICO are picked up annually in our operating earnings figure has nothing to do with their economic value to us, or to you as owners of Berkshire. The value of these retained earnings will be determined by the skill with which they are put to use by GEICO management.

On this score, we simply couldn't feel better. GEICO represents the best of all investment worlds - the coupling of a very important and very hard to duplicate business advantage with an extraordinary management whose skills in operations are matched by skills in capital allocation.

As you can see, our holdings cost us \$47 million, with about half of this amount invested in 1976 and most of the remainder invested in 1980. At the present dividend rate, our reported

earnings from GEICO amount to a little over \$3 million annually. But we estimate our share of its earning power is on the order of \$20 million annually. Thus, undistributed earnings applicable to this holding alone may amount to 40% of total reported operating earnings of Berkshire.

We should emphasize that we feel as comfortable with GEICO management retaining an estimated \$17 million of earnings applicable to our ownership as we would if that sum were in our own hands. In just the last two years GEICO, through repurchases of its own stock, has reduced the share equivalents it has outstanding from 34.2 million to 21.6 million, dramatically enhancing the interests of shareholders in a business that simply can't be replicated. The owners could not have been better served.

We have written in past reports about the disappointments that usually result from purchase and operation of "turnaround" businesses. Literally hundreds of turnaround possibilities in dozens of industries have been described to us over the years and, either as participants or as observers, we have tracked performance against expectations. Our conclusion is that, with few exceptions, when a management with a reputation for brilliance tackles a business with a reputation for poor fundamental economics, it is the reputation of the business that remains intact.

GEICO may appear to be an exception, having been turned around from the very edge of bankruptcy in 1976. It certainly is true that managerial brilliance was needed for its resuscitation, and that Jack Byrne, upon arrival in that year, supplied that ingredient in abundance.

But it also is true that the fundamental business advantage that GEICO had enjoyed - an advantage that previously had produced staggering success - was still intact within the company, although submerged in a sea of financial and operating troubles.

GEICO was designed to be the low-cost operation in an enormous marketplace (auto insurance) populated largely by companies whose marketing structures restricted adaptation. Run as designed, it could offer unusual value to its customers while earning unusual returns for itself. For decades it had been run in just this manner. Its troubles in the mid-70s were not produced by any diminution or disappearance of this essential economic advantage.

GEICO's problems at that time put it in a position analogous to that of American Express in 1964 following the salad oil scandal. Both were one-of-a-kind companies, temporarily reeling from the effects of a fiscal blow that did not destroy their exceptional underlying economics. The GEICO and American Express situations, extraordinary business franchises with a localized excisable cancer (needing, to be sure, a skilled surgeon), should be distinguished from the true "turnaround" situation in which the managers expect - and need - to pull off a corporate Pygmalion.

Whatever the appellation, we are delighted with our GEICO holding which, as noted, cost us \$47 million. To buy a similar \$20 million of earning power in a business with first-class economic characteristics and bright prospects would cost a minimum of \$200 million (much more in some industries) if it had to be accomplished through negotiated purchase of an entire company. A 100% interest of that kind gives the owner the options of leveraging the purchase, changing managements, directing cash flow, and selling the business. It may also provide some excitement around corporate headquarters (less frequently mentioned).

We find it perfectly satisfying that the nature of our insurance business dictates we buy many minority portions of already well-run businesses (at prices far below our share of the total value of the entire business) that do not need management change, re-direction of cash flow, or sale. There aren't many Jack Byrnes in the managerial world, or GEICOs in the business world. What could be better than buying into a partnership with both of them?

Insurance Industry Conditions

The insurance industry's underwriting picture continues to unfold about as we anticipated, with the combined ratio (see definition on page 37) rising from 100.6 in 1979 to an estimated 103.5 in 1980. It is virtually certain that this trend will continue and that industry underwriting losses will mount, significantly and progressively, in 1981 and 1982. To understand why, we recommend that you read the excellent analysis of property-casualty competitive dynamics done by Barbara Stewart of Chubb Corp. in an October 1980 paper. (Chubb's annual report consistently presents the most insightful, candid and well-written discussion of industry conditions; you should get on the company's mailing list.) Mrs. Stewart's analysis may not be cheerful, but we think it is very likely to be accurate.

And, unfortunately, a largely unreported but particularly pernicious problem may well prolong and intensify the coming industry agony. It is not only likely to keep many insurers scrambling for business when underwriting losses hit record levels - it is likely to cause them at such a time to redouble their efforts.

This problem arises from the decline in bond prices and the insurance accounting convention that allows companies to carry bonds at amortized cost, regardless of market value. Many insurers own long-term bonds that, at amortized cost, amount to two to three times net worth. If the level is three times, of course, a one-third shrink from cost in bond prices - if it were to be recognized on the books - would wipe out net worth. And shrink they have. Some of the largest and best known property-casualty companies currently find themselves with nominal, or even negative, net worth when bond holdings are valued at market. Of course their bonds could rise in price, thereby partially, or conceivably even fully, restoring the integrity of stated net worth. Or they could fall further. (We believe that short-term forecasts of stock or bond prices are useless. The forecasts may tell you a great deal about the forecaster; they tell you nothing about the future.)

It might strike some as strange that an insurance company's survival is threatened when its stock portfolio falls sufficiently in price to reduce net worth significantly, but that an even greater decline in bond prices produces no reaction at all. The industry would respond by pointing out that, no matter what the current price, the bonds will be paid in full at maturity, thereby eventually eliminating any interim price decline. It may take twenty, thirty, or even forty years, this argument says, but, as long as the bonds don't have to be sold, in the end they'll all be worth face value. Of course, if they are sold even if they are replaced with similar bonds offering better relative value - the loss must be booked immediately. And, just as promptly, published net worth must be adjusted downward by the amount of the loss.

Under such circumstances, a great many investment options disappear, perhaps for decades. For example, when large underwriting losses are in prospect, it may make excellent business logic for some insurers to shift from tax-exempt bonds into taxable bonds. Unwillingness to recognize major bond losses may be the sole factor that prevents such a sensible move.

But the full implications flowing from massive unrealized bond losses are far more serious than just the immobilization of investment intellect. For the source of funds to purchase *and hold* those bonds is a pool of money derived from policyholders and claimants (with changing faces) - money which, in effect, is temporarily on deposit with the insurer. As long as this pool retains its size, no bonds must be sold. If the pool of funds shrinks - which it will if the volume of business declines significantly - assets must be sold to pay off the liabilities. And if those assets consist of bonds with big unrealized losses, such losses will rapidly become realized, decimating net worth in the process.

Thus, an insurance company with a bond market value shrinkage approaching stated net worth (of which there are now many) and also faced with inadequate rate levels that are sure to deteriorate further has two options. One option for management is to tell the underwriters to keep pricing according to the exposure involved - "be sure to get a dollar of premium for every dollar of expense cost plus expectable loss cost".

The consequences of this directive are predictable: (a) with most business both price sensitive and renewable annually, many policies presently on the books will be lost to competitors in rather short order; (b) as premium volume shrinks significantly, there will be a lagged but corresponding decrease in liabilities (unearned premiums and claims payable); (c) assets (bonds) must be sold to match the decrease in liabilities; and (d) the formerly unrecognized disappearance of net worth will become partially recognized (depending upon the extent of such sales) in the insurer's published financial statements.

Variations of this depressing sequence involve a smaller penalty to stated net worth. The reaction of some companies at (c) would be to sell either stocks that are already carried at market values or recently purchased bonds involving less severe losses. This ostrich-like behavior - selling the better assets and keeping the biggest losers - while less painful in the short term, is unlikely to be a winner in the long term.

The second option is much simpler: just keep writing business regardless of rate levels and whopping prospective underwriting losses, thereby maintaining the present levels of premiums, assets and liabilities - and then pray for a better day, either for underwriting or for bond prices. There is much criticism in the trade press of "cash flow" underwriting; i.e., writing

business regardless of prospective underwriting losses in order to obtain funds to invest at current high interest rates. This second option might properly be termed “asset maintenance” underwriting - the acceptance of terrible business just to keep the assets you now have.

Of course you know which option will be selected. And it also is clear that as long as many large insurers feel compelled to choose that second option, there will be no better day for underwriting. For if much of the industry feels it must maintain premium volume levels regardless of price adequacy, all insurers will have to come close to meeting those prices. Right behind having financial problems yourself, the next worst plight is to have a large group of competitors with financial problems that they can defer by a “sell-at-any-price” policy.

We mentioned earlier that companies that were unwilling - for any of a number of reasons, including public reaction, institutional pride, or protection of stated net worth - to sell bonds at price levels forcing recognition of major losses might find themselves frozen in investment posture for a decade or longer. But, as noted, that’s only half of the problem. *Companies that have made extensive commitments to long-term bonds may have lost, for a considerable period of time, not only many of their investment options, but many of their underwriting options as well.*

Our own position in this respect is satisfactory. We believe our net worth, valuing bonds of all insurers at amortized cost, is the strongest relative to premium volume among all large property-casualty stockholder-owned groups. When bonds are valued at market, our relative strength becomes far more dramatic. (But lest we get too puffed up, we remind ourselves that our asset and liability maturities still are far more mismatched than we would wish and that we, too, lost important sums in bonds because your Chairman was talking when he should have been acting.)

Our abundant capital and investment flexibility will enable us to do whatever we think makes the most sense during the prospective extended period of inadequate pricing. But troubles for the industry mean troubles for us. Our financial strength doesn’t remove us from the hostile pricing environment now enveloping the entire property-casualty insurance industry. It just gives us more staying power and more options.

Insurance Operations

The National Indemnity managers, led by Phil Liesche with the usual able assistance of Roland Miller and Bill Lyons, outdid themselves in 1980. While volume was flat, underwriting margins relative to the industry were at an all-time high. We expect decreased volume from this operation in 1981. But its managers will hear no complaints from corporate headquarters, nor will employment or salaries suffer. We enormously admire the National Indemnity underwriting discipline - embedded from origin by the founder, Jack Ringwalt - and know that this discipline, if suspended, probably could not be fully regained.

John Seward at Home and Auto continues to make good progress in replacing a diminishing number of auto policies with volume from less competitive lines, primarily small-premium general liability. Operations are being slowly expanded, both geographically and by product line, as warranted by underwriting results.

The reinsurance business continues to reflect the excesses and problems of the primary writers. Worse yet, it has the potential for magnifying such excesses. Reinsurance is characterized by extreme ease of entry, large premium payments in advance, and much-delayed loss reports and loss payments. Initially, the morning mail brings lots of cash and few claims. This state of affairs can produce a blissful, almost euphoric, feeling akin to that experienced by an innocent upon receipt of his first credit card.

The magnetic lure of such cash-generating characteristics, currently enhanced by the presence of high interest rates, is transforming the reinsurance market into "amateur night". Without a super catastrophe, industry underwriting will be poor in the next few years. If we experience such a catastrophe, there could be a bloodbath with some companies not able to live up to contractual commitments. George Young continues to do a first-class job for us in this business. Results, with investment income included, have been reasonably profitable. We will retain an active reinsurance presence but, for the foreseeable future, we expect no premium growth from this activity.

We continue to have serious problems in the Homestate operation. Floyd Taylor in Kansas has done an outstanding job but our underwriting record elsewhere is considerably below average. Our poorest performer has been Insurance Company of Iowa, at which large losses have been sustained annually since its founding in 1973. Late in the fall we abandoned

underwriting in that state, and have merged the company into Cornhusker Casualty. There is potential in the homestate concept, but much work needs to be done in order to realize it.

Our Workers Compensation operation suffered a severe loss when Frank DeNardo died last year at 37. Frank instinctively thought like an underwriter. He was a superb technician and a fierce competitor; in short order he had straightened out major problems at the California Workers Compensation Division of National Indemnity. Dan Grossman, who originally brought Frank to us, stepped in immediately after Frank's death to continue that operation, which now utilizes Redwood Fire and Casualty, another Berkshire subsidiary, as the insuring vehicle.

Our major Workers Compensation operation, Cypress Insurance Company, run by Milt Thornton, continues its outstanding record. Year after year Milt, like Phil Liesche, runs an underwriting operation that far outpaces his competition. In the industry he is admired and copied, but not matched.

Overall, we look for a significant decline in insurance volume in 1981 along with a poorer underwriting result. We expect underwriting experience somewhat superior to that of the industry but, of course, so does most of the industry. There will be some disappointments.

Textile and Retail Operations

During the past year we have cut back the scope of our textile business. Operations at Waumbec Mills have been terminated, reluctantly but necessarily. Some equipment was transferred to New Bedford but most has been sold, or will be, along with real estate. Your Chairman made a costly mistake in not facing the realities of this situation sooner.

At New Bedford we have reduced the number of looms operated by about one-third, abandoning some high-volume lines in which product differentiation was insignificant. Even assuming everything went right - which it seldom did - these lines could not generate adequate returns related to investment. And, over a full industry cycle, losses were the most likely result.

Our remaining textile operation, still sizable, has been divided into a manufacturing and a sales division, each free to do business independent of the other. Thus, distribution strengths and mill capabilities will not be wedded to each other. We have more than doubled capacity in our most profitable textile segment through a recent purchase of used 130-inch Saurer looms. Current conditions indicate another tough year in textiles, but

with substantially less capital employed in the operation.

Ben Rosner's record at Associated Retail Stores continues to amaze us. In a poor retailing year, Associated's earnings continued excellent - and those earnings all were translated into cash. On March 7, 1981 Associated will celebrate its 50th birthday. Ben has run the business (along with Leo Simon, his partner from 1931 to 1966) in each of those fifty years.

Disposition of Illinois National Bank and Trust of Rockford

On December 31, 1980 we completed the exchange of 41,086 shares of Rockford Bancorp Inc. (which owns 97.7% of Illinois National Bank) for a like number of shares of Berkshire Hathaway Inc.

Our method of exchange allowed all Berkshire shareholders to maintain their proportional interest in the Bank (except for me; I was permitted 80% of my proportional share). They were thus guaranteed an ownership position identical to that they would have attained had we followed a more conventional spinoff approach. Twenty-four shareholders (of our approximate 1300) chose this proportional exchange option.

We also allowed overexchanges, and thirty-nine additional shareholders accepted this option, thereby increasing their ownership in the Bank and decreasing their proportional ownership in Berkshire. All got the full amount of Bancorp stock they requested, since the total shares desired by these thirty-nine holders was just slightly less than the number left available by the remaining 1200-plus holders of Berkshire who elected not to part with any Berkshire shares at all. As the exchanger of last resort, I took the small balance (3% of Bancorp's stock). These shares, added to shares I received from my basic exchange allotment (80% of normal), gave me a slightly reduced proportional interest in the Bank and a slightly enlarged proportional interest in Berkshire.

Management of the Bank is pleased with the outcome. Bancorp will operate as an inexpensive and uncomplicated holding company owned by 65 shareholders. And all of those shareholders will have become Bancorp owners through a conscious affirmative decision.

Financing

In August we sold \$60 million of 12 3/4% notes due August 1, 2005, with a sinking fund to begin in 1991. The managing underwriters, Donaldson, Lufkin & Jenrette Securities Corporation,

represented by Bill Fisher, and Chiles, Heider & Company, Inc., represented by Charlie Heider, did an absolutely first-class job from start to finish of the financing.

Unlike most businesses, Berkshire did not finance because of any specific immediate needs. Rather, we borrowed because we think that, over a period far shorter than the life of the loan, we will have many opportunities to put the money to good use. The most attractive opportunities may present themselves at a time when credit is extremely expensive - or even unavailable. At such a time we want to have plenty of financial firepower.

Our acquisition preferences run toward businesses that generate cash, not those that consume it. As inflation intensifies, more and more companies find that they must spend all funds they generate internally just to maintain their existing physical volume of business. There is a certain mirage-like quality to such operations. However attractive the earnings numbers, we remain leery of businesses that never seem able to convert such pretty numbers into no-strings-attached cash.

Businesses meeting our standards are not easy to find. (Each year we read of hundreds of corporate acquisitions; only a handful would have been of interest to us.) And logical expansion of our present operations is not easy to implement. But we'll continue to utilize both avenues in our attempts to further Berkshire's growth.

Under all circumstances we plan to operate with plenty of liquidity, with debt that is moderate in size and properly structured, and with an abundance of capital strength. Our return on equity is penalized somewhat by this conservative approach, but it is the only one with which we feel comfortable.

* * * * *

Gene Abegg, founder of our long-owned bank in Rockford, died on July 2, 1980 at the age of 82. As a friend, banker and citizen, he was unsurpassed.

You learn a great deal about a person when you purchase a business from him and he then stays on to run it as an employee rather than as an owner. Before the purchase the seller knows the business intimately, whereas you start from scratch. The seller has dozens of opportunities to mislead the buyer - through omissions, ambiguities, and misdirection. After the check has changed hands, subtle (and not so subtle) changes of attitude can occur and

implicit understandings can evaporate. As in the courtship-marriage sequence, disappointments are not infrequent.

From the time we first met, Gene shot straight 100% of the time - the only behavior pattern he had within him. At the outset of negotiations, he laid all negative factors face up on the table; on the other hand, for years after the transaction was completed he would tell me periodically of some previously undiscussed items of value that had come with our purchase.

Though he was already 71 years of age when he sold us the Bank, Gene subsequently worked harder for us than he had for himself. He never delayed reporting a problem for a minute, but problems were few with Gene. What else would you expect from a man who, at the time of the bank holiday in 1933, had enough cash on the premises to pay all depositors in full? Gene never forgot he was handling other people's money. Though this fiduciary attitude was always dominant, his superb managerial skills enabled the Bank to regularly achieve the top position nationally in profitability.

Gene was in charge of the Illinois National for close to fifty years - almost one-quarter of the lifetime of our country. George Mead, a wealthy industrialist, brought him in from Chicago to open a new bank after a number of other banks in Rockford had failed. Mr. Mead put up the money and Gene ran the show. His talent for leadership soon put its stamp on virtually every major civic activity in Rockford.

Dozens of Rockford citizens have told me over the years of help Gene extended to them. In some cases this help was financial; in all cases it involved much wisdom, empathy and friendship. He always offered the same to me. Because of our respective ages and positions I was sometimes the junior partner, sometimes the senior. Whichever the relationship, it always was a special one, and I miss it.

Warren E. Buffett

February 27, 1981

Chairman of the Board

1981 Letter

BERKSHIRE HATHAWAY INC.

February 26, 1982

To the Shareholders of Berkshire Hathaway Inc.:

Operating earnings of \$39.7 million in 1981 amounted to 15.2% of beginning equity capital (valuing securities at cost) compared to 17.8% in 1980. Our new plan that allows stockholders to designate corporate charitable contributions (detailed later) reduced earnings by about \$900,000 in 1981. This program, which we expect to continue subject to annual evaluation of our corporate tax position, had not been initiated in 1980.

Non-Controlled Ownership Earnings

In the 1980 annual report we discussed extensively the concept of non-controlled ownership earnings, i.e., Berkshire's share of the undistributed earnings of companies we don't control or significantly influence but in which we, nevertheless, have important investments. (We will be glad to make available to new or prospective shareholders copies of that discussion or others from earlier reports to which we refer in this report.) No portion of those undistributed earnings is included in the operating earnings of Berkshire.

However, our belief is that, in aggregate, those undistributed and, therefore, unrecorded earnings will be translated into tangible value for Berkshire shareholders just as surely as if subsidiaries we control had earned, retained - and reported - similar earnings.

We know that this translation of non-controlled ownership earnings into corresponding realized and unrealized capital gains for Berkshire will be extremely irregular as to time of occurrence. While market values track business values quite well over long periods, in any given year the relationship can gyrate capriciously. Market recognition of retained earnings also will be unevenly realized among companies. It will be disappointingly low or negative in cases where earnings are employed non-productively, and far greater than dollar-for-dollar of

retained earnings in cases of companies that achieve high returns with their augmented capital. Overall, if a group of non-controlled companies is selected with reasonable skill, the group result should be quite satisfactory.

In aggregate, our non-controlled business interests have more favorable underlying economic characteristics than our controlled businesses. That's understandable; the area of choice has been far wider. Small portions of exceptionally good businesses are usually available in the securities markets at reasonable prices. But such businesses are available for purchase in their entirety only rarely, and then almost always at high prices.

General Acquisition Behavior

As our history indicates, we are comfortable both with total ownership of businesses and with marketable securities representing small portions of businesses. We continually look for ways to employ large sums in each area. (But we try to avoid small commitments - "If something's not worth doing at all, it's not worth doing well".) Indeed, the liquidity requirements of our insurance and trading stamp businesses mandate major investments in marketable securities.

Our acquisition decisions will be aimed at maximizing real economic benefits, not at maximizing either managerial domain or reported numbers for accounting purposes. (In the long run, managements stressing accounting appearance over economic substance usually achieve little of either.)

Regardless of the impact upon immediately reportable earnings, we would rather buy 10% of Wonderful Business T at X per share than 100% of T at 2X per share. Most corporate managers prefer just the reverse, and have no shortage of stated rationales for their behavior.

However, we suspect three motivations - usually unspoken - to be, singly or in combination, the important ones in most high-premium takeovers:

(1) Leaders, business or otherwise, seldom are deficient in animal spirits and often relish increased activity and challenge. At Berkshire, the corporate pulse never beats faster than when an acquisition is in prospect.

(2) Most organizations, business or otherwise, measure themselves, are measured by others, and compensate their managers far more by the yardstick of size than by any other yardstick.

(Ask a *Fortune 500* manager where his corporation stands on that famous list and, invariably, the number responded will be from the list ranked by size of sales; he may well not even know where his corporation places on the list *Fortune* just as faithfully compiles ranking the same 500 corporations by profitability.)

(3) Many managements apparently were overexposed in impressionable childhood years to the story in which the imprisoned handsome prince is released from a toad's body by a kiss from a beautiful princess. Consequently, they are certain their managerial kiss will do wonders for the profitability of Company T(arget). Such optimism is essential. Absent that rosy view, why else should the shareholders of Company A(cquisitor) want to own an interest in T at the 2X takeover cost rather than at the X market price they would pay if they made direct purchases on their own? In other words, investors can always buy toads at the going price for toads. If investors instead bankroll princesses who wish to pay double for the right to kiss the toad, those kisses had better pack some real dynamite. We've observed many kisses but very few miracles. Nevertheless, many managerial princesses remain serenely confident about the future potency of their kisses - even after their corporate backyards are knee-deep in unresponsive toads.

In fairness, we should acknowledge that some acquisition records have been dazzling. Two major categories stand out.

The first involves companies that, through design or accident, have purchased only businesses that are particularly well adapted to an inflationary environment. Such favored business must have two characteristics: (1) an ability to increase prices rather easily (even when product demand is flat and capacity is not fully utilized) without fear of significant loss of either market share or unit volume, and (2) an ability to accommodate large dollar volume increases in business (often produced more by inflation than by real growth) with only minor additional investment of capital. Managers of ordinary ability, focusing solely on acquisition possibilities meeting these tests, have achieved excellent results in recent decades. However, very few enterprises possess both characteristics, and competition to buy those that do has now become fierce to the point of being self-defeating.

The second category involves the managerial superstars - men who can recognize that rare prince who is disguised as a toad, and who have managerial abilities that enable them to peel away the disguise. We salute such managers as Ben Heineman at Northwest Industries, Henry Singleton at Teledyne, Erwin Zaban at National Service Industries, and especially Tom Murphy at Capital Cities Communications (a real managerial “twofer”, whose acquisition efforts have been properly focused in Category 1 and whose operating talents also make him a leader of Category 2). From both direct and vicarious experience, we recognize the difficulty and rarity of these executives’ achievements. (So do they; these champs have made very few deals in recent years, and often have found repurchase of their own shares to be the most sensible employment of corporate capital.)

Your Chairman, unfortunately, does not qualify for Category 2. And, despite a reasonably good understanding of the economic factors compelling concentration in Category 1, our actual acquisition activity in that category has been sporadic and inadequate. Our preaching was better than our performance. (We neglected the Noah principle: predicting rain doesn’t count, building arks does.)

We have tried occasionally to buy toads at bargain prices with results that have been chronicled in past reports. Clearly our kisses fell flat. We have done well with a couple of princes - but they were princes when purchased. At least our kisses didn’t turn them into toads. And, finally, we have occasionally been quite successful in purchasing fractional interests in easily-identifiable princes at toad-like prices.

Berkshire Acquisition Objectives

We will continue to seek the acquisition of businesses in their entirety at prices that will make sense, even should the future of the acquired enterprise develop much along the lines of its past. We may very well pay a fairly fancy price for a Category 1 business if we are reasonably confident of what we are getting. But we will not normally pay a lot in any purchase for what we are supposed to bring to the party - for we find that we ordinarily don’t bring a lot.

During 1981 we came quite close to a major purchase involving both a business and a manager we liked very much. However, the price finally demanded, considering alternative

uses for the funds involved, would have left our owners worse off than before the purchase. The empire would have been larger, but the citizenry would have been poorer.

Although we had no success in 1981, from time to time in the future we will be able to purchase 100% of businesses meeting our standards. Additionally, we expect an occasional offering of a major “non-voting partnership” as discussed under the Pinkerton’s heading on page 47 of this report. We welcome suggestions regarding such companies where we, as a substantial junior partner, can achieve good economic results while furthering the long-term objectives of present owners and managers.

Currently, we find values most easily obtained through the open-market purchase of fractional positions in companies with excellent business franchises and competent, honest managements. We never expect to run these companies, but we do expect to profit from them.

We expect that undistributed earnings from such companies will produce full value (subject to tax when realized) for Berkshire and its shareholders. If they don’t, we have made mistakes as to either: (1) the management we have elected to join; (2) the future economics of the business; or (3) the price we have paid.

We have made plenty of such mistakes - both in the purchase of non-controlling and controlling interests in businesses. Category (2) miscalculations are the most common. Of course, it is necessary to dig deep into our history to find illustrations of such mistakes - sometimes as deep as two or three months back. For example, last year your Chairman volunteered his expert opinion on the rosy future of the aluminum business. Several minor adjustments to that opinion - now aggregating approximately 180 degrees - have since been required.

For personal as well as more objective reasons, however, we generally have been able to correct such mistakes far more quickly in the case of non-controlled businesses (marketable securities) than in the case of controlled subsidiaries. Lack of control, in effect, often has turned out to be an economic plus.

As we mentioned last year, the magnitude of our non-recorded “ownership” earnings has grown to the point where their total is greater than our reported operating earnings. We

expect this situation will continue. In just four ownership positions in this category - GEICO Corporation, General Foods Corporation, R. J. Reynolds Industries, Inc. and The Washington Post Company - our share of undistributed and therefore unrecorded earnings probably will total well over \$35 million in 1982. The accounting rules that entirely ignore these undistributed earnings diminish the utility of our annual return on equity calculation, or any other single year measure of economic performance.

Long-Term Corporate Performance

In measuring long-term economic performance, equities held by our insurance subsidiaries are valued at market subject to a charge reflecting the amount of taxes that would have to be paid if unrealized gains were actually realized. If we are correct in the premise stressed in the preceding section of this report, our unreported ownership earnings will find their way, irregularly but inevitably, into our net worth. To date, this has been the case.

An even purer calculation of performance would involve a valuation of bonds and non-insurance held equities at market. However, GAAP accounting does not prescribe this procedure, and the added purity would change results only very slightly. Should any valuation difference widen to significant proportions, as it has at most major insurance companies, we will report its effect to you.

On a GAAP basis, during the present management's term of seventeen years, book value has increased from \$19.46 per share to \$526.02 per share, or 21.1% compounded annually. This rate of return number is highly likely to drift downward in future years. We hope, however, that it can be maintained significantly above the rate of return achieved by the average large American corporation.

Over half of the large gain in Berkshire's net worth during 1981 - it totaled \$124 million, or about 31% - resulted from the market performance of a single investment, GEICO Corporation. In aggregate, our market gain from securities during the year considerably outstripped the gain in underlying business values. Such market variations will not always be on the pleasant side.

In past reports we have explained how inflation has caused our apparently satisfactory long-term corporate performance to be illusory as a measure of true investment results for our

owners. We applaud the efforts of Federal Reserve Chairman Volcker and note the currently more moderate increases in various price indices. Nevertheless, our views regarding long-term inflationary trends are as negative as ever. Like virginity, a stable price level seems capable of maintenance, but not of restoration.

Despite the overriding importance of inflation in the investment equation, we will not punish you further with another full recital of our views; inflation itself will be punishment enough. (Copies of previous discussions are available for masochists.) But, because of the unrelenting destruction of currency values, our corporate efforts will continue to do a much better job of filling your wallet than of filling your stomach.

Equity Value-Added

An additional factor should further subdue any residual enthusiasm you may retain regarding our long-term rate of return. The economic case justifying equity investment is that, in aggregate, additional earnings above passive investment returns - interest on fixed-income securities - will be derived through the employment of managerial and entrepreneurial skills in conjunction with that equity capital. Furthermore, the case says that since the equity capital position is associated with greater risk than passive forms of investment, it is "entitled" to higher returns. A "value-added" bonus from equity capital seems natural and certain.

But is it? Several decades back, a return on equity of as little as 10% enabled a corporation to be classified as a "good" business - i.e., one in which a dollar reinvested in the business logically could be expected to be valued by the market at more than one hundred cents. For, with long-term taxable bonds yielding 5% and long-term tax-exempt bonds 3%, a business operation that could utilize equity capital at 10% clearly was worth some premium to investors over the equity capital employed. That was true even though a combination of taxes on dividends and on capital gains would reduce the 10% earned by the corporation to perhaps 6%-8% in the hands of the individual investor.

Investment markets recognized this truth. During that earlier period, American business earned an average of 11% or so on equity capital employed and stocks, in aggregate, sold at valuations far above that equity capital (book value), averaging over 150 cents on the dollar. Most businesses were "good" businesses because they earned far more than their keep (the

return on long-term passive money). The value-added produced by equity investment, in aggregate, was substantial.

That day is gone. But the lessons learned during its existence are difficult to discard. While investors and managers must place their feet in the future, their memories and nervous systems often remain plugged into the past. It is much easier for investors to utilize historic p/e ratios or for managers to utilize historic business valuation yardsticks than it is for either group to rethink their premises daily. When change is slow, constant rethinking is actually undesirable; it achieves little and slows response time. But when change is great, yesterday's assumptions can be retained only at great cost. And the pace of economic change has become breathtaking.

During the past year, long-term taxable bond yields exceeded 16% and long-term tax-exempts 14%. The total return achieved from such tax-exempts, of course, goes directly into the pocket of the individual owner. Meanwhile, American business is producing earnings of only about 14% on equity. And this 14% will be substantially reduced by taxation before it can be banked by the individual owner. The extent of such shrinkage depends upon the dividend policy of the corporation and the tax rates applicable to the investor.

Thus, *with interest rates on passive investments at late 1981 levels*, a typical American business is no longer worth one hundred cents on the dollar to owners who are individuals. (If the business is owned by pension funds or other tax-exempt investors, the arithmetic, although still unenticing, changes substantially for the better.) Assume an investor in a 50% tax bracket; if our typical company pays out all earnings, the income return to the investor will be equivalent to that from a 7% tax-exempt bond. And, if conditions persist - if all earnings are paid out and return on equity stays at 14% - the 7% tax-exempt equivalent to the higher-bracket individual investor is just as frozen as is the coupon on a tax-exempt bond. Such a perpetual 7% tax-exempt bond might be worth fifty cents on the dollar as this is written.

If, on the other hand, all earnings of our typical American business are retained and return on equity again remains constant, earnings will grow at 14% per year. If the p/e ratio remains constant, the price of our typical stock will also grow at 14% per year. But that 14% is not yet in the pocket of the shareholder. Putting it there will require the payment of a capital

gains tax, presently assessed at a maximum rate of 20%. This net return, of course, works out to a poorer rate of return than the currently available passive after-tax rate.

Unless passive rates fall, companies achieving 14% per year gains in earnings per share while paying no cash dividend are an economic failure for their individual shareholders. The returns from passive capital outstrip the returns from active capital. This is an unpleasant fact for both investors and corporate managers and, therefore, one they may wish to ignore. But facts do not cease to exist, either because they are unpleasant or because they are ignored.

Most American businesses pay out a significant portion of their earnings and thus fall between the two examples. And most American businesses are currently “bad” businesses economically - producing less for their individual investors after-tax than the tax-exempt passive rate of return on money. Of course, some high-return businesses still remain attractive, even under present conditions. But American equity capital, in aggregate, produces no value-added for individual investors.

It should be stressed that this depressing situation does not occur because corporations are jumping, economically, less high than previously. In fact, they are jumping somewhat higher: return on equity has improved a few points in the past decade. But the crossbar of passive return has been elevated much faster. Unhappily, most companies can do little but hope that the bar will be lowered significantly; there are few industries in which the prospects seem bright for substantial gains in return on equity.

Inflationary experience and expectations will be major (but not the only) factors affecting the height of the crossbar in future years. If the causes of long-term inflation can be tempered, passive returns are likely to fall and the intrinsic position of American equity capital should significantly improve. Many businesses that now must be classified as economically “bad” would be restored to the “good” category under such circumstances.

A further, particularly ironic, punishment is inflicted by an inflationary environment upon the owners of the “bad” business. To continue operating in its present mode, such a low-return business usually must retain much of its earnings - no matter what penalty such a policy produces for shareholders.

Reason, of course, would prescribe just the opposite policy. An individual, stuck with a 5% bond with many years to run before maturity, does not take the coupons from that bond and pay one hundred cents on the dollar for more 5% bonds while similar bonds are available at, say, forty cents on the dollar. Instead, he takes those coupons from his low-return bond and - if inclined to reinvest - looks for the highest return with safety currently available. Good money is not thrown after bad.

What makes sense for the bondholder makes sense for the shareholder. Logically, a company with historic *and prospective* high returns on equity should retain much or all of its earnings so that shareholders can earn premium returns on enhanced capital. Conversely, low returns on corporate equity would suggest a very high dividend payout so that owners could direct capital toward more attractive areas. (The Scriptures concur. In the parable of the talents, the two high-earning servants are rewarded with 100% retention of earnings and encouraged to expand their operations. However, the non-earning third servant is not only chastised - "wicked and slothful" - but also is required to redirect all of his capital to the top performer. *Matthew 25: 14-30*)

But inflation takes us through the looking glass into the upside-down world of *Alice in Wonderland*. When prices continuously rise, the "bad" business must retain every nickel that it can. Not because it is attractive as a repository for equity capital, but precisely because it is so unattractive, the low-return business must follow a high retention policy. If it wishes to continue operating in the future as it has in the past - and most entities, including businesses, do - it simply has no choice.

For inflation acts as a gigantic corporate tapeworm. That tapeworm preemptively consumes its requisite daily diet of investment dollars regardless of the health of the host organism. Whatever the level of reported profits (even if nil), more dollars for receivables, inventory and fixed assets are continuously required by the business in order to merely match the unit volume of the previous year. The less prosperous the enterprise, the greater the proportion of available sustenance claimed by the tapeworm.

Under present conditions, a business earning 8% or 10% on equity often has no leftovers for expansion, debt reduction or "real" dividends. The tapeworm of inflation simply cleans the

plate. (The low-return company's inability to pay dividends, understandably, is often disguised. Corporate America increasingly is turning to dividend reinvestment plans, sometimes even embodying a discount arrangement that all but forces shareholders to reinvest. Other companies sell newly issued shares to Peter in order to pay dividends to Paul. Beware of "dividends" that can be paid out only if someone promises to replace the capital distributed.)

Berkshire continues to retain its earnings for offensive, not defensive or obligatory, reasons. But in no way are we immune from the pressures that escalating passive returns exert on equity capital. We continue to clear the crossbar of after-tax passive return - but barely. Our historic 21% return - not at all assured for the future - still provides, after the current capital gain tax rate (which we expect to rise considerably in future years), a modest margin over current after-tax rates on passive money. It would be a bit humiliating to have our corporate value-added turn negative. But it can happen here as it has elsewhere, either from events outside anyone's control or from poor relative adaptation on our part.

Sources of Reported Earnings

The table below shows the sources of Berkshire's reported earnings. Berkshire owns about 60% of Blue Chip Stamps which, in turn, owns 80% of Wesco Financial Corporation. The table displays aggregate operating earnings of the various business entities, as well as Berkshire's share of those earnings. All of the significant gains and losses attributable to unusual sales of assets by any of the business entities are aggregated with securities transactions in the line near the bottom of the table and are not included in operating earnings.

	Earnings	Before	Income	Taxes	Net Earnings	After Tax

**Amortization of intangibles arising in accounting for purchases of businesses (i.e. See's, Mutual and Buffalo Evening News) is reflected in the category designated as "Other".*

***Berkshire divested itself of its ownership of the Illinois National Bank on December 31, 1980.*

Blue Chip Stamps and Wesco are public companies with reporting requirements of their own. On pages 38-50 of this report we have reproduced the narrative reports of the principal executives of both companies, in which they describe 1981 operations. A copy of the full annual report of either company will be mailed to any Berkshire shareholder upon request to Mr. Robert H. Bird for Blue Chip Stamps, 5801 South Eastern Avenue, Los Angeles, California 90040, or to Mrs. Jeanne Leach for Wesco Financial Corporation, 315 East Colorado Boulevard, Pasadena, California 91109.

As we indicated earlier, undistributed earnings in companies we do not control are not fully as important as the reported operating earnings detailed in the preceding table. The distributed portion of earnings, of course, finds its way into the table primarily through the net investment income segment of Insurance Group earnings.

We show below Berkshire's proportional holdings in those non-controlled businesses for which only distributed earnings (dividends) are included in our earnings.

No. of Shares	Company	Cost (000's omitted)	Market (000's omitted)
451,650 (a)	Affiliated Publications, Inc.	\$3,297	\$14,114
703,634 (a)	Aluminum Company of America	\$19,359	\$18,031
420,441 (a)	Arcata Corporation	\$14,076	\$15,136
475,217 (b)	Cleveland-Cliffs Iron Company	\$12,942	\$14,362
441,522 (a)	GATX Corporation	\$17,147	\$13,466
2,101,244 (b)	General Foods, Inc.	\$66,277	\$66,714
7,200,000 (a)	GEICO Corporation	\$47,138	\$199,800
2,015,000 (a)	Handy & Harman	\$21,825	\$36,270
711,180 (a)	Interpublic Group of Companies	\$4,531	\$23,202
282,500 (a)	Media General, Inc.	\$4,545	\$11,088
391,400 (a)	Ogilvy & Mather Int'l. Inc.	\$3,709	\$12,329
370,088 (b)	Pinkerton's, Inc.	\$12,144	\$19,675
1,764,824 (b)	R. J. Reynolds Industries	\$76,668	\$83,127
785,225 (b)	SAFECO Corporation	\$21,329	\$31,016
151,104 (b)	The Times Mirror Company	\$4,447	\$6,271
1,868,600 (a)	The Washington Post Company Class B	\$10,628	\$58,160
	Total	\$335,615	\$616,490
	All Other Common Stockholdings	\$16,131	\$22,739
	Total Common Stocks	\$351,746	\$639,229

(a) All owned by Berkshire or its insurance subsidiaries.

(b) Blue Chip and/or Wesco own shares of these companies. All numbers represent Berkshire's net interest in the larger gross holdings of the group.

Our controlled and non-controlled businesses operate over such a wide spectrum of activities that detailed commentary here would prove too lengthy. Much additional financial information is included in Management's Discussion on pages 34-37 and in the narrative

reports on pages 38-50. However, our largest area of both controlled and non-controlled activity has been, and almost certainly will continue to be, the property-casualty insurance area, and commentary on important developments in that industry is appropriate.

Insurance Industry Conditions

“Forecasts”, said Sam Goldwyn, “are dangerous, particularly those about the future.” (Berkshire shareholders may have reached a similar conclusion after rereading our past annual reports featuring your Chairman’s prescient analysis of textile prospects.)

There is no danger, however, in forecasting that 1982 will be the worst year in recent history for insurance underwriting. That result already has been guaranteed by present pricing behavior, coupled with the term nature of the insurance contract.

While many auto policies are priced and sold at six-month intervals - and many property policies are sold for a three-year term - a weighted average of the duration of all property-casualty insurance policies probably runs a little under twelve months. And prices for the insurance coverage, of course, are frozen for the life of the contract. Thus, this year’s sales contracts (“premium written” in the parlance of the industry) determine about one-half of next year’s level of revenue (“premiums earned”). The remaining half will be determined by sales contracts written next year that will be about 50% earned in that year. The profitability consequences are automatic: if you make a mistake in pricing, you have to live with it for an uncomfortable period of time.

Note in the table below the year-over-year gain in industry-wide premiums written and the impact that it has on the current and following year’s level of underwriting profitability. The result is exactly as you would expect in an inflationary world. When the volume gain is well up in double digits, it bodes well for profitability trends in the current and following year. When the industry volume gain is small, underwriting experience very shortly will get worse, no matter how unsatisfactory the current level.

The Best’s data in the table reflect the experience of practically the entire industry, including stock, mutual and reciprocal companies. The combined ratio indicates total operating and loss costs as compared to premiums; a ratio below 100 indicates an underwriting profit, and one above 100 indicates a loss.

Year	Yearly Change in Premium Written	Yearly Change in Premium Earned	Combined Ratio after Policy-holder Dividends
1972	10.2%	10.9%	96.2
1973	8.0%	8.8%	99.2
1974	6.2%	6.9%	105.4
1975	11.0%	9.6%	107.9
1976	21.9%	19.4%	102.4
1977	19.8%	20.5%	97.2
1978	12.8%	14.3%	97.5
1979	10.3%	10.4%	100.6
1980	6.0%	7.8%	103.1
1981	3.6%	4.1%	105.7

Source: Best's Aggregates and Averages.

As Pogo would say, "The future isn't what it used to be." Current pricing practices promise devastating results, particularly if the respite from major natural disasters that the industry has enjoyed in recent years should end. *For underwriting experience has been getting worse in spite of good luck, not because of bad luck.* In recent years hurricanes have stayed at sea and motorists have reduced their driving. They won't always be so obliging.

And, of course the twin inflations, monetary and "social" (the tendency of courts and juries to stretch the coverage of policies beyond what insurers, relying upon contract terminology and precedent, had expected), are unstoppable. Costs of repairing both property and people - and the extent to which these repairs are deemed to be the responsibility of the insurer - will advance relentlessly.

Absent any bad luck (catastrophes, increased driving, etc.), an immediate industry volume gain of at least 10% per year probably is necessary to *stabilize* the record level of

underwriting losses that will automatically prevail in mid-1982. (Most underwriters expect incurred losses in aggregate to rise at least 10% annually; each, of course, counts on getting less than his share.) Every percentage point of annual premium growth below the 10% equilibrium figure quickens the pace of deterioration. Quarterly data in 1981 underscore the conclusion that a terrible underwriting picture is worsening at an accelerating rate.

In the 1980 annual report we discussed the investment policies that have destroyed the integrity of many insurers' balance sheets, forcing them to abandon underwriting discipline and write business at any price in order to avoid negative cash flow. It was clear that insurers with large holdings of bonds valued, for accounting purposes, at nonsensically high prices would have little choice but to keep the money revolving by selling large numbers of policies at nonsensically low prices. Such insurers necessarily fear a major decrease in volume more than they fear a major underwriting loss.

But, unfortunately, all insurers are affected; it's difficult to price much differently than your most threatened competitor. This pressure continues unabated and adds a new motivation to the others that drive many insurance managers to push for business; worship of size over profitability, and the fear that market share surrendered never can be regained.

Whatever the reasons, we believe it is true that virtually no major property-casualty insurer - despite protests by the entire industry that rates are inadequate and great selectivity should be exercised - has been willing to turn down business to the point where cash flow has turned significantly negative. Absent such a willingness, prices will remain under severe pressure.

Commentators continue to talk of the underwriting cycle, usually implying a regularity of rhythm and a relatively constant midpoint of profitability. Our own view is different. We believe that very large, although obviously varying, underwriting losses will be the norm for the industry, and that the best underwriting years in the future decade may appear substandard against the average year of the past decade.

We have no magic formula to insulate our controlled insurance companies against this deteriorating future. Our managers, particularly Phil Liesche, Bill Lyons, Roland Miller, Floyd Taylor and Milt Thornton, have done a magnificent job of swimming against the tide. We have sacrificed much volume, but have maintained a substantial underwriting superiority in

relation to industry-wide results. The outlook at Berkshire is for continued low volume. Our financial position offers us maximum flexibility, a very rare condition in the property-casualty insurance industry. And, at some point, should fear ever prevail throughout the industry, our financial strength could become an operational asset of immense value.

We believe that GEICO Corporation, our major non-controlled business operating in this field, is, by virtue of its extreme and improving operating efficiency, in a considerably more protected position than almost any other major insurer. GEICO is a brilliantly run implementation of a very important business idea.

Shareholder Designated Contributions

Our new program enabling shareholders to designate the recipients of corporate charitable contributions was greeted with extraordinary enthusiasm. A copy of the letter sent October 14, 1981 describing this program appears on pages 51-53. Of 932,206 shares eligible for participation (shares where the name of the actual owner appeared on our stockholder record), 95.6% responded. Even excluding Buffet-related shares, the response topped 90%.

In addition, more than 3% of our shareholders voluntarily wrote letters or notes, all but one approving of the program. Both the level of participation and of commentary surpass any shareholder response we have witnessed, even when such response has been intensively solicited by corporate staff and highly paid professional proxy organizations. In contrast, your extraordinary level of response occurred without even the nudge of a company-provided return envelope. This self-propelled behavior speaks well for the program, and speaks well for our shareholders.

Apparently the owners of our corporation like both possessing and exercising the ability to determine where gifts of their funds shall be made. The "father-knows-best" school of corporate governance will be surprised to find that none of our shareholders sent in a designation sheet with instructions that the officers of Berkshire - in their superior wisdom, of course - make the decision on charitable funds applicable to his shares. Nor did anyone suggest that his share of our charitable funds be used to match contributions made by our corporate directors to charities of the directors' choice (a popular, proliferating and non-publicized policy at many large corporations).

All told, \$1,783,655 of shareholder-designed contributions were distributed to about 675 charities. In addition, Berkshire and subsidiaries continue to make certain contributions pursuant to local level decisions made by our operating managers.

There will be some years, perhaps two or three out of ten, when contributions by Berkshire will produce substandard tax deductions - or none at all. In those years we will not effect our shareholder designated charitable program. In all other years we expect to inform you about October 10th of the amount per share that you may designate. A reply form will accompany the notice, and you will be given about three weeks to respond with your designation. *To qualify, your shares must be registered in your own name or the name of an owning trust, corporation, partnership or estate, if applicable, on our stockholder list of September 30th, or the Friday preceding if such date falls on a Saturday or Sunday.*

Our only disappointment with this program in 1981 was that some of our shareholders, through no fault of their own, missed the opportunity to participate. The Treasury Department ruling allowing us to proceed without tax uncertainty was received early in October. The ruling did not cover participation by shareholders whose stock was registered in the name of nominees, such as brokers, and additionally required that the owners of all designating shares make certain assurances to Berkshire. These assurances could not be given us in effective form by nominee holders.

Under these circumstances, we attempted to communicate with all of our owners promptly (via the October 14th letter) so that, if they wished, they could prepare themselves to participate by the November 13th record date. It was particularly important that this information be communicated promptly to stockholders whose holdings were in nominee name, since they would not be eligible unless they took action to re-register their shares before the record date.

Unfortunately, communication to such non-record shareholders could take place only through the nominees. We therefore strongly urged those nominees, mostly brokerage houses, to promptly transmit our letter to the real owners. We explained that their failure to do so could deprive such owners of an important benefit.

The results from our urgings would not strengthen the case for private ownership of the U.S. Postal Service. Many of our shareholders never heard from their brokers (as some

shareholders told us after reading news accounts of the program). Others were forwarded our letter too late for action.

One of the largest brokerage houses claiming to hold stock for sixty of its clients (about 4% of our shareholder population), apparently transmitted our letter about three weeks after receipt - too late for any of the sixty to participate. (Such lassitude did not pervade all departments of that firm; it billed Berkshire for mailing services within six days of that belated and ineffectual action.)

We recite such horror stories for two reasons: (1) if you wish to participate in future designated contribution programs, be sure to have your stock registered in your name well before September 30th; and (2) even if you don't care to participate and prefer to leave your stock in nominee form, it would be wise to have at least one share registered in your own name. By so doing, you can be sure that you will be notified of any important corporate news at the same time as all other shareholders.

The designated-contributions idea, along with many other ideas that have turned out well for us, was conceived by Charlie Munger, Vice Chairman of Berkshire and Chairman of Blue Chip. Irrespective of titles, Charlie and I work as partners in managing all controlled companies. To almost a sinful degree, we enjoy our work as managing partners. And we enjoy having you as our financial partners.

Warren E. Buffett

Chairman of the Board

1982 Letter

BERKSHIRE HATHAWAY INC.

March 3, 1983

To the Stockholders of Berkshire Hathaway Inc.:

Operating earnings of \$31.5 million in 1982 amounted to only 9.8% of beginning equity capital (valuing securities at cost), down from 15.2% in 1981 and far below our recent high of 19.4% in 1978. This decline largely resulted from:

- (1) a significant deterioration in insurance underwriting results;
- (2) a considerable expansion of equity capital without a corresponding growth in the businesses we operate directly; and
- (3) a continually-enlarging commitment of our resources to investment in partially-owned, nonoperated businesses; accounting rules dictate that a major part of our pro-rata share of earnings from such businesses must be excluded from Berkshire's reported earnings.

It was only a few years ago that we told you that the operating earnings/equity capital percentage, with proper allowance for a few other variables, was the most important yardstick of single-year managerial performance. While we still believe this to be the case with the vast majority of companies, we believe its utility in our own case has greatly diminished. You should be suspicious of such an assertion. Yardsticks seldom are discarded while yielding favorable readings. But when results deteriorate, most managers favor disposition of the yardstick rather than disposition of the manager.

To managers faced with such deterioration, a more flexible measurement system often suggests itself: just shoot the arrow of business performance into a blank canvas and then carefully draw the bullseye around the implanted arrow. We generally believe in pre-set, long-lived and small bullseyes. However, because of the importance of item (3) above, further explained in the following section, we believe our abandonment of the operating earnings/equity capital bullseye to be warranted.

Non-Reported Ownership Earnings

The appended financial statements reflect “accounting” earnings that generally include our proportionate share of earnings from any underlying business in which our ownership is at least 20%. Below the 20% ownership figure, however, only our share of dividends paid by the underlying business units is included in our accounting numbers; undistributed earnings of such less-than-20%-owned businesses are totally ignored.

There are a few exceptions to this rule; e.g., we own about 35% of GEICO Corporation but, because we have assigned our voting rights, the company is treated for accounting purposes as a less-than-20% holding. Thus, dividends received from GEICO in 1982 of \$3.5 million after tax are the only item included in our “accounting” earnings. An additional \$23 million that represents our share of GEICO’s undistributed operating earnings for 1982 is totally excluded from our reported operating earnings. If GEICO had earned less money in 1982 but had paid an additional \$1 million in dividends, our reported earnings would have been larger despite the poorer business results. Conversely, if GEICO had earned an additional \$100 million - and retained it all - our reported earnings would have been unchanged. Clearly “accounting” earnings can seriously misrepresent economic reality.

We prefer a concept of “economic” earnings that includes all undistributed earnings, regardless of ownership percentage. In our view, the value to all owners of the retained earnings of a business enterprise is determined by the effectiveness with which those earnings are used - and not by the size of one’s ownership percentage. If you have owned .01 of 1% of Berkshire during the past decade, you have benefited economically in full measure from your share of our retained earnings, no matter what your accounting system. Proportionately, you have done just as well as if you had owned the magic 20%. But if you have owned 100% of

a great many capital-intensive businesses during the decade, retained earnings that were credited fully and with painstaking precision to you under standard accounting methods have resulted in minor or zero economic value. This is not a criticism of accounting procedures. We would not like to have the job of designing a better system. It's simply to say that managers and investors alike must understand that accounting numbers are the beginning, not the end, of business valuation.

In most corporations, less-than-20% ownership positions are unimportant (perhaps, in part, because they prevent maximization of cherished reported earnings) and the distinction between accounting and economic results we have just discussed matters little. But in our own case, such positions are of very large and growing importance. Their magnitude, we believe, is what makes our reported operating earnings figure of limited significance.

In our 1981 annual report we predicted that our share of undistributed earnings from four of our major non-controlled holdings would aggregate over \$35 million in 1982. With no change in our holdings of three of these companies - GEICO, General Foods and The Washington Post - and a considerable increase in our ownership of the fourth, R. J. Reynolds Industries, our share of undistributed 1982 operating earnings of this group came to well over \$40 million. This number - not reflected at all in our earnings - is greater than our total reported earnings, which include only the \$14 million in dividends received from these companies. And, of course, we have a number of smaller ownership interests that, in aggregate, had substantial additional undistributed earnings.

We attach real significance to the general magnitude of these numbers, but we don't believe they should be carried to ten decimal places. Realization by Berkshire of such retained earnings through improved market valuations is subject to very substantial, but indeterminate, taxation. And while retained earnings over the years, and in the aggregate, have translated into at least equal market value for shareholders, the translation has been both extraordinarily uneven among companies and irregular and unpredictable in timing.

However, this very unevenness and irregularity offers advantages to the value-oriented purchaser of fractional portions of businesses. This investor may select from almost the entire

array of major American corporations, including many far superior to virtually any of the businesses that could be bought in their entirety in a negotiated deal. And fractional-interest purchases can be made in an auction market where prices are set by participants with behavior patterns that sometimes resemble those of an army of manic-depressive lemmings.

Within this gigantic auction arena, it is our job to select businesses with economic characteristics allowing each dollar of retained earnings to be translated eventually into at least a dollar of market value. Despite a lot of mistakes, we have so far achieved this goal. In doing so, we have been greatly assisted by Arthur Okun's patron saint for economists - St.

Offset. In some cases, that is, retained earnings attributable to our ownership position have had insignificant or even negative impact on market value, while in other major positions a dollar retained by an investee corporation has been translated into two or more dollars of market value. To date, our corporate over-achievers have more than offset the laggards. If we can continue this record, it will validate our efforts to maximize "economic" earnings, regardless of the impact upon "accounting" earnings.

Satisfactory as our partial-ownership approach has been, what really makes us dance is the purchase of 100% of good businesses at reasonable prices. We've accomplished this feat a few times (and expect to do so again), but it is an extraordinarily difficult job - far more difficult than the purchase at attractive prices of fractional interests.

As we look at the major acquisitions that others made during 1982, our reaction is not envy, but relief that we were non-participants. For in many of these acquisitions, managerial intellect wilted in competition with managerial adrenaline. The thrill of the chase blinded the pursuers to the consequences of the catch. Pascal's observation seems apt: "It has struck me that all men's misfortunes spring from the single cause that they are unable to stay quietly in one room."

(Your Chairman left the room once too often last year and almost starred in the Acquisition Follies of 1982. In retrospect, our major accomplishment of the year was that a very large purchase to which we had firmly committed was unable to be completed for reasons totally beyond our control. Had it come off, this transaction would have consumed extraordinary amounts of time and energy, all for a most uncertain payoff. If we were to introduce graphics

to this report, illustrating favorable business developments of the past year, two blank pages depicting this blown deal would be the appropriate centerfold.)

Our partial-ownership approach can be continued soundly only as long as portions of attractive businesses can be acquired at attractive prices. We need a moderately-priced stock market to assist us in this endeavor. The market, like the Lord, helps those who help themselves. But, unlike the Lord, the market does not forgive those who know not what they do. For the investor, a too-high purchase price for the stock of an excellent company can undo the effects of a subsequent decade of favorable business developments.

Should the stock market advance to considerably higher levels, our ability to utilize capital effectively in partial-ownership positions will be reduced or eliminated. This will happen periodically: just ten years ago, at the height of the two-tier market mania (with high-return-on-equity businesses bid to the sky by institutional investors), Berkshire's insurance subsidiaries owned only \$18 million in market value of equities, excluding their interest in Blue Chip Stamps. At that time, such equity holdings amounted to about 15% of our insurance company investments versus the present 80%. There were as many good businesses around in 1972 as in 1982, but the prices the stock market placed upon those businesses in 1972 looked absurd. While high stock prices in the future would make our performance look good temporarily, they would hurt our long-term business prospects rather than help them. We currently are seeing early traces of this problem.

Long-Term Corporate Performance

Our gain in net worth during 1982, valuing equities held by our insurance subsidiaries at market value (less capital gain taxes payable if unrealized gains were actually realized) amounted to \$208 million. On a beginning net worth base of \$519 million, the percentage gain was 40%.

During the 18-year tenure of present management, book value has grown from \$19.46 per share to \$737.43 per share, or 22.0% compounded annually. You can be certain that this percentage will diminish in the future. Geometric progressions eventually forge their own anchors.

Berkshire's economic goal remains to produce a long-term rate of return well above the return achieved by the average large American corporation. Our willingness to purchase either partial or total ownership positions in favorably-situated businesses, coupled with reasonable discipline about the prices we are willing to pay, should give us a good chance of achieving our goal.

Again this year the gain in market valuation of partially-owned businesses outpaced the gain in underlying economic value of those businesses. For example, \$79 million of our \$208 million gain is attributable to an increased market price for GEICO. This company continues to do exceptionally well, and we are more impressed than ever by the strength of GEICO's basic business idea and by the management skills of Jack Byrne. (Although not found in the catechism of the better business schools, "Let Jack Do It" works fine as a corporate creed for us.)

However, GEICO's increase in market value during the past two years has been considerably greater than the gain in its intrinsic business value, impressive as the latter has been. We expected such a favorable variation at some point, as the perception of investors converged with business reality. And we look forward to substantial future gains in underlying business value accompanied by irregular, but eventually full, market recognition of such gains.

Year-to-year variances, however, cannot consistently be in our favor. Even if our partially-owned businesses continue to perform well in an economic sense, there will be years when they perform poorly in the market. At such times our net worth could shrink significantly. We will not be distressed by such a shrinkage; if the businesses continue to look attractive and we have cash available, we simply will add to our holdings at even more favorable prices.

Sources of Reported Earnings

The table below shows the sources of Berkshire's reported earnings. In 1981 and 1982 Berkshire owned about 60% of Blue Chip Stamps which, in turn, owned 80% of Wesco Financial Corporation. The table displays aggregate operating earnings of the various business entities, as well as Berkshire's share of those earnings. All of the significant gains and losses attributable to unusual sales of assets by any of the business entities are aggregated with securities transactions in the line near the bottom of the table, and are not included in operating earnings.

	<i>Earnings</i>	<i>Before</i>	<i>Income</i>	<i>Taxes</i>	<i>Net Earnings</i>	<i>After Tax</i>
	Total	Total	Berkshire	Share	Berkshire	Share
000's of \$'s	1982	1981	1982	1981	1982	1981

* Amortization of intangibles arising in accounting for purchases of businesses (i.e. See's, Mutual and Buffalo Evening News) is reflected in the category designated as "Other".

On pages 45-61 of this report we have reproduced the narrative reports of the principal executives of Blue Chip and Wesco, in which they describe 1982 operations. A copy of the full annual report of either company will be mailed to any Berkshire shareholder upon request to Mr. Robert H. Bird for Blue Chip Stamps, 5801 South Eastern Avenue, Los Angeles, California 90040, or to Mrs. Jeanne Leach for Wesco Financial Corporation, 315 East Colorado Boulevard, Pasadena, California 91109.

I believe you will find the Blue Chip chronicle of developments in the Buffalo newspaper situation particularly interesting. There are now only 14 cities in the United States with a daily newspaper whose weekday circulation exceeds that of the Buffalo News. But the real story has been the growth in Sunday circulation. Six years ago, prior to introduction of a Sunday edition of the News, the long-established Courier-Express, as the only Sunday newspaper published in Buffalo, had circulation of 272,000. The News now has Sunday circulation of 367,000, a 35% gain - even though the number of households within the primary circulation area has shown little change during the six years. We know of no city in the United States with a long history of seven-day newspaper publication in which the percentage of households purchasing the Sunday newspaper has grown at anything like this rate. To the contrary, in most cities household penetration figures have grown negligibly, or not at all. Our key managers in Buffalo - Henry Urban, Stan Lipsey, Murray Light, Clyde Pinson, Dave Perona and Dick Feather - deserve great credit for this unmatched expansion in Sunday readership.

As we indicated earlier, undistributed earnings in companies we do not control are now fully as important as the reported operating earnings detailed in the preceding table. The distributed portion of non-controlled earnings, of course, finds its way into that table primarily through the net investment income segment of Insurance Group earnings.

We show below Berkshire's proportional holdings in those non-controlled businesses for which only distributed earnings (dividends) are included in our earnings.

No. of Shares	Company	Cost (000's omitted)	Market (000's omitted)
460,650 (a)	Affiliated Publications, Inc.	\$3,516	\$16,929
908,800 (c)	Crum & Forster	\$47,144	\$48,962
2,101,244 (b)	General Foods, Inc.	\$66,277	\$83,680
7,200,000 (a)	GEICO Corporation	\$47,138	\$309,600
2,379,200 (a)	Handy & Harman	\$27,318	\$46,692
711,180 (a)	Interpublic Group of Companies	\$4,531	\$34,314
282,500 (a)	Media General, Inc.	\$4,545	\$12,289
391,400 (a)	Ogilvy & Mather Int'l. Inc.	\$3,709	\$17,319
3,107,675 (b)	R. J. Reynolds Industries	\$142,343	\$158,715
1,531,391 (a)	Time, Inc.	\$45,273	\$79,824
1,868,600 (a)	The Washington Post Company Class B	\$10,628	\$103,240
Total		\$402,422	\$911,564
All Other Common Stockholdings		\$21,611	\$21,611
Total Common Stocks		\$424,033	\$945,622

(a) All owned by Berkshire or its insurance subsidiaries.

(b) Blue Chip and/or Wesco own shares of these companies. All numbers represent Berkshire's net interest in the larger gross holdings of the group.

(c) Temporary holding as cash substitute.

In case you haven't noticed, there is an important investment lesson to be derived from this table: nostalgia should be weighted heavily in stock selection. Our two largest unrealized gains are in Washington Post and GEICO, companies with which your Chairman formed his first commercial connections at the ages of 13 and 20, respectively. After straying for roughly 25 years, we returned as investors in the mid-1970s. The table quantifies the rewards for even long-delayed corporate fidelity.

Our controlled and non-controlled businesses operate over such a wide spectrum that detailed commentary here would prove too lengthy. Much financial and operational

information regarding the controlled businesses is included in Management's Discussion on pages 34-39, and in the narrative reports on pages 45-61. However, our largest area of business activity has been, and almost certainly will continue to be, the property-casualty insurance area. So commentary on developments in that industry is appropriate.

Insurance Industry Conditions

We show below an updated table of the industry statistics we utilized in last year's annual report. Its message is clear: underwriting results in 1983 will not be a sight for the squeamish.

Year	Yearly Change in Premium Written (%)	Yearly Change in Premium Earned (%)	Combined Ratio after Policy-holder Dividends
1972	10.2	10.9	96.2
1973	8.0	8.8	99.2
1974	6.2	6.9	105.4
1975	11.0	9.6	107.9
1976	21.9	19.4	102.4
1977	19.8	20.5	97.2
1978	12.8	14.3	97.5
1979	10.3	10.4	100.6
1980	6.0	7.8	103.1
1981 (Rev)	3.9	4.1	106.0
1982 (Est)	5.1	4.6	109.5

Source: Best's Aggregates and Averages.

The Best's data reflect the experience of practically the entire industry, including stock, mutual and reciprocal companies. The combined ratio represents total operating and loss costs as compared to revenue from premiums; a ratio below 100 indicates an underwriting profit, and one above 100 indicates a loss.

For reasons outlined in last year's report, as long as the annual gain in industry premiums written falls well below 10%, you can expect the underwriting picture in the next year to deteriorate. This will be true even at today's lower general rate of inflation. With the number of policies increasing annually, medical inflation far exceeding general inflation, and concepts of insured liability broadening, it is highly unlikely that yearly increases in insured losses will fall much below 10%.

You should be further aware that the 1982 combined ratio of 109.5 represents a "best case" estimate. In a given year, it is possible for an insurer to show almost any profit number it wishes, particularly if it (1) writes "long-tail" business (coverage where current costs can be only estimated, because claim payments are long delayed), (2) has been adequately reserved in the past, or (3) is growing very rapidly. There are indications that several large insurers opted in 1982 for obscure accounting and reserving maneuvers that masked significant deterioration in their underlying businesses. In insurance, as elsewhere, the reaction of weak managements to weak operations is often weak accounting. ("It's difficult for an empty sack to stand upright.")

The great majority of managements, however, try to play it straight. But even managements of integrity may subconsciously be less willing in poor profit years to fully recognize adverse loss trends. Industry statistics indicate some deterioration in loss reserving practices during 1982 and the true combined ratio is likely to be modestly worse than indicated by our table.

The conventional wisdom is that 1983 or 1984 will see the worst of underwriting experience and then, as in the past, the "cycle" will move, significantly and steadily, toward better results. We disagree because of a pronounced change in the competitive environment, hard to see for many years but now quite visible.

To understand the change, we need to look at some major factors that affect levels of corporate profitability generally. Businesses in industries with both substantial over-capacity and a "commodity" product (undifferentiated in any customer-important way by factors such as performance, appearance, service support, etc.) are prime candidates for profit troubles. These may be escaped, true, if prices or costs are administered in some manner and thereby insulated at least partially from normal market forces. This administration can be carried out

(a) legally through government intervention (until recently, this category included pricing for truckers and deposit costs for financial institutions), (b) illegally through collusion, or (c) “extra-legally” through OPEC-style foreign cartelization (with tag-along benefits for domestic non-cartel operators).

If, however, costs and prices are determined by full-bore competition, there is more than ample capacity, and the buyer cares little about whose product or distribution services he uses, industry economics are almost certain to be unexciting. They may well be disastrous.

Hence the constant struggle of every vendor to establish and emphasize special qualities of product or service. This works with candy bars (customers buy by brand name, not by asking for a “two-ounce candy bar”) but doesn’t work with sugar (how often do you hear, “I’ll have a cup of coffee with cream and C & H sugar, please”).

In many industries, differentiation simply can’t be made meaningful. A few producers in such industries may consistently do well if they have a cost advantage that is both wide and sustainable. By definition such exceptions are few, and, in many industries, are non-existent. For the great majority of companies selling “commodity” products, a depressing equation of business economics prevails: persistent over-capacity without administered prices (or costs) equals poor profitability.

Of course, over-capacity may eventually self-correct, either as capacity shrinks or demand expands. Unfortunately for the participants, such corrections often are long delayed. When they finally occur, the rebound to prosperity frequently produces a pervasive enthusiasm for expansion that, within a few years, again creates over-capacity and a new profitless environment. In other words, nothing fails like success.

What finally determines levels of long-term profitability in such industries is the ratio of supply-tight to supply-ample years. Frequently that ratio is dismal. (It seems as if the most recent supply-tight period in our textile business - it occurred some years back - lasted the better part of a morning.)

In some industries, however, capacity-tight conditions can last a long time. Sometimes actual growth in demand will outrun forecasted growth for an extended period. In other cases,

adding capacity requires very long lead times because complicated manufacturing facilities must be planned and built.

But in the insurance business, to return to that subject, capacity can be instantly created by capital plus an underwriter's willingness to sign his name. (Even capital is less important in a world in which state-sponsored guaranty funds protect many policyholders against insurer insolvency.) Under almost all conditions except that of fear for survival - produced, perhaps, by a stock market debacle or a truly major natural disaster - the insurance industry operates under the competitive sword of substantial overcapacity. Generally, also, despite heroic attempts to do otherwise, the industry sells a relatively undifferentiated commodity-type product. (Many insureds, including the managers of large businesses, do not even know the names of their insurers.) Insurance, therefore, would seem to be a textbook case of an industry usually faced with the deadly combination of excess capacity and a "commodity" product.

Why, then, was underwriting, despite the existence of cycles, generally profitable over many decades? (From 1950 through 1970, the industry combined ratio averaged 99.0 allowing all investment income plus 1% of premiums to flow through to profits.) The answer lies primarily in the historic methods of regulation and distribution. For much of this century, a large portion of the industry worked, in effect, within a legal quasi-administered pricing system fostered by insurance regulators. While price competition existed, it was not pervasive among the larger companies. The main competition was for agents, who were courted via various non-price-related strategies.

For the giants of the industry, most rates were set through negotiations between industry "bureaus" (or through companies acting in accord with their recommendations) and state regulators. Dignified haggling occurred, but it was between company and regulator rather than between company and customer. When the dust settled, Giant A charged the same price as Giant B - and both companies and agents were prohibited by law from cutting such filed rates.

The company-state negotiated prices included specific profit allowances and, when loss data indicated that current prices were unprofitable, both company managements and state regulators expected that they would act together to correct the situation. Thus, most of the

pricing actions of the giants of the industry were “gentlemanly”, predictable, and profit-producing. Of prime importance - and in contrast to the way most of the business world operated - insurance companies could legally price their way to profitability even in the face of substantial over-capacity.

That day is gone. Although parts of the old structure remain, far more than enough new capacity exists outside of that structure to force all parties, old and new, to respond. The new capacity uses various methods of distribution and is not reluctant to use price as a prime competitive weapon. Indeed, it relishes that use. In the process, customers have learned that insurance is no longer a one-price business. They won't forget.

Future profitability of the industry will be determined by current competitive characteristics, not past ones. Many managers have been slow to recognize this. It's not only generals that prefer to fight the last war. Most business and investment analysis also comes from the rear-view mirror. It seems clear to us, however, that only one condition will allow the insurance industry to achieve significantly improved underwriting results. That is the same condition that will allow better results for the aluminum, copper, or corn producer - a major narrowing of the gap between demand and supply.

Unfortunately, there can be no surge in demand for insurance policies comparable to one that might produce a market tightness in copper or aluminum. Rather, the supply of available insurance coverage must be curtailed. “Supply”, in this context, is mental rather than physical: plants or companies need not be shut; only the willingness of underwriters to sign their names need be curtailed.

This contraction will not happen because of generally poor profit levels. Bad profits produce much hand-wringing and finger-pointing. But they do not lead major sources of insurance capacity to turn their backs on very large chunks of business, thereby sacrificing market share and industry significance.

Instead, major capacity withdrawals require a shock factor such as a natural or financial “megadisaster”. One might occur tomorrow - or many years from now. The insurance business - even taking investment income into account - will not be particularly profitable in the meantime.

When supply ultimately contracts, large amounts of business will be available for the few with large capital capacity, a willingness to commit it, and an in-place distribution system.

We would expect great opportunities for our insurance subsidiaries at such a time.

During 1982, our insurance underwriting deteriorated far more than did the industry's. From a profit position well above average, we, slipped to a performance modestly below average.

The biggest swing was in National Indemnity's traditional coverages. Lines that have been highly profitable for us in the past are now priced at levels that guarantee underwriting losses.

In 1983 we expect our insurance group to record an average performance in an industry in which average is very poor.

Two of our stars, Milt Thornton at Cypress and Floyd Taylor at Kansas Fire and Casualty, continued their outstanding records of producing an underwriting profit every year since joining us. Both Milt and Floyd simply are incapable of being average. They maintain a passionately proprietary attitude toward their operations and have developed a business culture centered upon unusual cost-consciousness and customer service. It shows on their scorecards.

During 1982, parent company responsibility for most of our insurance operations was given to Mike Goldberg. Planning, recruitment, and monitoring all have shown significant improvement since Mike replaced me in this role.

GEICO continues to be managed with a zeal for efficiency and value to the customer that virtually guarantees unusual success. Jack Byrne and Bill Snyder are achieving the most elusive of human goals - keeping things simple and remembering what you set out to do. In Lou Simpson, additionally, GEICO has the best investment manager in the property-casualty business. We are happy with every aspect of this operation. GEICO is a magnificent illustration of the high-profit exception we described earlier in discussing commodity industries with over-capacity - a company with a wide and sustainable cost advantage. Our 35% interest in GEICO represents about \$250 million of premium volume, an amount considerably greater than all of the direct volume we produce.

Issuance of Equity

Berkshire and Blue Chip are considering merger in 1983. If it takes place, it will involve an exchange of stock based upon an identical valuation method applied to both companies. The one other significant issuance of shares by Berkshire or its affiliated companies that occurred during present management's tenure was in the 1978 merger of Berkshire with Diversified Retailing Company.

Our share issuances follow a simple basic rule: we will not issue shares unless we receive as much intrinsic business value as we give. Such a policy might seem axiomatic. Why, you might ask, would anyone issue dollar bills in exchange for fifty-cent pieces? Unfortunately, many corporate managers have been willing to do just that.

The first choice of these managers in making acquisitions may be to use cash or debt. But frequently the CEO's cravings outpace cash and credit resources (certainly mine always have). Frequently, also, these cravings occur when his own stock is selling far below intrinsic business value. This state of affairs produces a moment of truth. At that point, as Yogi Berra has said, "You can observe a lot just by watching." For shareholders then will find which objective the management truly prefers - expansion of domain or maintenance of owners' wealth.

The need to choose between these objectives occurs for some simple reasons. Companies often sell in the stock market below their intrinsic business value. But when a company wishes to sell out completely, in a negotiated transaction, it inevitably wants to - and usually can - receive full business value in whatever kind of currency the value is to be delivered. If cash is to be used in payment, the seller's calculation of value received couldn't be easier. If stock of the buyer is to be the currency, the seller's calculation is still relatively easy: just figure the market value in cash of what is to be received in stock.

Meanwhile, the buyer wishing to use his own stock as currency for the purchase has no problems if the stock is selling in the market at full intrinsic value.

But suppose it is selling at only half intrinsic value. In that case, the buyer is faced with the unhappy prospect of using a substantially undervalued currency to make its purchase.

Ironically, were the buyer to instead be a seller of its entire business, it too could negotiate for, and probably get, full intrinsic business value. But when the buyer makes a partial sale of

itself - *and that is what the issuance of shares to make an acquisition amounts to* - it can customarily get no higher value set on its shares than the market chooses to grant it.

The acquirer who nevertheless barges ahead ends up using an undervalued (market value) currency to pay for a fully valued (negotiated value) property. In effect, the acquirer must give up \$2 of value to receive \$1 of value. Under such circumstances, a marvelous business purchased at a fair sales price becomes a terrible buy. For gold valued as gold cannot be purchased intelligently through the utilization of gold - or even silver - valued as lead.

If, however, the thirst for size and action is strong enough, the acquirer's manager will find ample rationalizations for such a value-destroying issuance of stock. Friendly investment bankers will reassure him as to the soundness of his actions. (Don't ask the barber whether you need a haircut.)

A few favorite rationalizations employed by stock-issuing managements follow:

(a) "The company we're buying is going to be worth a lot more in the future." (Presumably so is the interest in the old business that is being traded away; future prospects are implicit in the business valuation process. If 2X is issued for X, the imbalance still exists when both parts double in business value.)

(b) "We have to grow." (Who, it might be asked, is the "we"? For present shareholders, the reality is that all existing businesses shrink when shares are issued. Were Berkshire to issue shares tomorrow for an acquisition, Berkshire would own everything that it now owns plus the new business, but *your* interest in such hard-to-match businesses as See's Candy Shops, National Indemnity, etc. would automatically be reduced. If (1) your family owns a 120-acre farm and (2) you invite a neighbor with 60 acres of comparable land to merge his farm into an equal partnership - with you to be managing partner, then (3) your managerial domain will have grown to 180 acres but you will have permanently shrunk by 25% your family's ownership interest in both acreage and crops. Managers who want to expand their domain at the expense of owners might better consider a career in government.)

(c) “Our stock is undervalued and we’ve minimized its use in this deal - but we need to give the selling shareholders 51% in stock and 49% in cash so that certain of those shareholders can get the tax-free exchange they want.” (This argument acknowledges that it is beneficial to the acquirer to hold down the issuance of shares, and we like that. But if it hurts the old owners to utilize shares on a 100% basis, it very likely hurts on a 51% basis. After all, a man is not charmed if a spaniel defaces his lawn, just because it’s a spaniel and not a St. Bernard. And the wishes of sellers can’t be the determinant of the best interests of the buyer - what would happen if, heaven forbid, the seller insisted that as a condition of merger the CEO of the acquirer be replaced?)

There are three ways to avoid destruction of value for old owners when shares are issued for acquisitions. One is to have a true business-value-for-business-value merger, such as the Berkshire-Blue Chip combination is intended to be. Such a merger attempts to be fair to shareholders of *both* parties, with each receiving just as much as it gives in terms of intrinsic business value. The Dart Industries-Kraft and Nabisco Standard Brands mergers appeared to be of this type, but they are the exceptions. It’s not that acquirers wish to avoid such deals; it’s just that they are very hard to do.

The second route presents itself when the acquirer’s stock sells at or above its intrinsic business value. In that situation, the use of stock as currency actually may enhance the wealth of the acquiring company’s owners. Many mergers were accomplished on this basis in the 1965-69 period. The results were the converse of most of the activity since 1970: the shareholders of the *acquired* company received very inflated currency (frequently pumped up by dubious accounting and promotional techniques) and were the losers of wealth through such transactions.

During recent years the second solution has been available to very few large companies. The exceptions have primarily been those companies in glamorous or promotional businesses to which the market temporarily attaches valuations at or above intrinsic business valuation.

The third solution is for the acquirer to go ahead with the acquisition, but then subsequently repurchase a quantity of shares equal to the number issued in the merger. In this manner,

what originally was a stock-for-stock merger can be converted, effectively, into a cash-for-stock acquisition. Repurchases of this kind are damage-repair moves. Regular readers will correctly guess that we much prefer repurchases that directly enhance the wealth of owners instead of repurchases that merely repair previous damage. Scoring touchdowns is more exhilarating than recovering one's fumbles. But, when a fumble has occurred, recovery is important and we heartily recommend damage-repair repurchases that turn a bad stock deal into a fair cash deal.

The language utilized in mergers tends to confuse the issues and encourage irrational actions by managers. For example, "dilution" is usually carefully calculated on a pro forma basis for both book value and current earnings per share. Particular emphasis is given to the latter item. When that calculation is negative (dilutive) from the acquiring company's standpoint, a justifying explanation will be made (internally, if not elsewhere) that the lines will cross favorably at some point in the future. (While deals often fail in practice, they never fail in projections - if the CEO is visibly panting over a prospective acquisition, subordinates and consultants will supply the requisite projections to rationalize any price.) Should the calculation produce numbers that are immediately positive - that is, anti-dilutive - for the acquirer, no comment is thought to be necessary.

The attention given this form of dilution is overdone: current earnings per share (or even earnings per share of the next few years) are an important variable in most business valuations, but far from all powerful.

There have been plenty of mergers, non-dilutive in this limited sense, that were instantly value destroying for the acquirer. And some mergers that have diluted current and near-term earnings per share have in fact been value-enhancing. What really counts is whether a merger is dilutive or anti-dilutive in terms of intrinsic business value (a judgment involving consideration of many variables). We believe calculation of dilution from this viewpoint to be all-important (and too seldom made).

A second language problem relates to the equation of exchange. If Company A announces that it will issue shares to merge with Company B, the process is customarily described as

“Company A to Acquire Company B”, or “B Sells to A”. Clearer thinking about the matter would result if a more awkward but more accurate description were used: “Part of A sold to acquire B”, or “Owners of B to receive part of A in exchange for their properties”. In a trade, what you are giving is just as important as what you are getting. This remains true even when the final tally on what is being given is delayed. Subsequent sales of common stock or convertible issues, either to complete the financing for a deal or to restore balance sheet strength, must be fully counted in evaluating the fundamental mathematics of the original acquisition. (If corporate pregnancy is going to be the consequence of corporate mating, the time to face that fact is before the moment of ecstasy.)

Managers and directors might sharpen their thinking by asking themselves if they would sell 100% of their business on the same basis they are being asked to sell part of it. And if it isn't smart to sell all on such a basis, they should ask themselves why it is smart to sell a portion. A cumulation of small managerial stupidities will produce a major stupidity - not a major triumph. (Las Vegas has been built upon the wealth transfers that occur when people engage in seemingly-small disadvantageous capital transactions.)

The “giving versus getting” factor can most easily be calculated in the case of registered investment companies. Assume Investment Company X, selling at 50% of asset value, wishes to merge with Investment Company Y. Assume, also, that Company X therefore decides to issue shares equal in market value to 100% of Y's asset value.

Such a share exchange would leave X trading \$2 of its previous intrinsic value for \$1 of Y's intrinsic value. Protests would promptly come forth from both X's shareholders and the SEC, which rules on the fairness of registered investment company mergers. Such a transaction simply would not be allowed.

In the case of manufacturing, service, financial companies, etc., values are not normally as precisely calculable as in the case of investment companies. But we have seen mergers in these industries that just as dramatically destroyed value for the owners of the acquiring company as was the case in the hypothetical illustration above. This destruction could not happen if management and directors would assess the fairness of any transaction by using the same yardstick in the measurement of both businesses.

Finally, a word should be said about the “double whammy” effect upon owners of the acquiring company when value-diluting stock issuances occur. Under such circumstances, the first blow is the loss of intrinsic business value that occurs through the merger itself. The second is the downward revision in market valuation that, quite rationally, is given to that now-diluted business value. For current and prospective owners understandably will not pay as much for assets lodged in the hands of a management that has a record of wealth-destruction through unintelligent share issuances as they will pay for assets entrusted to a management with precisely equal operating talents, but a known distaste for anti-owner actions. Once management shows itself insensitive to the interests of owners, shareholders will suffer a long time from the price/value ratio afforded their stock (relative to other stocks), no matter what assurances management gives that the value-diluting action taken was a one-of-a-kind event.

Those assurances are treated by the market much as one-bug-in-the-salad explanations are treated at restaurants. Such explanations, even when accompanied by a new waiter, do not eliminate a drop in the demand (and hence market value) for salads, both on the part of the offended customer and his neighbors pondering what to order. Other things being equal, the highest stock market prices relative to intrinsic business value are given to companies whose managers have demonstrated their unwillingness to issue shares at any time on terms unfavorable to the owners of the business.

At Berkshire, or any company whose policies we determine (including Blue Chip and Wesco), we will issue shares only if our owners receive in business value as much as we give. We will not equate activity with progress or corporate size with owner-wealth.

Miscellaneous

This annual report is read by a varied audience, and it is possible that some members of that audience may be helpful to us in our acquisition program.

We prefer:

- (1) large purchases (at least \$5 million of after-tax earnings),
- (2) demonstrated consistent earning power (future projections are of little interest to us, nor are “turn-around” situations),

- (3) businesses earning good returns on equity while employing little or no debt,
- (4) management in place (we can't supply it),
- (5) simple businesses (if there's lots of technology, we won't understand it),
- (6) an offering price (we don't want to waste our time or that of the seller by talking, even preliminarily, about a transaction when price is unknown).

We will not engage in unfriendly transactions. We can promise complete confidentiality and a very fast answer as to possible interest - customarily within five minutes. Cash purchases are preferred, but we will consider the use of stock when it can be done on the basis described in the previous section.

* * * * *

Our shareholder-designated contributions program met with enthusiasm again this year; 95.8% of eligible shares participated. This response was particularly encouraging since only \$1 per share was made available for designation, down from \$2 in 1981. If the merger with Blue Chip takes place, a probable by-product will be the attainment of a consolidated tax position that will significantly enlarge our contribution base and give us a potential for designating bigger per-share amounts in the future.

If you wish to participate in future programs, we strongly urge that you immediately make sure that your shares are registered in the actual owner's name, not a "street" or nominee name. For new shareholders, a more complete description of the program is on pages 62-63.

* * * * *

In a characteristically rash move, we have expanded World Headquarters by 252 square feet (17%), coincidental with the signing of a new five-year lease at 1440 Kiewit Plaza. The five people who work here with me - Joan Atherton, Mike Goldberg, Gladys Kaiser, Verne McKenzie and Bill Scott - outproduce corporate groups many times their number. A compact organization lets all of us spend our time managing the business rather than managing each other.

Charlie Munger, my partner in management, will continue to operate from Los Angeles whether or not the Blue Chip merger occurs. Charlie and I are interchangeable in business decisions. Distance impedes us not at all: we've always found a telephone call to be more productive than a half-day committee meeting.

* * * * *

Two of our managerial stars retired this year: Phil Liesche at 65 from National Indemnity Company, and Ben Rosner at 79 from Associated Retail Stores. Both of these men made you, as shareholders of Berkshire, a good bit wealthier than you otherwise would have been. National Indemnity has been the most important operation in Berkshire's growth. Phil and Jack Ringwalt, his predecessor, were the two prime movers in National Indemnity's success. Ben Rosner sold Associated Retail Stores to Diversified Retailing Company for cash in 1967, promised to stay on only until the end of the year, and then hit business home runs for us for the next fifteen years.

Both Ben and Phil ran their businesses for Berkshire with every bit of the care and drive that they would have exhibited had they personally owned 100% of these businesses. No rules were necessary to enforce or even encourage this attitude; it was embedded in the character of these men long before we came on the scene. Their good character became our good fortune. If we can continue to attract managers with the qualities of Ben and Phil, you need not worry about Berkshire's future.

Warren E. Buffett

Chairman of the Board

1983 Letter

BERKSHIRE HATHAWAY INC.

To the Shareholders of Berkshire Hathaway Inc.:

This past year our registered shareholders increased from about 1900 to about 2900. Most of this growth resulted from our merger with Blue Chip Stamps, but there also was an acceleration in the pace of “natural” increase that has raised us from the 1000 level a few years ago.

With so many new shareholders, it’s appropriate to summarize the major business principles we follow that pertain to the manager-owner relationship:

- o Although our form is corporate, our attitude is partnership. Charlie Munger and I think of our shareholders as owner-partners, and of ourselves as managing partners. (Because of the size of our shareholdings we also are, for better or worse, controlling partners.) We do not view the company itself as the ultimate owner of our business assets but, instead, view the company as a conduit through which our shareholders own the assets.

- o In line with this owner-orientation, our directors are all major shareholders of Berkshire Hathaway. In the case of at least four of the five, over 50% of family net worth is represented by holdings of Berkshire. We eat our own cooking.

- o Our long-term economic goal (subject to some qualifications mentioned later) is to maximize the average annual rate of gain in intrinsic business value on a per-share basis. We do not measure the economic significance or performance of Berkshire by its size; we measure by per-share progress. We are certain that the rate of per-share progress will diminish in the future - a greatly enlarged capital base will see to that. But we will be disappointed if our rate does not exceed that of the average large American corporation.

- o Our preference would be to reach this goal by directly owning a diversified group of businesses that generate cash and consistently earn above-average returns on capital. Our second choice is to own parts of similar businesses, attained primarily through purchases of

marketable common stocks by our insurance subsidiaries. The price and availability of businesses and the need for insurance capital determine any given year's capital allocation.

- o Because of this two-pronged approach to business ownership and because of the limitations of conventional accounting, consolidated reported earnings may reveal relatively little about our true economic performance. Charlie and I, both as owners and managers, virtually ignore such consolidated numbers. However, we will also report to you the earnings of each major business we control, numbers we consider of great importance. These figures, along with other information we will supply about the individual businesses, should generally aid you in making judgments about them.

- o Accounting consequences do not influence our operating or capital-allocation decisions. When acquisition costs are similar, we much prefer to purchase \$2 of earnings that is not reportable by us under standard accounting principles than to purchase \$1 of earnings that is reportable. This is precisely the choice that often faces us since entire businesses (whose earnings will be fully reportable) frequently sell for double the pro-rata price of small portions (whose earnings will be largely unreportable). In aggregate and over time, we expect the unreported earnings to be fully reflected in our intrinsic business value through capital gains.

- o We rarely use much debt and, when we do, we attempt to structure it on a long-term fixed rate basis. We will reject interesting opportunities rather than over-leverage our balance sheet. This conservatism has penalized our results but it is the only behavior that leaves us comfortable, considering our fiduciary obligations to policyholders, depositors, lenders and the many equity holders who have committed unusually large portions of their net worth to our care.

- o A managerial "wish list" will not be filled at shareholder expense. We will not diversify by purchasing entire businesses at control prices that ignore long-term economic consequences to our shareholders. We will only do with your money what we would do with our own, weighing fully the values you can obtain by diversifying your own portfolios through direct purchases in the stock market.

- o We feel noble intentions should be checked periodically against results. We test the wisdom of retaining earnings by assessing whether retention, over time, delivers shareholders at least \$1 of market value for each \$1 retained. To date, this test has been met. We will continue to apply it on a five-year rolling basis. As our net worth grows, it is more difficult to use retained earnings wisely.

- o We will issue common stock only when we receive as much in business value as we give. This rule applies to all forms of issuance - not only mergers or public stock offerings, but stock for-debt swaps, stock options, and convertible securities as well. We will not sell small portions of your company - and that is what the issuance of shares amounts to - on a basis inconsistent with the value of the entire enterprise.

- o You should be fully aware of one attitude Charlie and I share that hurts our financial performance: regardless of price, we have no interest at all in selling any good businesses that Berkshire owns, and are very reluctant to sell sub-par businesses as long as we expect them to generate at least some cash and as long as we feel good about their managers and labor relations. We hope not to repeat the capital-allocation mistakes that led us into such sub-par businesses. And we react with great caution to suggestions that our poor businesses can be restored to satisfactory profitability by major capital expenditures. (The projections will be dazzling - the advocates will be sincere - but, in the end, major additional investment in a terrible industry usually is about as rewarding as struggling in quicksand.) Nevertheless, gin rummy managerial behavior (discard your least promising business at each turn) is not our style. We would rather have our overall results penalized a bit than engage in it.

- o We will be candid in our reporting to you, emphasizing the pluses and minuses important in appraising business value. Our guideline is to tell you the business facts that we would want to know if our positions were reversed. We owe you no less. Moreover, as a company with a major communications business, it would be inexcusable for us to apply lesser standards of accuracy, balance and incisiveness when reporting on ourselves than we would expect our news people to apply when reporting on others. We also believe candor benefits us as managers: the CEO who misleads others in public may eventually mislead himself in private.

o Despite our policy of candor, we will discuss our activities in marketable securities only to the extent legally required. Good investment ideas are rare, valuable and subject to competitive appropriation just as good product or business acquisition ideas are. Therefore, we normally will not talk about our investment ideas. This ban extends even to securities we have sold (because we may purchase them again) and to stocks we are incorrectly rumored to be buying. If we deny those reports but say “no comment” on other occasions, the no-comments become confirmation.

That completes the catechism, and we can now move on to the high point of 1983 - the acquisition of a majority interest in Nebraska Furniture Mart and our association with Rose Blumkin and her family.

Nebraska Furniture Mart

Last year, in discussing how managers with bright, but adrenalin-soaked minds scramble after foolish acquisitions, I quoted Pascal: “It has struck me that all the misfortunes of men spring from the single cause that they are unable to stay quietly in one room.”

Even Pascal would have left the room for Mrs. Blumkin.

About 67 years ago Mrs. Blumkin, then 23, talked her way past a border guard to leave Russia for America. She had no formal education, not even at the grammar school level, and knew no English. After some years in this country, she learned the language when her older daughter taught her, every evening, the words she had learned in school during the day.

In 1937, after many years of selling used clothing, Mrs. Blumkin had saved \$500 with which to realize her dream of opening a furniture store. Upon seeing the American Furniture Mart in Chicago - then the center of the nation’s wholesale furniture activity - she decided to christen her dream Nebraska Furniture Mart.

She met every obstacle you would expect (and a few you wouldn’t) when a business endowed with only \$500 and no locational or product advantage goes up against rich, long-entrenched competition. At one early point, when her tiny resources ran out, “Mrs. B” (a personal trademark now as well recognized in Greater Omaha as Coca-Cola or Sanka) coped in a way not taught at business schools: she simply sold the furniture and appliances from her home in order to pay creditors precisely as promised.

Omaha retailers began to recognize that Mrs. B would offer customers far better deals than they had been giving, and they pressured furniture and carpet manufacturers not to sell to her. But by various strategies she obtained merchandise and cut prices sharply. Mrs. B was then hauled into court for violation of Fair Trade laws. She not only won all the cases, but received invaluable publicity. At the end of one case, after demonstrating to the court that she could profitably sell carpet at a huge discount from the prevailing price, she sold the judge \$1400 worth of carpet.

Today Nebraska Furniture Mart generates over \$100 million of sales annually out of one 200,000 square-foot store. No other home furnishings store in the country comes close to that volume. That single store also sells more furniture, carpets, and appliances than do all Omaha competitors combined.

One question I always ask myself in appraising a business is how I would like, assuming I had ample capital and skilled personnel, to compete with it. I'd rather wrestle grizzlies than compete with Mrs. B and her progeny. They buy brilliantly, they operate at expense ratios competitors don't even dream about, and they then pass on to their customers much of the savings. It's the ideal business - one built upon exceptional value to the customer that in turn translates into exceptional economics for its owners.

Mrs. B is wise as well as smart and, for far-sighted family reasons, was willing to sell the business last year. I had admired both the family and the business for decades, and a deal was quickly made. But Mrs. B, now 90, is not one to go home and risk, as she puts it, "losing her marbles". She remains Chairman and is on the sales floor seven days a week. Carpet sales are her specialty. She personally sells quantities that would be a good departmental total for other carpet retailers.

We purchased 90% of the business - leaving 10% with members of the family who are involved in management - and have optioned 10% to certain key young family managers.

And what managers they are. Geneticists should do handsprings over the Blumkin family. Louie Blumkin, Mrs. B's son, has been President of Nebraska Furniture Mart for many years and is widely regarded as the shrewdest buyer of furniture and appliances in the country. Louie says he had the best teacher, and Mrs. B says she had the best student. They're both right.

Louie and his three sons all have the Blumkin business ability, work ethic, and, most important, character. On top of that, they are really nice people. We are delighted to be in partnership with them.

Corporate Performance

During 1983 our book value increased from \$737.43 per share to \$975.83 per share, or by 32%. We never take the one-year figure very seriously. After all, why should the time required for a planet to circle the sun synchronize precisely with the time required for business actions to pay off? Instead, we recommend not less than a five-year test as a rough yardstick of economic performance. Red lights should start flashing if the five-year average annual gain falls much below the return on equity earned over the period by American industry in aggregate. (Watch out for our explanation if that occurs as Goethe observed, "When ideas fail, words come in very handy.")

During the 19-year tenure of present management, book value has grown from \$19.46 per share to \$975.83, or 22.6% compounded annually. Considering our present size, nothing close to this rate of return can be sustained. Those who believe otherwise should pursue a career in sales, but avoid one in mathematics.

We report our progress in terms of book value because in our case (though not, by any means, in all cases) it is a conservative but reasonably adequate proxy for growth in intrinsic business value - *the measurement that really counts*. Book value's virtue as a score-keeping measure is that it is easy to calculate and doesn't involve the subjective (but important) judgments employed in calculation of intrinsic business value. It is important to understand, however, that the two terms - book value and intrinsic business value - have very different meanings.

Book value is an accounting concept, recording the accumulated financial input from both contributed capital and retained earnings. Intrinsic business value is an economic concept, estimating future cash output discounted to present value. Book value tells you what has been put in; intrinsic business value estimates what can be taken out.

An analogy will suggest the difference. Assume you spend identical amounts putting each of two children through college. The book value (measured by financial input) of each child's

education would be the same. But the present value of the future payoff (the intrinsic business value) might vary enormously - from zero to many times the cost of the education. So, also, do businesses having equal financial input end up with wide variations in value.

At Berkshire, at the beginning of fiscal 1965 when the present management took over, the \$19.46 per share book value considerably overstated intrinsic business value. All of that book value consisted of textile assets that could not earn, on average, anything close to an appropriate rate of return. In the terms of our analogy, the investment in textile assets resembled investment in a largely-wasted education.

Now, however, our intrinsic business value considerably exceeds book value. There are two major reasons:

(1) Standard accounting principles require that common stocks held by our insurance subsidiaries be stated on our books at market value, but that other stocks we own be carried at the lower of aggregate cost or market. At the end of 1983, the market value of this latter group exceeded carrying value by \$70 million pre-tax, or about \$50 million after tax. This excess belongs in our intrinsic business value, but is not included in the calculation of book value;

(2) More important, we own several businesses that possess economic Goodwill (which is properly includable in intrinsic business value) far larger than the accounting Goodwill that is carried on our balance sheet and reflected in book value.

Goodwill, both economic and accounting, is an arcane subject and requires more explanation than is appropriate here. The appendix that follows this letter - "Goodwill and its Amortization: The Rules and The Realities" - explains why economic and accounting Goodwill can, and usually do, differ enormously.

You can live a full and rewarding life without ever thinking about Goodwill and its amortization. But students of investment and management should understand the nuances of the subject. My own thinking has changed drastically from 35 years ago when I was taught to favor tangible assets and to shun businesses whose value depended largely upon economic Goodwill. This bias caused me to make many important business mistakes of omission, although relatively few of commission.

Keynes identified my problem: “The difficulty lies not in the new ideas but in escaping from the old ones.” My escape was long delayed, in part because most of what I had been taught by the same teacher had been (and continues to be) so extraordinarily valuable. Ultimately, business experience, direct and vicarious, produced my present strong preference for businesses that possess large amounts of enduring Goodwill and that utilize a minimum of tangible assets.

I recommend the Appendix to those who are comfortable with accounting terminology and who have an interest in understanding the business aspects of Goodwill. Whether or not you wish to tackle the Appendix, you should be aware that Charlie and I believe that Berkshire possesses very significant economic Goodwill value above that reflected in our book value.

Sources of Reported Earnings

The table below shows the sources of Berkshire’s reported earnings. In 1982, Berkshire owned about 60% of Blue Chip Stamps whereas, in 1983, our ownership was 60% throughout the first six months and 100% thereafter. In turn, Berkshire’s net interest in Wesco was 48% during 1982 and the first six months of 1983, and 80% for the balance of 1983. Because of these changed ownership percentages, the first two columns of the table provide the best measure of underlying business performance.

All of the significant gains and losses attributable to unusual sales of assets by any of the business entities are aggregated with securities transactions on the line near the bottom of the table, and are not included in operating earnings. (We regard any annual figure for realized capital gains or losses as meaningless, but we regard the aggregate realized and unrealized capital gains over a period of years as very important.) Furthermore, amortization of Goodwill is not charged against the specific businesses but, for reasons outlined in the Appendix, is set forth as a separate item.

	<i>Earnings</i>	<i>Before</i>	<i>Income</i>	<i>Taxes</i>	<i>Net Earnings</i>	<i>After Tax</i>
	Total	Total	Berkshire	Share	Berkshire	Share
000's of \$'s	1983	1982	1983	1982	1983	1982

(1) October through December

(2) 1982 and 1983 are not comparable; major assets were transferred in the merger.

For a discussion of the businesses owned by Wesco, please read Charlie Munger's report on pages 46-51. Charlie replaced Louie Vincenti as Chairman of Wesco late in 1983 when health forced Louie's retirement at age 77. In some instances, "health" is a euphemism, but in Louie's case nothing but health would cause us to consider his retirement. Louie is a marvelous man and has been a marvelous manager.

The special GEICO distribution reported in the table arose when that company made a tender offer for a portion of its stock, buying both from us and other shareholders. At GEICO's request, we tendered a quantity of shares that kept our ownership percentage the same after the transaction as before. The proportional nature of our sale permitted us to treat the proceeds as a dividend. Unlike individuals, corporations net considerably more when earnings are derived from dividends rather than from capital gains, since the effective Federal income tax rate on dividends is 6.9% versus 28% on capital gains.

Even with this special item added in, our total dividends from GEICO in 1983 were considerably less than our share of GEICO's earnings. Thus it is perfectly appropriate, from both an accounting and economic standpoint, to include the redemption proceeds in our reported earnings. It is because the item is large and unusual that we call your attention to it.

The table showing you our sources of earnings includes dividends from those non-controlled companies whose marketable equity securities we own. But the table does not include earnings those companies have retained that are applicable to our ownership. In aggregate and over time we expect those undistributed earnings to be reflected in market prices and to increase our intrinsic business value on a dollar-for-dollar basis, just as if those earnings had been under our control and reported as part of our profits. That does not mean we expect all of our holdings to behave uniformly; some will disappoint us, others will deliver pleasant surprises. To date our experience has been better than we originally anticipated, In aggregate, we have received far more than a dollar of market value gain for every dollar of earnings retained.

The following table shows our 1983 yearend net holdings in marketable equities. All numbers represent 100% of Berkshire's holdings, and 80% of Wesco's holdings. The portion attributable to minority shareholders of Wesco has been excluded.

No. of Shares	Company	Cost (000's omitted)	Market (000's omitted)
690,975	Affiliated Publications, Inc.	\$3,516	\$26,603
4,451,544	General Foods Corporation (a)	\$163,786	\$228,698
6,850,000	GEICO Corporation	\$47,138	\$398,156
2,379,200	Handy & Harman	\$27,318	\$42,231
636,310	Interpublic Group of Companies	\$4,056	\$33,088
197,200	Media General	\$3,191	\$11,191
250,400	Ogilvy & Mather Int'l. Inc.	\$2,580	\$12,833
5,618,661	R. J. Reynolds Industries, Inc. (a)	\$268,918	\$314,334
901,788	Time, Inc.	\$27,732	\$56,860
1,868,600	The Washington Post Company Class B	\$10,628	\$136,875
	Total	\$558,863	\$1,287,869
	All Other Common Stockholdings	\$7,485	\$18,044
	Total Common Stocks	\$566,348	\$1,305,913

(a) WESCO owns shares in these companies.

Based upon present holdings and present dividend rates - excluding any special items such as the GEICO proportional redemption last year - we would expect reported dividends from this group to be approximately \$39 million in 1984. We can also make a very rough guess about the earnings this group will retain that will be attributable to our ownership: these may total about \$65 million for the year. These retained earnings could well have no immediate effect on market prices of the securities. Over time, however, we feel they will have real meaning.

In addition to the figures already supplied, information regarding the businesses we control appears in Management's Discussion on pages 40-44. The most significant of these are Buffalo

Evening News, See's, and the Insurance Group, to which we will give some special attention here.

Buffalo Evening News

First, a clarification: our corporate name is Buffalo Evening News, Inc. but the name of the newspaper, since we began a morning edition a little over a year ago, is Buffalo News.

In 1983 the News somewhat exceeded its targeted profit margin of 10% after tax. Two factors were responsible: (1) a state income tax cost that was subnormal because of a large loss carry-forward, now fully utilized, and (2) a large drop in the per-ton cost of newsprint (an unanticipated fluke that will be reversed in 1984).

Although our profit margins in 1983 were about average for newspapers such as the News, the paper's performance, nevertheless, was a significant achievement considering the economic and retailing environment in Buffalo.

Buffalo has a concentration of heavy industry, a segment of the economy that was hit particularly hard by the recent recession and that has lagged the recovery. As Buffalo consumers have suffered, so also have the paper's retailing customers. Their numbers have shrunk over the past few years and many of those surviving have cut their lineage.

Within this environment the News has one exceptional strength: its acceptance by the public, a matter measured by the paper's "penetration ratio" - the percentage of households within the community purchasing the paper each day. Our ratio is superb: for the six months ended September 30, 1983 the News stood number one in weekday penetration among the 100 largest papers in the United States (the ranking is based on "city zone" numbers compiled by the Audit Bureau of Circulations).

In interpreting the standings, it is important to note that many large cities have two papers, and that in such cases the penetration of either paper is necessarily lower than if there were a single paper, as in Buffalo. Nevertheless, the list of the 100 largest papers includes many that have a city to themselves. Among these, the News is at the top nationally, far ahead of many of the country's best-known dailies.

Among Sunday editions of these same large dailies, the News ranks number three in penetration - ten to twenty percentage points ahead of many well-known papers. It was not

always this way in Buffalo. Below we show Sunday circulation in Buffalo in the years prior to 1977 compared with the present period. In that earlier period the Sunday paper was the Courier-Express (the News was not then publishing a Sunday paper). Now, of course, it is the News.

Average Sunday Circulation

Year	Circulation
1970	314,000
1971	306,000
1972	302,000
1973	290,000
1974	278,000
1974	269,000
1975	270,000
1984 (Current)	376,000

We believe a paper's penetration ratio to be the best measure of the strength of its franchise. Papers with unusually high penetration in the geographical area that is of prime interest to major local retailers, and with relatively little circulation elsewhere, are exceptionally efficient buys for those retailers. Low-penetration papers have a far less compelling message to present to advertisers.

In our opinion, three factors largely account for the unusual acceptance of the News in the community. Among these, points 2 and 3 also may explain the popularity of the Sunday News compared to that of the Sunday Courier-Express when it was the sole Sunday paper:

(1) The first point has nothing to do with merits of the News. Both emigration and immigration are relatively low in Buffalo. A stable population is more interested and involved in the activities of its community than is a shifting population - and, as a result, is more interested in the content of the local daily paper. Increase the movement in and out of a city and penetration ratios will fall.

(2) The News has a reputation for editorial quality and integrity that was honed by our longtime editor, the legendary Alfred Kirchofer, and that has been preserved and extended by Murray Light. This reputation was enormously important to our success in establishing a Sunday paper against entrenched competition. And without a Sunday edition, the News would not have survived in the long run.

(3) The News lives up to its name - it delivers a very unusual amount of news. During 1983, our "news hole" (editorial material - not ads) amounted to 50% of the newspaper's content (excluding preprinted inserts). Among papers that dominate their markets and that are of comparable or larger size, we know of only one whose news hole percentage exceeds that of the News. Comprehensive figures are not available, but a sampling indicates an average percentage in the high 30s. In other words, page for page, our mix gives readers over 25% more news than the typical paper. This news-rich mixture is by intent. Some publishers, pushing for higher profit margins, have cut their news holes during the past decade. We have maintained ours and will continue to do so. Properly written and edited, a full serving of news makes our paper more valuable to the reader and contributes to our unusual penetration ratio.

Despite the strength of the News' franchise, gains in ROP lineage (advertising printed within the newspaper pages as contrasted to preprinted inserts) are going to be very difficult to achieve. We had an enormous gain in preprints during 1983: lines rose from 9.3 million to 16.4 million, revenues from \$3.6 million to \$8.1 million. These gains are consistent with national trends, but exaggerated in our case by business we picked up when the Courier-Express closed.

On balance, the shift from ROP to preprints has negative economic implications for us. Profitability on preprints is less and the business is more subject to competition from alternative means of delivery. Furthermore, a reduction in ROP lineage means less absolute space devoted to news (since the news hole percentage remains constant), thereby reducing the utility of the paper to the reader.

Stan Lipsey became Publisher of the Buffalo News at midyear upon the retirement of Henry Urban. Henry never flinched during the dark days of litigation and losses following our introduction of the Sunday paper - an introduction whose wisdom was questioned

by many in the newspaper business, including some within our own building. Henry is admired by the Buffalo business community, he's admired by all who worked for him, and he is admired by Charlie and me. Stan worked with Henry for several years, and has worked for Berkshire Hathaway since 1969. He has been personally involved in all nuts-and-bolts aspects of the newspaper business from editorial to circulation. We couldn't do better.

See's Candy Shops

The financial results at See's continue to be exceptional. The business possesses a valuable and solid consumer franchise and a manager equally valuable and solid.

In recent years See's has encountered two important problems, at least one of which is well on its way toward solution. That problem concerns costs, except those for raw materials. We have enjoyed a break on raw material costs in recent years though so, of course, have our competitors. One of these days we will get a nasty surprise in the opposite direction. In effect, raw material costs are largely beyond our control since we will, as a matter of course, buy the finest ingredients that we can, regardless of changes in their price levels. We regard product quality as sacred.

But other kinds of costs are more controllable, and it is in this area that we have had problems. On a per-pound basis, our costs (not including those for raw materials) have increased in the last few years at a rate significantly greater than the increase in the general price level. It is vital to our competitive position and profit potential that we reverse this trend.

In recent months much better control over costs has been attained and we feel certain that our rate of growth in these costs in 1984 will be below the rate of inflation. This confidence arises out of our long experience with the managerial talents of Chuck Huggins. We put Chuck in charge the day we took over, and his record has been simply extraordinary, as shown by the following table:

52 – 53 Week Year Ended About December 31	Sales Revenues	Operating Profits After Taxes	Number of Pounds of Candy Sold	Number of Stores Open at Year End
1983 (53 Weeks)	\$133,531,000	\$13,699,000	24,651,000	207
1982	123,662,000	11,875,000	24,216,000	202
1981	112,578,000	10,779,000	24,052,000	199
1980	97,715,000	7,547,000	24,065,000	191
1979	87,314,000	6,330,000	23,985,000	188
1978	73,653,000	6,178,000	22,407,000	182
1977	62,886,000	6,154,000	20,921,000	179
1976	56,333,000	5,569,000	20,553,000	173
1975	50,492,000	5,132,000	19,134,000	172
1974	41,248,000	3,021,000	17,883,000	170
1973	35,050,000	1,940,000	17,813,000	169
1972	31,337,000	2,083,000	16,954,000	167

The other problem we face, as the table suggests, is our recent inability to achieve meaningful gains in pounds sold. The industry has the same problem. But for many years we outperformed the industry in this respect and now we are not.

The poundage volume in our retail stores has been virtually unchanged each year for the past four, despite small increases every year in the number of shops (and in distribution expense as well). Of course, dollar volume has increased because we have raised prices significantly. But we regard the most important measure of retail trends to be units sold per store rather than dollar volume. On a same-store basis (counting only shops open throughout both years) with all figures adjusted to a 52-week year, poundage was down .8 of 1% during 1983. This small decline was our best same-store performance since 1979; the cumulative

decline since then has been about 8%. Quantity-order volume, about 25% of our total, has plateaued in recent years following very large poundage gains throughout the 1970s.

We are not sure to what extent this flat volume - both in the retail shop area and the quantity order area - is due to our pricing policies and to what extent it is due to static industry volume, the recession, and the extraordinary share of market we already enjoy in our primary marketing area. Our price increase for 1984 is much more modest than has been the case in the past few years, and we hope that next year we can report better volume figures to you. But we have no basis to forecast these.

Despite the volume problem, See's strengths are many and important. In our primary marketing area, the West, our candy is preferred by an enormous margin to that of any competitor. In fact, we believe most lovers of chocolate prefer it to candy costing two or three times as much. (In candy, as in stocks, price and value can differ; price is what you give, value is what you get.) The quality of customer service in our shops - operated throughout the country by us and not by franchisees is every bit as good as the product. Cheerful, helpful personnel are as much a trademark of See's as is the logo on the box. That's no small achievement in a business that requires us to hire about 2000 seasonal workers. We know of no comparably-sized organization that betters the quality of customer service delivered by Chuck Huggins and his associates.

Because we have raised prices so modestly in 1984, we expect See's profits this year to be about the same as in 1983.

Insurance - Controlled Operations

We both operate insurance companies and have a large economic interest in an insurance business we don't operate, GEICO. The results for all can be summed up easily: in aggregate, the companies we operate and whose underwriting results reflect the consequences of decisions that were my responsibility a few years ago, had absolutely terrible results.

Fortunately, GEICO, whose policies I do not influence, simply shot the lights out. The inference you draw from this summary is the correct one. I made some serious mistakes a few years ago that came home to roost.

The industry had its worst underwriting year in a long time, as indicated by the table below:

Year	Yearly Change in Premium Written (%)	Combined Ratio after Policy- holder Dividends
1972	10.2	96.2
1973	8.0	99.2
1974	6.2	105.4
1975	11.0	107.9
1976	21.9	102.4
1977	19.8	97.2
1978	12.8	97.5
1979	10.3	100.6
1980	6.0	103.1
1981	3.9	106.0
1982 (Rev)	4.4	109.7
1983 (Est)	4.6	110.0

Source: Best's Aggregates and Averages.

Best's data reflect the experience of practically the entire industry, including stock, mutual, and reciprocal companies. The combined ratio represents total insurance costs (losses incurred plus expenses) compared to revenue from premiums; a ratio below 100 indicates an underwriting profit and one above 100 indicates a loss.

For the reasons outlined in last year's report, we expect the poor industry experience of 1983 to be more or less typical for a good many years to come. (As Yogi Berra put it: "It will be deja vu all over again.") That doesn't mean we think the figures won't bounce around a bit; they are certain to. But we believe it highly unlikely that the combined ratio during the balance of the decade will average significantly below the 1981-1983 level. Based on our expectations regarding inflation - *and we are as pessimistic as ever on that front* - industry premium volume must grow about 10% annually merely to stabilize loss ratios at present levels.

Our own combined ratio in 1983 was 121. Since Mike Goldberg recently took over most of the responsibility for the insurance operation, it would be nice for me if our shortcomings could be placed at his doorstep rather than mine. But unfortunately, as we have often pointed out, the insurance business has a long lead-time. Though business policies may be changed and personnel improved, a significant period must pass before the effects are seen. (This characteristic of the business enabled us to make a great deal of money in GEICO; we could picture what was likely to happen well before it actually occurred.) So the roots of the 1983 results are operating and personnel decisions made two or more years back when I had direct managerial responsibility for the insurance group.

Despite our poor results overall, several of our managers did truly outstanding jobs. Roland Miller guided the auto and general liability business of National Indemnity Company and National Fire and Marine Insurance Company to improved results, while those of competitors deteriorated. In addition, Tom Rowley at Continental Divide Insurance - our fledgling Colorado homestate company - seems certain to be a winner. Mike found him a little over a year ago, and he was an important acquisition.

We have become active recently - and hope to become much more active - in reinsurance transactions where the buyer's overriding concern should be the seller's long-term creditworthiness. In such transactions our premier financial strength should make us the number one choice of both claimants and insurers who must rely on the reinsurer's promises for a great many years to come.

A major source of such business is structured settlements - a procedure for settling losses under which claimants receive periodic payments (almost always monthly, for life) rather than a single lump sum settlement. This form of settlement has important tax advantages for the claimant and also prevents his squandering a large lump-sum payment. Frequently, some inflation protection is built into the settlement. Usually the claimant has been seriously injured, and thus the periodic payments must be unquestionably secure for decades to come. We believe we offer unparalleled security. No other insurer we know of - even those with much larger gross assets - has our financial strength.

We also think our financial strength should recommend us to companies wishing to transfer loss reserves. In such transactions, other insurance companies pay us lump sums to assume all (or a specified portion of) future loss payments applicable to large blocks of expired business. Here also, the company transferring such claims needs to be certain of the transferee's financial strength for many years to come. Again, most of our competitors soliciting such business appear to us to have a financial condition that is materially inferior to ours.

Potentially, structured settlements and the assumption of loss reserves could become very significant to us. Because of their potential size and because these operations generate large amounts of investment income compared to premium volume, we will show underwriting results from those businesses on a separate line in our insurance segment data. We also will exclude their effect in reporting our combined ratio to you. We "front end" no profit on structured settlement or loss reserve transactions, and all attributable overhead is expensed currently. Both businesses are run by Don Wurster at National Indemnity Company.

Insurance - GEICO

Geico's performance during 1983 was as good as our own insurance performance was poor. Compared to the industry's combined ratio of 111, GEICO wrote at 96 *after* a large voluntary accrual for policyholder dividends. A few years ago I would not have thought GEICO could so greatly outperform the industry. Its superiority reflects the combination of a truly exceptional business idea and an exceptional management.

Jack Byrne and Bill Snyder have maintained extraordinary discipline in the underwriting area (including, crucially, provision for full and proper loss reserves), and their efforts are now being further rewarded by significant gains in new business. Equally important, Lou Simpson is the class of the field among insurance investment managers. The three of them are some team.

We have approximately a one-third interest in GEICO. That gives us a \$270 million share in the company's premium volume, an amount some 80% larger than our own volume. Thus, the major portion of our total insurance business comes from the best insurance book in the country. This fact does not moderate by an iota the need for us to improve our own operation.

Stock Splits and Stock Activity

We often are asked why Berkshire does not split its stock. The assumption behind this question usually appears to be that a split would be a pro-shareholder action. We disagree. Let me tell you why.

One of our goals is to have Berkshire Hathaway stock sell at a price rationally related to its intrinsic business value. (But note “rationally related”, not “identical”: if well-regarded companies are generally selling in the market at large discounts from value, Berkshire might well be priced similarly.) The key to a rational stock price is rational shareholders, both current and prospective.

If the holders of a company’s stock and/or the prospective buyers attracted to it are prone to make irrational or emotion-based decisions, some pretty silly stock prices are going to appear periodically. Manic-depressive personalities produce manic-depressive valuations. Such aberrations may help us in buying and selling the stocks of other companies. But we think it is in both your interest and ours to minimize their occurrence in the market for Berkshire.

To obtain only high quality shareholders is no cinch. Mrs. Astor could select her 400, but anyone can buy any stock. Entering members of a shareholder “club” cannot be screened for intellectual capacity, emotional stability, moral sensitivity or acceptable dress. Shareholder eugenics, therefore, might appear to be a hopeless undertaking.

In large part, however, we feel that high quality ownership can be attracted and maintained if we consistently communicate our business and ownership philosophy - *along with no other conflicting messages* - and then let self selection follow its course. For example, self selection will draw a far different crowd to a musical event advertised as an opera than one advertised as a rock concert even though anyone can buy a ticket to either.

Through our policies and communications - our “advertisements” - we try to attract investors who will understand our operations, attitudes and expectations. (And, fully as important, we try to dissuade those who won’t.) We want those who think of themselves as business owners and invest in companies with the intention of staying a long time. And, we want those who keep their eyes focused on business results, not market prices.

Investors possessing those characteristics are in a small minority, but we have an exceptional collection of them. I believe well over 90% - probably over 95% - of our shares are held by

those who were shareholders of Berkshire or Blue Chip five years ago. And I would guess that over 95% of our shares are held by investors for whom the holding is at least double the size of their next largest. Among companies with at least several thousand public shareholders and more than \$1 billion of market value, we are almost certainly the leader in the degree to which our shareholders think and act like owners. Upgrading a shareholder group that possesses these characteristics is not easy.

Were we to split the stock or take other actions focusing on stock price rather than business value, we would attract an entering class of buyers inferior to the exiting class of sellers. At \$1300, there are very few investors who can't afford a Berkshire share. Would a potential one-share purchaser be better off if we split 100 for 1 so he could buy 100 shares? Those who think so and who would buy the stock because of the split or in anticipation of one would definitely downgrade the quality of our present shareholder group. (Could we really improve our shareholder group by trading some of our present clear-thinking members for impressionable new ones who, preferring paper to value, feel wealthier with nine \$10 bills than with one \$100 bill?) People who buy for non-value reasons are likely to sell for non-value reasons. Their presence in the picture will accentuate erratic price swings unrelated to underlying business developments.

We will try to avoid policies that attract buyers with a short-term focus on our stock price and try to follow policies that attract informed long-term investors focusing on business values. Just as you purchased your Berkshire shares in a market populated by rational informed investors, you deserve a chance to sell - should you ever want to - in the same kind of market. We will work to keep it in existence.

One of the ironies of the stock market is the emphasis on activity. Brokers, using terms such as "marketability" and "liquidity", sing the praises of companies with high share turnover (those who cannot fill your pocket will confidently fill your ear). But investors should understand that what is good for the croupier is not good for the customer. A hyperactive stock market is the pickpocket of enterprise.

For example, consider a typical company earning, say, 12% on equity. Assume a very high turnover rate in its shares of 100% per year. If a purchase and sale of the stock each extract

commissions of 1% (the rate may be much higher on low-priced stocks) and if the stock trades at book value, the owners of our hypothetical company will pay, in aggregate, 2% of the company's net worth annually for the privilege of transferring ownership. This activity does nothing for the earnings of the business, and means that 1/6 of them are lost to the owners through the "frictional" cost of transfer. (And this calculation does not count option trading, which would increase frictional costs still further.)

All that makes for a rather expensive game of musical chairs. Can you imagine the agonized cry that would arise if a governmental unit were to impose a new 16 2/3% tax on earnings of corporations or investors? By market activity, investors can impose upon themselves the equivalent of such a tax.

Days when the market trades 100 million shares (and that kind of volume, when over-the-counter trading is included, is today abnormally low) are a curse for owners, not a blessing - for they mean that owners are paying twice as much to change chairs as they are on a 50-million-share day. If 100 million-share days persist for a year and the average cost on each purchase and sale is 15 cents a share, the chair-changing tax for investors in aggregate would total about \$7.5 billion - an amount roughly equal to the combined 1982 profits of Exxon, General Motors, Mobil and Texaco, the four largest companies in the Fortune 500.

These companies had a combined net worth of \$75 billion at yearend 1982 and accounted for over 12% of both net worth and net income of the entire Fortune 500 list. Under our assumption investors, in aggregate, every year forfeit all earnings from this staggering sum of capital merely to satisfy their penchant for "financial flip-flopping". In addition, investment management fees of over \$2 billion annually - sums paid for chair-changing advice - require the forfeiture by investors of all earnings of the five largest banking organizations (Citicorp, Bank America, Chase Manhattan, Manufacturers Hanover and J. P. Morgan). These expensive activities may decide who eats the pie, but they don't enlarge it.

(We are aware of the pie-expanding argument that says that such activities improve the rationality of the capital allocation process. We think that this argument is specious and that, on balance, hyperactive equity markets subvert rational capital allocation and act as pie shrinkers. Adam Smith felt that all noncollusive acts in a free market were guided by an

invisible hand that led an economy to maximum progress; our view is that casino-type markets and hair-trigger investment management act as an invisible foot that trips up and slows down a forward-moving economy.)

Contrast the hyperactive stock with Berkshire. The bid-and-ask spread in our stock currently is about 30 points, or a little over 2%. Depending on the size of the transaction, the difference between proceeds received by the seller of Berkshire and cost to the buyer may range downward from 4% (in trading involving only a few shares) to perhaps 1 1/2% (in large trades where negotiation can reduce both the market-maker's spread and the broker's commission). Because most Berkshire shares are traded in fairly large transactions, the spread on all trading probably does not average more than 2%.

Meanwhile, true turnover in Berkshire stock (excluding inter-dealer transactions, gifts and bequests) probably runs 3% per year. Thus our owners, in aggregate, are paying perhaps 6/100 of 1% of Berkshire's market value annually for transfer privileges. By this very rough estimate, that's \$900,000 - not a small cost, but far less than average. Splitting the stock would increase that cost, downgrade the quality of our shareholder population, and encourage a market price less consistently related to intrinsic business value. We see no offsetting advantages.

Miscellaneous

Last year in this section I ran a small ad to encourage acquisition candidates. In our communications businesses we tell our advertisers that repetition is a key to results (which it is), so we will again repeat our acquisition criteria.

We prefer:

- (1) large purchases (at least \$5 million of after-tax earnings),
- (2) demonstrated consistent earning power (future projections are of little interest to us, nor are "turn-around" situations),
- (3) businesses earning good returns on equity while employing little or no debt,
- (4) management in place (we can't supply it),
- (5) simple businesses (if there's lots of technology, we won't understand it),

(6) an offering price (we don't want to waste our time or that of the seller by talking, even preliminarily, about a transaction when price is unknown).

We will not engage in unfriendly transactions. We can promise complete confidentiality and a very fast answer as to possible interest - customarily within five minutes. Cash purchases are preferred, but we will consider the use of stock when it can be done on the basis described in the previous section.

We will not engage in unfriendly takeovers. We can promise complete confidentiality and a very fast answer - customarily within five minutes - as to whether we're interested. We prefer to buy for cash, but will consider issuance of stock when we receive as much in intrinsic business value as we give. We invite potential sellers to check us out by contacting people with whom we have done business in the past. For the right business - and the right people - we can provide a good home.

* * * * *

About 96.4% of all eligible shares participated in our 1983 shareholder-designated contributions program. The total contributions made pursuant to this program - disbursed in the early days of 1984 but fully expensed in 1983 - were \$3,066,501, and 1353 charities were recipients. Although the response measured by the percentage of shares participating was extraordinarily good, the response measured by the percentage of holders participating was not as good. The reason may well be the large number of new shareholders acquired through the merger and their lack of familiarity with the program. We urge new shareholders to read the description of the program on pages 52-53.

If you wish to participate in future programs, we strongly urge that you immediately make sure that your shares are registered in the actual owner's name, not in "street" or nominee name. Shares not so registered on September 28, 1984 will not be eligible for any 1984 program.

* * * * *

The Blue Chip/Berkshire merger went off without a hitch. Less than one-tenth of 1% of the shares of each company voted against the merger, and no requests for appraisal were made. In 1983, we gained some tax efficiency from the merger and we expect to gain more in the future.

One interesting sidelight to the merger: Berkshire now has 1,146,909 shares outstanding compared to 1,137,778 shares at the beginning of fiscal 1965, the year present management assumed responsibility. For every 1% of the company you owned at that time, you now would own .99%. Thus, all of today's assets - the News, See's, Nebraska Furniture Mart, the Insurance Group, \$1.3 billion in marketable stocks, etc. - have been added to the original textile assets with virtually no net dilution to the original owners.

We are delighted to have the former Blue Chip shareholders join us. To aid in your understanding of Berkshire Hathaway, we will be glad to send you the Compendium of Letters from the Annual Reports of 1977-1981, and/or the 1982 Annual report. Direct your request to the Company at 1440 Kiewit Plaza, Omaha, Nebraska 68131.

Warren E. Buffett

Chairman of the Board

Appendix

BERKSHIRE HATHAWAY INC.

Goodwill and its Amortization: The Rules and The Realities

This appendix deals only with economic and accounting Goodwill – not the goodwill of everyday usage. For example, a business may be well liked, even loved, by most of its customers but possess no economic goodwill. (AT&T, before the breakup, was generally well thought of, but possessed not a dime of economic Goodwill.) And, regrettably, a business may be disliked by its customers but possess substantial, and growing, economic Goodwill. So, just for the moment, forget emotions and focus only on economics and accounting.

When a business is purchased, accounting principles require that the purchase price first be assigned to the fair value of the identifiable assets that are acquired. Frequently the sum of the fair values put on the assets (after the deduction of liabilities) is less than the total purchase price of the business. In that case, the difference is assigned to an asset account entitled

"excess of cost over equity in net assets acquired". To avoid constant repetition of this mouthful, we will substitute "Goodwill".

Accounting Goodwill arising from businesses purchased before November 1970 has a special standing. Except under rare circumstances, it can remain an asset on the balance sheet as long as the business bought is retained. That means no amortization charges to gradually extinguish that asset need be made against earnings.

The case is different, however, with purchases made from November 1970 on. When these create Goodwill, it must be amortized over not more than 40 years through charges – of equal amount in every year – to the earnings account. Since 40 years is the maximum period allowed, 40 years is what managements (including us) usually elect. This annual charge to earnings is not allowed as a tax deduction and, thus, has an effect on after-tax income that is roughly double that of most other expenses.

That's how accounting Goodwill works. To see how it differs from economic reality, let's look at an example close at hand. We'll round some figures, and greatly oversimplify, to make the example easier to follow. We'll also mention some implications for investors and managers.

Blue Chip Stamps bought See's early in 1972 for \$25 million, at which time See's had about \$8 million of net tangible assets. (Throughout this discussion, accounts receivable will be classified as tangible assets, a definition proper for business analysis.) This level of tangible assets was adequate to conduct the business without use of debt, except for short periods seasonally. See's was earning about \$2 million after tax at the time, and such earnings seemed conservatively representative of future earning power in constant 1972 dollars.

Thus our first lesson: businesses logically are worth far more than net tangible assets when they can be expected to produce earnings on such assets considerably in excess of market rates of return. The capitalized value of this excess return is economic Goodwill.

In 1972 (and now) relatively few businesses could be expected to consistently earn the 25% after tax on net tangible assets that was earned by See's – doing it, furthermore, with conservative accounting and no financial leverage. It was not the fair market value of the inventories, receivables or fixed assets that produced the premium rates of return. Rather it was a combination of intangible assets, particularly a pervasive favorable reputation with

consumers based upon countless pleasant experiences they have had with both product and personnel.

Such a reputation creates a consumer franchise that allows the value of the product to the purchaser, rather than its production cost, to be the major determinant of selling price. Consumer franchises are a prime source of economic Goodwill. Other sources include governmental franchises not subject to profit regulation, such as television stations, and an enduring position as the low cost producer in an industry.

Let's return to the accounting in the See's example. Blue Chip's purchase of See's at \$17 million over net tangible assets required that a Goodwill account of this amount be established as an asset on Blue Chip's books and that \$425,000 be charged to income annually for 40 years to amortize that asset. By 1983, after 11 years of such charges, the \$17 million had been reduced to about \$12.5 million. Berkshire, meanwhile, owned 60% of Blue Chip and, therefore, also 60% of See's. This ownership meant that Berkshire's balance sheet reflected 60% of See's Goodwill, or about \$7.5 million.

In 1983 Berkshire acquired the rest of Blue Chip in a merger that required purchase accounting as contrasted to the "pooling" treatment allowed for some mergers. Under purchase accounting, the "fair value" of the shares we gave to (or "paid") Blue Chip holders had to be spread over the net assets acquired from Blue Chip. This "fair value" was measured, as it almost always is when public companies use their shares to make acquisitions, by the market value of the shares given up.

The assets "purchased" consisted of 40% of everything owned by Blue Chip (as noted, Berkshire already owned the other 60%). What Berkshire "paid" was more than the net identifiable assets we received by \$51.7 million, and was assigned to two pieces of Goodwill: \$28.4 million to See's and \$23.3 million to Buffalo Evening News.

After the merger, therefore, Berkshire was left with a Goodwill asset for See's that had two components: the \$7.5 million remaining from the 1971 purchase, and \$28.4 million newly created by the 40% "purchased" in 1983. Our amortization charge now will be about \$1.0 million for the next 28 years, and \$.7 million for the following 12 years, 2002 through 2013.

In other words, different purchase dates and prices have given us vastly different asset values and amortization charges for two pieces of the same asset. (We repeat our usual disclaimer: we have no better accounting system to suggest. The problems to be dealt with are mind boggling and require arbitrary rules.)

But what are the economic realities? One reality is that the amortization charges that have been deducted as costs in the earnings statement each year since acquisition of See's were not true economic costs. We know that because See's last year earned \$13 million after taxes on about \$20 million of net tangible assets – a performance indicating the existence of economic Goodwill far larger than the total original cost of our accounting Goodwill. In other words, while accounting Goodwill regularly decreased from the moment of purchase, economic Goodwill increased in irregular but very substantial fashion.

Another reality is that annual amortization charges in the future will not correspond to economic costs. It is possible, of course, that See's economic Goodwill will disappear. But it won't shrink in even decrements or anything remotely resembling them. What is more likely is that the Goodwill will *increase* – in current, if not in constant, dollars – because of inflation.

That probability exists because true economic Goodwill tends to rise in nominal value proportionally with inflation. To illustrate how this works, let's contrast a See's kind of business with a more mundane business. When we purchased See's in 1972, it will be recalled, it was earning about \$2 million on \$8 million of net tangible assets. Let us assume that our hypothetical mundane business then had \$2 million of earnings also, but needed \$18 million in net tangible assets for normal operations. Earning only 11% on required tangible assets, that mundane business would possess little or no economic Goodwill.

A business like that, therefore, might well have sold for the value of its net tangible assets, or for \$18 million. In contrast, we paid \$25 million for See's, even though it had no more in earnings and less than half as much in "honest-to-God" assets. Could less really have been more, as our purchase price implied? The answer is "yes" – *even if both businesses were expected to have flat unit volume* – as long as you anticipated, as we did in 1972, a world of continuous inflation.

To understand why, imagine the effect that a doubling of the price level would subsequently have on the two businesses. Both would need to double their nominal earnings to \$4 million to keep themselves even with inflation. This would seem to be no great trick: just sell the same number of units at double earlier prices and, assuming profit margins remain unchanged, profits also must double.

But, crucially, to bring that about, both businesses probably would have to double their nominal investment in net tangible assets, since that is the kind of economic requirement that inflation usually imposes on businesses, both good and bad. A doubling of dollar sales means correspondingly more dollars must be employed immediately in receivables and inventories. Dollars employed in fixed assets will respond more slowly to inflation, but probably just as surely. And all of this inflation-required investment will produce no improvement in rate of return. The motivation for this investment is the survival of the business, not the prosperity of the owner.

Remember, however, that See's had net tangible assets of only \$8 million. So it would only have had to commit an additional \$8 million to finance the capital needs imposed by inflation. The mundane business, meanwhile, had a burden over twice as large – a need for \$18 million of additional capital.

After the dust had settled, the mundane business, now earning \$4 million annually, might still be worth the value of its tangible assets, or \$36 million. That means its owners would have gained only a dollar of nominal value for every new dollar invested. (This is the same dollar-for-dollar result they would have achieved if they had added money to a savings account.)

See's, however, also earning \$4 million, might be worth \$50 million if valued (as it logically would be) on the same basis as it was at the time of our purchase. So it would have gained \$25 million in nominal value while the owners were putting up only \$8 million in additional capital – over \$3 of nominal value gained for each \$1 invested.

Remember, even so, that the owners of the See's kind of business were forced by inflation to ante up \$8 million in additional capital just to stay even in real profits. Any unleveraged business that requires some net tangible assets to operate (and almost all do) is hurt by inflation. Businesses needing little in the way of tangible assets simply are hurt the least.

And that fact, of course, has been hard for many people to grasp. For years the traditional wisdom – long on tradition, short on wisdom – held that inflation protection was best provided by businesses laden with natural resources, plants and machinery, or other tangible assets ("In Goods We Trust"). It doesn't work that way. Asset-heavy businesses generally earn low rates of return – rates that often barely provide enough capital to fund the inflationary needs of the existing business, with nothing left over for real growth, for distribution to owners, or for acquisition of new businesses.

In contrast, a disproportionate number of the great business fortunes built up during the inflationary years arose from ownership of operations that combined intangibles of lasting value with relatively minor requirements for tangible assets. In such cases earnings have bounded upward in nominal dollars, and these dollars have been largely available for the acquisition of additional businesses. This phenomenon has been particularly evident in the communications business. That But that statement applies, naturally, only to true economic Goodwill. Spurious accounting Goodwill – and there is plenty of it around – is another matter. When an overexcited management purchases a business at a silly price, the same accounting niceties described earlier are observed. Because it can't go anywhere else, the silliness ends up in the Goodwill account. Considering the lack of managerial discipline that created the account, under such circumstances it might better be labeled "No-Will". Whatever the term, the 40-year ritual typically is observed and the adrenalin so capitalized remains on the books as an "asset" just as if the acquisition had been a sensible one.

business has required little in the way of tangible investment – yet its franchises have endured. During inflation, Goodwill is the gift that keeps giving.

* * * * *

If you cling to any belief that accounting treatment of Goodwill is the best measure of economic reality, I suggest one final item to ponder.

Assume a company with \$20 per share of net worth, all tangible assets. Further assume the company has internally developed some magnificent consumer franchise, or that it was fortunate enough to obtain some important television stations by original FCC grant. Therefore, it earns a great deal on tangible assets, say \$5 per share, or 25%.

With such economics, it might sell for \$100 per share or more, and it might well also bring that price in a negotiated sale of the entire business.

Assume an investor buys the stock at \$100 per share, paying in effect \$80 per share for Goodwill (just as would a corporate purchaser buying the whole company). Should the investor impute a \$2 per share amortization charge annually (\$80 divided by 40 years) to calculate "true" earnings per share? And, if so, should the new "true" earnings of \$3 per share cause him to rethink his purchase price?

* * * * *

We believe managers and investors alike should view intangible assets from two perspectives: In analysis of operating results – that is, in evaluating the underlying economics of a business unit – amortization charges should be ignored. What a business can be expected to earn on unleveraged net tangible assets, excluding any charges against earnings for amortization of Goodwill, is the best guide to the economic attractiveness of the operation. It is also the best guide to the current value of the operation's economic Goodwill.

In evaluating the wisdom of business acquisitions, amortization charges should be ignored also. They should be deducted neither from earnings nor from the cost of the business. This means forever viewing purchased Goodwill at its full cost, before any amortization. Furthermore, cost should be defined as including the full intrinsic business value – not just the recorded accounting value – of all consideration given, irrespective of market prices of the securities involved at the time of merger and irrespective of whether pooling treatment was allowed. For example, what we truly paid in the Blue Chip merger for 40% of the Goodwill of See's and the News was considerably more than the \$51.7 million entered on our books. This disparity exists because the market value of the Berkshire shares given up in the merger was less than their intrinsic business value, which is the value that defines the true cost to us.

Operations that appear to be winners based upon perspective (1) may pale when viewed from perspective (2). A good business is not always a good purchase – although it's a good place to look for one.

We will try to acquire businesses that have excellent operating economics measured by (1) and that provide reasonable returns measured by (2). Accounting consequences will be totally ignored.

At yearend 1983, net Goodwill on our accounting books totaled \$62 million, consisting of the \$79 million you see stated on the asset side of our balance sheet, and \$17 million of negative Goodwill that is offset against the carrying value of our interest in Mutual Savings and Loan.

We believe net economic Goodwill far exceeds the \$62 million accounting number.

1984 Letter

BERKSHIRE HATHAWAY INC.

To the Shareholders of Berkshire Hathaway Inc.:

Our gain in net worth during 1984 was \$152.6 million, or \$133 per share. This sounds pretty good but actually it's mediocre. Economic gains must be evaluated by comparison with the capital that produces them. Our twenty-year compounded annual gain in book value has been 22.1% (from \$19.46 in 1964 to \$1108.77 in 1984), but our gain in 1984 was only 13.6%.

As we discussed last year, the gain in per-share intrinsic business value is the economic measurement that really counts. But calculations of intrinsic business value are subjective. In our case, book value serves as a useful, although somewhat understated, proxy. In my judgment, intrinsic business value and book value increased during 1984 at about the same rate.

Using my academic voice, I have told you in the past of the drag that a mushrooming capital base exerts upon rates of return. Unfortunately, my academic voice is now giving way to a reportorial voice. Our historical 22% rate is just that - history. To earn even 15% annually over the next decade (assuming we continue to follow our present dividend policy, about which more will be said later in this letter) we would need profits aggregating about \$3.9 billion. Accomplishing this will require a few big ideas - small ones just won't do. Charlie Munger, my partner in general management, and I do not have any such ideas at present, but our experience has been that they pop up occasionally. (How's that for a strategic plan?)

Sources of Reported Earnings

The table on the following page shows the sources of Berkshire's reported earnings. Berkshire's net ownership interest in many of the constituent businesses changed at midyear 1983 when the Blue Chip merger took place. Because of these changes, the first two columns of the table provide the best measure of underlying business performance.

All of the significant gains and losses attributable to unusual sales of assets by any of the business entities are aggregated with securities transactions on the line near the bottom of the table, and are not included in operating earnings. (We regard any annual figure for realized

capital gains or losses as meaningless, but we regard the aggregate realized and unrealized capital gains over a period of years as very important.)

Furthermore, amortization of Goodwill is not charged against the specific businesses but, for reasons outlined in the Appendix to my letter in the 1983 annual report, is set forth as a separate item.

(1) 1983 figures are those for October through December.

(2) 1984 and 1983 are not comparable; major assets were transferred in the mid-year 1983 merger of Blue Chip Stamps.

Sharp-eyed shareholders will notice that the amount of the special GEICO distribution and its location in the table have been changed from the presentation of last year. Though they reclassify and reduce “accounting” earnings, the changes are entirely of form, not of substance. The story behind the changes, however, is interesting.

As reported last year: (1) in mid-1983 GEICO made a tender offer to buy its own shares; (2) at the same time, we agreed by written contract to sell GEICO an amount of its shares that would be proportionately related to the aggregate number of shares GEICO repurchased via the tender from all other shareholders; (3) at completion of the tender, we delivered 350,000 shares to GEICO, received \$21 million cash, and were left owning exactly the same percentage of GEICO that we owned before the tender; (4) GEICO’s transaction with us amounted to a proportionate redemption, an opinion rendered us, without qualification, by a leading law firm; (5) the Tax Code logically regards such proportionate redemptions as substantially equivalent to dividends and, therefore, the \$21 million we received was taxed at only the 6.9% inter-corporate dividend rate; (6) importantly, that \$21 million was far less than the previously-undistributed earnings that had inured to our ownership in GEICO and, thus, from the standpoint of economic substance, was in our view equivalent to a dividend.

Because it was material and unusual, we highlighted the GEICO distribution last year to you, both in the applicable quarterly report and in this section of the annual report. Additionally, we emphasized the transaction to our auditors, Peat, Marwick, Mitchell & Co. Both the Omaha office of Peat Marwick and the reviewing Chicago partner, without objection, concurred with our dividend presentation.

In 1984, we had a virtually identical transaction with General Foods. The only difference was that General Foods repurchased its stock over a period of time in the open market, whereas GEICO had made a “one-shot” tender offer. In the General Foods case we sold to the company, on each day that it repurchased shares, a quantity of shares that left our ownership percentage precisely unchanged. Again our transaction was pursuant to a written contract executed before repurchases began. And again the money we received was far less than the retained earnings that had inured to our ownership interest since our purchase. Overall we received \$21,843,601 in cash from General Foods, and our ownership remained at exactly 8.75%.

At this point the New York office of Peat Marwick came into the picture. Late in 1984 it indicated that it disagreed with the conclusions of the firm’s Omaha office and Chicago

reviewing partner. The New York view was that the GEICO and General Foods transactions should be treated as sales of stock by Berkshire rather than as the receipt of dividends. Under this accounting approach, a portion of the cost of our investment in the stock of each company would be charged against the redemption payment and any gain would be shown as a capital gain, not as dividend income. This is an accounting approach only, having no bearing on taxes: Peat Marwick agrees that the transactions were dividends for IRS purposes.

We disagree with the New York position from both the viewpoint of economic substance and proper accounting. But, to avoid a qualified auditor's opinion, we have adopted herein Peat Marwick's 1984 view and restated 1983 accordingly. None of this, however, has any effect on intrinsic business value: our ownership interests in GEICO and General Foods, our cash, our taxes, and the market value and tax basis of our holdings all remain the same.

This year we have again entered into a contract with General Foods whereby we will sell them shares concurrently with open market purchases that they make. The arrangement provides that our ownership interest will remain unchanged at all times. By keeping it so, we will insure ourselves dividend treatment for tax purposes. In our view also, the economic substance of this transaction again is the creation of dividend income. However, we will account for the redemptions as sales of stock rather than dividend income unless accounting rules are adopted that speak directly to this point. We will continue to prominently identify any such special transactions in our reports to you.

While we enjoy a low tax charge on these proportionate redemptions, and have participated in several of them, we view such repurchases as at least equally favorable for shareholders who do not sell. When companies with outstanding businesses and comfortable financial positions find their shares selling far below intrinsic value in the marketplace, no alternative action can benefit shareholders as surely as repurchases.

(Our endorsement of repurchases is limited to those dictated by price/value relationships and does not extend to the "greenmail" repurchase - a practice we find odious and repugnant. In these transactions, two parties achieve their personal ends by exploitation of an innocent and unconsulted third party. The players are: (1) the "shareholder" extortionist who, even before the ink on his stock certificate dries, delivers his "your-money-or-your-life" message to managers; (2) the corporate insiders who quickly seek peace at any price - as long as the

price is paid by someone else; and (3) the shareholders whose money is used by (2) to make (1) go away. As the dust settles, the mugging, transient shareholder gives his speech on “free enterprise”, the mugging management gives its speech on “the best interests of the company”, and the innocent shareholder standing by mutely funds the payoff.)

The companies in which we have our largest investments have all engaged in significant stock repurchases at times when wide discrepancies existed between price and value. As shareholders, we find this encouraging and rewarding for two important reasons - one that is obvious, and one that is subtle and not always understood. The obvious point involves basic arithmetic: major repurchases at prices well below per-share intrinsic business value immediately increase, in a highly significant way, that value. When companies purchase their own stock, they often find it easy to get \$2 of present value for \$1. Corporate acquisition programs almost never do as well and, in a discouragingly large number of cases, fail to get anything close to \$1 of value for each \$1 expended.

The other benefit of repurchases is less subject to precise measurement but can be fully as important over time. By making repurchases when a company’s market value is well below its business value, management clearly demonstrates that it is given to actions that enhance the wealth of shareholders, rather than to actions that expand management’s domain but that do nothing for (or even harm) shareholders. Seeing this, shareholders and potential shareholders increase their estimates of future returns from the business. This upward revision, in turn, produces market prices more in line with intrinsic business value. These prices are entirely rational. Investors should pay more for a business that is lodged in the hands of a manager with demonstrated pro-shareholder leanings than for one in the hands of a self-interested manager marching to a different drummer. (To make the point extreme, how much would you pay to be a minority shareholder of a company controlled by Robert Wesco?)

The key word is “demonstrated”. A manager who consistently turns his back on repurchases, when these clearly are in the interests of owners, reveals more than he knows of his motivations. No matter how often or how eloquently he mouths some public relations-inspired phrase such as “maximizing shareholder wealth” (this season’s favorite), the market correctly discounts assets lodged with him. His heart is not listening to his mouth - and, after a while, neither will the market.

We have prospered in a very major way - as have other shareholders - by the large share repurchases of GEICO, Washington Post, and General Foods, our three largest holdings. (Exxon, in which we have our fourth largest holding, has also wisely and aggressively repurchased shares but, in this case, we have only recently established our position.) In each of these companies, shareholders have had their interests in outstanding businesses materially enhanced by repurchases made at bargain prices. We feel very comfortable owning interests in businesses such as these that offer excellent economics combined with shareholder-conscious managements.

The following table shows our 1984 yearend net holdings in marketable equities. All numbers exclude the interests attributable to minority shareholders of Wesco and Nebraska Furniture Mart.

Shares	Company	Cost (000's omitted)	Market (000's omitted)
690,975	Affiliated Publications, Inc.	\$3,516	\$32,908
740,400	American Broadcasting Companies, Inc.	44,416	46,738
3,895,710	Exxon Corporation	173,401	175,307
4,047,191	General Foods Corporation (a)	149,870	226,137
6,850,000	GEICO Corporation	45,713	397,300
2,379,200	Handy & Harman	27,318	38,662
818,872	Interpublic Group of Companies	2,570	28,149
555,949	Northwest Industries	26,581	27,242
2,553,488	Time, Inc.	89,327	109,162
1,868,600	The Washington Post Company Class B	10,628	149,955
Total		\$573,340	\$1,231,560
All Other Common Stockholdings		11,634	37,326
Total Common Stocks		\$584,974	\$1,268,886

It's been over ten years since it has been as difficult as now to find equity investments that meet both our qualitative standards and our quantitative standards of value versus price. We try to avoid compromise of these standards, although we find doing nothing the most difficult task of all. (One English statesman attributed his country's greatness in the nineteenth century to a policy of "masterly inactivity". This is a strategy that is far easier for historians to commend than for participants to follow.)

In addition to the figures supplied at the beginning of this section, information regarding the businesses we own appears in Management's Discussion on pages 42-47. An amplified discussion of Wesco's businesses appears in Charlie Munger's report on pages 50-59. You will find particularly interesting his comments about conditions in the thrift industry. Our other major controlled businesses are Nebraska Furniture Mart, See's, Buffalo Evening News, and the Insurance Group, to which we will give some special attention here.

Nebraska Furniture Mart

Last year I introduced you to Mrs. B (Rose Blumkin) and her family. I told you they were terrific, and I understated the case. After another year of observing their remarkable talents and character, I can honestly say that I never have seen a managerial group that either functions or behaves better than the Blumkin family.

Mrs. B, Chairman of the Board, is now 91, and recently was quoted in the local newspaper as saying, "I come home to eat and sleep, and that's about it. I can't wait until it gets daylight so I can get back to the business". Mrs. B is at the store seven days a week, from opening to close, and probably makes more decisions in a day than most CEOs do in a year (better ones, too).

In May Mrs. B was granted an Honorary Doctorate in Commercial Science by New York University. (She's a "fast track" student: not one day in her life was spent in a school room prior to her receipt of the doctorate.) Previous recipients of honorary degrees in business from NYU include Clifton Garvin, Jr., CEO of Exxon Corp.; Walter Wriston, then CEO of Citicorp; Frank Cary, then CEO of IBM; Tom Murphy, then CEO of General Motors; and, most recently, Paul Volcker. (They are in good company.)

The Blumkin blood did not run thin. Louie, Mrs. B's son, and his three boys, Ron, Irv, and Steve, all contribute in full measure to NFM's amazing success. The younger generation has attended the best business school of them all - that conducted by Mrs. B and Louie - and their training is evident in their performance.

Last year NFM's net sales increased by \$14.3 million, bringing the total to \$115 million, all from the one store in Omaha. That is by far the largest volume produced by a single home furnishings store in the United States. In fact, the gain in sales last year was itself greater than the annual volume of many good-sized successful stores. The business achieves this success because it deserves this success. A few figures will tell you why.

In its fiscal 1984 10-K, the largest independent specialty retailer of home furnishings in the country, Levitz Furniture, described its prices as "generally lower than the prices charged by conventional furniture stores in its trading area". Levitz, in that year, operated at a gross margin of 44.4% (that is, on average, customers paid it \$100 for merchandise that had cost it

\$55.60 to buy). The gross margin at NFM is not much more than half of that. NFM's low mark-ups are possible because of its exceptional efficiency: operating expenses (payroll, occupancy, advertising, etc.) are about 16.5% of sales versus 35.6% at Levitz.

None of this is in criticism of Levitz, which has a well-managed operation. But the NFM operation is simply extraordinary (and, remember, it all comes from a \$500 investment by Mrs. B in 1937). By unparalleled efficiency and astute volume purchasing, NFM is able to earn excellent returns on capital while saving its customers at least \$30 million annually from what, on average, it would cost them to buy the same merchandise at stores maintaining typical mark-ups. Such savings enable NFM to constantly widen its geographical reach and thus to enjoy growth well beyond the natural growth of the Omaha market.

I have been asked by a number of people just what secrets the Blumkins bring to their business. These are not very esoteric. All members of the family: (1) apply themselves with an enthusiasm and energy that would make Ben Franklin and Horatio Alger look like dropouts; (2) define with extraordinary realism their area of special competence and act decisively on all matters within it; (3) ignore even the most enticing propositions failing outside of that area of special competence; and, (4) unfailingly behave in a high-grade manner with everyone they deal with. (Mrs. B boils it down to "sell cheap and tell the truth".)

Our evaluation of the integrity of Mrs. B and her family was demonstrated when we purchased 90% of the business: NFM had never had an audit and we did not request one; we did not take an inventory nor verify the receivables; we did not check property titles. We gave Mrs. B a check for \$55 million and she gave us her word. That made for an even exchange.

You and I are fortunate to be in partnership with the Blumkin family.

See's Candy Shops, Inc.

Below is our usual recap of See's performance since the time of purchase by Blue Chip Stamps:

52-53 Week Year Ended About December 31	Sales Revenues	Operating Profits After Taxes	Number of Pounds of Candy Sold	Number of Stores Open at Year End
1984	\$135,946,000	\$13,380,000	24,759,000	214
1983 (53 Weeks)	133,531,000	13,699,000	24,651,000	207
1982	123,662,000	11,875,000	24,216,000	202
1981	112,578,000	10,779,000	24,052,000	199
1980	97,715,000	7,547,000	24,065,000	191
1979	87,314,000	6,330,000	23,985,000	188
1978	73,653,000	6,178,000	22,407,000	182
1977	62,886,000	6,154,000	20,921,000	179
1976 (53 Weeks)	56,333,000	5,569,000	20,553,000	173
1975	50,492,000	5,132,000	19,134,000	172
1974	41,248,000	3,021,000	17,883,000	170
1973	35,050,000	1,940,000	17,813,000	169
1972	31,337,000	2,083,000	16,954,000	167

This performance has not been produced by a generally rising tide. To the contrary, many well-known participants in the boxed-chocolate industry either have lost money in this same period or have been marginally profitable. To our knowledge, only one good-sized competitor has achieved high profitability. The success of See's reflects the combination of an exceptional product and an exceptional manager, Chuck Huggins.

During 1984 we increased prices considerably less than has been our practice in recent years: per-pound realization was \$5.49, up only 1.4% from 1983. Fortunately, we made good progress on cost control, an area that has caused us problems in recent years. Per-pound costs - other than those for raw materials, a segment of expense largely outside of our control - increased by only 2.2% last year.

Our cost-control problem has been exacerbated by the problem of modestly declining volume (measured by pounds, not dollars) on a same-store basis. Total pounds sold through shops in

recent years has been maintained at a roughly constant level only by the net addition of a few shops annually. This more-shops-to-get-the-same-volume situation naturally puts heavy pressure on per-pound selling costs.

In 1984, same-store volume declined 1.1%. Total shop volume, however, grew 0.6% because of an increase in stores. (Both percentages are adjusted to compensate for a 53-week fiscal year in 1983.)

See's business tends to get a bit more seasonal each year. In the four weeks prior to Christmas, we do 40% of the year's volume and earn about 75% of the year's profits. We also earn significant sums in the Easter and Valentine's Day periods, but pretty much tread water the rest of the year. In recent years, shop volume at Christmas has grown in relative importance, and so have quantity orders and mail orders. The increased concentration of business in the Christmas period produces a multitude of managerial problems, all of which have been handled by Chuck and his associates with exceptional skill and grace.

Their solutions have in no way involved compromises in either quality of service or quality of product. Most of our larger competitors could not say the same. Though faced with somewhat less extreme peaks and valleys in demand than we, they add preservatives or freeze the finished product in order to smooth the production cycle and thereby lower unit costs. We reject such techniques, opting, in effect, for production headaches rather than product modification.

Our mall stores face a host of new food and snack vendors that provide particularly strong competition at non-holiday periods. We need new products to fight back and during 1984 we introduced six candy bars that, overall, met with a good reception. Further product introductions are planned.

In 1985 we will intensify our efforts to keep per-pound cost increases below the rate of inflation. Continued success in these efforts, however, will require gains in same-store poundage. Prices in 1985 should average 6% - 7% above those of 1984. Assuming no change in same-store volume, profits should show a moderate gain.

Buffalo Evening News

Profits at the News in 1984 were considerably greater than we expected. As at See's, excellent progress was made in controlling costs. Excluding hours worked in the newsroom, total hours worked decreased by about 2.8%. With this productivity improvement, overall costs

increased only 4.9%. This performance by Stan Lipsey and his management team was one of the best in the industry.

However, we now face an acceleration in costs. In mid-1984 we entered into new multi-year union contracts that provided for a large “catch-up” wage increase. This catch-up is entirely appropriate: the cooperative spirit of our unions during the unprofitable 1977-1982 period was an important factor in our success in remaining cost competitive with The Courier-Express. Had we not kept costs down, the outcome of that struggle might well have been different.

Because our new union contracts took effect at varying dates, little of the catch-up increase was reflected in our 1984 costs. But the increase will be almost totally effective in 1985 and, therefore, our unit labor costs will rise this year at a rate considerably greater than that of the industry. We expect to mitigate this increase by continued small gains in productivity, but we cannot avoid significantly higher wage costs this year. Newsprint price trends also are less favorable now than they were in 1984. Primarily because of these two factors, we expect at least a minor contraction in margins at the News.

Working in our favor at the News are two factors of major economic importance:

(1) Our circulation is concentrated to an unusual degree in the area of maximum utility to our advertisers. “Regional” newspapers with wide-ranging circulation, on the other hand, have a significant portion of their circulation in areas that are of negligible utility to most advertisers. A subscriber several hundred miles away is not much of a prospect for the puppy you are offering to sell via a classified ad - nor for the grocer with stores only in the metropolitan area.

“Wasted” circulation - as the advertisers call it - hurts profitability: expenses of a newspaper are determined largely by gross circulation while advertising revenues (usually 70% - 80% of total revenues) are responsive only to useful circulation;

(2) Our penetration of the Buffalo retail market is exceptional; advertisers can reach almost all of their potential customers using only the News.

Last year I told you about this unusual reader acceptance: among the 100 largest newspapers in the country, we were then number one, daily, and number three, Sunday, in penetration. The most recent figures show us number one in penetration on weekdays and number two on Sunday. (Even so, the number of households in Buffalo has declined, so our current weekday circulation is down slightly; on Sundays it is unchanged.)

I told you also that one of the major reasons for this unusual acceptance by readers was the unusual quantity of news that we delivered to them: a greater percentage of our paper is devoted to news than is the case at any other dominant paper in our size range. In 1984 our “news hole” ratio was 50.9%, (versus 50.4% in 1983), a level far above the typical 35% - 40%. We will continue to maintain this ratio in the 50% area. Also, though we last year reduced total hours worked in other departments, we maintained the level of employment in the newsroom and, again, will continue to do so. Newsroom costs advanced 9.1% in 1984, a rise far exceeding our overall cost increase of 4.9%.

Our news hole policy costs us significant extra money for newsprint. As a result, our news costs (newsprint for the news hole plus payroll and expenses of the newsroom) as a percentage of revenue run higher than those of most dominant papers of our size. There is adequate room, however, for our paper or any other dominant paper to sustain these costs: the difference between “high” and “low” news costs at papers of comparable size runs perhaps three percentage points while pre-tax profit margins are often ten times that amount.

The economics of a dominant newspaper are excellent, among the very best in the business world. Owners, naturally, would like to believe that their wonderful profitability is achieved only because they unfailingly turn out a wonderful product. That comfortable theory wilts before an uncomfortable fact. While first-class newspapers make excellent profits, the profits of third-rate papers are as good or better - as long as either class of paper is dominant within its community. Of course, product quality may have been crucial to the paper in achieving dominance. We believe this was the case at the News, in very large part because of people such as Alfred Kirchhofer who preceded us.

Once dominant, the newspaper itself, not the marketplace, determines just how good or how bad the paper will be. Good or bad, it will prosper. That is not true of most businesses: inferior quality generally produces inferior economics. But even a poor newspaper is a bargain to most citizens simply because of its “bulletin board” value. Other things being equal, a poor product will not achieve quite the level of readership achieved by a first-class product. A poor product, however, will still remain essential to most citizens, and what commands their attention will command the attention of advertisers.

Since high standards are not imposed by the marketplace, management must impose its own. Our commitment to an above-average expenditure for news represents an important quantitative

standard. We have confidence that Stan Lipsey and Murray Light will continue to apply the far-more important qualitative standards. Charlie and I believe that newspapers are very special institutions in society. We are proud of the News, and intend an even greater pride to be justified in the years ahead.

Insurance Operations

Shown below is an updated version of our usual table listing two key figures for the insurance industry:

Year	Yearly Change in Premiums Written (%)	Combined Ratio after Policy- holder Dividends
1972	10.2	96.2
1973	8.0	99.2
1974	6.2	105.4
1975	11.0	107.9
1976	21.9	102.4
1976	19.8	97.2
1978	12.8	97.5
1979	10.3	100.6
1980	6.0	103.1
1981	3.9	106.0
1982	4.4	109.7
1983 (Revised)	4.5	111.9
1984 (Est.)	8.1	117.7

Best's data reflect the experience of practically the entire industry, including stock, mutual, and reciprocal companies. The combined ratio represents total insurance costs (losses incurred plus expenses) compared to revenue from premiums; a ratio below 100 indicates an underwriting profit, and one above 100 indicates a loss.

For a number of years, we have told you that an annual increase by the industry of about 10% per year in premiums written is necessary for the combined ratio to remain roughly unchanged. We assumed in making that assertion that expenses as a percentage of premium volume would stay relatively stable and that losses would grow at about 10% annually because of the combined influence of unit volume increases, inflation, and judicial rulings that expand what is covered by the insurance policy.

Our opinion is proving dismayingly accurate: a premium increase of 10% per year since 1979 would have produced an aggregate increase through 1984 of 61% and a combined ratio in 1984 almost identical to the 100.6 of 1979. Instead, the industry had only a 30% increase in premiums and a 1984 combined ratio of 117.7. Today, we continue to believe that the key index to the trend of underwriting profitability is the year-to-year percentage change in industry premium volume.

It now appears that premium volume in 1985 will grow well over 10%. Therefore, assuming that catastrophes are at a "normal" level, we would expect the combined ratio to begin easing downward toward the end of the year. However, under our industrywide loss assumptions (i.e., increases of 10% annually), five years of 15%-per-year increases in premiums would be required to get the combined ratio back to 100. This would mean a doubling of industry volume by 1989, an outcome that seems highly unlikely to us. Instead, we expect several years of premium gains somewhat above the 10% level, followed by highly-competitive pricing that generally will produce combined ratios in the 108-113 range.

Our own combined ratio in 1984 was a humbling 134. (Here, as throughout this report, we exclude structured settlements and the assumption of loss reserves in reporting this ratio. Much additional detail, including the effect of discontinued operations on the ratio, appears on pages 42-43). This is the third year in a row that our underwriting performance has been far poorer than that of the industry. We expect an improvement in the combined ratio in 1985, and also expect our improvement to be substantially greater than that of the industry. Mike Goldberg has corrected many of the mistakes I made before he took over insurance operations. Moreover, our business is concentrated in lines that have experienced poorer-than-average results during the past several years, and that circumstance has begun to subdue many of our competitors and even eliminate some. With the competition shaken, we were able during the last half of 1984 to raise prices significantly in certain important lines with little loss of business.

For some years I have told you that there could be a day coming when our premier financial strength would make a real difference in the competitive position of our insurance operation. That day may have arrived. We are almost without question the strongest property/casualty insurance operation in the country, with a capital position far superior to that of well-known companies of much greater size.

Equally important, our corporate policy is to retain that superiority. The buyer of insurance receives only a promise in exchange for his cash. The value of that promise should be appraised against the possibility of adversity, not prosperity. At a minimum, the promise should appear able to withstand a prolonged combination of depressed financial markets and exceptionally unfavorable underwriting results. Our insurance subsidiaries are both willing and able to keep their promises in any such environment - and not too many other companies clearly are.

Our financial strength is a particular asset in the business of structured settlements and loss reserve assumptions that we reported on last year. The claimant in a structured settlement and the insurance company that has reinsured loss reserves need to be completely confident that payments will be forthcoming for decades to come. Very few companies in the property/casualty field can meet this test of unquestioned long-term strength. (In fact, only a handful of companies exists with which we will reinsure our own liabilities.)

We have grown in these new lines of business: funds that we hold to offset assumed liabilities grew from \$16.2 million to \$30.6 million during the year. We expect growth to continue and perhaps to greatly accelerate. To support this projected growth we have added substantially to the capital of Columbia Insurance Company, our reinsurance unit specializing in structured settlements and loss reserve assumptions. While these businesses are very competitive, returns should be satisfactory.

At GEICO the news, as usual, is mostly good. That company achieved excellent unit growth in its primary insurance business during 1984, and the performance of its investment portfolio continued to be extraordinary. Though underwriting results deteriorated late in the year, they still remain far better than those of the industry. Our ownership in GEICO at yearend amounted to 36% and thus our interest in their direct property/casualty volume of \$885 million amounted to \$320 million, or well over double our own premium volume.

I have reported to you in the past few years that the performance of GEICO's stock has considerably exceeded that company's business performance, brilliant as the latter has been. In those years, the carrying value of our GEICO investment on our balance sheet grew at a rate greater than the growth in GEICO's intrinsic business value. I warned you that over performance by the stock relative to the performance of the business obviously could not occur every year, and that in some years the stock must under perform the business. In 1984 that occurred and the carrying value of our interest in GEICO changed hardly at all, while the intrinsic business value of that interest increased substantially. Since 27% of Berkshire's net worth at the beginning of 1984 was represented by GEICO, its static market value had a significant impact upon our rate of gain for the year. We are not at all unhappy with such a result: we would far rather have the business value of GEICO increase by X during the year, while market value decreases, than have the intrinsic value increase by only 1/2 X with market value soaring. In GEICO's case, as in all of our investments, we look to business performance, not market performance. If we are correct in expectations regarding the business, the market eventually will follow along.

You, as shareholders of Berkshire, have benefited in enormous measure from the talents of GEICO's Jack Byrne, Bill Snyder, and Lou Simpson. In its core business - low-cost auto and homeowners insurance - GEICO has a major, sustainable competitive advantage. That is a rare asset in business generally, and it's almost non-existent in the field of financial services. (GEICO, itself, illustrates this point: despite the company's excellent management, superior profitability has eluded GEICO in all endeavors other than its core business.) In a large industry, a competitive advantage such as GEICO's provides the potential for unusual economic rewards, and Jack and Bill continue to exhibit great skill in realizing that potential.

Most of the funds generated by GEICO's core insurance operation are made available to Lou for investment. Lou has the rare combination of temperamental and intellectual characteristics that produce outstanding long-term investment performance. Operating with below-average risk, he has generated returns that have been by far the best in the insurance industry.

I applaud and appreciate the efforts and talents of these three outstanding managers.

Errors in Loss Reserving

Any shareholder in a company with important interests in the property/casualty insurance business should have some understanding of the weaknesses inherent in the reporting of

current earnings in that industry. Phil Graham, when publisher of the Washington Post, described the daily newspaper as “a first rough draft of history”. Unfortunately, the financial statements of a property/casualty insurer provide, at best, only a first rough draft of earnings and financial condition.

The determination of costs is the main problem. Most of an insurer’s costs result from losses on claims, and many of the losses that should be charged against the current year’s revenue are exceptionally difficult to estimate. Sometimes the extent of these losses, or even their existence, is not known for decades.

The loss expense charged in a property/casualty company’s current income statement represents: (1) losses that occurred and were paid during the year; (2) estimates for losses that occurred and were reported to the insurer during the year, but which have yet to be settled; (3) estimates of ultimate dollar costs for losses that occurred during the year but of which the insurer is unaware (termed “IBNR”: incurred but not reported); and (4) the net effect of revisions this year of similar estimates for (2) and (3) made in past years.

Such revisions may be long delayed, but eventually any estimate of losses that causes the income for year X to be misstated must be corrected, whether it is in year X + 1, or X + 10. This, perforce, means that earnings in the year of correction also are misstated. For example, assume a claimant was injured by one of our insureds in 1979 and we thought a settlement was likely to be made for \$10,000. That year we would have charged \$10,000 to our earnings statement for the estimated cost of the loss and, correspondingly, set up a liability reserve on the balance sheet for that amount. If we settled the claim in 1984 for \$100,000, we would charge earnings with a loss cost of \$90,000 in 1984, although that cost was truly an expense of 1979. And if that piece of business was our only activity in 1979, we would have badly misled ourselves as to costs, and you as to earnings.

The necessarily-extensive use of estimates in assembling the figures that appear in such deceptively precise form in the income statement of property/casualty companies means that some error must seep in, no matter how proper the intentions of management. In an attempt to minimize error, most insurers use various statistical techniques to adjust the thousands of individual loss evaluations (called case reserves) that comprise the raw data for estimation of aggregate liabilities. The extra reserves created by these adjustments are variously labeled

“bulk”, “development”, or “supplemental” reserves. The goal of the adjustments should be a loss-reserve total that has a 50-50 chance of being proved either slightly too high or slightly too low when all losses that occurred prior to the date of the financial statement are ultimately paid.

At Berkshire, we have added what we thought were appropriate supplemental reserves but in recent years they have not been adequate. It is important that you understand the magnitude of the errors that have been involved in our reserving. You can thus see for yourselves just how imprecise the process is, and also judge whether we may have some systemic bias that should make you wary of our current and future figures.

The following table shows the results from insurance underwriting as we have reported them to you in recent years, and also gives you calculations a year later on an “if-we-knew-then-what-we-think-we-know-now” basis. I say “what we think we know now” because the adjusted figures still include a great many estimates for losses that occurred in the earlier years.

However, many claims from the earlier years have been settled so that our one-year-later estimate contains less guess work than our earlier estimate:

Year	Underwriting Results as Reported to You	Corrected Figures After One Year’s Experience
1980	\$6,738,000	\$14,887,000
1981	1,478,000	(1,118,000)
1982	(21,462,000)	(25,066,000)
1984	(33,192,000)	(50,974,000)
1984	(45,413,000)	?

Our structured settlement and loss-reserve assumption businesses are not included in this table. Important additional information on loss reserve experience appears on pages 43-45.

To help you understand this table, here is an explanation of the most recent figures: 1984’s reported pre-tax underwriting loss of \$45.4 million consists of \$27.6 million we estimate that

we lost on 1984's business, plus the increased loss of \$17.8 million reflected in the corrected figure for 1983.

As you can see from reviewing the table, my errors in reporting to you have been substantial and recently have always presented a better underwriting picture than was truly the case.

This is a source of particular chagrin to me because: (1) I like for you to be able to count on what I say; (2) our insurance managers and I undoubtedly acted with less urgency than we would have had we understood the full extent of our losses; and (3) we paid income taxes calculated on overstated earnings and thereby gave the government money that we didn't need to. (These overpayments eventually correct themselves, but the delay is long and we don't receive interest on the amounts we overpaid.)

Because our business is weighted toward casualty and reinsurance lines, we have more problems in estimating loss costs than companies that specialize in property insurance. (When a building that you have insured burns down, you get a much faster fix on your costs than you do when an employer you have insured finds out that one of his retirees has contracted a disease attributable to work he did decades earlier.) But I still find our errors embarrassing. In our direct business, we have far underestimated the mushrooming tendency of juries and courts to make the "deep pocket" pay, regardless of the factual situation and the past precedents for establishment of liability. We also have underestimated the contagious effect that publicity regarding giant awards has on juries. In the reinsurance area, where we have had our worst experience in under reserving, our customer insurance companies have made the same mistakes. Since we set reserves based on information they supply us, their mistakes have become our mistakes.

I heard a story recently that is applicable to our insurance accounting problems: a man was traveling abroad when he received a call from his sister informing him that their father had died unexpectedly. It was physically impossible for the brother to get back home for the funeral, but he told his sister to take care of the funeral arrangements and to send the bill to him.

After returning home he received a bill for several thousand dollars, which he promptly paid. The following month another bill came along for \$15, and he paid that too. Another month followed, with a similar bill. When, in the next month, a third bill for \$15 was presented, he called his sister to ask what was going on. "Oh", she said. "I forgot to tell you. We buried Dad in a rented suit."

If you've been in the insurance business in recent years - particularly the reinsurance business - this story hurts. We have tried to include all of our "rented suit" liabilities in our current financial statement, but our record of past error should make us humble, and you suspicious. I will continue to report to you the errors, plus or minus, that surface each year.

Not all reserving errors in the industry have been of the innocent-but-dumb variety. With underwriting results as bad as they have been in recent years - and with managements having as much discretion as they do in the presentation of financial statements - some unattractive aspects of human nature have manifested themselves. Companies that would be out of business if they realistically appraised their loss costs have, in some cases, simply preferred to take an extraordinarily optimistic view about these yet-to-be-paid sums. Others have engaged in various transactions to hide true current loss costs.

Both of these approaches can "work" for a considerable time: external auditors cannot effectively police the financial statements of property/casualty insurers. If liabilities of an insurer, correctly stated, would exceed assets, it falls to the insurer to volunteer this morbid information. In other words, the corpse is supposed to file the death certificate. Under this "honor system" of mortality, the corpse sometimes gives itself the benefit of the doubt.

In most businesses, of course, insolvent companies run out of cash. Insurance is different: you can be broke but flush. Since cash comes in at the inception of an insurance policy and losses are paid much later, insolvent insurers don't run out of cash until long after they have run out of net worth. In fact, these "walking dead" often redouble their efforts to write business, accepting almost any price or risk, simply to keep the cash flowing in. With an attitude like that of an embezzler who has gambled away his purloined funds, these companies hope that somehow they can get lucky on the next batch of business and thereby cover up earlier shortfalls. Even if they don't get lucky, the penalty to managers is usually no greater for a \$100 million shortfall than one of \$10 million; in the meantime, while the losses mount, the managers keep their jobs and perquisites.

The loss-reserving errors of other property/casualty companies are of more than academic interest to Berkshire. Not only does Berkshire suffer from sell-at-any-price competition by the "walking dead", but we also suffer when their insolvency is finally acknowledged. Through various state guarantee funds that levy assessments, Berkshire ends up paying a portion of the

insolvent insurers' asset deficiencies, swollen as they usually are by the delayed detection that results from wrong reporting. There is even some potential for cascading trouble. The insolvency of a few large insurers and the assessments by state guarantee funds that would follow could imperil weak-but-previously-solvent insurers. Such dangers can be mitigated if state regulators become better at prompt identification and termination of insolvent insurers, but progress on that front has been slow.

Washington Public Power Supply System

From October, 1983 through June, 1984 Berkshire's insurance subsidiaries continuously purchased large quantities of bonds of Projects 1, 2, and 3 of Washington Public Power Supply System ("WPPSS"). This is the same entity that, on July 1, 1983, defaulted on \$2.2 billion of bonds issued to finance partial construction of the now-abandoned Projects 4 and 5. While there are material differences in the obligors, promises, and properties underlying the two categories of bonds, the problems of Projects 4 and 5 have cast a major cloud over Projects 1, 2, and 3, and might possibly cause serious problems for the latter issues. In addition, there have been a multitude of problems related directly to Projects 1, 2, and 3 that could weaken or destroy an otherwise strong credit position arising from guarantees by Bonneville Power Administration.

Despite these important negatives, Charlie and I judged the risks *at the time we purchased the bonds and at the prices Berkshire paid* (much lower than present prices) to be considerably more than compensated for by prospects of profit.

As you know, we buy marketable stocks for our insurance companies based upon the criteria we would apply in the purchase of an entire business. This business-valuation approach is not widespread among professional money managers and is scorned by many academics. Nevertheless, it has served its followers well (to which the academics seem to say, "Well, it may be all right in practice, but it will never work in theory.") Simply put, we feel that if we can buy small pieces of businesses with satisfactory underlying economics at a fraction of the per-share value of the entire business, something good is likely to happen to us - particularly if we own a group of such securities.

We extend this business-valuation approach even to bond purchases such as WPPSS. We compare the \$139 million cost of our yearend investment in WPPSS to a similar \$139 million investment in an operating business. In the case of WPPSS, the "business" contractually earns

\$22.7 million after tax (via the interest paid on the bonds), and those earnings are available to us currently in cash. We are unable to buy operating businesses with economics close to these. Only a relatively few businesses earn the 16.3% after tax on unleveraged capital that our PPSS investment does and those businesses, when available for purchase, sell at large premiums to that capital. In the average negotiated business transaction, unleveraged corporate earnings of \$22.7 million after-tax (equivalent to about \$45 million pre-tax) might command a price of \$250 - \$300 million (or sometimes far more). For a business we understand well and strongly like, we will gladly pay that much. But it is double the price we paid to realize the same earnings from WPPSS bonds.

However, in the case of WPPSS, there is what we view to be a very slight risk that the “business” could be worth nothing within a year or two. There also is the risk that interest payments might be interrupted for a considerable period of time. Furthermore, the most that the “business” could be worth is about the \$205 million face value of the bonds that we own, an amount only 48% higher than the price we paid.

This ceiling on upside potential is an important minus. It should be realized, however, that the great majority of operating businesses have a limited upside potential also unless more capital is continuously invested in them. That is so because most businesses are unable to significantly improve their average returns on equity - even under inflationary conditions, though these were once thought to automatically raise returns.

(Let’s push our bond-as-a-business example one notch further: if you elect to “retain” the annual earnings of a 12% bond by using the proceeds from coupons to buy more bonds, earnings of that bond “business” will grow at a rate comparable to that of most operating businesses that similarly reinvest all earnings. In the first instance, a 30-year, zero-coupon, 12% bond purchased today for \$10 million will be worth \$300 million in 2015. In the second, a \$10 million business that regularly earns 12% on equity and retains all earnings to grow, will also end up with \$300 million of capital in 2015. Both the business and the bond will earn over \$32 million in the final year.)

Our approach to bond investment - treating it as an unusual sort of “business” with special advantages and disadvantages - may strike you as a bit quirky. However, we believe that many staggering errors by investors could have been avoided if they had viewed bond investment with a businessman’s perspective. For example, in 1946, 20-year AAA tax-exempt bonds traded at

slightly below a 1% yield. In effect, the buyer of those bonds at that time bought a “business” that earned about 1% on “book value” (and that, moreover, could never earn a dime more than 1% on book), and paid 100 cents on the dollar for that abominable business.

If an investor had been business-minded enough to think in those terms - and that was the precise reality of the bargain struck - he would have laughed at the proposition and walked away. For, at the same time, businesses with excellent future prospects could have been bought at, or close to, book value while earning 10%, 12%, or 15% after tax on book. Probably no business in America changed hands in 1946 at book value that the buyer believed lacked the ability to earn more than 1% on book. But investors with bond-buying habits eagerly made economic commitments throughout the year on just that basis. Similar, although less extreme, conditions prevailed for the next two decades as bond investors happily signed up for twenty or thirty years on terms outrageously inadequate by business standards. (In what I think is by far the best book on investing ever written - “The Intelligent Investor”, by Ben Graham - the last section of the last chapter begins with, “Investment is most intelligent when it is most businesslike.” This section is called “A Final Word”, and it is appropriately titled.)

We will emphasize again that there is unquestionably some risk in the WPPSS commitment. It is also the sort of risk that is difficult to evaluate. Were Charlie and I to deal with 50 similar evaluations over a lifetime, we would expect our judgment to prove reasonably satisfactory. But we do not get the chance to make 50 or even 5 such decisions in a single year. Even though our long-term results may turn out fine, in any given year we run a risk that we will look extraordinarily foolish. (That’s why all of these sentences say “Charlie and I”, or “we”.)

Most managers have very little incentive to make the intelligent-but-with-some-chance-of-looking-like-an-idiot decision. Their personal gain/loss ratio is all too obvious: if an unconventional decision works out well, they get a pat on the back and, if it works out poorly, they get a pink slip. (Failing conventionally is the route to go; as a group, lemmings may have a rotten image, but no individual lemming has ever received bad press.)

Our equation is different. With 47% of Berkshire’s stock, Charlie and I don’t worry about being fired, and we receive our rewards as owners, not managers. Thus we behave with Berkshire’s money as we would with our own. That frequently leads us to unconventional behavior both in investments and general business management.

We remain unconventional in the degree to which we concentrate the investments of our insurance companies, including those in WPPSS bonds. This concentration makes sense only because our insurance business is conducted from a position of exceptional financial strength. For almost all other insurers, a comparable degree of concentration (or anything close to it) would be totally inappropriate. Their capital positions are not strong enough to withstand a big error, no matter how attractive an investment opportunity might appear when analyzed on the basis of probabilities.

With our financial strength we can own large blocks of a few securities that we have thought hard about and bought at attractive prices. (Billy Rose described the problem of over-diversification: "If you have a harem of forty women, you never get to know any of them very well.") Over time our policy of concentration should produce superior results, though these will be tempered by our large size. When this policy produces a really bad year, as it must, at least you will know that our money was committed on the same basis as yours.

We made the major part of our WPPSS investment at different prices and under somewhat different factual circumstances than exist at present. If we decide to change our position, we will not inform shareholders until long after the change has been completed. (We may be buying or selling as you read this.) The buying and selling of securities is a competitive business, and even a modest amount of added competition on either side can cost us a great deal of money. Our WPPSS purchases illustrate this principle. From October, 1983 through June, 1984, we attempted to buy almost all the bonds that we could of Projects 1, 2, and 3. Yet we purchased less than 3% of the bonds outstanding. Had we faced even a few additional well-heeled investors, stimulated to buy because they knew we were, we could have ended up with a materially smaller amount of bonds, purchased at a materially higher price. (A couple of coat-tail riders easily could have cost us \$5 million.) For this reason, we will not comment about our activities in securities - neither to the press, nor shareholders, nor to anyone else - unless legally required to do so.

One final observation regarding our WPPSS purchases: we dislike the purchase of most long-term bonds under most circumstances and have bought very few in recent years. That's because bonds are as sound as a dollar - and we view the long-term outlook for dollars as dismal. We believe substantial inflation lies ahead, although we have no idea what the average

rate will turn out to be. Furthermore, we think there is a small, but not insignificant, chance of runaway inflation.

Such a possibility may seem absurd, considering the rate to which inflation has dropped. But we believe that present fiscal policy - featuring a huge deficit - is both extremely dangerous and difficult to reverse. (So far, most politicians in both parties have followed Charlie Brown's advice: "No problem is so big that it can't be run away from.") Without a reversal, high rates of inflation may be delayed (perhaps for a long time), but will not be avoided. If high rates materialize, they bring with them the potential for a runaway upward spiral.

While there is not much to choose between bonds and stocks (as a class) when annual inflation is in the 5%-10% range, runaway inflation is a different story. In that circumstance, a diversified stock portfolio would almost surely suffer an enormous loss in real value. But bonds already outstanding would suffer far more. Thus, we think an all-bond portfolio carries a small but unacceptable "wipe out" risk, and we require any purchase of long-term bonds to clear a special hurdle. Only when bond purchases appear decidedly superior to other business opportunities will we engage in them. Those occasions are likely to be few and far between.

Dividend Policy

Dividend policy is often reported to shareholders, but seldom explained. A company will say something like, "Our goal is to pay out 40% to 50% of earnings and to increase dividends at a rate at least equal to the rise in the CPI". And that's it - no analysis will be supplied as to why that particular policy is best for the owners of the business. Yet, allocation of capital is crucial to business and investment management. Because it is, we believe managers and owners should think hard about the circumstances under which earnings should be retained and under which they should be distributed.

The first point to understand is that all earnings are not created equal. In many businesses particularly those that have high asset/profit ratios - inflation causes some or all of the reported earnings to become ersatz. The ersatz portion - let's call these earnings "restricted" - cannot, if the business is to retain its economic position, be distributed as dividends. Were these earnings to be paid out, the business would lose ground in one or more of the following areas: its ability to maintain its unit volume of sales, its long-term competitive position, its financial strength. No matter how conservative its payout ratio, a company that consistently distributes restricted earnings is destined for oblivion unless equity capital is otherwise infused.

Restricted earnings are seldom valueless to owners, but they often must be discounted heavily. In effect, they are conscripted by the business, no matter how poor its economic potential. (This retention-no-matter-how-unattractive-the-return situation was communicated unwittingly in a marvelously ironic way by Consolidated Edison a decade ago. At the time, a punitive regulatory policy was a major factor causing the company's stock to sell as low as one-fourth of book value; i.e., every time a dollar of earnings was retained for reinvestment in the business, that dollar was transformed into only 25 cents of market value. But, despite this gold-into-lead process, most earnings were reinvested in the business rather than paid to owners. Meanwhile, at construction and maintenance sites throughout New York, signs proudly proclaimed the corporate slogan, "Dig We Must".)

Restricted earnings need not concern us further in this dividend discussion. Let's turn to the much-more-valued unrestricted variety. These earnings may, with equal feasibility, be retained or distributed. In our opinion, management should choose whichever course makes greater sense for the owners of the business.

This principle is not universally accepted. For a number of reasons managers like to withhold unrestricted, readily distributable earnings from shareholders - to expand the corporate empire over which the managers rule, to operate from a position of exceptional financial comfort, etc. But we believe there is only one valid reason for retention. Unrestricted earnings should be retained only when there is a reasonable prospect - backed preferably by historical evidence or, when appropriate, by a thoughtful analysis of the future - that *for every dollar retained by the corporation, at least one dollar of market value will be created for owners*. This will happen only if the capital retained produces incremental earnings equal to, or above, those generally available to investors.

To illustrate, let's assume that an investor owns a risk-free 10% perpetual bond with one very unusual feature. Each year the investor can elect either to take his 10% coupon in cash, or to reinvest the coupon in more 10% bonds with identical terms; i.e., a perpetual life and coupons offering the same cash-or-reinvest option. If, in any given year, the prevailing interest rate on long-term, risk-free bonds is 5%, it would be foolish for the investor to take his coupon in cash since the 10% bonds he could instead choose would be worth considerably more than 100 cents on the dollar. Under these circumstances, the investor wanting to get his hands on cash should take his coupon in additional bonds and then immediately sell them. By doing that,

he would realize more cash than if he had taken his coupon directly in cash. Assuming all bonds were held by rational investors, no one would opt for cash in an era of 5% interest rates, not even those bondholders needing cash for living purposes.

If, however, interest rates were 15%, no rational investor would want his money invested for him at 10%. Instead, the investor would choose to take his coupon in cash, even if his personal cash needs were nil. The opposite course - reinvestment of the coupon - would give an investor additional bonds with market value far less than the cash he could have elected. If he should want 10% bonds, he can simply take the cash received and buy them in the market, where they will be available at a large discount.

An analysis similar to that made by our hypothetical bondholder is appropriate for owners in thinking about whether a company's unrestricted earnings should be retained or paid out. Of course, the analysis is much more difficult and subject to error because the rate earned on reinvested earnings is not a contractual figure, as in our bond case, but rather a fluctuating figure. Owners must guess as to what the rate will average over the intermediate future. However, once an informed guess is made, the rest of the analysis is simple: you should wish your earnings to be reinvested if they can be expected to earn high returns, and you should wish them paid to you if low returns are the likely outcome of reinvestment.

Many corporate managers reason very much along these lines in determining whether subsidiaries should distribute earnings to their parent company. At that level, the managers have no trouble thinking like intelligent owners. But payout decisions at the parent company level often are a different story. Here managers frequently have trouble putting themselves in the shoes of their shareholder-owners.

With this schizoid approach, the CEO of a multi-divisional company will instruct Subsidiary A, whose earnings on incremental capital may be expected to average 5%, to distribute all available earnings in order that they may be invested in Subsidiary B, whose earnings on incremental capital are expected to be 15%. The CEO's business school oath will allow no lesser behavior. But if his own long-term record with incremental capital is 5% - and market rates are 10% - he is likely to impose a dividend policy on shareholders of the parent company that merely follows some historical or industry-wide payout pattern. Furthermore, he will expect managers of subsidiaries to give him a full account as to why it makes sense for earnings to be

retained in their operations rather than distributed to the parent-owner. But seldom will he supply his owners with a similar analysis pertaining to the whole company.

In judging whether managers should retain earnings, shareholders should not simply compare total incremental earnings in recent years to total incremental capital because that relationship may be distorted by what is going on in a core business. During an inflationary period, companies with a core business characterized by extraordinary economics can use small amounts of incremental capital in that business at very high rates of return (as was discussed in last year's section on Goodwill). But, unless they are experiencing tremendous unit growth, outstanding businesses by definition generate large amounts of excess cash. If a company sinks most of this money in other businesses that earn low returns, the company's overall return on retained capital may nevertheless appear excellent because of the extraordinary returns being earned by the portion of earnings incrementally invested in the core business. The situation is analogous to a Pro-Am golf event: even if all of the amateurs are hopeless duffers, the team's best-ball score will be respectable because of the dominating skills of the professional.

Many corporations that consistently show good returns both on equity and on overall incremental capital have, indeed, employed a large portion of their retained earnings on an economically unattractive, even disastrous, basis. Their marvelous core businesses, however, whose earnings grow year after year, camouflage repeated failures in capital allocation elsewhere (usually involving high-priced acquisitions of businesses that have inherently mediocre economics). The managers at fault periodically report on the lessons they have learned from the latest disappointment. They then usually seek out future lessons. (Failure seems to go to their heads.)

In such cases, shareholders would be far better off if earnings were retained only to expand the high-return business, with the balance paid in dividends or used to repurchase stock (an action that increases the owners' interest in the exceptional business while sparing them participation in subpar businesses). Managers of high-return businesses who consistently employ much of the cash thrown off by those businesses in other ventures with low returns should be held to account for those allocation decisions, regardless of how profitable the overall enterprise is.

Nothing in this discussion is intended to argue for dividends that bounce around from quarter to quarter with each wiggle in earnings or in investment opportunities. Shareholders of public corporations understandably prefer that dividends be consistent and predictable. Payments, therefore, should reflect long-term expectations for both earnings and returns on incremental capital. Since the long-term corporate outlook changes only infrequently, dividend patterns should change no more often. But over time distributable earnings that have been withheld by managers should earn their keep. If earnings have been unwisely retained, it is likely that managers, too, have been unwisely retained.

Let's now turn to Berkshire Hathaway and examine how these dividend principles apply to it. Historically, Berkshire has earned well over market rates on retained earnings, thereby creating over one dollar of market value for every dollar retained. Under such circumstances, any distribution would have been contrary to the financial interest of shareholders, large or small.

In fact, significant distributions in the early years might have been disastrous, as a review of our starting position will show you. Charlie and I then controlled and managed three companies, Berkshire Hathaway Inc., Diversified Retailing Company, Inc., and Blue Chip Stamps (all now merged into our present operation). Blue Chip paid only a small dividend, Berkshire and DRC paid nothing. If, instead, the companies had paid out their entire earnings, we almost certainly would have no earnings at all now - and perhaps no capital as well. The three companies each originally made their money from a single business: (1) textiles at Berkshire; (2) department stores at Diversified; and (3) trading stamps at Blue Chip. These cornerstone businesses (carefully chosen, it should be noted, by your Chairman and Vice Chairman) have, respectively, (1) survived but earned almost nothing, (2) shriveled in size while incurring large losses, and (3) shrunk in sales volume to about 5% its size at the time of our entry. (Who says "you can't lose 'em all"?) Only by committing available funds to much better businesses were we able to overcome these origins. (It's been like overcoming a misspent youth.) Clearly, diversification has served us well.

We expect to continue to diversify while also supporting the growth of current operations though, as we've pointed out, our returns from these efforts will surely be below our historical

returns. But as long as prospective returns are above the rate required to produce a dollar of market value per dollar retained, we will continue to retain all earnings. Should our estimate of future returns fall below that point, we will distribute all unrestricted earnings that we believe can not be effectively used. In making that judgment, we will look at both our historical record and our prospects. Because our year-to-year results are inherently volatile, we believe a five-year rolling average to be appropriate for judging the historical record.

Our present plan is to use our retained earnings to further build the capital of our insurance companies. Most of our competitors are in weakened financial condition and reluctant to expand substantially. Yet large premium-volume gains for the industry are imminent, amounting probably to well over \$15 billion in 1985 versus less than \$5 billion in 1983. These circumstances could produce major amounts of profitable business for us. Of course, this result is no sure thing, but prospects for it are far better than they have been for many years.

Miscellaneous

This is the spot where each year I run my small “business wanted” ad. In 1984 John Loomis, one of our particularly knowledgeable and alert shareholders, came up with a company that met all of our tests. We immediately pursued this idea, and only a chance complication prevented a deal. Since our ad is pulling, we will repeat it in precisely last year’s form:

We prefer:

- (1) large purchases (at least \$5 million of after-tax earnings),
- (2) demonstrated consistent earning power (future projections are of little interest to us, nor are “turn-around” situations),
- (3) businesses earning good returns on equity while employing little or no debt,
- (4) management in place (we can’t supply it),
- (5) simple businesses (if there’s lots of technology, we won’t understand it),
- (6) an offering price (we don’t want to waste our time or that of the seller by talking, even preliminarily, about a transaction when price is unknown).

We will not engage in unfriendly transactions. We can promise complete confidentiality and a very fast answer as to possible interest - customarily within five minutes. Cash purchases are preferred, but we will consider the use of stock when it can be done on the basis described in the previous section.

We will not engage in unfriendly takeovers. We can promise complete confidentiality and a very fast answer - customarily within five minutes - as to whether we're interested. We prefer to buy for cash, but will consider issuance of stock when we receive as much in intrinsic business value as we give. We invite potential sellers to check us out by contacting people with whom we have done business in the past. For the right business - and the right people - we can provide a good home.

* * *

A record 97.2% of all eligible shares participated in Berkshire's 1984 shareholder-designated contributions program. Total contributions made through this program were \$3,179,000, and 1,519 charities were recipients. Our proxy material for the annual meeting will allow you to cast an advisory vote expressing your views about this program - whether you think we should continue it and, if so, at what per-share level. (You may be interested to learn that we were unable to find a precedent for an advisory vote in which management seeks the opinions of shareholders about owner-related corporate policies. Managers who put their trust in capitalism seem in no hurry to put their trust in capitalists.)

We urge new shareholders to read the description of our shareholder-designated contributions program that appears on pages 60 and 61. If you wish to participate in future programs, we strongly urge that you immediately make sure that your shares are registered in the name of the actual owner, not in "street" name or nominee name. Shares not so registered on September 30, 1985 will be ineligible for the 1985 program.

* * *

Our annual meeting will be on May 21, 1985 in Omaha, and I hope that you attend. Many annual meetings are a waste of time, both for shareholders and for management. Sometimes that is true because management is reluctant to open up on matters of business substance. More often a nonproductive session is the fault of shareholder participants who are more concerned about their own moment on stage than they are about the affairs of the

corporation. What should be a forum for business discussion becomes a forum for theatrics, spleen-venting and advocacy of issues. (The deal is irresistible: for the price of one share you get to tell a captive audience your ideas as to how the world should be run.) Under such circumstances, the quality of the meeting often deteriorates from year to year as the antics of those interested in themselves discourage attendance by those interested in the business.

Berkshire's meetings are a different story. The number of shareholders attending grows a bit each year and we have yet to experience a silly question or an ego-inspired commentary. Instead, we get a wide variety of thoughtful questions about the business. Because the annual meeting is the time and place for these, Charlie and I are happy to answer them all, no matter how long it takes. (We cannot, however, respond to written or phoned questions at other times of the year; one-person-at-a time reporting is a poor use of management time in a company with 3000 shareholders.) The only business matters that are off limits at the annual meeting are those about which candor might cost our company real money. Our activities in securities would be the main example.

We always have bragged a bit on these pages about the quality of our shareholder-partners. Come to the annual meeting and you will see why. Out-of-towners should schedule a stop at Nebraska Furniture Mart. If you make some purchases, you'll save far more than enough to pay for your trip, and you'll enjoy the experience.

Warren E. Buffett

Chairman of the Board

February 25, 1985

Subsequent Event: On March 18, a week after copy for this report went to the typographer but shortly before production, we agreed to purchase three million shares of Capital Cities Communications, Inc. at \$172.50 per share. Our purchase is contingent upon the acquisition of American Broadcasting Companies, Inc. by Capital Cities, and will close when that transaction closes. At the earliest, that will be very late in 1985. Our admiration for the management of Capital Cities, led by Tom Murphy and Dan Burke, has been expressed several times in previous annual reports. Quite simply, they are tops in both ability and integrity. We will have more to say about this investment in next year's report.

1985 Letter

BERKSHIRE HATHAWAY INC.

To the Shareholders of Berkshire Hathaway Inc.:

You may remember the wildly upbeat message of last year's report: nothing much was in the works but our experience had been that something big popped up occasionally. This carefully-crafted corporate strategy paid off in 1985. Later sections of this report discuss (a) our purchase of a major position in Capital Cities/ABC, (b) our acquisition of Scott & Fetzer, (c) our entry into a large, extended term participation in the insurance business of Fireman's Fund, and (d) our sale of our stock in General Foods.

Our gain in net worth during the year was \$613.6 million, or 48.2%. It is fitting that the visit of Halley's Comet coincided with this percentage gain: neither will be seen again in my lifetime. Our gain in per-share book value over the last twenty-one years (that is, since present management took over) has been from \$19.46 to \$1643.71, or 23.2% compounded annually, another percentage that will not be repeated.

Two factors make anything approaching this rate of gain unachievable in the future. One factor probably transitory - is a stock market that offers very little opportunity compared to the markets that prevailed throughout much of the 1964-1984 period. Today we cannot find significantly-undervalued equities to purchase for our insurance company portfolios. The current situation is 180 degrees removed from that existing about a decade ago, when the only question was which bargain to choose.

This change in the market also has negative implications for our present portfolio. In our 1974 annual report I could say: "We consider several of our major holdings to have great potential for significantly increased values in future years." I can't say that now. It's true that our insurance companies currently hold major positions in companies with exceptional underlying economics and outstanding managements, just as they did in 1974. But current market prices generously appraise these attributes, whereas they were ignored in 1974. Today's

valuations mean that our insurance companies have no chance for future portfolio gains on the scale of those achieved in the past.

The second negative factor, far more telling, is our size. Our equity capital is more than twenty times what it was only ten years ago. And an iron law of business is that growth eventually dampens exceptional economics. Just look at the records of high-return companies once they have amassed even \$1 billion of equity capital. None that I know of has managed subsequently, over a ten-year period, to keep on earning 20% or more on equity while reinvesting all or substantially all of its earnings. Instead, to sustain their high returns, such companies have needed to shed a lot of capital by way of either dividends or repurchases of stock. Their shareholders would have been far better off if all earnings could have been reinvested at the fat returns earned by these exceptional businesses. But the companies simply couldn't turn up enough high-return opportunities to make that possible.

Their problem is our problem. Last year I told you that we needed profits of \$3.9 billion over the ten years then coming up to earn 15% annually. The comparable figure for the ten years now ahead is \$5.7 billion, a 48% increase that corresponds - as it must mathematically - to the growth in our capital base during 1985. (Here's a little perspective: leaving aside oil companies, only about 15 U.S. businesses have managed to earn over \$5.7 billion during the past ten years.)

Charlie Munger, my partner in managing Berkshire, and I are reasonably optimistic about Berkshire's ability to earn returns superior to those earned by corporate America generally, and you will benefit from the company's retention of all earnings as long as those returns are forthcoming. We have several things going for us: (1) we don't have to worry about quarterly or annual figures but, instead, can focus on whatever actions will maximize long-term value; (2) we can expand the business into any areas that make sense - our scope is not circumscribed by history, structure, or concept; and (3) we love our work. All of these help. Even so, we will also need a full measure of good fortune to average our hoped-for 15% - far more good fortune than was required for our past 23.2%.

We need to mention one further item in the investment equation that could affect recent purchasers of our stock. Historically, Berkshire shares have sold modestly below intrinsic business value. With the price there, purchasers could be certain (as long as they did not experience a widening of this discount) that their personal investment experience would at least

equal the financial experience of the business. But recently the discount has disappeared, and occasionally a modest premium has prevailed.

The elimination of the discount means that Berkshire's market value increased even faster than business value (which, itself, grew at a pleasing pace). That was good news for any owner holding while that move took place, but it is bad news for the new or prospective owner. If the financial experience of new owners of Berkshire is merely to match the future financial experience of the company, any premium of market value over intrinsic business value that they pay must be maintained.

Management cannot determine market prices, although it can, by its disclosures and policies, encourage rational behavior by market participants. My own preference, as perhaps you'd guess, is for a market price that consistently approximates business value. Given that relationship, all owners prosper precisely as the business prospers during their period of ownership. Wild swings in market prices far above and below business value do not change the final gains for owners in aggregate; in the end, investor gains must equal business gains. But long periods of substantial undervaluation and/or overvaluation will cause the gains of the business to be inequitably distributed among various owners, with the investment result of any given owner largely depending upon how lucky, shrewd, or foolish he happens to be.

Over the long term there has been a more consistent relationship between Berkshire's market value and business value than has existed for any other publicly-traded equity with which I am familiar. This is a tribute to you. Because you have been rational, interested, and investment-oriented, the market price for Berkshire stock has almost always been sensible. This unusual result has been achieved by a shareholder group with unusual demographics: virtually all of our shareholders are individuals, not institutions. No other public company our size can claim the same.

You might think that institutions, with their large staffs of highly-paid and experienced investment professionals, would be a force for stability and reason in financial markets. They are not: stocks heavily owned and constantly monitored by institutions have often been among the most inappropriately valued.

Ben Graham told a story 40 years ago that illustrates why investment professionals behave as they do: An oil prospector, moving to his heavenly reward, was met by St. Peter with bad news. "You're qualified for residence", said St. Peter, "but, as you can see, the compound reserved for

oil men is packed. There's no way to squeeze you in." After thinking a moment, the prospector asked if he might say just four words to the present occupants. That seemed harmless to St. Peter, so the prospector cupped his hands and yelled, "Oil discovered in hell." Immediately the gate to the compound opened and all of the oil men marched out to head for the nether regions. Impressed, St. Peter invited the prospector to move in and make himself comfortable. The prospector paused. "No," he said, "I think I'll go along with the rest of the boys. There might be some truth to that rumor after all."

Sources of Reported Earnings

The table on the next page shows the major sources of Berkshire's reported earnings. These numbers, along with far more detailed sub-segment numbers, are the ones that Charlie and I focus upon. We do not find consolidated figures an aid in either managing or evaluating Berkshire and, in fact, never prepare them for internal use.

Segment information is equally essential for investors wanting to know what is going on in a multi-line business. Corporate managers always have insisted upon such information before making acquisition decisions but, until a few years ago, seldom made it available to investors faced with acquisition and disposition decisions of their own. Instead, when owners wishing to understand the economic realities of their business asked for data, managers usually gave them a we-can't-tell-you-what-is-going-on-because-it-would-hurt-the-company answer. Ultimately the SEC ordered disclosure of segment data and management began supplying real answers. The change in their behavior recalls an insight of Al Capone: "You can get much further with a kind word and a gun than you can with a kind word alone."

In the table, amortization of Goodwill is not charged against the specific businesses but, for reasons outlined in the Appendix to my letter in the 1983 annual report, is aggregated as a separate item. (A compendium of the 1977-1984 letters is available upon request.) In the Business Segment Data and Management's Discussion sections on pages 39-41 and 49-55, much additional information regarding our businesses is provided, including Goodwill and Goodwill Amortization figures for each of the segments. I urge you to read those sections as well as Charlie Munger's letter to Wesco shareholders, which starts on page 56.

Operating Earnings (000s omitted)	Pre-Tax 1985	Earnings 1984	Berkshire 1985	Share 1984

Total Earnings- all entities	\$200,549	\$147,878	\$191,293	\$148,896

Our 1985 results include unusually large earnings from the sale of securities. This fact, in itself, does not mean that we had a particularly good year (though, of course, we did). Security profits in a given year bear similarities to a college graduation ceremony in which the knowledge gained over four years is recognized on a day when nothing further is learned. We may hold a stock for a decade or more, and during that period it may grow quite consistently in both business and market value. In the year in which we finally sell it there may be no increase in value, or there may even be a decrease. But all growth in value since purchase will be reflected in the accounting earnings of the year of sale. (If the stock owned is in our insurance subsidiaries, however, any gain or loss in market value will be reflected in net worth annually.) Thus, reported capital gains or losses in any given year are meaningless as a measure of how well we have done in the current year.

A large portion of the realized gain in 1985 (\$338 million pre-tax out of a total of \$488 million) came about through the sale of our General Foods shares. We held most of these shares since 1980, when we had purchased them at a price far below what we felt was their per/share business value. Year by year, the managerial efforts of Jim Ferguson and Phil Smith substantially increased General Foods' business value and, last fall, Philip Morris made an offer for the company that reflected the increase. We thus benefited from four factors: a bargain purchase price, a business with fine underlying economics, an able management concentrating on the interests of shareholders, and a buyer willing to pay full business value. While that last factor is the only one that produces reported earnings, we consider identification of the first three to be the key to building value for Berkshire shareholders. In selecting common stocks, we devote our attention to attractive purchases, not to the possibility of attractive sales.

We have again reported substantial income from special distributions, this year from Washington Post and General Foods. (The General Foods transactions obviously took place well before the Philip Morris offer.) Distributions of this kind occur when we sell a portion of our shares in a company back to it simultaneously with its purchase of shares from other shareholders. The number of shares we sell is contractually set so as to leave our percentage ownership in the company precisely the same after the sale as before. Such a transaction is quite properly regarded by the IRS as substantially equivalent to a dividend since we, as a shareholder, receive cash while maintaining an unchanged ownership interest. This tax treatment benefits us because corporate taxpayers, unlike individual taxpayers, incur much lower taxes on dividend income than on income from long-term capital gains. (This difference will be widened further if the House-passed tax bill becomes law: under its provisions, capital gains realized by corporations will be taxed at the same rate as ordinary income.) However, accounting rules are unclear as to proper treatment for shareholder reporting. To conform with last year's treatment, we have shown these transactions as capital gains.

Though we have not sought out such transactions, we have agreed to them on several occasions when managements initiated the idea. In each case we have felt that non-selling shareholders (all of whom had an opportunity to sell at the same price we received) benefited because the companies made their repurchases at prices below intrinsic business value. The tax advantages we receive and our wish to cooperate with managements that are increasing values

for all shareholders have sometimes led us to sell - but only to the extent that our proportional share of the business was undiminished.

At this point we usually turn to a discussion of some of our major business units. Before doing so, however, we should first look at a failure at one of our smaller businesses. Our Vice Chairman, Charlie Munger, has always emphasized the study of mistakes rather than successes, both in business and other aspects of life. He does so in the spirit of the man who said: "All I want to know is where I'm going to die so I'll never go there." You'll immediately see why we make a good team: Charlie likes to study errors and I have generated ample material for him, particularly in our textile and insurance businesses.

Shutdown of Textile Business

In July we decided to close our textile operation, and by yearend this unpleasant job was largely completed. The history of this business is instructive.

When Buffett Partnership, Ltd., an investment partnership of which I was general partner, bought control of Berkshire Hathaway 21 years ago, it had an accounting net worth of \$22 million, all devoted to the textile business. The company's intrinsic business value, however, was considerably less because the textile assets were unable to earn returns commensurate with their accounting value. Indeed, during the previous nine years (the period in which Berkshire and Hathaway operated as a merged company) aggregate sales of \$530 million had produced an aggregate loss of \$10 million. Profits had been reported from time to time but the net effect was always one step forward, two steps back.

At the time we made our purchase, southern textile plants - largely non-union - were believed to have an important competitive advantage. Most northern textile operations had closed and many people thought we would liquidate our business as well.

We felt, however, that the business would be run much better by a long-time employee whom we immediately selected to be president, Ken Chace. In this respect we were 100% correct: Ken and his recent successor, Garry Morrison, have been excellent managers, every bit the equal of managers at our more profitable businesses.

In early 1967 cash generated by the textile operation was used to fund our entry into insurance via the purchase of National Indemnity Company. Some of the money came from earnings and some from reduced investment in textile inventories, receivables, and fixed assets.

This pullback proved wise: although much improved by Ken's management, the textile business never became a good earner, not even in cyclical upturns.

Further diversification for Berkshire followed, and gradually the textile operation's depressing effect on our overall return diminished as the business became a progressively smaller portion of the corporation. We remained in the business for reasons that I stated in the 1978 annual report (and summarized at other times also): "(1) our textile businesses are very important employers in their communities, (2) management has been straightforward in reporting on problems and energetic in attacking them, (3) labor has been cooperative and understanding in facing our common problems, and (4) the business should average modest cash returns relative to investment." I further said, "As long as these conditions prevail - and we expect that they will - we intend to continue to support our textile business despite more attractive alternative uses for capital."

It turned out that I was very wrong about (4). Though 1979 was moderately profitable, the business thereafter consumed major amounts of cash. By mid-1985 it became clear, even to me, that this condition was almost sure to continue. Could we have found a buyer who would continue operations, I would have certainly preferred to sell the business rather than liquidate it, even if that meant somewhat lower proceeds for us. But the economics that were finally obvious to me were also obvious to others, and interest was nil.

I won't close down businesses of sub-normal profitability merely to add a fraction of a point to our corporate rate of return. However, I also feel it inappropriate for even an exceptionally profitable company to fund an operation once it appears to have unending losses in prospect. Adam Smith would disagree with my first proposition, and Karl Marx would disagree with my second; the middle ground is the only position that leaves me comfortable.

I should reemphasize that Ken and Garry have been resourceful, energetic and imaginative in attempting to make our textile operation a success. Trying to achieve sustainable profitability, they reworked product lines, machinery configurations and distribution arrangements. We also made a major acquisition, Waumbec Mills, with the expectation of important synergy (a term widely used in business to explain an acquisition that otherwise makes no sense). But in the end nothing worked and I should be faulted for not quitting sooner. A recent *Business Week* article stated that 250 textile mills have closed since 1980. Their owners were not privy to any

information that was unknown to me; they simply processed it more objectively. I ignored Comte's advice - "the intellect should be the servant of the heart, but not its slave" - and believed what I preferred to believe.

The domestic textile industry operates in a commodity business, competing in a world market in which substantial excess capacity exists. Much of the trouble we experienced was attributable, both directly and indirectly, to competition from foreign countries whose workers are paid a small fraction of the U.S. minimum wage. But that in no way means that our labor force deserves any blame for our closing. In fact, in comparison with employees of American industry generally, our workers were poorly paid, as has been the case throughout the textile business. In contract negotiations, union leaders and members were sensitive to our disadvantageous cost position and did not push for unrealistic wage increases or unproductive work practices. To the contrary, they tried just as hard as we did to keep us competitive. Even during our liquidation period they performed superbly. (Ironically, we would have been better off financially if our union had behaved unreasonably some years ago; we then would have recognized the impossible future that we faced, promptly closed down, and avoided significant future losses.)

Over the years, we had the option of making large capital expenditures in the textile operation that would have allowed us to somewhat reduce variable costs. Each proposal to do so looked like an immediate winner. Measured by standard return-on-investment tests, in fact, these proposals usually promised greater economic benefits than would have resulted from comparable expenditures in our highly-profitable candy and newspaper businesses.

But the promised benefits from these textile investments were illusory. Many of our competitors, both domestic and foreign, were stepping up to the same kind of expenditures and, once enough companies did so, their reduced costs became the baseline for reduced prices industrywide. Viewed individually, each company's capital investment decision appeared cost-effective and rational; viewed collectively, the decisions neutralized each other and were irrational (just as happens when each person watching a parade decides he can see a little better if he stands on tiptoes). After each round of investment, all the players had more money in the game and returns remained anemic.

Thus, we faced a miserable choice: huge capital investment would have helped to keep our textile business alive, but would have left us with terrible returns on ever-growing amounts of

capital. After the investment, moreover, the foreign competition would still have retained a major, continuing advantage in labor costs. A refusal to invest, however, would make us increasingly non-competitive, even measured against domestic textile manufacturers. I always thought myself in the position described by Woody Allen in one of his movies: "More than any other time in history, mankind faces a crossroads. One path leads to despair and utter hopelessness, the other to total extinction. Let us pray we have the wisdom to choose correctly."

For an understanding of how the to-invest-or-not-to-invest dilemma plays out in a commodity business, it is instructive to look at Burlington Industries, by far the largest U.S. textile company both 21 years ago and now. In 1964 Burlington had sales of \$1.2 billion against our \$50 million. It had strengths in both distribution and production that we could never hope to match and also, of course, had an earnings record far superior to ours. Its stock sold at 60 at the end of 1964; ours was 13.

Burlington made a decision to stick to the textile business, and in 1985 had sales of about \$2.8 billion. During the 1964-85 period, the company made capital expenditures of about \$3 billion, far more than any other U.S. textile company and more than \$200-per-share on that \$60 stock. A very large part of the expenditures, I am sure, was devoted to cost improvement and expansion. Given Burlington's basic commitment to stay in textiles, I would also surmise that the company's capital decisions were quite rational.

Nevertheless, Burlington has lost sales volume in real dollars and has far lower returns on sales and equity now than 20 years ago. Split 2-for-1 in 1965, the stock now sells at 34 -- on an adjusted basis, just a little over its \$60 price in 1964. Meanwhile, the CPI has more than tripled. Therefore, each share commands about one-third the purchasing power it did at the end of 1964. Regular dividends have been paid but they, too, have shrunk significantly in purchasing power.

This devastating outcome for the shareholders indicates what can happen when much brain power and energy are applied to a faulty premise. The situation is suggestive of Samuel Johnson's horse: "A horse that can count to ten is a remarkable horse - not a remarkable mathematician." Likewise, a textile company that allocates capital brilliantly within its industry is a remarkable textile company - but not a remarkable business.

My conclusion from my own experiences and from much observation of other businesses is that a good managerial record (measured by economic returns) is far more a function of what

business boat you get into than it is of how effectively you row (though intelligence and effort help considerably, of course, in any business, good or bad). Some years ago I wrote: “When a management with a reputation for brilliance tackles a business with a reputation for poor fundamental economics, it is the reputation of the business that remains intact.” Nothing has since changed my point of view on that matter. Should you find yourself in a chronically-leaking boat, energy devoted to changing vessels is likely to be more productive than energy devoted to patching leaks.

* * *

There is an investment postscript in our textile saga. Some investors weight book value heavily in their stock-buying decisions (as I, in my early years, did myself). And some economists and academicians believe replacement values are of considerable importance in calculating an appropriate price level for the stock market as a whole. Those of both persuasions would have received an education at the auction we held in early 1986 to dispose of our textile machinery.

The equipment sold (including some disposed of in the few months prior to the auction) took up about 750,000 square feet of factory space in New Bedford and was eminently usable. It originally cost us about \$13 million, including \$2 million spent in 1980-84, and had a current book value of \$866,000 (after accelerated depreciation). Though no sane management would have made the investment, the equipment could have been replaced new for perhaps \$30-\$50 million.

Gross proceeds from our sale of this equipment came to \$163,122. Allowing for necessary pre- and post-sale costs, our net was less than zero. Relatively modern looms that we bought for \$5,000 apiece in 1981 found no takers at \$50. We finally sold them for scrap at \$26 each, a sum less than removal costs.

Ponder this: the economic goodwill attributable to two paper routes in Buffalo - or a single See’s candy store - considerably exceeds the proceeds we received from this massive collection of tangible assets that not too many years ago, under different competitive conditions, was able to employ over 1,000 people.

Three Very Good Businesses (and a Few Thoughts About Incentive Compensation)

When I was 12, I lived with my grandfather for about four months. A grocer by trade, he was also working on a book and each night he dictated a few pages to me. The title - brace yourself -

was “How to Run a Grocery Store and a Few Things I Have Learned About Fishing”. My grandfather was sure that interest in these two subjects was universal and that the world awaited his views. You may conclude from this section’s title and contents that I was overexposed to Grandpa’s literary style (and personality).

I am merging the discussion of Nebraska Furniture Mart, See’s Candy Shops, and Buffalo Evening News here because the economic strengths, weaknesses, and prospects of these businesses have changed little since I reported to you a year ago. The shortness of this discussion, however, is in no way meant to minimize the importance of these businesses to us: in 1985 they earned an aggregate of \$72 million pre-tax. Fifteen years ago, before we had acquired any of them, their aggregate earnings were about \$8 million pre-tax.

While an increase in earnings from \$8 million to \$72 million sounds terrific - and usually is - you should not automatically assume that to be the case. You must first make sure that earnings were not severely depressed in the base year. If they were instead substantial in relation to capital employed, an even more important point must be examined: how much additional capital was required to produce the additional earnings?

In both respects, our group of three scores well. First, earnings 15 years ago were excellent compared to capital then employed in the businesses. Second, although annual earnings are now \$64 million greater, the businesses require only about \$40 million more in invested capital to operate than was the case then.

The dramatic growth in earning power of these three businesses, accompanied by their need for only minor amounts of capital, illustrates very well the power of economic goodwill during an inflationary period (a phenomenon explained in detail in the 1983 annual report). The financial characteristics of these businesses have allowed us to use a very large portion of the earnings they generate elsewhere. Corporate America, however, has had a different experience: in order to increase earnings significantly, most companies have needed to increase capital significantly also. The average American business has required about \$5 of additional capital to generate an additional \$1 of annual pre-tax earnings. That business, therefore, would have required over \$300 million in additional capital from its owners in order to achieve an earnings performance equal to our group of three.

When returns on capital are ordinary, an earn-more-by-putting-up-more record is no great managerial achievement. You can get the same result personally while operating from your

rocking chair. just quadruple the capital you commit to a savings account and you will quadruple your earnings. You would hardly expect hosannas for that particular accomplishment. Yet, retirement announcements regularly sing the praises of CEOs who have, say, quadrupled earnings of their widget company during their reign - with no one examining whether this gain was attributable simply too many years of retained earnings and the workings of compound interest.

If the widget company consistently earned a superior return on capital throughout the period, or if capital employed only doubled during the CEO's reign, the praise for him may be well deserved. But if return on capital was lackluster and capital employed increased in pace with earnings, applause should be withheld. A savings account in which interest was reinvested would achieve the same year-by-year increase in earnings - and, at only 8% interest, would quadruple its annual earnings in 18 years.

The power of this simple math is often ignored by companies to the detriment of their shareholders. Many corporate compensation plans reward managers handsomely for earnings increases produced solely, or in large part, by retained earnings - i.e., earnings withheld from owners. For example, ten-year, fixed-price stock options are granted routinely, often by companies whose dividends are only a small percentage of earnings.

An example will illustrate the inequities possible under such circumstances. Let's suppose that you had a \$100,000 savings account earning 8% interest and "managed" by a trustee who could decide each year what portion of the interest you were to be paid in cash. Interest not paid out would be "retained earnings" added to the savings account to compound. And let's suppose that your trustee, in his superior wisdom, set the "pay-out ratio" at one-quarter of the annual earnings.

Under these assumptions, your account would be worth \$179,084 at the end of ten years. Additionally, your annual earnings would have increased about 70% from \$8,000 to \$13,515 under this inspired management. And, finally, your "dividends" would have increased commensurately, rising regularly from \$2,000 in the first year to \$3,378 in the tenth year. Each year, when your manager's public relations firm prepared his annual report to you, all of the charts would have had lines marching skyward.

Now, just for fun, let's push our scenario one notch further and give your trustee-manager a ten-year fixed-price option on part of your "business" (i.e., your savings account) based on its

fair value in the first year. With such an option, your manager would reap a substantial profit at your expense - just from having held on to most of your earnings. If he were both Machiavellian and a bit of a mathematician, your manager might also have cut the pay-out ratio once he was firmly entrenched.

This scenario is not as farfetched as you might think. Many stock options in the corporate world have worked in exactly that fashion: they have gained in value simply because management retained earnings, not because it did well with the capital in its hands.

Managers actually apply a double standard to options. Leaving aside warrants (which deliver the issuing corporation immediate and substantial compensation), I believe it is fair to say that nowhere in the business world are ten-year fixed-price options on all or a portion of a business granted to outsiders. Ten months, in fact, would be regarded as extreme. It would be particularly unthinkable for managers to grant a long-term option on a business that was regularly adding to its capital. Any outsider wanting to secure such an option would be required to pay fully for capital added during the option period.

The unwillingness of managers to do-unto-outsiders, however, is not matched by an unwillingness to do-unto-themselves. (Negotiating with one's self seldom produces a barroom brawl.) Managers regularly engineer ten-year, fixed-price options for themselves and associates that, first, totally ignore the fact that retained earnings automatically build value and, second, ignore the carrying cost of capital. As a result, these managers end up profiting much as they would have had they had an option on that savings account that was automatically building up in value.

Of course, stock options often go to talented, value-adding managers and sometimes deliver them rewards that are perfectly appropriate. (Indeed, managers who are really exceptional almost always get far less than they should.) But when the result is equitable, it is accidental. Once granted, the option is blind to individual performance. Because it is irrevocable and unconditional (so long as a manager stays in the company), the sluggard receives rewards from his options precisely as does the star. A managerial Rip Van Winkle, ready to doze for ten years, could not wish for a better "incentive" system.

(I can't resist commenting on one long-term option given an "outsider": that granted the U.S. Government on Chrysler shares as partial consideration for the government's guarantee of some lifesaving loans. When these options worked out well for the government, Chrysler sought to

modify the payoff, arguing that the rewards to the government were both far greater than intended and outsize in relation to its contribution to Chrysler's recovery. The company's anguish over what it saw as an imbalance between payoff and performance made national news. That anguish may well be unique: to my knowledge, no managers - anywhere - have been similarly offended by unwarranted payoffs arising from options granted to themselves or their colleagues.)

Ironically, the rhetoric about options frequently describes them as desirable because they put managers and owners in the same financial boat. In reality, the boats are far different. No owner has ever escaped the burden of capital costs, whereas a holder of a fixed-price option bears no capital costs at all. An owner must weigh upside potential against downside risk; an option holder has no downside. In fact, the business project in which you would wish to have an option frequently is a project in which you would reject ownership. (I'll be happy to accept a lottery ticket as a gift - but I'll never buy one.)

In dividend policy also, the option holders' interests are best served by a policy that may ill serve the owner. Think back to the savings account example. The trustee, holding his option, would benefit from a no-dividend policy. Conversely, the owner of the account should lead to a total payout so that he can prevent the option-holding manager from sharing in the account's retained earnings.

Despite their shortcomings, options can be appropriate under some circumstances. My criticism relates to their indiscriminate use and, in that connection, I would like to emphasize three points:

First, stock options are inevitably tied to the overall performance of a corporation. Logically, therefore, they should be awarded only to those managers with overall responsibility. Managers with limited areas of responsibility should have incentives that pay off in relation to results under their control. The .350 hitter expects, and also deserves, a big payoff for his performance - even if he plays for a cellar-dwelling team. And the .150 hitter should get no reward - even if he plays for a pennant winner. Only those with overall responsibility for the team should have their rewards tied to its results.

Second, options should be structured carefully. Absent special factors, they should have built into them a retained-earnings or carrying-cost factor. Equally important, they should be priced realistically. When managers are faced with offers for their companies, they unfailingly point

out how unrealistic market prices can be as an index of real value. But why, then, should these same depressed prices be the valuations at which managers sell portions of their businesses to themselves? (They may go further: officers and directors sometimes consult the Tax Code to determine the *lowest* prices at which they can, in effect, sell part of the business to insiders. While they're at it, they often elect plans that produce the worst tax result for the company.) Except in highly unusual cases, owners are not well served by the sale of part of their business at a bargain price - whether the sale is to outsiders or to insiders. The obvious conclusion: options should be priced at true business value.

Third, I want to emphasize that some managers whom I admire enormously - and whose operating records are far better than mine - disagree with me regarding fixed-price options. They have built corporate cultures that work, and fixed-price options have been a tool that helped them. By their leadership and example, and by the use of options as incentives, these managers have taught their colleagues to think like owners. Such a Culture is rare and when it exists should perhaps be left intact - despite inefficiencies and inequities that may infest the option program. "If it ain't broke, don't fix it" is preferable to "purity at any price".

At Berkshire, however, we use an incentive@compensation system that rewards key managers for meeting targets in their own bailiwicks. If See's does well, that does not produce incentive compensation at the News - nor vice versa. Neither do we look at the price of Berkshire stock when we write bonus checks. We believe good unit performance should be rewarded whether Berkshire stock rises, falls, or stays even. Similarly, we think average performance should earn no special rewards even if our stock should soar. "Performance", furthermore, is defined in different ways depending upon the underlying economics of the business: in some our managers enjoy tailwinds not of their own making, in others they fight unavoidable headwinds.

The rewards that go with this system can be large. At our various business units, top managers sometimes receive incentive bonuses of five times their base salary, or more, and it would appear possible that one manager's bonus could top \$2 million in 1986. (I hope so.) We do not put a cap on bonuses, and the potential for rewards is not hierarchical. The manager of a relatively small unit can earn far more than the manager of a larger unit if results indicate he should. We believe, further, that such factors as seniority and age should not affect incentive

compensation (though they sometimes influence basic compensation). A 20-year-old who can hit .300 is as valuable to us as a 40-year-old performing as well.

Obviously, all Berkshire managers can use their bonus money (or other funds, including borrowed money) to buy our stock in the market. Many have done just that - and some now have large holdings. By accepting both the risks and the carrying costs that go with outright purchases, these managers truly walk in the shoes of owners.

Now let's get back - at long last - to our three businesses:

At Nebraska Furniture Mart our basic strength is an exceptionally low-cost operation that allows the business to regularly offer customers the best values available in home furnishings. NFM is the largest store of its kind in the country. Although the already-depressed farm economy worsened considerably in 1985, the store easily set a new sales record. I also am happy to report that NFM's Chairman, Rose Blumkin (the legendary "Mrs. B"), continues at age 92 to set a pace at the store that none of us can keep up with. She's there wheeling and dealing seven days a week, and I hope that any of you who visit Omaha will go out to the Mart and see her in action. It will inspire you, as it does me.

At See's we continue to get store volumes that are far beyond those achieved by any competitor we know of. Despite the unmatched consumer acceptance we enjoy, industry trends are not good, and we continue to experience slippage in poundage sales on a same-store basis. This puts pressure on per-pound costs. We now are willing to increase prices only modestly and, unless we can stabilize per-shop poundage, profit margins will narrow.

At the News volume gains are also difficult to achieve. Though lineage increased during 1985, the gain was more than accounted for by preprints. ROP lineage (advertising printed on our own pages) declined. Preprints are far less profitable than ROP ads, and also more vulnerable to competition. In 1985, the News again controlled costs well and our household penetration continues to be exceptional.

One problem these three operations do not have is management. At See's we have Chuck Huggins, the man we put in charge the day we bought the business. Selecting him remains one of our best business decisions. At the News we have Stan Lipsey, a manager of equal caliber. Stan has been with us 17 years, and his unusual business talents have become more evident with every additional level of responsibility he has tackled. And, at the Mart, we have the amazing Blumkins - Mrs. B, Louie, Ron, Irv, and Steve - a three-generation miracle of management.

I consider myself extraordinarily lucky to be able to work with managers such as these. I like them personally as much as I admire them professionally.

Insurance Operations

Shown below is an updated version of our usual table, listing two key figures for the insurance industry:

Year	Yearly Change in Premiums Written (%)	Combined Ratio after Policy- holder Dividends
1972	10.2	96.2
1973	8.0	99.2
1974	6.2	105.4
1975	11.0	107.9
1976	21.9	102.4
1976	19.8	97.2
1978	12.8	97.5
1979	10.3	100.6
1980	6.0	103.1
1981	3.9	106.0
1982	4.4	109.7
1983	4.5	111.9
1984 (Revised)	9.2	118.0
1985 (Est.)	20.9	118.0

The combined ratio represents total insurance costs (losses incurred plus expenses) compared to revenue from premiums: a ratio below 100 indicates an underwriting profit, and one above 100 indicates a loss.

The industry's 1985 results were highly unusual. The revenue gain was exceptional, and had insured losses grown at their normal rate of most recent years - that is, a few points above the

inflation rate - a significant drop in the combined ratio would have occurred. But losses in 1985 didn't cooperate, as they did not in 1984. Though inflation slowed considerably in these years, insured losses perversely accelerated, growing by 16% in 1984 and by an even more startling 17% in 1985. The year's growth in losses therefore exceeds the inflation rate by over 13 percentage points, a modern record.

Catastrophes were not the culprit in this explosion of loss cost. True, there were an unusual number of hurricanes in 1985, but the aggregate damage caused by all catastrophes in 1984 and 1985 was about 2% of premium volume, a not unusual proportion. Nor was there any burst in the number of insured autos, houses, employers, or other kinds of "exposure units".

A partial explanation for the surge in the loss figures is all the additions to reserves that the industry made in 1985. As results for the year were reported, the scene resembled a revival meeting: shouting "I've sinned, I've sinned", insurance managers rushed forward to confess they had under reserved in earlier years. Their corrections significantly affected 1985 loss numbers.

A more disturbing ingredient in the loss surge is the acceleration in "social" or "judicial" inflation. The insurer's ability to pay has assumed overwhelming importance with juries and judges in the assessment of both liability and damages. More and more, "the deep pocket" is being sought and found, no matter what the policy wording, the facts, or the precedents.

This judicial inflation represents a wild card in the industry's future, and makes forecasting difficult. Nevertheless, the short-term outlook is good. Premium growth improved as 1985 went along (quarterly gains were an estimated 15%, 19%, 24%, and 22%) and, barring a supercatastrophe, the industry's combined ratio should fall sharply in 1986.

The profit improvement, however, is likely to be of short duration. Two economic principles will see to that. First, commodity businesses achieve good levels of profitability only when prices are fixed in some manner or when capacity is short. Second, managers quickly add to capacity when prospects start to improve and capital is available.

In my 1982 report to you, I discussed the commodity nature of the insurance industry extensively. The typical policyholder does not differentiate between products but concentrates instead on price. For many decades a cartel-like procedure kept prices up, but this arrangement has disappeared for good. The insurance product now is priced as any other commodity for which a free market exists: when capacity is tight, prices will be set

remuneratively; otherwise, they will not be.

Capacity currently is tight in many lines of insurance - though in this industry, unlike most, capacity is an attitudinal concept, not a physical fact. Insurance managers can write whatever amount of business they feel comfortable writing, subject only to pressures applied by regulators and Best's, the industry's authoritative rating service. The comfort level of both managers and regulators is tied to capital. More capital means more comfort, which in turn means more capacity. In the typical commodity business, furthermore, such as aluminum or steel, a long gestation precedes the birth of additional capacity. In the insurance industry, capital can be secured instantly. Thus, any capacity shortage can be eliminated in short order. That's exactly what's going on right now. In 1985, about 15 insurers raised well over \$3 billion, piling up capital so that they can write all the business possible at the better prices now available. The capital-raising trend has accelerated dramatically so far in 1986.

If capacity additions continue at this rate, it won't be long before serious price-cutting appears and next a fall in profitability. When the fall comes, it will be the fault of the capital-raisers of 1985 and 1986, not the price-cutters of 198X. (Critics should be understanding, however: as was the case in our textile example, the dynamics of capitalism cause each insurer to make decisions that for itself appear sensible, but that collectively slash profitability.)

In past reports, I have told you that Berkshire's strong capital position - the best in the industry - should one day allow us to claim a distinct competitive advantage in the insurance market. With the tightening of the market, that day arrived. Our premium volume more than tripled last year, following a long period of stagnation. Berkshire's financial strength (and our record of maintaining unusual strength through thick and thin) is now a major asset for us in securing good business.

We correctly foresaw a flight to quality by many large buyers of insurance and reinsurance who belatedly recognized that a policy is only an IOU - and who, in 1985, could not collect on many of their IOUs. These buyers today are attracted to Berkshire because of its strong capital position. But, in a development we did not foresee, we also are finding buyers drawn to us because our ability to insure substantial risks sets us apart from the crowd.

To understand this point, you need a few background facts about large risks. Traditionally, many insurers have wanted to write this kind of business. However, their willingness to do so

has been almost always based upon reinsurance arrangements that allow the insurer to keep just a small portion of the risk itself while passing on (“laying off”) most of the risk to its reinsurers. Imagine, for example, a directors and officers (“D & O”) liability policy providing \$25 million of coverage. By various “excess-of-loss” reinsurance contracts, the company issuing that policy might keep the liability for only the first \$1 million of any loss that occurs. The liability for any loss above that amount up to \$24 million would be borne by the reinsurers of the issuing insurer. In trade parlance, a company that issues large policies but retains relatively little of the risk for its own account writes a large gross line but a small net line.

In any reinsurance arrangement, a key question is how the premiums paid for the policy should be divided among the various “layers” of risk. In our D & O policy, for example, what part of the premium received should be kept by the issuing company to compensate it fairly for taking the first \$1 million of risk and how much should be passed on to the reinsurers to compensate them fairly for taking the risk between \$1 million and \$25 million?

One way to solve this problem might be deemed the Patrick Henry approach: “I have but one lamp by which my feet are guided, and that is the lamp of experience.” In other words, how much of the total premium would reinsurers have needed in the past to compensate them fairly for the losses they actually had to bear?

Unfortunately, the lamp of experience has always provided imperfect illumination for reinsurers because so much of their business is “long-tail”, meaning it takes many years before they know what their losses are. Lately, however, the light has not only been dim but also grossly misleading in the images it has revealed. That is, the courts’ tendency to grant awards that are both huge and lacking in precedent makes reinsurers’ usual extrapolations or inferences from past data a formula for disaster. Out with Patrick Henry and in with Pogo: “The future ain’t what it used to be.”

The burgeoning uncertainties of the business, coupled with the entry into reinsurance of many unsophisticated participants, worked in recent years in favor of issuing companies writing a small net line: they were able to keep a far greater percentage of the premiums than the risk. By doing so, the issuing companies sometimes made money on business that was distinctly unprofitable for the issuing and reinsuring companies combined. (This result was not necessarily by intent: issuing companies generally knew no more than reinsurers did about the ultimate costs that would be experienced at higher layers of risk.) Inequities of this sort have been particularly

pronounced in lines of insurance in which much change was occurring and losses were soaring; e.g., professional malpractice, D & O, products liability, etc. Given these circumstances, it is not surprising that issuing companies remained enthusiastic about writing business long after premiums became woefully inadequate on a gross basis.

An example of just how disparate results have been for issuing companies versus their reinsurers is provided by the 1984 financials of one of the leaders in large and unusual risks. In that year the company wrote about \$6 billion of business and kept around \$2 1/2 billion of the premiums, or about 40%. It gave the remaining \$3 1/2 billion to reinsurers. On the part of the business kept, the company's underwriting loss was less than \$200 million - an excellent result in that year. Meanwhile, the part laid off produced a loss of over \$1.5 billion for the reinsurers. Thus, the issuing company wrote at a combined ratio of well under 110 while its reinsurers, participating in precisely the same policies, came in considerably over 140. This result was not attributable to natural catastrophes; it came from run-of-the-mill insurance losses (occurring, however, in surprising frequency and size). The issuing company's 1985 report is not yet available, but I would predict it will show that dramatically unbalanced results continued.

A few years such as this, and even slow-witted reinsurers can lose interest, particularly in explosive lines where the proper split in premium between issuer and reinsurer remains impossible to even roughly estimate. The behavior of reinsurers finally becomes like that of Mark Twain's cat: having once sat on a hot stove, it never did so again - but it never again sat on a cold stove, either. Reinsurers have had so many unpleasant surprises in long-tail casualty lines that many have decided (probably correctly) to give up the game entirely, regardless of price inducements. Consequently, there has been a dramatic pull-back of reinsurance capacity in certain important lines.

This development has left many issuing companies under pressure. They can no longer commit their reinsurers, time after time, for tens of millions per policy as they so easily could do only a year or two ago, and they do not have the capital and/or appetite to take on large risks for their own account. For many issuing companies, gross capacity has shrunk much closer to net capacity - and that is often small, indeed.

At Berkshire we have never played the lay-it-off-at-a-profit game and, until recently, that put us at a severe disadvantage in certain lines. Now the tables are turned: we have the underwriting capability whereas others do not. If we believe the price to be right, we are willing to write a net

line larger than that of any but the largest insurers. For instance, we are perfectly willing to risk losing \$10 million of our own money on a single event, as long as we believe that the price is right and that the risk of loss is not significantly correlated with other risks we are insuring. Very few insurers are willing to risk half that much on single events - although, just a short while ago, many were willing to lose five or ten times that amount as long as virtually all of the loss was for the account of their reinsurers.

In mid-1985 our largest insurance company, National Indemnity Company, broadcast its willingness to underwrite large risks by running an ad in three issues of an insurance weekly. The ad solicited policies of only large size: those with a minimum premium of \$1 million. This ad drew a remarkable 600 replies and ultimately produced premiums totaling about \$50 million. (Hold the applause: it's all long-tail business and it will be at least five years before we know whether this marketing success was also an underwriting success.) Today, our insurance subsidiaries continue to be sought out by brokers searching for large net capacity.

As I have said, this period of tightness will pass; insurers and reinsurers will return to underpricing. But for a year or two we should do well in several segments of our insurance business. Mike Goldberg has made many important improvements in the operation (prior mismanagement by your Chairman having provided him ample opportunity to do so). He has been particularly successful recently in hiring young managers with excellent potential. They will have a chance to show their stuff in 1986.

Our combined ratio has improved - from 134 in 1984 to 111 in 1985 - but continues to reflect past misdeeds. Last year I told you of the major mistakes I had made in loss-reserving, and promised I would update you annually on loss-development figures. Naturally, I made this promise thinking my future record would be much improved. So far this has not been the case. Details on last year's loss development are on pages 50-52. They reveal significant underreserving at the end of 1984, as they did in the several years preceding.

The only bright spot in this picture is that virtually all of the underreserving revealed in 1984 occurred in the reinsurance area - and there, in very large part, in a few contracts that were discontinued several years ago. This explanation, however, recalls all too well a story told me many years ago by the then Chairman of General Reinsurance Company. He said that every year his managers told him that "except for the Florida hurricane" or "except for Midwestern tornadoes", they would have had a terrific year. Finally he called the group together and

suggested that they form a new operation - the Except-For Insurance Company - in which they would henceforth place all of the business that they later wouldn't want to count.

In any business, insurance or otherwise, "except for" should be excised from the lexicon. If you are going to play the game, you must count the runs scored against you in all nine innings. Any manager who consistently says "except for" and then reports on the lessons he has learned from his mistakes may be missing the only important lesson - namely, that the real mistake is not the act, but the actor.

Inevitably, of course, business errors will occur and the wise manager will try to find the proper lessons in them. But the trick is to learn most lessons from the experiences of others. Managers who have learned much from personal experience in the past usually are destined to learn much from personal experience in the future.

GEICO, 38%-owned by Berkshire, reported an excellent year in 1985 in premium growth and investment results, but a poor year - by its lofty standards - in underwriting. Private passenger auto and homeowners insurance were the only important lines in the industry whose results deteriorated significantly during the year. GEICO did not escape the trend, although its record was far better than that of virtually all its major competitors.

Jack Byrne left GEICO at mid-year to head Fireman's Fund, leaving behind Bill Snyder as Chairman and Lou Simpson as Vice Chairman. Jack's performance in reviving GEICO from near-bankruptcy was truly extraordinary, and his work resulted in enormous gains for Berkshire. We owe him a great deal for that.

We are equally indebted to Jack for an achievement that eludes most outstanding leaders: he found managers to succeed him who have talents as valuable as his own. By his skill in identifying, attracting and developing Bill and Lou, Jack extended the benefits of his managerial stewardship well beyond his tenure.

Fireman's Fund Quota-Share Contract

Never one to let go of a meal ticket, we have followed Jack Byrne to Fireman's Fund ("FFIC") where he is Chairman and CEO of the holding company.

On September 1, 1985 we became a 7% participant in all of the business in force of the FFIC group, with the exception of reinsurance they write for unaffiliated companies. Our contract runs for four years, and provides that our losses and costs will be proportionate to theirs throughout

the contract period. If there is no extension, we will thereafter have no participation in any ongoing business. However, for a great many years in the future, we will be reimbursing FFIC for our 7% of the losses that occurred in the September 1, 1985 - August 31, 1989 period.

Under the contract FFIC remits premiums to us promptly and we reimburse FFIC promptly for expenses and losses it has paid. Thus, funds generated by our share of the business are held by us for investment. As part of the deal, I'm available to FFIC for consultation about general investment strategy. I'm not involved, however, in specific investment decisions of FFIC, nor is Berkshire involved in any aspect of the company's underwriting activities.

Currently FFIC is doing about \$3 billion of business, and it will probably do more as rates rise. The company's September 1, 1985 unearned premium reserve was \$1.324 billion, and it therefore transferred 7% of this, or \$92.7 million, to us at initiation of the contract. We concurrently paid them \$29.4 million representing the underwriting expenses that they had incurred on the transferred premium. All of the FFIC business is written by National Indemnity Company, but two-sevenths of it is passed along to Wesco-Financial Insurance Company ("Wes-FIC"), a new company organized by our 80%-owned subsidiary, Wesco Financial Corporation. Charlie Munger has some interesting comments about Wes-FIC and the reinsurance business on pages 60-62.

To the Insurance Segment tables on page 41, we have added a new line, labeled Major Quota Share Contracts. The 1985 results of the FFIC contract are reported there, though the newness of the arrangement makes these results only very rough approximations.

After the end of the year, we secured another quota-share contract, whose 1986 volume should be over \$50 million. We hope to develop more of this business, and industry conditions suggest that we could: a significant number of companies are generating more business than they themselves can prudently handle. Our financial strength makes us an attractive partner for such companies.

Marketable Securities

We show below our 1985 yearend net holdings in marketable equities. All positions with a market value over \$25 million are listed, and the interests attributable to minority shareholders of Wesco and Nebraska Furniture Mart are excluded.

Shares	Company	Cost (000's omitted)	Market (000's omitted)
1,036,461	Affiliated Publications, Inc.	\$3,516	\$55,710
900,800	American Broadcasting Companies, Inc.	54,435	108,997
2,350,922	Exxon Corporation	106,811	108,142
6,850,000	GEICO Corporation	45,713	595,950
2,379,200	Handy & Harman	27,318	43,718
847,788	Time, Inc.	20,385	52,669
1,727,765	The Washington Post Company	9,731	205,172
	Total	\$267,909	\$1,170,358
	All Other Common Stockholdings	7,201	27,963
	Total Common Stocks	\$275,110	\$1,198,321

We mentioned earlier that in the past decade the investment environment has changed from one in which great businesses were totally unappreciated to one in which they are appropriately recognized. The Washington Post Company (“WPC”) provides an excellent example.

We bought all of our WPC holdings in mid-1973 at a price of not more than one-fourth of the then per-share business value of the enterprise. Calculating the price/value ratio required no unusual insights. Most security analysts, media brokers, and media executives would have estimated WPC’s intrinsic business value at \$400 to \$500 million just as we did. And its \$100 million stock market valuation was published daily for all to see. Our advantage, rather, was attitude: we had learned from Ben Graham that the key to successful investing was the purchase of shares in good businesses when market prices were at a large discount from underlying business values.

Most institutional investors in the early 1970s, on the other hand, regarded business value as of only minor relevance when they were deciding the prices at which they would buy or sell. This now seems hard to believe. However, these institutions were then under the spell of academics at prestigious business schools who were preaching a newly-fashioned theory: the stock market was totally efficient, and therefore calculations of business value - and even thought, itself - were of no importance in investment activities. (We are enormously indebted to those academics: what could be more advantageous in an intellectual contest - whether it be

bridge, chess, or stock selection than to have opponents who have been taught that thinking is a waste of energy?)

Through 1973 and 1974, WPC continued to do fine as a business, and intrinsic value grew. Nevertheless, by yearend 1974 our WPC holding showed a loss of about 25%, with market value at \$8 million against our cost of \$10.6 million. What we had thought ridiculously cheap a year earlier had become a good bit cheaper as the market, in its infinite wisdom, marked WPC stock down to well below 20 cents on the dollar of intrinsic value.

You know the happy outcome. Kay Graham, CEO of WPC, had the brains and courage to repurchase large quantities of stock for the company at those bargain prices, as well as the managerial skills necessary to dramatically increase business values. Meanwhile, investors began to recognize the exceptional economics of the business and the stock price moved closer to underlying value. Thus, we experienced a triple dip: the company's business value soared upward, per-share business value increased considerably faster because of stock repurchases and, with a narrowing of the discount, the stock price outpaced the gain in per-share business value.

We hold all of the WPC shares we bought in 1973, except for those sold back to the company in 1985's proportionate redemption. Proceeds from the redemption plus yearend market value of our holdings total \$221 million.

If we had invested our \$10.6 million in any of a half-dozen media companies that were investment favorites in mid-1973, the value of our holdings at yearend would have been in the area of \$40 - \$60 million. Our gain would have far exceeded the gain in the general market, an outcome reflecting the exceptional economics of the media business. The extra \$160 million or so we gained through ownership of WPC came, in very large part, from the superior nature of the managerial decisions made by Kay as compared to those made by managers of most media companies. Her stunning business success has in large part gone unreported but among Berkshire shareholders it should not go unappreciated.

Our Capital Cities purchase, described in the next section, required me to leave the WPC Board early in 1986. But we intend to hold indefinitely whatever WPC stock FCC rules allow us to. We expect WPC's business values to grow at a reasonable rate, and we know that management is both able and shareholder-oriented. However, the market now values the company at over \$1.8 billion, and there is no way that the value can progress from that level at a

rate anywhere close to the rate possible when the company's valuation was only \$100 million. Because market prices have also been bid up for our other holdings, we face the same vastly-reduced potential throughout our portfolio.

You will notice that we had a significant holding in Beatrice Companies at yearend. This is a short-term arbitrage holding - in effect, a parking place for money (though not a totally safe one, since deals sometimes fall through and create substantial losses). We sometimes enter the arbitrage field when we have more money than ideas, but only to participate in announced mergers and sales. We would be a lot happier if the funds currently employed on this short-term basis found a long-term home. At the moment, however, prospects are bleak.

At yearend our insurance subsidiaries had about \$400 million in tax-exempt bonds, of which \$194 million at amortized cost were issues of Washington Public Power Supply System ("WPPSS") Projects 1, 2, and 3. I discussed this position fully last year, and explained why we would not disclose further purchases or sales until well after the fact (adhering to the policy we follow on stocks). Our unrealized gain on the WPPSS bonds at yearend was \$62 million, perhaps one-third arising from the upward movement of bonds generally, and the remainder from a more positive investor view toward WPPSS 1, 2, and 3s. Annual tax-exempt income from our WPPSS issues is about \$30 million.

Capital Cities/ABC, Inc.

Right after yearend, Berkshire purchased 3 million shares of Capital Cities/ABC, Inc. ("Cap Cities") at \$172.50 per share, the market price of such shares at the time the commitment was made early in March, 1985. I've been on record for many years about the management of Cap Cities: I think it is the best of any publicly-owned company in the country. And Tom Murphy and Dan Burke are not only great managers, they are precisely the sort of fellows that you would want your daughter to marry. It is a privilege to be associated with them - and also a lot of fun, as any of you who know them will understand.

Our purchase of stock helped Cap Cities finance the \$3.5 billion acquisition of American Broadcasting Companies. For Cap Cities, ABC is a major undertaking whose economics are likely to be unexciting over the next few years. This bothers us not an iota; we can be very patient. (No matter how great the talent or effort, some things just take time: you can't produce a baby in one month by getting nine women pregnant.)

As evidence of our confidence, we have executed an unusual agreement: for an extended period Tom, as CEO (or Dan, should he be CEO) votes our stock. This arrangement was initiated by Charlie and me, not by Tom. We also have restricted ourselves in various ways regarding sale of our shares. The object of these restrictions is to make sure that our block does not get sold to anyone who is a large holder (or intends to become a large holder) without the approval of management, an arrangement similar to ones we initiated some years ago at GEICO and

Washington Post.

Since large blocks frequently command premium prices, some might think we have injured Berkshire financially by creating such restrictions. Our view is just the opposite. We feel the long-term economic prospects for these businesses - and, thus, for ourselves as owners - are enhanced by the arrangements. With them in place, the first-class managers with whom we have aligned ourselves can focus their efforts entirely upon running the businesses and maximizing long-term values for owners. Certainly this is much better than having those managers distracted by “revolving-door capitalists” hoping to put the company “in play”. (Of course, some managers place their own interests above those of the company and its owners and deserve to be shaken up - but, in making investments, we try to steer clear of this type.)

Today, corporate instability is an inevitable consequence of widely-diffused ownership of voting stock. At any time a major holder can surface, usually mouthing reassuring rhetoric but frequently harboring uncivil intentions. By circumscribing our blocks of stock as we often do, we intend to promote stability where it otherwise might be lacking. That kind of certainty, combined with a good manager and a good business, provides excellent soil for a rich financial harvest. That’s the economic case for our arrangements.

The human side is just as important. We don’t want managers we like and admire - and who have welcomed a major financial commitment by us - to ever lose any sleep wondering whether surprises might occur because of our large ownership. I have told them there will be no surprises, and these agreements put Berkshire’s signature where my mouth is. That signature also means the managers have a corporate commitment and therefore need not worry if my personal participation in Berkshire’s affairs ends prematurely (a term I define as any age short of three digits).

Our Cap Cities purchase was made at a full price, reflecting the very considerable enthusiasm for both media stocks and media properties that has developed in recent years (and that, in the case of some property purchases, has approached a mania). It's no field for bargains. However, our Cap Cities investment allies us with an exceptional combination of properties and people - and we like the opportunity to participate in size.

Of course, some of you probably wonder why we are now buying Cap Cities at \$172.50 per share given that your Chairman, in a characteristic burst of brilliance, sold Berkshire's holdings in the same company at \$43 per share in 1978-80. Anticipating your question, I spent much of 1985 working on a snappy answer that would reconcile these acts.

A little more time, please.

Acquisition of Scott & Fetzer

Right after yearend we acquired The Scott & Fetzer Company ("Scott Fetzer") of Cleveland for about \$320 million. (In addition, about \$90 million of pre-existing Scott Fetzer debt remains in place.) In the next section of this report I describe the sort of businesses that we wish to buy for Berkshire. Scott Fetzer is a prototype - understandable, large, well-managed, a good earner.

The company has sales of about \$700 million derived from 17 businesses, many leaders in their fields. Return on invested capital is good to excellent for most of these businesses. Some well-known products are Kirby home-care systems, Campbell Hausfeld air compressors, and Wayne burners and water pumps.

World Book, Inc. - accounting for about 40% of Scott Fetzer's sales and a bit more of its income - is by far the company's largest operation. It also is by far the leader in its industry, selling more than twice as many encyclopedia sets annually as its nearest competitor. In fact, it sells more sets in the U.S. than its four biggest competitors combined.

Charlie and I have a particular interest in the World Book operation because we regard its encyclopedia as something special. I've been a fan (and user) for 25 years, and now have grandchildren consulting the sets just as my children did. World Book is regularly rated the most useful encyclopedia by teachers, librarians and consumer buying guides. Yet it sells for less than any of its major competitors. Childcraft, another World Book, Inc. product, offers similar value. This combination of exceptional products and modest prices at World Book, Inc. helped make us willing to pay the price demanded for Scott Fetzer, despite declining results for many companies in the direct-selling industry.

An equal attraction at Scott Fetzer is Ralph Schey, its CEO for nine years. When Ralph took charge, the company had 31 businesses, the result of an acquisition spree in the 1960s. He disposed of many that did not fit or had limited profit potential, but his focus on rationalizing the original potpourri was not so intense that he passed by World Book when it became available for purchase in 1978. Ralph's operating and capital-allocation record is superb, and we are delighted to be associated with him.

The history of the Scott Fetzer acquisition is interesting, marked by some zigs and zags before we became involved. The company had been an announced candidate for purchase since early 1984. A major investment banking firm spent many months canvassing scores of prospects, evoking interest from several. Finally, in mid-1985 a plan of sale, featuring heavy participation by an ESOP (Employee Stock Ownership Plan), was approved by shareholders. However, as difficulty in closing followed, the plan was scuttled.

I had followed this corporate odyssey through the newspapers. On October 10, well after the ESOP deal had fallen through, I wrote a short letter to Ralph, whom I did not know. I said we admired the company's record and asked if he might like to talk. Charlie and I met Ralph for dinner in Chicago on October 22 and signed an acquisition contract the following week.

The Scott Fetzer acquisition, plus major growth in our insurance business, should push revenues above \$2 billion in 1986, more than double those of 1985.

Miscellaneous

The Scott Fetzer purchase illustrates our somewhat haphazard approach to acquisitions. We have no master strategy, no corporate planners delivering us insights about socioeconomic trends, and no staff to investigate a multitude of ideas presented by promoters and intermediaries. Instead, we simply hope that something sensible comes along - and, when it does, we act.

To give fate a helping hand, we again repeat our regular "business wanted" ad. The only change from last year's copy is in (1): because we continue to want any acquisition we make to have a measurable impact on Berkshire's financial results, we have raised our minimum profit requirement.

Here's what we're looking for:

- (1) large purchases (at least \$10 million of after-tax earnings),
- (2) demonstrated consistent earning power (future projections are of little interest to us, nor are "turn-around" situations),

- (3) businesses earning good returns on equity while employing little or no debt,
- (4) management in place (we can't supply it),
- (5) simple businesses (if there's lots of technology, we won't understand it),
- (6) an offering price (we don't want to waste our time or that of the seller by talking, even preliminarily, about a transaction when price is unknown).

We will not engage in unfriendly takeovers. We can promise complete confidentiality and a very fast answer - customarily within five minutes - as to whether we're interested. We prefer to buy for cash, but will consider issuance of stock when we receive as much in intrinsic business value as we give. Indeed, following recent advances in the price of Berkshire stock, transactions involving stock issuance may be quite feasible. We invite potential sellers to check us out by contacting people with whom we have done business in the past. For the right business - and the right people - we can provide a good home.

On the other hand, we frequently get approached about acquisitions that don't come close to meeting our tests: new ventures, turnarounds, auction-like sales, and the ever-popular (among brokers) "I'm-sure-something-will-work-out-if-you-people-get-to-know-each-other". None of these attracts us in the least.

* * *

Besides being interested in the purchases of entire businesses as described above, we are also interested in the negotiated purchase of large, but not controlling, blocks of stock, as in our Cap Cities purchase. Such purchases appeal to us only when we are very comfortable with both the economics of the business and the ability and integrity of the people running the operation. We prefer large transactions: in the unusual case we might do something as small as \$50 million (or even smaller), but our preference is for commitments many times that size.

* * *

About 96.8% of all eligible shares participated in Berkshire's 1985 shareholder-designated contributions program. Total contributions made through the program were \$4 million, and

1,724 charities were recipients. We conducted a plebiscite last year in order to get your views about this program, as well as about our dividend policy. (Recognizing that it's possible to influence the answers to a question by the framing of it, we attempted to make the wording of ours as neutral as possible.) We present the ballot and the results in the Appendix on page 69. I think it's fair to summarize your response as highly supportive of present policies and your group preference - allowing for the tendency of people to vote for the status quo - to be for increasing the annual charitable commitment as our asset values build.

We urge new shareholders to read the description of our shareholder-designated contributions program that appears on pages 66 and 67. If you wish to participate in future programs, we strongly urge that you immediately make sure that your shares are registered in the name of the actual owner, not in "street" name or nominee name. Shares not so registered on September 30, 1986 will be ineligible for the 1986 program.

* * *

Five years ago we were required by the Bank Holding Company Act of 1969 to dispose of our holdings in The Illinois National Bank and Trust Company of Rockford, Illinois. Our method of doing so was unusual: we announced an exchange ratio between stock of Rockford Bancorp Inc. (the Illinois National's holding company) and stock of Berkshire, and then let each of our shareholders - except me - make the decision as to whether to exchange all, part, or none of his Berkshire shares for Rockford shares. I took the Rockford stock that was left over and thus my own holding in Rockford was determined by your decisions. At the time I said, "This technique embodies the world's oldest and most elementary system of fairly dividing an object. Just as when you were a child and one person cut the cake and the other got first choice, I have tried to cut the company fairly, but you get first choice as to which piece you want."

Last fall Illinois National was sold. When Rockford's liquidation is completed, its shareholders will have received per-share proceeds about equal to Berkshire's per-share intrinsic value at the time of the bank's sale. I'm pleased that this five-year result indicates that the division of the cake was reasonably equitable.

Last year I put in a plug for our annual meeting, and you took me up on the invitation. Over 250 of our more than 3,000 registered shareholders showed up. Those attending behaved just

as those present in previous years, asking the sort of questions you would expect from intelligent and interested owners. You can attend a great many annual meetings without running into a crowd like ours. (Lester Maddox, when Governor of Georgia, was criticized regarding the state's abysmal prison system. "The solution", he said, "is simple. All we need is a better class of prisoners." Upgrading annual meetings works the same way.)

I hope you come to this year's meeting, which will be held on May 20 in Omaha. There will be only one change: after 48 years of allegiance to another soft drink, your Chairman, in an unprecedented display of behavioral flexibility, has converted to the new Cherry Coke. Henceforth, it will be the Official Drink of the Berkshire Hathaway Annual Meeting.

And bring money: Mrs. B promises to have bargains galore if you will pay her a visit at The Nebraska Furniture Mart after the meeting.

Warren E. Buffett

Chairman of the Board

1986 Letter

BERKSHIRE HATHAWAY INC.

To the Shareholders of Berkshire Hathaway Inc.:

Our gain in net worth during 1986 was \$492.5 million, or 26.1%. Over the last 22 years (that is, since present management took over), our per-share book value has grown from \$19.46 to \$2,073.06, or 23.3% compounded annually. Both the numerator and denominator are important in the per-share book value calculation: during the 22-year period our corporate net worth has increased 10,600% while shares outstanding have increased less than 1%.

In past reports I have noted that book value at most companies differs widely from intrinsic business value - the number that really counts for owners. In our own case, however, book value has served for more than a decade as a reasonable if somewhat conservative proxy for business value. That is, our business value has moderately exceeded our book value, with the ratio between the two remaining fairly steady.

The good news is that in 1986 our percentage gain in business value probably exceeded the book value gain. I say "probably" because business value is a soft number: in our own case, two equally well-informed observers might make judgments more than 10% apart.

A large measure of our improvement in business value relative to book value reflects the outstanding performance of key managers at our major operating businesses. These managers - the Blumkins, Mike Goldberg, the Heldmans, Chuck Huggins, Stan Lipsey, and Ralph Schey - have over the years improved the earnings of their businesses dramatically while, except in the case of insurance, utilizing little additional capital. This accomplishment builds economic value, or "Goodwill," that does not show up in the net worth figure on our balance sheet, nor in our per-share book value. In 1986 this unrecorded gain was substantial.

So much for the good news. The bad news is that my performance did not match that of our managers. While they were doing a superb job in running our businesses, I was unable to skillfully deploy much of the capital they generated.

Charlie Munger, our Vice Chairman, and I really have only two jobs. One is to attract and keep outstanding managers to run our various operations. This hasn't been all that difficult. Usually the managers came with the companies we bought, having demonstrated their talents throughout careers that spanned a wide variety of business circumstances. They were managerial stars long before they knew us, and our main contribution has been to not get in their way. This approach seems elementary: if my job were to manage a golf team - and if Jack Nicklaus or Arnold Palmer were willing to play for me - neither would get a lot of directives from me about how to swing.

Some of our key managers are independently wealthy (we hope they all become so), but that poses no threat to their continued interest: they work because they love what they do and relish the thrill of outstanding performance. They unfailingly think like owners (the highest compliment we can pay a manager) and find all aspects of their business absorbing.

(Our prototype for occupational fervor is the Catholic tailor who used his small savings of many years to finance a pilgrimage to the Vatican. When he returned, his parish held a special meeting to get his first-hand account of the Pope. "Tell us," said the eager faithful, "just what sort of fellow is he?" Our hero wasted no words: "He's a forty-four, medium.")

Charlie and I know that the right players will make almost any team manager look good. We subscribe to the philosophy of Ogilvy & Mather's founding genius, David Ogilvy: "If each of us hires people who are smaller than we are, we shall become a company of dwarfs. But, if each of us hires people who are bigger than we are, we shall become a company of giants."

A by-product of our managerial style is the ability it gives us to easily expand Berkshire's activities. We've read management treatises that specify exactly how many people should report to any one executive, but they make little sense to us. When you have able managers of high character running businesses about which they are passionate, you can have a dozen or more reporting to you and still have time for an afternoon nap. Conversely, if you have even one person reporting to you who is deceitful, inept or uninterested, you will find yourself with more than you can handle. Charlie and I could work with double the number of managers we now have, so long as they had the rare qualities of the present ones.

We intend to continue our practice of working only with people whom we like and admire. This policy not only maximizes our chances for good results, it also ensures us an extraordinarily good time. On the other hand, working with people who cause your stomach to churn seems

much like marrying for money - probably a bad idea under any circumstances, but absolute madness if you are already rich.

The second job Charlie and I must handle is the allocation of capital, which at Berkshire is a considerably more important challenge than at most companies. Three factors make that so: we earn more money than average; we retain all that we earn; and, we are fortunate to have operations that, for the most part, require little incremental capital to remain competitive and to grow. Obviously, the future results of a business earning 23% annually and retaining it all are far more affected by today's capital allocations than are the results of a business earning 10% and distributing half of that to shareholders. If our retained earnings - and those of our major investees, GEICO and Capital Cities/ABC, Inc. - are employed in an unproductive manner, the economics of Berkshire will deteriorate very quickly. In a company adding only, say, 5% to net worth annually, capital-allocation decisions, though still important, will change the company's economics far more slowly.

Capital allocation at Berkshire was tough work in 1986. We did make one business acquisition - The Fechheimer Bros. Company, which we will discuss in a later section. Fechheimer is a company with excellent economics, run by exactly the kind of people with whom we enjoy being associated. But it is relatively small, utilizing only about 2% of Berkshire's net worth.

Meanwhile, we had no new ideas in the marketable equities field, an area in which once, only a few years ago, we could readily employ large sums in outstanding businesses at very reasonable prices. So our main capital allocation moves in 1986 were to pay off debt and stockpile funds. Neither is a fate worse than death, but they do not inspire us to do handsprings either. If Charlie and I were to draw blanks for a few years in our capital-allocation endeavors, Berkshire's rate of growth would slow significantly.

We will continue to look for operating businesses that meet our tests and, with luck, will acquire such a business every couple of years. But an acquisition will have to be large if it is to help our performance materially. Under current stock market conditions, we have little hope of finding equities to buy for our insurance companies. Markets will change significantly - you can be sure of that and some day we will again get our turn at bat. However, we haven't the faintest idea when that might happen.

It can't be said too often (although I'm sure you feel I've tried) that, even under favorable conditions, our returns are certain to drop substantially because of our enlarged size. We have told you that we hope to average a return of 15% on equity and we maintain that hope, despite some negative tax law changes described in a later section of this report. If we are to achieve this rate of return, our net worth must increase \$7.2 billion in the next ten years. A gain of that magnitude will be possible only if, before too long, we come up with a few very big (and good) ideas. Charlie and I can't promise results, but we do promise you that we will keep our efforts focused on our goals.

Sources of Reported Earnings

The table on the next page shows the major sources of Berkshire's reported earnings. This table differs in several ways from the one presented last year. We have added four new lines of business because of the Scott Fetzer and Fechheimer acquisitions. In the case of Scott Fetzer, the two major units acquired were World Book and Kirby, and each is presented separately. Fourteen other businesses of Scott Fetzer are aggregated in Scott Fetzer - Diversified Manufacturing. SF Financial Group, a credit company holding both World Book and Kirby receivables, is included in "Other." This year, because Berkshire is so much larger, we also have eliminated separate reporting for several of our smaller businesses.

In the table, amortization of Goodwill is not charged against the specific businesses but, for reasons outlined in the Appendix to my letter in the 1983 Annual Report, is aggregated as a separate item. (A Compendium of earlier letters, including the Goodwill discussion, is available upon request.) Both the Scott Fetzer and Fechheimer acquisitions created accounting Goodwill, which is why the amortization charge for Goodwill increased in 1986.

Additionally, the Scott Fetzer acquisition required other major purchase-price accounting adjustments, as prescribed by generally accepted accounting principles (GAAP). The GAAP figures, of course, are the ones used in our consolidated financial statements. But, in our view, the GAAP figures are not necessarily the most useful ones for investors or managers. Therefore, the figures shown for specific operating units are earnings before purchase-price adjustments are taken into account. In effect, these are the earnings that would have been reported by the businesses if we had not purchased them.

A discussion of our reasons for preferring this form of presentation is in the Appendix to this letter. This Appendix will never substitute for a steamy novel and definitely is not required

reading. However, I know that among our 6,000 shareholders there are those who are thrilled by my essays on accounting - and I hope that both of you enjoy the Appendix.

In the Business Segment Data on pages 41-43 and in the Management's Discussion section on pages 45-49, you will find much additional information about our businesses. I urge you to read those sections, as well as Charlie Munger's letter to Wesco shareholders, describing the various businesses of that subsidiary, which starts on page 50.

Operating Earnings (000s omitted)	Pre-Tax 1987	Earnings 1986	Berkshire 1987	Share 1986
Insurance Group:				
Underwriting	\$ (55,844)	\$ (44,230)	\$ (29,894)	\$ (23,569)
Net investment income	107,143	95,217	96,440	79,716
Buffalo News	34,736	29,921	16,918	14,580
Fechheimer (Acquired 6/3/86)	8,400	---	3,792	---
Kirby	20,218	---	10,508	---
Nebraska Furniture Mart	17,685	12,686	7,192	5,181
Scott Fetzer - Diversified Mfg.	25,358	---	13,354	---
See's Candies	30,347	28,989	15,176	14,558
Wesco - Other than Insurance	5,542	16,018	5,550	9,684
World Book	21,978	---	11,670	---
Amortization of Goodwill	(2,555)	(1,475)	4,191	(1,475)
Other Purchase Price accounting charges	(10,033)	---	(2,555)	---
Interest On Debt and Pre-Payment Penalty	(23,891)	(14,415)	(12,213)	(7,288)
Shareholder-Designated Contributions	(3,997)	(4,006)	(2,158)	(2,164)
Other	20,770	6,744	8,685	3,725
Operating Earnings	195,857	125,449	131,464	92,948
Special General Foods Distribution	---	4,127	---	3,779
Special Washington Post Distribution	---	14,877	---	13,851
Sales of Securities	216,242	468,903	150,897	325,237
Total Earnings- all entities	\$412,099	\$613,356	\$282,361	\$435,815

As you can see, operating earnings substantially improved during 1986. Some of the improvement came from the insurance operation, whose results I will discuss in a later section. Fechheimer also will be discussed separately. Our other major businesses performed as follows:

o Operating results at The Buffalo News continue to reflect a truly superb managerial job by Stan Lipsey. For the third year in a row, man-hours worked fell significantly and other costs were closely controlled. Consequently, our operating margins improved materially in 1986, even though our advertising rate increases were well below those of most major newspapers.

Our cost-control efforts have in no way reduced our commitment to news. We continue to deliver a 50% "news hole" (the portion of the total space in the paper devoted to news), a higher percentage, we believe, than exists at any dominant newspaper in this country of our size or larger.

The average news hole at papers comparable to the News is about 40%. The difference between 40% and 50% is more important than it might first seem: a paper with 30 pages of ads and a 40% news hole delivers 20 pages of news a day, whereas our paper matches 30 pages of ads with 30 pages of news. Therefore, given ad pages equal in number, we end up delivering our readers no less than 50% more news.

We believe this heavy commitment to news is one of the reasons The Buffalo News has the highest weekday penetration rate (the percentage of households in the paper's primary marketing area purchasing it each day) among any of the top 50 papers in the country. Our Sunday penetration, where we are also number one, is even more impressive. Ten years ago, the only Sunday paper serving Buffalo (the Courier-Express) had circulation of 271,000 and a penetration ratio of about 63%. The Courier-Express had served the area for many decades and its penetration ratio - which was similar to those existing in many metropolitan markets - was thought to be a "natural" one, accurately reflecting the local citizenry's appetite for a Sunday product.

Our Sunday paper was started in late 1977. It now has a penetration ratio of 83% and sells about 100,000 copies more each Sunday than did the Courier-Express ten years ago - even though population in our market area has declined during the decade. In recent history, no other city that has long had a local Sunday paper has experienced a penetration gain anywhere close to Buffalo's.

Despite our exceptional market acceptance, our operating margins almost certainly have peaked. A major newsprint price increase took effect at the end of 1986, and our advertising rate increases in 1987 will again be moderate compared to those of the industry. However, even if margins should materially shrink, we would not reduce our news-hole ratio.

As I write this, it has been exactly ten years since we purchased The News. The financial rewards it has brought us have far exceeded our expectations and so, too, have the non-financial rewards. Our respect for the News - high when we bought it - has grown consistently ever since the purchase, as has our respect and admiration for Murray Light, the editor who turns out the product that receives such extraordinary community acceptance. The efforts of Murray and Stan, which were crucial to the News during its dark days of financial reversals and litigation, have not in the least been lessened by prosperity. Charlie and I are grateful to them.

- o The amazing Blumkins continue to perform business miracles at Nebraska Furniture Mart. Competitors come and go (mostly go), but Mrs. B. and her progeny roll on. In 1986 net sales increased 10.2% to \$132 million. Ten years ago sales were \$44 million and, even then, NFM appeared to be doing just about all of the business available in the Greater Omaha Area. Given NFM's remarkable dominance, Omaha's slow growth in population and the modest inflation rates that have applied to the goods NFM sells, how can this operation continue to rack up such large sales gains? The only logical explanation is that the marketing territory of NFM's one-and-only store continues to widen because of its ever-growing reputation for rock-bottom everyday prices and the broadest of selections. In preparation for further gains, NFM is expanding the capacity of its warehouse, located a few hundred yards from the store, by about one-third.

Mrs. B, Chairman of Nebraska Furniture Mart, continues at age 93 to outsell and out-hustle any manager I've ever seen. She's at the store seven days a week, from opening to close. Competing with her represents a triumph of courage over judgment.

It's easy to overlook what I consider to be the critical lesson of the Mrs. B saga: at 93, Omaha based Board Chairmen have yet to reach their peak. Please file this fact away to consult before you mark your ballot at the 2024 annual meeting of Berkshire.

- o At See's, sales trends improved somewhat from those of recent years. Total pounds sold rose about 2%. (For you chocaholics who like to fantasize, one statistic: we sell over 12,000 tons annually.) Same-store sales, measured in pounds, were virtually unchanged. In the previous six years, same store poundage fell, and we gained or maintained poundage volume only by adding stores. But a particularly strong Christmas season in 1986 stemmed the decline. By stabilizing same-store volume and making a major effort to control costs, See's was able to maintain its excellent profit margin in 1986 though it put through only minimal price increases. We have Chuck Huggins, our long-time manager at See's, to thank for this significant achievement.

See's has a one-of-a-kind product "personality" produced by a combination of its candy's delicious taste and moderate price, the company's total control of the distribution process, and the exceptional service provided by store employees. Chuck rightfully measures his success by the satisfaction of our customers, and his attitude permeates the organization. Few major retailing companies have been able to sustain such a customer-oriented spirit, and we owe Chuck a great deal for keeping it alive and well at See's.

See's profits should stay at about their present level. We will continue to increase prices very modestly, merely matching prospective cost increases.

o World Book is the largest of 17 Scott Fetzer operations that joined Berkshire at the beginning of 1986. Last year I reported to you enthusiastically about the businesses of Scott Fetzer and about Ralph Schey, its manager. A year's experience has added to my enthusiasm for both. Ralph is a superb businessman and a straight shooter. He also brings exceptional versatility and energy to his job: despite the wide array of businesses that he manages, he is on top of the operations, opportunities and problems of each. And, like our other managers, Ralph is a real pleasure to work with. Our good fortune continues.

World Book's unit volume increased for the fourth consecutive year, with encyclopedia sales up 7% over 1985 and 45% over 1982. Childcraft's unit sales also grew significantly.

World Book continues to dominate the U.S. direct-sales encyclopedia market - and for good reasons. Extraordinarily well-edited and priced at under 5 cents per page, these books are a bargain for youngster and adult alike. You may find one editing technique interesting: World Book ranks over 44,000 words by difficulty. Longer entries in the encyclopedia include only the most easily comprehended words in the opening sections, with the difficulty of the material gradually escalating as the exposition proceeds. As a result, youngsters can easily and profitably read to the point at which subject matter gets too difficult, instead of immediately having to deal with a discussion that mixes up words requiring college-level comprehension with others of fourth-grade level.

Selling World Book is a calling. Over one-half of our active salespeople are teachers or former teachers, and another 5% have had experience as librarians. They correctly think of themselves as educators, and they do a terrific job. If you don't have a World Book set in your house, I recommend one.

o Kirby likewise recorded its fourth straight year of unit volume gains. Worldwide, unit sales grew 4% from 1985 and 33% from 1982. While the Kirby product is more expensive than most cleaners, it performs in a manner that leaves cheaper units far behind ("in the dust," so to speak). Many 30- and 40-year-old Kirby cleaners are still in active duty. If you want the best, you buy a Kirby.

Some companies that historically have had great success in direct sales have stumbled in recent years. Certainly the era of the working woman has created new challenges for direct sales organizations. So far, the record shows that both Kirby and World Book have responded most successfully.

The businesses described above, along with the insurance operation and Fechheimer, constitute our major business units. The brevity of our descriptions is in no way meant to diminish the importance of these businesses to us. All have been discussed in past annual reports and, because of the tendency of Berkshire owners to stay in the fold (about 98% of the stock at the end of each year is owned by people who were owners at the start of the year), we want to avoid undue repetition of basic facts. You can be sure that we will immediately report to you in detail if the underlying economics or competitive position of any of these businesses should materially change. In general, the businesses described in this section can be characterized as having very strong market positions, very high returns on capital employed, and the best of operating managements.

The Fechheimer Bros. Co.

Every year in Berkshire's annual report I include a description of the kind of business that we would like to buy. This "ad" paid off in 1986.

On January 15th of last year I received a letter from Bob Heldman of Cincinnati, a shareholder for many years and also Chairman of Fechheimer Bros. Until I read the letter, however, I did not know of either Bob or Fechheimer. Bob wrote that he ran a company that met our tests and suggested that we get together, which we did in Omaha after their results for 1985 were compiled.

He filled me in on a little history: Fechheimer, a uniform manufacturing and distribution business, began operations in 1842. Warren Heldman, Bob's father, became involved in the business in 1941 and his sons, Bob and George (now President), along with their sons,

subsequently joined the company. Under the Heldmans' management, the business was highly successful.

In 1981 Fechheimer was sold to a group of venture capitalists in a leveraged buy out (an LBO), with management retaining an equity interest. The new company, as is the case with all LBOS, started with an exceptionally high debt/equity ratio. After the buy out, however, operations continued to be very successful. So by the start of last year debt had been paid down substantially and the value of the equity had increased dramatically. For a variety of reasons, the venture capitalists wished to sell and Bob, having dutifully read Berkshire's annual reports, thought of us.

Fechheimer is exactly the sort of business we like to buy. Its economic record is superb; its managers are talented, high-grade, and love what they do; and the Heldman family wanted to continue its financial interest in partnership with us. Therefore, we quickly purchased about 84% of the stock for a price that was based upon a \$55 million valuation for the entire business.

The circumstances of this acquisition were similar to those prevailing in our purchase of Nebraska Furniture Mart: most of the shares were held by people who wished to employ funds elsewhere; family members who enjoyed running their business wanted to continue both as owners and managers; several generations of the family were active in the business, providing management for as far as the eye can see; and the managing family wanted a purchaser who would not re-sell, regardless of price, and who would let the business be run in the future as it had been in the past. Both Fechheimer and NFM were right for us, and we were right for them.

You may be amused to know that neither Charlie nor I have been to Cincinnati, headquarters for Fechheimer, to see their operation. (And, incidentally, it works both ways: Chuck Huggins, who has been running See's for 15 years, has never been to Omaha.) If our success were to depend upon insights we developed through plant inspections, Berkshire would be in big trouble. Rather, in considering an acquisition, we attempt to evaluate the economic characteristics of the business - its competitive strengths and weaknesses - and the quality of the people we will be joining. Fechheimer was a standout in both respects. In addition to Bob and George Heldman, who are in their mid-60s - spring chickens by our standards - there are three members of the next generation, Gary, Roger and Fred, to insure continuity.

As a prototype for acquisitions, Fechheimer has only one drawback: size. We hope our next acquisition is at least several times as large but a carbon copy in all other respects. Our threshold

for minimum annual after-tax earnings of potential acquisitions has been moved up to \$10 million from the \$5 million level that prevailed when Bob wrote to me.

Flushed with success, we repeat our ad. If you have a business that fits, call me or, preferably, write.

Here's what we're looking for:

- (1) large purchases (at least \$10 million of after-tax earnings),
- (2) demonstrated consistent earning power (future projections are of little interest to us, nor are "turn-around" situations),
- (3) businesses earning good returns on equity while employing little or no debt.
- (4) management in place (we can't supply it),
- (5) simple businesses (if there's lots of technology, we won't understand it),
- (6) an offering price (we don't want to waste our time or that of the seller by talking, even preliminarily, about a transaction when price is unknown).

We will not engage in unfriendly takeovers. We can promise complete confidentiality and a very fast answer - customarily within five minutes - as to whether we're interested. We prefer to buy for cash, but will consider issuing stock when we receive as much in intrinsic business value as we give. Indeed, following recent advances in the price of Berkshire stock, transactions involving stock issuance may be quite feasible. We invite potential sellers to check us out by contacting people with whom we have done business in the past. For the right business - and the right people - we can provide a good home. On the other hand, we frequently get approached about acquisitions that don't come close to meeting our tests: new ventures, turnarounds, auction-like sales, and the ever-popular (among brokers) "I'm-sure-something-will-work-out-if-you-people-get-to-know-each-other." None of these attracts us in the least.

* * *

Besides being interested in the purchases of entire businesses as described above, we are also interested in the negotiated purchase of large, but not controlling, blocks of stock, as in our Cap Cities purchase. Such purchases appeal to us only when we are very comfortable with both the economics of the business and the ability and integrity of the people running the operation. We

prefer large transactions: in the unusual case we might do something as small as \$50 million (or even smaller), but our preference is for commitments many times that size.

Insurance Operations

We present our usual table of industry figures, expanded this year to include data about incurred losses and the GNP inflation index. The contrast in 1986 between the growth in premiums and growth in incurred losses will show you why underwriting results for the year improved materially:

Year	Yearly Change in Premiums Written (%)	Statutory Combined Ratio after Policyholder Dividends	Yearly Change in Incurred Losses (%)	Inflation Rate Measured by GNP Deflator (%)
1981	3.8	106.0	6.5	9.7
1982	4.4	109.8	8.4	6.4
1983	4.6	112.0	6.8	3.9
1984	9.2	117.9	16.9	3.8
1985	22.1	116.5	16.1	3.3
1986 (Est.)	22.6	108.5	15.5	2.6

Source: Best's Insurance Management Reports

The combined ratio represents total insurance costs (losses incurred plus expenses) compared to revenue from premiums: a ratio below 100 indicates an underwriting profit, and one above 100 indicates a loss. When the investment income that an insurer earns from holding on to policyholders' funds ("the float") is taken into account, a combined ratio in the 107-112 range typically produces an overall break-even result, exclusive of earnings on the funds provided by shareholders.

The math of the insurance business, encapsulated by the table, is not very complicated. In years when the industry's annual gain in revenues (premiums) pokes along at 4% or 5%, underwriting losses are sure to mount. This is not because auto accidents, fires, windstorms and the like are occurring more frequently, nor has it lately been the fault of general inflation.

Today, social and judicial inflation are the major culprits; the cost of entering a courtroom has simply ballooned. Part of the jump in cost arises from skyrocketing verdicts, and part from the tendency of judges and juries to expand the coverage of insurance policies beyond that contemplated by the insurer when the policies were written. Seeing no let-up in either trend, we continue to believe that the industry's revenues must grow at close to 10% annually for it to just hold its own in terms of profitability, even though general inflation may be running only 2% - 4%.

In 1986, as noted, the industry's premium volume soared even faster than loss costs. Consequently, the underwriting loss of the industry fell dramatically. In last year's report we predicted this sharp improvement but also predicted that prosperity would be fleeting. Alas, this second prediction is already proving accurate. The rate of gain in the industry's premium volume has slowed significantly (from an estimated 27.1% in 1986's first quarter, to 23.5% in the second, to 21.8% in the third, to 18.7% in the fourth), and we expect further slowing in 1987. Indeed, the rate of gain may well fall below my 10% "equilibrium" figure by the third quarter.

Nevertheless, underwriting results in 1987, assuming they are not dragged down by a major natural catastrophe, will again improve materially because price increases are recognized in revenues on a lagged basis. In effect, the good news in earnings follows the good news in prices by six to twelve months. But the improving trend in earnings will probably end by late 1988 or early 1989. Thereafter the industry is likely to head south in a hurry.

Pricing behavior in the insurance industry continues to be exactly what can be expected in a commodity-type business. Only under shortage conditions are high profits achieved, and such conditions don't last long. When the profit sun begins to shine, long-established insurers shower investors with new shares in order to build capital. In addition, newly-formed insurers rush to sell shares at the advantageous prices available in the new-issue market (prices advantageous, that is, to the insiders promoting the company but rarely to the new shareholders). These moves guarantee future trouble: capacity soars, competitive juices flow, and prices fade.

It's interesting to observe insurance leaders beseech their colleagues to behave in a more "statesmanlike" manner when pricing policies. "Why," they ask, "can't we learn from history, even out the peaks and valleys, and consistently price to make reasonable profits?" What they wish, of course, is pricing that resembles, say, that of The Wall Street journal, whose prices are ample to start with and rise consistently each year.

Such calls for improved behavior have all of the efficacy of those made by a Nebraska corn grower asking his fellow growers, worldwide, to market their corn with more statesmanship. What's needed is not more statesmen, but less corn. By raising large amounts of capital in the last two years, the insurance industry has, to continue our metaphor, vastly expanded its plantings of corn. The resulting increase in "crop" - i.e., the proliferation of insurance capacity - will have the same effect on prices and profits that surplus crops have had since time immemorial.

Our own insurance operation did well in 1986 and is also likely to do well in 1987. We have benefited significantly from industry conditions. But much of our prosperity arises from the efforts and ability of Mike Goldberg, manager of all insurance operations.

Our combined ratio (on a statutory basis and excluding structured settlements and financial reinsurance) fell from 111 in 1985 to 103 in 1986. In addition, our premium growth has been exceptional: although final figures aren't available, I believe that over the past two years we were the fastest growing company among the country's top 100 insurers. Some of our growth, it is true, came from our large quota-share contract with Fireman's Fund, described in last year's report and updated in Charlie's letter on page 54. But even if the premiums from that contract are excluded from the calculation, we probably still ranked first in growth.

Interestingly, we were the slowest-growing large insurer in the years immediately preceding 1985. In fact, we shrank - and we will do so again from time to time in the future. Our large swings in volume do not mean that we come and go from the insurance marketplace. Indeed, we are its most steadfast participant, always standing ready, at prices we believe adequate, to write a wide variety of high-limit coverages. The swings in our volume arise instead from the here-today, gone-tomorrow behavior of other insurers. When most insurers are "gone," because their capital is inadequate or they have been frightened by losses, insured's rush to us and find us ready to do business. But when hordes of insurers are "here," and are slashing prices far below expectable costs, many customers naturally leave us in order to take advantage of the bargains temporarily being offered by our competition.

Our firmness on prices works no hardship on the consumer: he is being bombarded by attractively priced insurance offers at those times when we are doing little business. And it works no hardship on our employees: we don't engage in layoffs when we experience a cyclical slowdown at one of our generally-profitable insurance operations. This no-layoff practice is in

our self-interest. Employees who fear that large layoffs will accompany sizable reductions in premium volume will understandably produce scads of business through thick and thin (mostly thin).

The trends in National Indemnity's traditional business - the writing of commercial auto and general liability policies through general agents - suggest how gun-shy other insurers became for a while and how brave they are now getting. In the last quarter of 1984, NICO's monthly volume averaged \$5 million, about what it had been running for several years. By the first quarter of 1986, monthly volume had climbed to about \$35 million. In recent months, a sharp decline has set in. Monthly volume is currently about \$20 million and will continue to fall as new competitors surface and prices are cut. Ironically, the managers of certain major new competitors are the very same managers that just a few years ago bankrupted insurers that were our old competitors. Through state-mandated guaranty funds, we must pay some of the losses these managers left unpaid, and now we find them writing the same sort of business under a new name. C'est la guerre.

The business we call "large risks" expanded significantly during 1986, and will be important to us in the future. In this operation, we regularly write policies with annual premiums of \$1 - \$3 million, or even higher. This business will necessarily be highly volatile - both in volume and profitability - but our premier capital position and willingness to write large net lines make us a very strong force in the market when prices are right. On the other hand, our structured settlement business has become near-dormant because present prices make no sense to us.

The 1986 loss reserve development of our insurance group is chronicled on page 46. The figures show the amount of error in our yearend 1985 liabilities that a year of settlements and further evaluation has revealed. As you can see, what I told you last year about our loss liabilities was far from true - and that makes three years in a row of error. If the physiological rules that applied to Pinocchio were to apply to me, my nose would now draw crowds.

When insurance executives belatedly establish proper reserves, they often speak of "reserve strengthening," a term that has a rather noble ring to it. They almost make it sound as if they are adding extra layers of strength to an already-solid balance sheet. That's not the case: instead the term is a euphemism for what should more properly be called "correction of previous untruths" (albeit non-intentional ones).

We made a special effort at the end of 1986 to reserve accurately. However, we tried just as hard at the end of 1985. Only time will tell whether we have finally succeeded in correctly estimating our insurance liabilities.

Despite the difficulties we have had in reserving and the commodity economics of the industry, we expect our insurance business to both grow and make significant amounts of money - but progress will be distinctly irregular and there will be major unpleasant surprises from time to time. It's a treacherous business and a wary attitude is essential. We must heed Woody Allen: "While the lamb may lie down with the lion, the lamb shouldn't count on getting a whole lot of sleep."

In our insurance operations we have an advantage in attitude, we have an advantage in capital, and we are developing an advantage in personnel. Additionally, I like to think we have some long-term edge in investing the float developed from policyholder funds. The nature of the business suggests that we will need all of these advantages in order to prosper.

* * *

GEICO Corporation, 41% owned by Berkshire, had an outstanding year in 1986. Industrywide, underwriting experience in personal lines did not improve nearly as much as it did in commercial lines. But GEICO, writing personal lines almost exclusively, improved its combined ratio to 96.9 and recorded a 16% gain in premium volume. GEICO also continued to repurchase its own shares and ended the year with 5.5% fewer shares outstanding than it had at the start of the year. Our share of GEICO's premium volume is over \$500 million, close to double that of only three years ago. GEICO's book of business is one of the best in the world of insurance, far better indeed than Berkshire's own book.

The most important ingredient in GEICO's success is rock-bottom operating costs, which set the company apart from literally hundreds of competitors that offer auto insurance. The total of GEICO's underwriting expense and loss adjustment expense in 1986 was only 23.5% of premiums. Many major companies show percentages 15 points higher than that. Even such huge direct writers as Allstate and State Farm incur appreciably higher costs than does GEICO.

The difference between GEICO's costs and those of its competitors is a kind of moat that protects a valuable and much-sought-after business castle. No one understands this moat-

around-the-castle concept better than Bill Snyder, Chairman of GEICO. He continually widens the moat by driving down costs still more, thereby defending and strengthening the economic franchise. Between 1985 and 1986, GEICO's total expense ratio dropped from 24.1% to the 23.5% mentioned earlier and, under Bill's leadership, the ratio is almost certain to drop further. If it does - and if GEICO maintains its service and underwriting standards - the company's future will be brilliant indeed.

The second stage of the GEICO rocket is fueled by Lou Simpson, Vice Chairman, who has run the company's investments since late 1979. Indeed, it's a little embarrassing for me, the fellow responsible for investments at Berkshire, to chronicle Lou's performance at GEICO. Only my ownership of a controlling block of Berkshire stock makes me secure enough to give you the following figures, comparing the overall return of the equity portfolio at GEICO to that of the Standard & Poor's 500:

Year	GEICO's Equities	S&P 500
1980	23.7%	32.3%
1981	5.4	(5.0)
1982	45.8	21.4
1983	36.0	22.4
1984	21.8	6.2
1985	45.8	31.6
1986	38.7	18.6

These are not only terrific figures but, fully as important, they have been achieved in the right way. Lou has consistently invested in undervalued common stocks that, individually, were unlikely to present him with a permanent loss and that, collectively, were close to risk-free.

In sum, GEICO is an exceptional business run by exceptional managers. We are fortunate to be associated with them.

Marketable Securities

During 1986, our insurance companies purchased about \$700 million of tax-exempt bonds, most having a maturity of 8 to 12 years. You might think that this commitment indicates a considerable enthusiasm for such bonds. Unfortunately, that's not so: at best, the bonds are

mediocre investments. They simply seemed the least objectionable alternative at the time we bought them, and still seem so. (Currently liking neither stocks nor bonds, I find myself the polar opposite of Mae West as she declared: "I like only two kinds of men - foreign and domestic.")

We must, of necessity, hold marketable securities in our insurance companies and, as money comes in, we have only five directions to go: (1) long-term common stock investments; (2) long-term fixed-income securities; (3) medium-term fixed-income securities; (4) short-term cash equivalents; and (5) short-term arbitrage commitments.

Common stocks, of course, are the most fun. When conditions are right that is, when companies with good economics and good management sell well below intrinsic business value - stocks sometimes provide grand-slam home runs. But we currently find no equities that come close to meeting our tests. This statement in no way translates into a stock market prediction: we have no idea - and never have had - whether the market is going to go up, down, or sideways in the near- or intermediate term future.

What we do know, however, is that occasional outbreaks of those two super-contagious diseases, fear and greed, will forever occur in the investment community. The timing of these epidemics will be unpredictable. And the market aberrations produced by them will be equally unpredictable, both as to duration and degree. Therefore, we never try to anticipate the arrival or departure of either disease. Our goal is more modest: we simply attempt to be fearful when others are greedy and to be greedy only when others are fearful.

As this is written, little fear is visible in Wall Street. Instead, euphoria prevails - and why not? What could be more exhilarating than to participate in a bull market in which the rewards to owners of businesses become gloriously uncoupled from the plodding performances of the businesses themselves. Unfortunately, however, stocks can't outperform businesses indefinitely.

Indeed, because of the heavy transaction and investment management costs they bear, stockholders as a whole and over the long term must inevitably underperform the companies they own. If American business, in aggregate, earns about 12% on equity annually, investors must end up earning significantly less. Bull markets can obscure mathematical laws, but they cannot repeal them.

The second category of investments open to our insurance companies is long-term bonds. These are unlikely to be of interest to us except in very special situations, such as the Washington Public Power Supply System #1, #2 and #3 issues, discussed in our 1984 report. (At

yearend, we owned WPPSS issues having an amortized cost of \$218 million and a market value of \$310 million, paying us \$31.7 million in annual tax-exempt income.) Our aversion to long-term bonds relates to our fear that we will see much higher rates of inflation within the next decade. Over time, the behavior of our currency will be determined by the behavior of our legislators. This relationship poses a continuing threat to currency stability - and a corresponding threat to the owners of long-term bonds.

We continue to periodically employ money in the arbitrage field. However, unlike most arbitrageurs, who purchase dozens of securities each year, we purchase only a few. We restrict ourselves to large deals that have been announced publicly and do not bet on the come. Therefore, our potential profits are apt to be small; but, with luck, our disappointments will also be few.

Our yearend portfolio shown below includes one arbitrage commitment, Lear-Siegler. Our balance sheet also includes a receivable for \$145 million, representing the money owed us (and paid a few days later) by Unilever, then in the process of purchasing Chesebrough-Ponds, another of our arbitrage holdings. Arbitrage is an alternative to Treasury Bills as a short-term parking place for money - a choice that combines potentially higher returns with higher risks. To date, our returns from the funds committed to arbitrage have been many times higher than they would have been had we left those funds in Treasury Bills. Nonetheless, one bad experience could change the scorecard markedly.

We also, though it takes some straining, currently view medium-term tax-exempt bonds as an alternative to short-term Treasury holdings. Buying these bonds, we run a risk of significant loss if, as seems probable, we sell many of them well before maturity. However, we believe this risk is more than counter-balanced first, by the much higher after-tax returns currently realizable from these securities as compared to Treasury Bills and second, by the possibility that sales will produce an overall profit rather than a loss. Our expectation of a higher total return, after allowing for the possibility of loss and after taking into account all tax effects, is a relatively close call and could well be wrong. Even if we sell our bonds at a fairly large loss, however, we may end up reaping a higher after-tax return than we would have realized by repeatedly rolling over Treasury Bills.

In any event, you should know that our expectations for both the stocks and bonds we now hold are exceptionally modest, given current market levels. Probably the best thing that could

happen to us is a market in which we would choose to sell many of our bond holdings at a significant loss in order to re-allocate funds to the far-better equity values then very likely to exist. The bond losses I am talking about would occur if high interest rates came along; the same rates would probably depress common stocks considerably more than medium-term bonds.

We show below our 1986 yearend net holdings in marketable equities. All positions with a market value of over \$25 million are listed, and the interests attributable to minority shareholdings of Wesco Financial Corp. and Nebraska Furniture Mart are excluded.

Shares	Company	Cost (000's omitted)	Market (000's omitted)
2,990,000	Capital Cities/ABC, Inc.	\$515,775	\$801,694
6,850,000	GEICO Corporation.	45,713	674,725
2,379,200	Handy & Harman	27,318	46,989
489,300	Lear Siegler, Inc.	44,064	46,989
1,727,765	The Washington Post Company	9,731	205,172
	Total	\$642,601	\$1,837,526
	All Other Common Stockholdings	12,763	36,507
	Total Common Stocks	\$655,364	\$1,874,033

We should note that we expect to keep permanently our three primary holdings, Capital Cities/ABC, Inc., GEICO Corporation, and The Washington Post. Even if these securities were to appear significantly overpriced, we would not anticipate selling them, just as we would not sell See's or Buffalo Evening News if someone were to offer us a price far above what we believe those businesses are worth.

This attitude may seem old-fashioned in a corporate world in which activity has become the order of the day. The modern manager refers to his "portfolio" of businesses - meaning that all of them are candidates for "restructuring" whenever such a move is dictated by Wall Street preferences, operating conditions or a new corporate "concept." (Restructuring is defined narrowly, however: it extends only to dumping offending businesses, not to dumping the officers and directors who bought the businesses in the first place. "Hate the sin but love the sinner" is a theology as popular with the Fortune 500 as it is with the Salvation Army.)

Investment managers are even more hyperkinetic: their behavior during trading hours makes whirling dervishes appear sedated by comparison. Indeed, the term "institutional investor" is becoming one of those self-contradictions called an oxymoron, comparable to "jumbo shrimp," "lady mudwrestler" and "inexpensive lawyer."

Despite the enthusiasm for activity that has swept business and financial America, we will stick with our 'til-death-do-us-part policy. It's the only one with which Charlie and I are comfortable, it produces decent results, and it lets our managers and those of our investees run their businesses free of distractions.

NHP, Inc.

Last year we paid \$23.7 million for about 50% of NHP, Inc., a developer, syndicator, owner and manager of multi-family rental housing. Should all executive stock options that have been authorized be granted and exercised, our equity interest will decline to slightly over 45%.

NHP, Inc. has a most unusual genealogy. In 1967, President Johnson appointed a commission of business and civic leaders, led by Edgar Kaiser, to study ways to increase the supply of multifamily housing for low- and moderate-income tenants. Certain members of the commission subsequently formed and promoted two business entities to foster this goal. Both are now owned by NHP, Inc. and one operates under unusual ground rules: three of its directors must be appointed by the President, with the advice and consent of the Senate, and it is also required by law to submit an annual report to the President.

Over 260 major corporations, motivated more by the idea of public service than profit, invested \$42 million in the two original entities, which promptly began, through partnerships, to develop government-subsidized rental property. The typical partnership owned a single property and was largely financed by a non-recourse mortgage. Most of the equity money for each partnership was supplied by a group of limited partners who were primarily attracted by the large tax deductions that went with the investment. NHP acted as general partner and also purchased a small portion of each partnership's equity.

The Government's housing policy has, of course, shifted and NHP has necessarily broadened its activities to include non-subsidized apartments commanding market-rate rents. In addition, a subsidiary of NHP builds single-family homes in the Washington, D.C. area, realizing revenues of about \$50 million annually.

NHP now oversees about 500 partnership properties that are located in 40 states, the District of Columbia and Puerto Rico, and that include about 80,000 housing units. The cost of these properties was more than \$2.5 billion and they have been well maintained. NHP directly manages about 55,000 of the housing units and supervises the management of the rest. The company's revenues from management are about \$16 million annually, and growing.

In addition to the equity interests it purchased upon the formation of each partnership, NHP owns varying residual interests that come into play when properties are disposed of and distributions are made to the limited partners. The residuals on many of NHP's "deep subsidy" properties are unlikely to be of much value. But residuals on certain other properties could prove quite valuable, particularly if inflation should heat up.

The tax-oriented syndication of properties to individuals has been halted by the Tax Reform Act of 1986. In the main, NHP is currently trying to develop equity positions or significant residual interests in non-subsidized rental properties of quality and size (typically 200 to 500 units). In projects of this kind, NHP usually works with one or more large institutional investors or lenders. NHP will continue to seek ways to develop low- and moderate-income apartment housing, but will not likely meet success unless government policy changes.

Besides ourselves, the large shareholders in NHP are Weyerhaeuser (whose interest is about 25%) and a management group led by Rod Heller, chief executive of NHP. About 60 major corporations also continue to hold small interests, none larger than 2%.

Taxation

The Tax Reform Act of 1986 affects our various businesses in important and divergent ways. Although we find much to praise in the Act, the net financial effect for Berkshire is negative: our rate of increase in business value is likely to be at least moderately slower under the new law than under the old. The net effect for our shareholders is even more negative: every dollar of increase in per-share business value, assuming the increase is accompanied by an equivalent dollar gain in the market value of Berkshire stock, will produce 72 cents of after-tax gain for our shareholders rather than the 80 cents produced under the old law. This result, of course, reflects the rise in the maximum tax rate on personal capital gains from 20% to 28%.

Here are the main tax changes that affect Berkshire:

o The tax rate on corporate ordinary income is scheduled to decrease from 46% in 1986 to 34% in 1988. This change obviously affects us positively - and it also has a significant positive effect on two of our three major investees, Capital Cities/ABC and The Washington Post Company.

I say this knowing that over the years there has been a lot of fuzzy and often partisan commentary about who really pays corporate taxes - businesses or their customers. The argument, of course, has usually turned around tax increases, not decreases. Those people resisting increases in corporate rates frequently argue that corporations in reality pay none of the taxes levied on them but, instead, act as a sort of economic pipeline, passing all taxes through to consumers. According to these advocates, any corporate-tax increase will simply lead to higher prices that, for the corporation, offset the increase. Having taken this position, proponents of the "pipeline" theory must also conclude that a tax decrease for corporations will not help profits but will instead flow through, leading to correspondingly lower prices for consumers.

Conversely, others argue that corporations not only pay the taxes levied upon them, but absorb them also. Consumers, this school says, will be unaffected by changes in corporate rates.

What really happens? When the corporate rate is cut, do Berkshire, The Washington Post, Cap Cities, etc., themselves soak up the benefits, or do these companies pass the benefits along to their customers in the form of lower prices? This is an important question for investors and managers, as well as for policymakers.

Our conclusion is that in some cases the benefits of lower corporate taxes fall exclusively, or almost exclusively, upon the corporation and its shareholders, and that in other cases the benefits are entirely, or almost entirely, passed through to the customer. What determines the outcome is the strength of the corporation's business franchise and whether the profitability of that franchise is regulated.

For example, when the franchise is strong and after-tax profits are regulated in a relatively precise manner, as is the case with electric utilities, changes in corporate tax rates are largely reflected in prices, not in profits. When taxes are cut, prices will usually be reduced in short order. When taxes are increased, prices will rise, though often not as promptly.

A similar result occurs in a second arena - in the price-competitive industry, whose companies typically operate with very weak business franchises. In such industries, the free market "regulates" after-tax profits in a delayed and irregular, but generally effective, manner. The marketplace, in effect, performs much the same function in dealing with the price-competitive

industry as the Public Utilities Commission does in dealing with electric utilities. In these industries, therefore, tax changes eventually affect prices more than profits.

In the case of unregulated businesses blessed with strong franchises, however, it's a different story: the corporation and its shareholders are then the major beneficiaries of tax cuts. These companies benefit from a tax cut much as the electric company would if it lacked a regulator to force down prices.

Many of our businesses, both those we own in whole and in part, possess such franchises. Consequently, reductions in their taxes largely end up in our pockets rather than the pockets of our customers. While this may be impolitic to state, it is impossible to deny. If you are tempted to believe otherwise, think for a moment of the most able brain surgeon or lawyer in your area. Do you really expect the fees of this expert (the local "franchise-holder" in his or her specialty) to be reduced now that the top personal tax rate is being cut from 50% to 28%?

Your joy at our conclusion that lower rates benefit a number of our operating businesses and investees should be severely tempered, however, by another of our convictions: scheduled 1988 tax rates, both individual and corporate, seem totally unrealistic to us. These rates will very likely bestow a fiscal problem on Washington that will prove incompatible with price stability. We believe, therefore, that ultimately - within, say, five years - either higher tax rates or higher inflation rates are almost certain to materialize. And it would not surprise us to see both.

o Corporate capital gains tax rates have been increased from 28% to 34%, effective in 1987. This change will have an important adverse effect on Berkshire because we expect much of our gain in business value in the future, as in the past, to arise from capital gains. For example, our three major investment holdings - Cap Cities, GEICO, and Washington Post - at yearend had a market value of over \$1.7 billion, close to 75% of the total net worth of Berkshire, and yet they deliver us only about \$9 million in annual income. Instead, all three retain a very high percentage of their earnings, which we expect to eventually deliver us capital gains.

The new law increases the rate for all gains realized in the future, including the unrealized gains that existed before the law was enacted. At yearend, we had \$1.2 billion of such unrealized gains in our equity investments. The effect of the new law on our balance sheet will be delayed because a GAAP rule stipulates that the deferred tax liability applicable to unrealized gains should be stated at last year's 28% tax rate rather than the current 34% rate. This rule is

expected to change soon. The moment it does, about \$73 million will disappear from our GAAP net worth and be added to the deferred tax account.

- o Dividend and interest income received by our insurance companies will be taxed far more heavily under the new law. First, all corporations will be taxed on 20% of the dividends they receive from other domestic corporations, up from 15% under the old law. Second, there is a change concerning the residual 80% that applies only to property/casualty companies: 15% of that residual will be taxed if the stocks paying the dividends were purchased after August 7, 1986. A third change, again applying only to property/casualty companies, concerns tax-exempt bonds: interest on bonds purchased by insurers after August 7, 1986 will only be 85% tax-exempt.

The last two changes are very important. They mean that our income from the investments we make in future years will be significantly lower than would have been the case under the old law. My best guess is that these changes alone will eventually reduce the earning power of our insurance operation by at least 10% from what we could previously have expected.

- o The new tax law also materially changes the timing of tax payments by property/casualty insurance companies. One new rule requires us to discount our loss reserves in our tax returns, a change that will decrease deductions and increase taxable income. Another rule, to be phased in over six years, requires us to include 20% of our unearned premium reserve in taxable income.

Neither rule changes the amount of the annual tax accrual in our reports to you, but each materially accelerates the schedule of payments. That is, taxes formerly deferred will now be front-ended, a change that will significantly cut the profitability of our business. An analogy will suggest the toll: if, upon turning 21, you were required to immediately pay tax on all income you were due to receive throughout your life, both your lifetime wealth and your estate would be a small fraction of what they would be if all taxes on your income were payable only when you died.

Attentive readers may spot an inconsistency in what we say. Earlier, discussing companies in price-competitive industries, we suggested that tax increases or reductions affect these companies relatively little, but instead are largely passed along to their customers. But now we are saying that tax increases will affect profits of Berkshire's property/casualty companies even though they operate in an intensely price-competitive industry.

The reason this industry is likely to be an exception to our general rule is that not all major insurers will be working with identical tax equations. Important differences will exist for several reasons: a new alternative minimum tax will materially affect some companies but not others; certain major insurers have huge loss carry-forwards that will largely shield their income from significant taxes for at least a few years; and the results of some large insurers will be folded into the consolidated returns of companies with non-insurance businesses. These disparate conditions will produce widely varying marginal tax rates in the property/casualty industry. That will not be the case, however, in most other price-competitive industries, such as aluminum, autos and department stores, in which the major players will generally contend with similar tax equations.

The absence of a common tax calculus for property/casualty companies means that the increased taxes falling on the industry will probably not be passed along to customers to the degree that they would in a typical price-competitive industry. Insurers, in other words, will themselves bear much of the new tax burdens.

- o A partial offset to these burdens is a "fresh start" adjustment that occurred on January 1, 1987 when our December 31, 1986 loss reserve figures were converted for tax purposes to the newly-required discounted basis. (In our reports to you, however, reserves will remain on exactly the same basis as in the past - undiscounted except in special cases such as structured settlements.) The net effect of the "fresh start" is to give us a double deduction: we will get a tax deduction in 1987 and future years for a portion of our-incurred-but-unpaid insurance losses that have already been fully deducted as costs in 1986 and earlier years.

The increase in net worth that is produced by this change is not yet reflected in our financial statements. Rather, under present GAAP rules (which may be changed), the benefit will flow into the earnings statement and, consequently, into net worth over the next few years by way of reduced tax charges. We expect the total benefit from the fresh-start adjustment to be in the \$30 - \$40 million range. It should be noted, however, that this is a one-time benefit, whereas the negative impact of the other insurance-related tax changes is not only ongoing but, in important respects, will become more severe as time passes.

- o The General Utilities Doctrine was repealed by the new tax law. This means that in 1987 and thereafter there will be a double tax on corporate liquidations, one at the corporate level and another at the shareholder level. In the past, the tax at the corporate level could be avoided. If Berkshire, for example, were to be liquidated - which it most certainly won't be - shareholders

would, under the new law, receive far less from the sales of our properties than they would have if the properties had been sold in the past, assuming identical prices in each sale. Though this outcome is theoretical in our case, the change in the law will vary materially affect many companies. Therefore, it also affects our evaluations of prospective investments. Take, for example, producing oil and gas businesses, selected media companies, real estate companies, etc. that might wish to sell out. The values that their shareholders can realize are likely to be significantly reduced simply because the General Utilities Doctrine has been repealed - though the companies' operating economics will not have changed adversely at all. My impression is that this important change in the law has not yet been fully comprehended by either investors or managers.

This section of our report has been longer and more complicated than I would have liked. But the changes in the law are many and important, particularly for property/casualty insurers. As I have noted, the new law will hurt Berkshire's results, but the negative impact is impossible to quantify with any precision.

Miscellaneous

We bought a corporate jet last year. What you have heard about such planes is true: they are very expensive and a luxury in situations like ours where little travel to out-of-the-way places is required. And planes not only cost a lot to operate, they cost a lot just to look at. Pre-tax, cost of capital plus depreciation on a new \$15 million plane probably runs \$3 million annually. On our own plane, bought for \$850,000 used, such costs run close to \$200,000 annually.

Cognizant of such figures, your Chairman, unfortunately, has in the past made a number of rather intemperate remarks about corporate jets. Accordingly, prior to our purchase, I was forced into my Galileo mode. I promptly experienced the necessary "counter-revelation" and travel is now considerably easier - and considerably costlier - than in the past. Whether Berkshire will get its money's worth from the plane is an open question, but I will work at achieving some business triumph that I can (no matter how dubiously) attribute to it. I'm afraid Ben Franklin had my number. Said he: "So convenient a thing it is to be a reasonable creature, since it enables one to find or make a reason for everything one has a mind to do."

About 97% of all eligible shares participated in Berkshire's 1986 shareholder-designated contributions program. Contributions made through the program were \$4 million, and 1,934 charities were recipients.

We urge new shareholders to read the description of our shareholder-designated contributions program that appears on pages 58 and 59. If you wish to participate in future programs, we strongly urge that you immediately make sure your shares are registered in the name of the actual owner, not in "street" name or nominee name. Shares not so registered on September 30, 1987 will be ineligible for the 1987 program.

* * *

Last year almost 450 people attended our shareholders' meeting, up from about 250 the year before (and from about a dozen ten years ago). I hope you can join us on May 19th in Omaha. Charlie and I like to answer owner-related questions and I can promise you that our shareholders will pose many good ones. Finishing up the questions may take quite a while - we had about 65 last year so you should feel free to leave once your own have been answered.

Last year, after the meeting, one shareholder from New Jersey and another from New York went to the Furniture Mart, where each purchased a \$5,000 Oriental rug from Mrs. B. (To be precise, they purchased rugs that might cost \$10,000 elsewhere for which they were charged about \$5,000.) Mrs. B was pleased - but not satisfied - and she will be looking for you at the store after this year's meeting. Unless our shareholders top last year's record, I'll be in trouble. So do me (and yourself) a favor, and go see her.

Warren E. Buffett

Appendix

Purchase-Price Accounting Adjustments and the "Cash Flow" Fallacy

First a short quiz: below are abbreviated 1986 statements of earnings for two companies. Which business is the more valuable?

(000's Omitted)	Company O	Company N
Revenues	\$677,240	\$677,240
<i>Cost of Goods Sold</i>		
Historical Costs Excluding Depreciation	341,170	341,170
Special non-cash inventory costs	0	4,979
Depreciation of plant and equipment	8,301	13,355
Total	349,471	359,504
Gross Profit	327,769	317,736
Selling and Administrative Expense	260,286	260,286
Amortization of Goodwill	0	595
Total	260,286	260,881
Operating Profit	67,483	56,855
Other Income, Net	4,135	4,135
Pre-Tax Income	71,618	60,990
<i>Applicable Income Tax</i>		
Historical deferred and current tax	31,387	31,387
Non-Cash Inter-period Allocation Adjustment	0	998
Total	31,387	32,385
Net Income	40,231	28,605

As you've probably guessed, Companies O and N are the same business - Scott Fetzer. In the "O" (for "old") column we have shown what the company's 1986 GAAP earnings would have been if we had not purchased it; in the "N" (for "new") column we have shown Scott Fetzer's GAAP earnings as actually reported by Berkshire. It should be emphasized that the two columns depict identical economics - i.e., the same sales, wages, taxes, etc. And both "companies" generate the

same amount of cash for owners. Only the accounting is different. So, fellow philosophers, which column presents truth? Upon which set of numbers should managers and investors focus? Before we tackle those questions, let's look at what produces the disparity between O and N. We will simplify our discussion in some respects, but the simplification should not produce any inaccuracies in analysis or conclusions.

The contrast between O and N comes about because we paid an amount for Scott Fetzer that was different from its stated net worth. Under GAAP, such differences - such premiums or discounts - must be accounted for by "purchase-price adjustments." In Scott Fetzer's case, we paid \$315 million for net assets that were carried on its books at \$172.4 million. So we paid a premium of \$142.6 million.

The first step in accounting for any premium paid is to adjust the carrying value of current assets to current values. In practice, this requirement usually does not affect receivables, which are routinely carried at current value, but often affects inventories. Because of a \$22.9 million LIFO reserve and other accounting intricacies, Scott Fetzer's inventory account was carried at a \$37.3 million discount from current value. So, making our first accounting move, we used \$37.3 million of our \$142.6 million premium to increase the carrying value of the inventory.

Assuming any premium is left after current assets are adjusted, the next step is to adjust fixed assets to current value. In our case, this adjustment also required a few accounting acrobatics relating to deferred taxes. Since this has been billed as a simplified discussion, I will skip the details and give you the bottom line: \$68.0 million was added to fixed assets and \$13.0 million was eliminated from deferred tax liabilities. After making this \$81.0 million adjustment, we were left with \$24.3 million of premium to allocate.

Had our situation called for them two steps would next have been required: the adjustment of intangible assets other than Goodwill to current fair values, and the restatement of liabilities to current fair values, a requirement that typically affects only long-term debt and unfunded pension liabilities. In Scott Fetzer's case, however, neither of these steps was necessary.

The final accounting adjustment we needed to make, after recording fair market values for all assets and liabilities, was the assignment of the residual premium to Goodwill (technically known as "excess of cost over the fair value of net assets acquired"). This residual amounted to \$24.3 million. Thus, the balance sheet of Scott Fetzer immediately before the acquisition, which is summarized below in column O, was transformed by the purchase into the balance sheet

shown in column N. In real terms, both balance sheets depict the same assets and liabilities - but, as you can see, certain figures differ significantly.

(000's Omitted)	Company O	Company N
<i>Assets</i>		
Cash and Cash Equivalents	\$3,593	\$3,593
Receivables, net	90,919	90,919
Inventories	77,489	114,764
Other	5,954	5,954
Total Current Assets	177,955	215,230
Property, Plant, and Equipment, net	80,967	148,960
Investments in and Advances to Unconsolidated Subsidiaries and Joint Ventures	93,589	93,589
Other Assets, including Goodwill	9,836	34,210
Total	\$362,347	491,989
<i>Liabilities</i>		
Notes Payable and Current Portion of Long- term Debt	4,650	4,650
Accounts Payable	39,003	39,003
Accrued Liabilities	84,939	84,939
Total Current Liabilities	128,592	128,592
Long-term Debt and Capitalized Leases	34,669	34,669
Deferred Income Taxes	17,052	17,052
Othered Deferred Credits	9,657	9,657
Total Liabilities	189,970	176,993
Shareholders' Equity	172,377	314,996
Total	\$362,347	\$491,989

The higher balance sheet figures shown in column N produce the lower income figures shown in column N of the earnings statement presented earlier. This is the result of the asset write-ups and of the fact that some of the written-up assets must be depreciated or amortized. The higher the asset figure, the higher the annual depreciation or amortization charge to earnings must be. The charges that flowed to the earnings statement because of the balance sheet write-ups were numbered in the statement of earnings shown earlier:

1. \$4,979,000 for non-cash inventory costs resulting, primarily, from reductions that Scott Fetzer made in its inventories during 1986; charges of this kind are apt to be small or non-existent in future years.
2. \$5,054,000 for extra depreciation attributable to the write-up of fixed assets; a charge approximating this amount will probably be made annually for 12 more years.
3. \$595,000 for amortization of Goodwill; this charge will be made annually for 39 more years in a slightly larger amount because our purchase was made on January 6 and, therefore, the 1986 figure applies to only 98% of the year.
4. \$998,000 for deferred-tax acrobatics that are beyond my ability to explain briefly (or perhaps even non-briefly); a charge approximating this amount will probably be made annually for 12 more years.

It is important to understand that none of these newly-created accounting costs, totaling \$11.6 million, are deductible for income tax purposes. The "new" Scott Fetzer pays exactly the same tax as the "old" Scott Fetzer would have, even though the GAAP earnings of the two entities differ greatly. And, in respect to operating earnings, that would be true in the future also. However, in the unlikely event that Scott Fetzer sells one of its businesses, the tax consequences to the "old" and "new" company might differ widely.

By the end of 1986 the difference between the net worth of the "old" and "new" Scott Fetzer had been reduced from \$142.6 million to \$131.0 million by means of the extra \$11.6 million that was charged to earnings of the new entity. As the years go by, similar charges to earnings will cause most of the premium to disappear, and the two balance sheets will converge. However, the higher land values and most of the higher inventory values that were established on the new balance sheet will remain unless land is disposed of or inventory levels are further reduced.

* * *

What does all this mean for owners? Did the shareholders of Berkshire buy a business that earned \$40.2 million in 1986 or did they buy one earning \$28.6 million? Were those \$11.6 million of new charges a real economic cost to us? Should investors pay more for the stock of Company O than of Company N? And, if a business is worth some given multiple of earnings, was Scott Fetzer worth considerably more the day before we bought it than it was worth the following day?

If we think through these questions, we can gain some insights about what may be called "owner earnings." These represent (a) reported earnings plus (b) depreciation, depletion, amortization, and certain other non-cash charges such as Company N's items (1) and (4) less (c) the average annual amount of capitalized expenditures for plant and equipment, etc. that the business requires to fully maintain its long-term competitive position and its unit volume. (If the business requires additional working capital to maintain its competitive position and unit volume, the increment also should be included in (c). However, businesses following the LIFO inventory method usually do not require additional working capital if unit volume does not change.)

Our owner-earnings equation does not yield the deceptively precise figures provided by GAAP, since (c) must be a guess - and one sometimes very difficult to make. Despite this problem, we consider the owner earnings figure, not the GAAP figure, to be the relevant item for valuation purposes - both for investors in buying stocks and for managers in buying entire businesses. We agree with Keynes's observation: "I would rather be vaguely right than precisely wrong."

The approach we have outlined produces "owner earnings" for Company O and Company N that are identical, which means valuations are also identical, just as common sense would tell you should be the case. This result is reached because the sum of (a) and (b) is the same in both columns O and N, and because (c) is necessarily the same in both cases.

And what do Charlie and I, as owners and managers, believe is the correct figure for the owner earnings of Scott Fetzer? Under current circumstances, we believe (c) is very close to the "old" company's (b) number of \$8.3 million and much below the "new" company's (b) number of \$19.9 million. Therefore, we believe that owner earnings are far better depicted by the reported earnings in the O column than by those in the N column. In other words, we feel owner earnings of Scott Fetzer are considerably larger than the GAAP figures that we report.

That is obviously a happy state of affairs. But calculations of this sort usually do not provide such pleasant news. Most managers probably will acknowledge that they need to spend something more than (b) on their businesses over the longer term just to hold their ground in terms of both unit volume and competitive position. When this imperative exists - that is, when c exceeds (b) - GAAP earnings overstate owner earnings. Frequently this overstatement is substantial. The oil industry has in recent years provided a conspicuous example of this phenomenon. Had most major oil companies spent only (b) each year, they would have guaranteed their shrinkage in real terms.

All of this points up the absurdity of the "cash flow" numbers that are often set forth in Wall Street reports. These numbers routinely include (a) plus (b) - but do not subtract c . Most sales brochures of investment bankers also feature deceptive presentations of this kind. These imply that the business being offered is the commercial counterpart of the Pyramids - forever state-of-the-art, never needing to be replaced, improved or refurbished. Indeed, if all U.S. corporations were to be offered simultaneously for sale through our leading investment bankers - and if the sales brochures describing them were to be believed - governmental projections of national plant and equipment spending would have to be slashed by 90%.

"Cash Flow", true, may serve as a shorthand of some utility in descriptions of certain real estate businesses or other enterprises that make huge initial outlays and only tiny outlays thereafter. A company whose only holding is a bridge or an extremely long-lived gas field would be an example. But "cash flow" is meaningless in such businesses as manufacturing, retailing, extractive companies, and utilities because, for them, c is always significant. To be sure, businesses of this kind may in a given year be able to defer capital spending. But over a five- or ten-year period, they must make the investment - or the business decays.

Why, then, are "cash flow" numbers so popular today? In answer, we confess our cynicism: we believe these numbers are frequently used by marketers of businesses and securities in attempts to justify the unjustifiable (and thereby to sell what should be the unsalable). When (a) - that is, GAAP earnings - looks by itself inadequate to service debt of a junk bond or justify a foolish stock price, how convenient it becomes for salesmen to focus on (a) + (b). But you shouldn't add (b) without subtracting c : though dentists correctly claim that if you ignore your teeth they'll go away, the same is not true for c . The company or investor believing

that the debt-servicing ability or the equity valuation of an enterprise can be measured by totaling (a) and (b) while ignoring c is headed for certain trouble.

* * *

To sum up: in the case of both Scott Fetzer and our other businesses, we feel that (b) on an historical-cost basis - i.e., with both amortization of intangibles and other purchase-price adjustments excluded - is quite close in amount to c . (The two items are not identical, of course. For example, at See's we annually make capitalized expenditures that exceed depreciation by \$500,000 to \$1 million, simply to hold our ground competitively.) Our conviction about this point is the reason we show our amortization and other purchase-price adjustment items separately in the table on page 8 and is also our reason for viewing the earnings of the individual businesses as reported there as much more closely approximating owner earnings than the GAAP figures.

Questioning GAAP figures may seem impious to some. After all, what are we paying the accountants for if it is not to deliver us the "truth" about our business. But the accountants' job is to record, not to evaluate. The evaluation job falls to investors and managers.

Accounting numbers, of course, are the language of business and as such are of enormous help to anyone evaluating the worth of a business and tracking its progress. Charlie and I would be lost without these numbers: they invariably are the starting point for us in evaluating our own businesses and those of others. Managers and owners need to remember, however, that accounting is but an aid to business thinking, never a substitute for it.

1987 Letter

BERKSHIRE HATHAWAY INC.

To the Shareholders of Berkshire Hathaway Inc.:

Our gain in net worth during 1987 was \$464 million, or 19.5%. Over the last 23 years (that is, since present management took over), our per-share book value has grown from \$19.46 to \$2,477.47, or at a rate of 23.1% compounded annually.

What counts, of course, is the rate of gain in per-share business value, not book value. In many cases, a corporation's book value and business value are almost totally unrelated. For example, just before they went bankrupt, LTV and Baldwin-United published yearend audits showing their book values to be \$652 million and \$397 million, respectively. Conversely, Belridge Oil was sold to Shell in 1979 for \$3.6 billion although its book value was only \$177 million.

At Berkshire, however, the two valuations have tracked rather closely, with the growth rate in business value over the last decade moderately outpacing the growth rate in book value. This good news continued in 1987.

Our premium of business value to book value has widened for two simple reasons: We own some remarkable businesses and they are run by even more remarkable managers.

You have a right to question that second assertion. After all, CEOs seldom tell their shareholders that they have assembled a bunch of turkeys to run things. Their reluctance to do so makes for some strange annual reports. Oftentimes, in his shareholders' letter, a CEO will go on for pages detailing corporate performance that is woefully inadequate. He will nonetheless end with a warm paragraph describing his managerial comrades as "our most precious asset." Such comments sometimes make you wonder what the other assets can possibly be.

At Berkshire, however, my appraisal of our operating managers is, if anything, understated. To understand why, first take a look at page 7, where we show the earnings (on an historical-cost accounting basis) of our seven largest non-financial units: Buffalo News, Fechheimer, Kirby,

Nebraska Furniture Mart, Scott Fetzer Manufacturing Group, See's Candies, and World Book. In 1987, these seven business units had combined operating earnings before interest and taxes of \$180 million.

By itself, this figure says nothing about economic performance. To evaluate that, we must know how much total capital - debt and equity - was needed to produce these earnings. Debt plays an insignificant role at our seven units: Their net interest expense in 1987 was only \$2 million. Thus, pre-tax earnings on the equity capital employed by these businesses amounted to \$178 million. And this equity - again on an historical-cost basis - was only \$175 million.

If these seven business units had operated as a single company, their 1987 *after-tax* earnings would have been approximately \$100 million - a return of about 57% on equity capital. You'll seldom see such a percentage anywhere, let alone at large, diversified companies with nominal leverage. Here's a benchmark: In its 1988 Investor's Guide issue, Fortune reported that among the 500 largest industrial companies and 500 largest service companies, only six had averaged a return on equity of over 30% during the previous decade. The best performer among the 1000 was Commerce Clearing House at 40.2%.

Of course, the returns that Berkshire earns from these seven units are not as high as their underlying returns because, in aggregate, we bought the businesses at a substantial premium to underlying equity capital. Overall, these operations are carried on our books at about \$222 million above the historical accounting values of the underlying assets. However, the managers of the units should be judged by the returns they achieve on the underlying assets; what we pay for a business does not affect the amount of capital its manager has to work with. (If, to become a shareholder and part owner of Commerce Clearing House, you pay, say, six times book value, that does not change CCH's return on equity.)

Three important inferences can be drawn from the figures I have cited. First, the current business value of these seven units is far above their historical book value and also far above the value at which they are carried on Berkshire's balance sheet. Second, because so little capital is required to run these businesses, they can grow while concurrently making almost all of their earnings available for deployment in new opportunities. Third, these businesses are run by truly extraordinary managers. The Blumkins, the Heldmans, Chuck Huggins, Stan Lipsey, and Ralph Schey all meld unusual talent, energy and character to achieve exceptional financial results.

For good reasons, we had very high expectations when we joined with these managers. In every case, however, our experience has greatly exceeded those expectations. We have received far more than we deserve, but we are willing to accept such inequities. (We subscribe to the view Jack Benny expressed upon receiving an acting award: "I don't deserve this, but then, I have arthritis and I don't deserve that either.")

Beyond the Sainted Seven, we have our other major unit, insurance, which I believe also has a business value well above the net assets employed in it. However, appraising the business value of a property-casualty insurance company is a decidedly imprecise process. The industry is volatile, reported earnings oftentimes are seriously inaccurate, and recent changes in the Tax Code will severely hurt future profitability. Despite these problems, we like the business and it will almost certainly remain our largest operation. Under Mike Goldberg's management, the insurance business should treat us well over time.

With managers like ours, my partner, Charlie Munger, and I have little to do with operations. In fact, it is probably fair to say that if we did more, less would be accomplished. We have no corporate meetings, no corporate budgets, and no performance reviews (though our managers, of course, oftentimes find such procedures useful at their operating units). After all, what can we tell the Blumkins about home furnishings, or the Heldmans about uniforms?

Our major contribution to the operations of our subsidiaries is applause. But it is not the indiscriminate applause of a Pollyanna. Rather it is informed applause based upon the two long careers we have spent intensively observing business performance and managerial behavior. Charlie and I have seen so much of the ordinary in business that we can truly appreciate a virtuoso performance. Only one response to the 1987 performance of our operating managers is appropriate: sustained, deafening applause.

Sources of Reported Earnings

The table on the following page shows the major sources of Berkshire's reported earnings. In the table, amortization of Goodwill and other major purchase-price accounting adjustments are not charged against the specific businesses to which they apply but, instead, are aggregated and shown separately. In effect, this procedure presents the earnings of our businesses as they would have been reported had we not purchased them. In appendixes to my letters in the 1983 and 1986 annual reports, I explained why this form of presentation seems to us to be more useful to

investors and managers than the standard GAAP presentation, which makes purchase-price adjustments on a business-by business basis. The total net earnings we show in the table are, of course, identical to the GAAP figures in our audited financial statements.

In the Business Segment Data on pages 36-38 and in the Management's Discussion section on pages 40-44 you will find much additional information about our businesses. In these sections you will also find our segment earnings reported on a GAAP basis. I urge you to read that material, as well as Charlie Munger's letter to Wesco shareholders, describing the various businesses of that subsidiary, which starts on page 45.

Operating Earnings (000s omitted)	Pre-Tax 1986	Earnings 1985	Berkshire 1986	Share 1985
Insurance Group:				
Underwriting	\$(55,429)	\$(55,844)	\$(20,696)	\$(29,894)

Total Earnings- all entities	\$308,238	\$412,099	\$234,552	\$282,361

Gypsy Rose Lee announced on one of her later birthdays: "I have everything I had last year; it's just that it's all two inches lower." As the table shows, during 1987 almost all of our businesses aged in a more upbeat way.

There's not a lot new to report about these businesses - and that's good, not bad. Severe change and exceptional returns usually don't mix. Most investors, of course, behave as if just the opposite were true. That is, they usually confer the highest price-earnings ratios on exotic-sounding businesses that hold out the promise of feverish change. That prospect lets investors fantasize about future profitability rather than face today's business realities. For such investor-dreamers, any blind date is preferable to one with the girl next door, no matter how desirable she may be.

Experience, however, indicates that the best business returns are usually achieved by companies that are doing something quite similar today to what they were doing five or ten years ago. That is no argument for managerial complacency. Businesses always have opportunities to improve service, product lines, manufacturing techniques, and the like, and obviously these opportunities should be seized. But a business that constantly encounters major change also encounters many chances for major error. Furthermore, economic terrain that is forever shifting violently is ground on which it is difficult to build a fortress-like business franchise. Such a franchise is usually the key to sustained high returns.

The Fortune study I mentioned earlier supports our view. Only 25 of the 1,000 companies met two tests of economic excellence - an average return on equity of over 20% in the ten years, 1977 through 1986, and no year worse than 15%. These business superstars were also stock market superstars: During the decade, 24 of the 25 outperformed the S&P 500.

The Fortune champs may surprise you in two respects. First, most use very little leverage compared to their interest-paying capacity. Really good businesses usually don't need to borrow. Second, except for one company that is "high-tech" and several others that manufacture ethical drugs, the companies are in businesses that, on balance, seem rather mundane. Most sell non-sexy products or services in much the same manner as they did ten years ago (though in larger quantities now, or at higher prices, or both). The record of these 25 companies confirms that making the most of an already strong business franchise, or concentrating on a single winning business theme, is what usually produces exceptional economics.

Berkshire's experience has been similar. Our managers have produced extraordinary results by doing rather ordinary things - but doing them exceptionally well. Our managers protect their franchises, they control costs, they search for new products and markets that build on their existing strengths and they don't get diverted. They work exceptionally hard at the details of their businesses, and it shows.

Here's an update:

- o Agatha Christie, whose husband was an archaeologist, said that was the perfect profession for one's spouse: "The older you become, the more interested they are in you." It is students of business management, not archaeologists, who should be interested in Mrs. B (Rose Blumkin), the 94-year-old chairman of Nebraska Furniture Mart.

Fifty years ago Mrs. B started the business with \$500, and today NFM is far and away the largest home furnishings store in the country. Mrs. B continues to work seven days a week at the job from the opening of each business day until the close. She buys, she sells, she manages - and she runs rings around the competition. It's clear to me that she's gathering speed and may well reach her full potential in another five or ten years. Therefore, I've persuaded the Board to scrap our mandatory retirement-at-100 policy. (And it's about time: With every passing year, this policy has seemed sillier to me.)

Net sales of NFM were \$142.6 million in 1987, up 8% from 1986. There's nothing like this store in the country, and there's nothing like the family Mrs. B has produced to carry on: Her son Louie, and his three boys, Ron, Irv and Steve, possess the business instincts, integrity and drive of Mrs. B. They work as a team and, strong as each is individually, the whole is far greater than the sum of the parts.

The superb job done by the Blumkins benefits us as owners, but even more dramatically benefits NFM's customers. They saved about \$30 million in 1987 by buying from NFM. In other words, the goods they bought would have cost that much more if purchased elsewhere.

You'll enjoy an anonymous letter I received last August: "Sorry to see Berkshire profits fall in the second quarter. One way you may gain back part of your lost. (sic) Check the pricing at The Furniture Mart. You will find that they are leaving 10% to 20% on the table. This additional profit on \$140 million of sells (sic) is \$28 million. Not small change in anyone's pocket! Check out other furniture, carpet, appliance and T.V. dealers. Your raising prices to a reasonable profit will help. Thank you. /signed/ A Competitor."

NFM will continue to grow and prosper by following Mrs. B's maxim: "Sell cheap and tell the truth."

o Among dominant papers of its size or larger, the Buffalo News continues to be the national leader in two important ways: (1) its weekday and Sunday penetration rate (the percentage of households in the paper's primary market area that purchase it); and (2) its "news-hole" percentage (the portion of the paper devoted to news).

It may not be coincidence that one newspaper leads in both categories: an exceptionally "newsrich" product makes for broad audience appeal, which in turn leads to high penetration. Of course, quantity must be matched by quality. This not only means good reporting and good writing; it means freshness and relevance. To be indispensable, a paper must promptly tell its readers many things they want to know but won't otherwise learn until much later, if ever.

At the News, we put out seven fresh editions every 24 hours, each one extensively changed in content. Here's a small example that may surprise you: We redo the obituary page in every edition of the News, or seven times a day. Any obituary added runs through the next six editions until the publishing cycle has been completed.

It's vital, of course, for a newspaper to cover national and international news well and in depth. But it is also vital for it to do what only a local newspaper can: promptly and extensively chronicle the personally-important, otherwise-unreported details of community life. Doing this job well requires a very broad range of news - and that means lots of space, intelligently used.

Our news hole was about 50% in 1987, just as it has been year after year. If we were to cut it to a more typical 40%, we would save approximately \$4 million annually in newsprint costs. That interests us not at all - and it won't interest us even if, for one reason or another, our profit margins should significantly shrink.

Charlie and I do not believe in flexible operating budgets, as in "Non-direct expenses can be X if revenues are Y, but must be reduced if revenues are Y - 5%." Should we really cut our news hole at the Buffalo News, or the quality of product and service at See's, simply because profits are down during a given year or quarter? Or, conversely, should we add a staff economist, a corporate strategist, an institutional advertising campaign or something else that does Berkshire no good simply because the money currently is rolling in?

That makes no sense to us. We neither understand the adding of unneeded people or activities because profits are booming, nor the cutting of essential people or activities because profitability

is shrinking. That kind of yo-yo approach is neither business-like nor humane. Our goal is to do what makes sense for Berkshire's customers and employees at all times, and never to add the unneeded. ("But what about the corporate jet?" you rudely ask. Well, occasionally a man must rise above principle.)

Although the News' revenues have grown only moderately since 1984, superb management by Stan Lipsey, its publisher, has produced excellent profit growth. For several years, I have incorrectly predicted that profit margins at the News would fall. This year I will not let you down: Margins will, without question, shrink in 1988 and profit may fall as well. Skyrocketing newsprint costs will be the major cause.

- o Fechheimer Bros. Company is another of our family businesses - and, like the Blumkins, what a family. Three generations of Heldmans have for decades consistently, built the sales and profits of this manufacturer and distributor of uniforms. In the year that Berkshire acquired its controlling interest in Fechheimer - 1986 - profits were a record. The Heldmans didn't slow down after that. Last year earnings increased substantially and the outlook is good for 1988.

There's nothing magic about the Uniform business; the only magic is in the Heldmans. Bob, George, Gary, Roger and Fred know the business inside and out, and they have fun running it. We are fortunate to be in partnership with them.

- o Chuck Huggins continues to set new records at See's, just as he has ever since we put him in charge on the day of our purchase some 16 years ago. In 1987, volume hit a new high at slightly Under 25 million pounds. For the second year in a row, moreover, same-store sales, measured in pounds, were virtually unchanged. In case you are wondering, that represents improvement: In each of the previous six years, same-store sales had fallen.

Although we had a particularly strong 1986 Christmas season, we racked up better store-for-store comparisons in the 1987 Christmas season than at any other time of the year. Thus, the seasonal factor at See's becomes even more extreme. In 1987, about 85% of our profit was earned during December.

Candy stores are fun to visit, but most have not been fun for their owners. From what we can learn, practically no one besides See's has made significant profits in recent years from the operation of candy shops. Clearly, Chuck's record at See's is not due to a rising industry tide. Rather, it is a one-of-a-kind performance.

His achievement requires an excellent product - which we have - but it also requires genuine affection for the customer. Chuck is 100% customer-oriented, and his attitude sets the tone for the rest of the See's organization.

Here's an example of Chuck in action: At See's we regularly add new pieces of candy to our mix and also cull a few to keep our product line at about 100 varieties. Last spring we selected 14 items for elimination. Two, it turned out, were badly missed by our customers, who wasted no time in letting us know what they thought of our judgment: "A pox on all in See's who participated in the abominable decision...;" "May your new truffles melt in transit, may they sour in people's mouths, may your costs go up and your profits go down...;" "We are investigating the possibility of obtaining a mandatory injunction requiring you to supply...;" You get the picture. In all, we received many hundreds of letters.

Chuck not only reintroduced the pieces, he turned this miscue into an opportunity. Each person who had written got a complete and honest explanation in return. Said Chuck's letter: "Fortunately, when I make poor decisions, good things often happen as a result...;" And with the letter went a special gift certificate.

See's increased prices only slightly in the last two years. In 1988 we have raised prices somewhat more, though still moderately. To date, sales have been weak and it may be difficult for See's to improve its earnings this year.

o World Book, Kirby, and the Scott Fetzer Manufacturing Group are all under the management of Ralph Schey. And what a lucky thing for us that they are. I told you last year that Scott Fetzer performance in 1986 had far exceeded the expectations that Charlie and I had at the time of our purchase. Results in 1987 were even better. Pre-tax earnings rose 10% while average capital employed declined significantly.

Ralph's mastery of the 19 businesses for which he is responsible is truly amazing, and he has also attracted some outstanding managers to run them. We would love to find a few additional units that could be put under Ralph's wing.

The businesses of Scott Fetzer are too numerous to describe in detail. Let's just update you on one of our favorites: At the end of 1987, World Book introduced its most dramatically-revised edition since 1962. The number of color photos was increased from 14,000 to 24,000; over 6,000 articles were revised; 840 new contributors were added. Charlie and I recommend this

product to you and your family, as we do World Book's products for younger children, Childcraft and Early World of Learning.

In 1987, World Book unit sales in the United States increased for the fifth consecutive year. International sales and profits also grew substantially. The outlook is good for Scott Fetzer operations in aggregate, and for World Book in particular.

Insurance Operations

Shown below is an updated version of our usual table presenting key figures for the insurance industry:

Year	Yearly Change in Premiums Written (%)	Statutory Combined Ratio after Policyholder Dividends	Yearly Change in Incurred Losses (%)	Inflation Rate Measured by GNP Deflator (%)
1981	3.8	106.0	6.5	9.6
1982	4.4	109.8	8.4	6.4
1983	4.6	112.0	6.8	3.9
1984	9.2	117.9	16.9	3.8
1985	22.1	116.5	16.1	3.3
1986 (Rev.)	22.2	108.0	13.5	2.6
1987 (Est.)	8.7	104.7	6.8	3.0

Source: Best's Insurance Management Reports

The combined ratio represents total insurance costs (losses incurred plus expenses) compared to revenue from premiums: A ratio below 100 indicates an underwriting profit, and one above 100 indicates a loss. When the investment income that an insurer earns from holding on to policyholders' funds ("the float") is taken into account, a combined ratio in the 107-111 range typically produces an overall break-even result, exclusive of earnings on the funds provided by shareholders.

The math of the insurance business, encapsulated by the table, is not very complicated. In years when the industry's annual gain in revenues (premiums) pokes along at 4% or 5%,

underwriting losses are sure to mount. That is not because auto accidents, fires, windstorms and the like are occurring more frequently, nor has it lately been the fault of general inflation. Today, social and judicial inflation are the major culprits; the cost of entering a courtroom has simply ballooned. Part of the jump in cost arises from skyrocketing verdicts, and part from the tendency of judges and juries to expand the coverage of insurance policies beyond that contemplated by the insurer when the policies were written. Seeing no let-up in either trend, we continue to believe that the industry's revenues must grow at about 10% annually for it to just hold its own in terms of profitability, even though general inflation may be running at a considerably lower rate.

The strong revenue gains of 1985-87 almost guaranteed the industry an excellent underwriting performance in 1987 and, indeed, it was a banner year. But the news soured as the quarters rolled by: Best's estimates that year-over-year volume increases were 12.9%, 11.1%, 5.7%, and 5.6%. In 1988, the revenue gain is certain to be far below our 10% "equilibrium" figure. Clearly, the party is over.

However, earnings will not immediately sink. A lag factor exists in this industry: Because most policies are written for a one-year term, higher or lower insurance prices do not have their full impact on earnings until many months after they go into effect. Thus, to resume our metaphor, when the party ends and the bar is closed, you are allowed to finish your drink. If results are not hurt by a major natural catastrophe, we predict a small climb for the industry's combined ratio in 1988, followed by several years of larger increases.

The insurance industry is cursed with a set of dismal economic characteristics that make for a poor long-term outlook: hundreds of competitors, ease of entry, and a product that cannot be differentiated in any meaningful way. In such a commodity-like business, only a very low-cost operator or someone operating in a protected, and usually small, niche can sustain high profitability levels.

When shortages exist, however, even commodity businesses flourish. The insurance industry enjoyed that kind of climate for a while but it is now gone. One of the ironies of capitalism is that most managers in commodity industries abhor shortage conditions - even though those are the only circumstances permitting them good returns. Whenever shortages appear, the typical manager simply can't wait to expand capacity and thereby plug the hole through which money is

showering upon him. This is precisely what insurance managers did in 1985-87, confirming again Disraeli's observation: "What we learn from history is that we do not learn from history."

At Berkshire, we work to escape the industry's commodity economics in two ways. First, we differentiate our product by our financial strength, which exceeds that of all others in the industry. This strength, however, is limited in its usefulness. It means nothing in the personal insurance field: The buyer of an auto or homeowners policy is going to get his claim paid even if his insurer fails (as many have). It often means nothing in the commercial insurance arena: When times are good, many major corporate purchasers of insurance and their brokers pay scant attention to the insurer's ability to perform under the more adverse conditions that may exist, say, five years later when a complicated claim is finally resolved. (Out of sight, out of mind - and, later on, maybe out-of-pocket.)

Periodically, however, buyers remember Ben Franklin's observation that it is hard for an empty sack to stand upright and recognize their need to buy promises only from insurers that have enduring financial strength. It is then that we have a major competitive advantage. When a buyer really focuses on whether a \$10 million claim can be easily paid by his insurer five or ten years down the road, and when he takes into account the possibility that poor underwriting conditions may then coincide with depressed financial markets and defaults by reinsurer, he will find only a few companies he can trust. Among those, Berkshire will lead the pack.

Our second method of differentiating ourselves is the total indifference to volume that we maintain. In 1989, we will be perfectly willing to write five times as much business as we write in 1988 - or only one-fifth as much. We hope, of course, that conditions will allow us large volume. But we cannot control market prices. If they are unsatisfactory, we will simply do very little business. No other major insurer acts with equal restraint.

Three conditions that prevail in insurance, but not in most businesses, allow us our flexibility. First, market share is not an important determinant of profitability: In this business, in contrast to the newspaper or grocery businesses, the economic rule is not survival of the fittest. Second, in many sectors of insurance, including most of those in which we operate, distribution channels are not proprietary and can be easily entered: Small volume this year does not preclude huge volume next year. Third, idle capacity - which in this industry largely means people - does not result in intolerable costs. In a way that industries such as printing or steel cannot, we can operate at quarter-speed much of the time and still enjoy long-term prosperity.

We follow a price-based-on-exposure, not-on-competition policy because it makes sense for our shareholders. But we're happy to report that it is also pro-social. This policy means that we are always available, given prices that we believe are adequate, to write huge volumes of almost any type of property-casualty insurance. Many other insurers follow an in-and-out approach. When they are "out" - because of mounting losses, capital inadequacy, or whatever - we are available. Of course, when others are panting to do business we are also available - but at such times we often find ourselves priced above the market. In effect, we supply insurance buyers and brokers with a large reservoir of standby capacity.

One story from mid-1987 illustrates some consequences of our pricing policy: One of the largest family-owned insurance brokers in the country is headed by a fellow who has long been a shareholder of Berkshire. This man handles a number of large risks that are candidates for placement with our New York office. Naturally, he does the best he can for his clients. And, just as naturally, when the insurance market softened dramatically in 1987 he found prices at other insurers lower than we were willing to offer. His reaction was, first, to place all of his business elsewhere and, second, to buy more stock in Berkshire. Had we been really competitive, he said, we would have gotten his insurance business but he would not have bought our stock.

Berkshire's underwriting experience was excellent in 1987, in part because of the lag factor discussed earlier. Our combined ratio (on a statutory basis and excluding structured settlements and financial reinsurance) was 105. Although the ratio was somewhat less favorable than in 1986, when it was 103, our profitability improved materially in 1987 because we had the use of far more float. This trend will continue to run in our favor: Our ratio of float to premium volume will increase very significantly during the next few years. Thus, Berkshire's insurance profits are quite likely to improve during 1988 and 1989, even though we expect our combined ratio to rise.

Our insurance business has also made some important non-financial gains during the last few years. Mike Goldberg, its manager, has assembled a group of talented professionals to write larger risks and unusual coverages. His operation is now well equipped to handle the lines of business that will occasionally offer us major opportunities.

Our loss reserve development, detailed on pages 41-42, looks better this year than it has previously. But we write lots of "long-tail" business - that is, policies generating claims that

often take many years to resolve. Examples would be product liability, or directors and officers liability coverages. With a business mix like this, one year of reserve development tells you very little.

You should be very suspicious of any earnings figures reported by insurers (including our own, as we have unfortunately proved to you in the past). The record of the last decade shows that a great many of our best-known insurers have reported earnings to shareholders that later proved to be wildly erroneous. In most cases, these errors were totally innocent: The unpredictability of our legal system makes it impossible for even the most conscientious insurer to come close to judging the eventual cost of long-tail claims.

Nevertheless, auditors annually certify the numbers given them by management and in their opinions unqualifiedly state that these figures "present fairly" the financial position of their clients. The auditors use this reassuring language even though they know from long and painful experience that the numbers so certified are likely to differ dramatically from the true earnings of the period. Despite this history of error, investors understandably rely upon auditors' opinions. After all, a declaration saying that "the statements present fairly" hardly sounds equivocal to the non-accountant.

The wording in the auditor's standard opinion letter is scheduled to change next year. The new language represents improvement, but falls far short of describing the limitations of a casualty-insurer audit. If it is to depict the true state of affairs, we believe the standard opinion letter to shareholders of a property-casualty company should read something like: "We have relied upon representations of management in respect to the liabilities shown for losses and loss adjustment expenses, the estimate of which, in turn, very materially affects the earnings and financial condition herein reported. We can express no opinion about the accuracy of these figures. Subject to that important reservation, in our opinion, etc."

If lawsuits develop in respect to wildly inaccurate financial statements (which they do), auditors will definitely say something of that sort in court anyway. Why should they not be forthright about their role and its limitations from the outset?

We want to emphasize that we are not faulting auditors for their inability to accurately assess loss reserves (and therefore earnings). We fault them only for failing to publicly acknowledge that they can't do this job.

From all appearances, the innocent mistakes that are constantly made in reserving are accompanied by others that are deliberate. Various charlatans have enriched themselves at the expense of the investing public by exploiting, first, the inability of auditors to evaluate reserve figures and, second, the auditors' willingness to confidently certify those figures as if they had the expertise to do so. We will continue to see such chicanery in the future. Where "earnings" can be created by the stroke of a pen, the dishonest will gather. For them, long-tail insurance is heaven. The audit wording we suggest would at least serve to put investors on guard against these predators.

The taxes that insurance companies pay - which increased materially, though on a delayed basis, upon enactment of the Tax Reform Act of 1986 - took a further turn for the worse at the end of 1987. We detailed the 1986 changes in last year's report. We also commented on the irony of a statute that substantially increased 1987 reported earnings for insurers even as it materially reduced both their long-term earnings potential and their business value. At Berkshire, the temporarily-helpful "fresh start" adjustment inflated 1987 earnings by \$8.2 million.

In our opinion, the 1986 Act was the most important economic event affecting the insurance industry over the past decade. The 1987 Bill further reduced the intercorporate dividends-received credit from 80% to 70%, effective January 1, 1988, except for cases in which the taxpayer owns at least 20% of an investee.

Investors who have owned stocks or bonds through corporate intermediaries other than qualified investment companies have always been disadvantaged in comparison to those owning the same securities directly. The penalty applying to indirect ownership was greatly increased by the 1986 Tax Bill and, to a lesser extent, by the 1987 Bill, particularly in instances where the intermediary is an insurance company. We have no way of offsetting this increased level of taxation. It simply means that a given set of pre-tax investment returns will now translate into much poorer after-tax results for our shareholders.

All in all, we expect to do well in the insurance business, though our record is sure to be uneven. The immediate outlook is for substantially lower volume but reasonable earnings improvement. The decline in premium volume will accelerate after our quota-share agreement with Fireman's Fund expires in 1989. At some point, likely to be at least a few years away, we

may see some major opportunities, for which we are now much better prepared than we were in 1985.

Marketable Securities - Permanent Holdings

Whenever Charlie and I buy common stocks for Berkshire's insurance companies (leaving aside arbitrage purchases, discussed later) we approach the transaction as if we were buying into a private business. We look at the economic prospects of the business, the people in charge of running it, and the price we must pay. We do not have in mind any time or price for sale. Indeed, we are willing to hold a stock indefinitely so long as we expect the business to increase in intrinsic value at a satisfactory rate. When investing, we view ourselves as business analysts - not as market analysts, not as macroeconomic analysts, and not even as security analysts.

Our approach makes an active trading market useful, since it periodically presents us with mouth-watering opportunities. But by no means is it essential: a prolonged suspension of trading in the securities we hold would not bother us any more than does the lack of daily quotations on World Book or Fechheimer. Eventually, our economic fate will be determined by the economic fate of the business we own, whether our ownership is partial or total.

Ben Graham, my friend and teacher, long ago described the mental attitude toward market fluctuations that I believe to be most conducive to investment success. He said that you should imagine market quotations as coming from a remarkably accommodating fellow named Mr. Market who is your partner in a private business. Without fail, Mr. Market appears daily and names a price at which he will either buy your interest or sell you his.

Even though the business that the two of you own may have economic characteristics that are stable, Mr. Market's quotations will be anything but. For, sad to say, the poor fellow has incurable emotional problems. At times he feels euphoric and can see only the favorable factors affecting the business. When in that mood, he names a very high buy-sell price because he fears that you will snap up his interest and rob him of imminent gains. At other times he is depressed and can see nothing but trouble ahead for both the business and the world. On these occasions he will name a very low price, since he is terrified that you will unload your interest on him.

Mr. Market has another endearing characteristic: He doesn't mind being ignored. If his quotation is uninteresting to you today, he will be back with a new one tomorrow. Transactions

are strictly at your option. Under these conditions, the more manic-depressive his behavior, the better for you.

But, like Cinderella at the ball, you must heed one warning or everything will turn into pumpkins and mice: Mr. Market is there to serve you, not to guide you. It is his pocketbook, not his wisdom, that you will find useful. If he shows up some day in a particularly foolish mood, you are free to either ignore him or to take advantage of him, but it will be disastrous if you fall under his influence. Indeed, if you aren't certain that you understand and can value your business far better than Mr. Market, you don't belong in the game. As they say in poker, "If you've been in the game 30 minutes and you don't know who the patsy is, *you're* the patsy."

Ben's Mr. Market allegory may seem out-of-date in today's investment world, in which most professionals and academicians talk of efficient markets, dynamic hedging and betas. Their interest in such matters is understandable, since techniques shrouded in mystery clearly have value to the purveyor of investment advice. After all, what witch doctor has ever achieved fame and fortune by simply advising "Take two aspirins"?

The value of market esoterica to the consumer of investment advice is a different story. In my opinion, investment success will not be produced by arcane formulae, computer programs or signals flashed by the price behavior of stocks and markets. Rather an investor will succeed by coupling good business judgment with an ability to insulate his thoughts and behavior from the super-contagious emotions that swirl about the marketplace. In my own efforts to stay insulated, I have found it highly useful to keep Ben's Mr. Market concept firmly in mind.

Following Ben's teachings, Charlie and I let our marketable equities tell us by their operating results - not by their daily, or even yearly, price quotations - whether our investments are successful. The market may ignore business success for a while, but eventually will confirm it. As Ben said: "In the short run, the market is a voting machine but in the long run it is a weighing machine." The speed at which a business's success is recognized, furthermore, is not that important as long as the company's intrinsic value is increasing at a satisfactory rate. In fact, delayed recognition can be an advantage: It may give us the chance to buy more of a good thing at a bargain price.

Sometimes, of course, the market may judge a business to be more valuable than the underlying facts would indicate it is. In such a case, we will sell our holdings. Sometimes, also,

we will sell a security that is fairly valued or even undervalued because we require funds for a still more undervalued investment or one we believe we understand better.

We need to emphasize, however, that we do not sell holdings just because they have appreciated or because we have held them for a long time. (Of Wall Street maxims the most foolish may be "You can't go broke taking a profit.") We are quite content to hold any security indefinitely, so long as the prospective return on equity capital of the underlying business is satisfactory, management is competent and honest, and the market does not overvalue the business.

However, our insurance companies own three marketable common stocks that we would not sell even though they became far overpriced in the market. In effect, we view these investments exactly like our successful controlled businesses - a permanent part of Berkshire rather than merchandise to be disposed of once Mr. Market offers us a sufficiently high price. To that, I will add one qualifier: These stocks are held by our insurance companies and we would, if absolutely necessary, sell portions of our holdings to pay extraordinary insurance losses. We intend, however, to manage our affairs so that sales are never required.

A determination to have and to hold, which Charlie and I share, obviously involves a mixture of personal and financial considerations. To some, our stand may seem highly eccentric. (Charlie and I have long followed David Ogilvy's advice: "Develop your eccentricities while you are young. That way, when you get old, people won't think you're going ga-ga.") Certainly, in the transaction-fixated Wall Street of recent years, our posture must seem odd: To many in that arena, both companies and stocks are seen only as raw material for trades.

Our attitude, however, fits our personalities and the way we want to live our lives. Churchill once said, "You shape your houses and then they shape you." We know the manner in which we wish to be shaped. For that reason, we would rather achieve a return of X while associating with people whom we strongly like and admire than realize 110% of X by exchanging these relationships for uninteresting or unpleasant ones. And we will never find people we like and admire more than some of the main participants at the three companies - our permanent holdings - shown below:

Shares	Company	Cost (000's omitted)	Market (000's omitted)
3,000,000	Capital Cities/ABC, Inc.	\$517,500	\$1,035,000
6,850,000	GEICO Corporation.	45,713	756,925
1,727,765	The Washington Post Company	9,731	323,092

We really don't see many fundamental differences between the purchase of a controlled business and the purchase of marketable holdings such as these. In each case we try to buy into businesses with favorable long-term economics. Our goal is to find an outstanding business at a sensible price, not a mediocre business at a bargain price. Charlie and I have found that making silk purses out of silk is the best that we can do; with sow's ears, we fail.

(It must be noted that your Chairman, always a quick study, required only 20 years to recognize how important it was to buy good businesses. In the interim, I searched for "bargains" - and had the misfortune to find some. My punishment was an education in the economics of short-line farm implement manufacturers, third-place department stores, and New England textile manufacturers.)

Of course, Charlie and I may misread the fundamental economics of a business. When that happens, we will encounter problems whether that business is a wholly-owned subsidiary or a marketable security, although it is usually far easier to exit from the latter. (Indeed, businesses can be misread: Witness the European reporter who, after being sent to this country to profile Andrew Carnegie, cabled his editor, "My God, you'll never believe the sort of money there is in running libraries.")

In making both control purchases and stock purchases, we try to buy not only good businesses, but ones run by high-grade, talented and likeable managers. If we make a mistake about the managers we link up with, the controlled company offers a certain advantage because we have the power to effect change. In practice, however, this advantage is somewhat illusory: Management changes, like marital changes, are painful, time-consuming and chancy. In any event, at our three marketable-but permanent holdings, this point is moot: With Tom Murphy and Dan Burke at Cap Cities, Bill Snyder and Lou Simpson at GEICO, and Kay Graham and Dick Simmons at The Washington Post, we simply couldn't be in better hands.

I would say that the controlled company offers two main advantages. First, when we control a company we get to allocate capital, whereas we are likely to have little or nothing to say about this process with marketable holdings. This point can be important because the heads of many companies are not skilled in capital allocation. Their inadequacy is not surprising. Most bosses rise to the top because they have excelled in an area such as marketing, production, engineering, administration or, sometimes, institutional politics.

Once they become CEOs, they face new responsibilities. They now must make capital allocation decisions, a critical job that they may have never tackled and that is not easily mastered. To stretch the point, it's as if the final step for a highly-talented musician was not to perform at Carnegie Hall but, instead, to be named Chairman of the Federal Reserve.

The lack of skill that many CEOs have at capital allocation is no small matter: After ten years on the job, a CEO whose company annually retains earnings equal to 10% of net worth will have been responsible for the deployment of more than 60% of all the capital at work in the business.

CEOs who recognize their lack of capital-allocation skills (which not all do) will often try to compensate by turning to their staffs, management consultants, or investment bankers. Charlie and I have frequently observed the consequences of such "help." On balance, we feel it is more likely to accentuate the capital-allocation problem than to solve it.

In the end, plenty of unintelligent capital allocation takes place in corporate America. (That's why you hear so much about "restructuring.") Berkshire, however, has been fortunate. At the companies that are our major non-controlled holdings, capital has generally been well-deployed and, in some cases, brilliantly so.

The second advantage of a controlled company over a marketable security has to do with taxes. Berkshire, as a corporate holder, absorbs some significant tax costs through the ownership of partial positions that we do not when our ownership is 80%, or greater. Such tax disadvantages have long been with us, but changes in the tax code caused them to increase significantly during the past year. As a consequence, a given business result can now deliver Berkshire financial results that are as much as 50% better if they come from an 80%-or-greater holding rather than from a lesser holding.

The disadvantages of owning marketable securities are sometimes offset by a huge advantage: Occasionally the stock market offers us the chance to buy non-controlling pieces of

extraordinary businesses at truly ridiculous prices - dramatically below those commanded in negotiated transactions that transfer control. For example, we purchased our Washington Post stock in 1973 at \$5.63 per share, and per-share operating earnings in 1987 after taxes were \$10.30. Similarly, Our GEICO stock was purchased in 1976, 1979 and 1980 at an average of \$6.67 per share, and after-tax operating earnings per share last year were \$9.01. In cases such as these, Mr. Market has proven to be a mighty good friend.

An interesting accounting irony overlays a comparison of the reported financial results of our controlled companies with those of the permanent minority holdings listed above. As you can see, those three stocks have a market value of over \$2 billion. Yet they produced only \$11 million in reported after-tax earnings for Berkshire in 1987.

Accounting rules dictate that we take into income only the dividends these companies pay us - which are little more than nominal - rather than our share of their earnings, which in 1987 amounted to well over \$100 million. On the other hand, accounting rules provide that the carrying value of these three holdings - owned, as they are, by insurance companies - must be recorded on our balance sheet at current market prices. The result: GAAP accounting lets us reflect in our net worth the up-to-date underlying values of the businesses we partially own, but does not let us reflect their underlying earnings in our income account.

In the case of our controlled companies, just the opposite is true. Here, we show full earnings in our income account but never change asset values on our balance sheet, no matter how much the value of a business might have increased since we purchased it.

Our mental approach to this accounting schizophrenia is to ignore GAAP figures and to focus solely on the future earning power of both our controlled and non-controlled businesses. Using this approach, we establish our own ideas of business value, keeping these independent from both the accounting values shown on our books for controlled companies and the values placed by a sometimes foolish market on our partially-owned companies. It is this business value that we hope to increase at a reasonable (or, preferably, unreasonable) rate in the years ahead.

Marketable Securities - Other

In addition to our three permanent common stock holdings, we hold large quantities of marketable securities in our insurance companies. In selecting these, we can choose among five major categories: (1) long-term common stock investments, (2) medium-term fixed-income

securities, (3) long-term fixed income securities, (4) short-term cash equivalents, and (5) short-term arbitrage commitments.

We have no particular bias when it comes to choosing from these categories. We just continuously search among them for the highest after-tax returns as measured by "mathematical expectation," limiting ourselves always to investment alternatives we think we understand. Our criteria have nothing to do with maximizing immediately reportable earnings; our goal, rather, is to maximize eventual net worth.

o Let's look first at common stocks. During 1987 the stock market was an area of much excitement but little net movement: The Dow advanced 2.3% for the year. You are aware, of course, of the roller coaster ride that produced this minor change. Mr. Market was on a manic rampage until October and then experienced a sudden, massive seizure.

We have "professional" investors, those who manage many billions, to thank for most of this turmoil. Instead of focusing on what businesses will do in the years ahead, many prestigious money managers now focus on what they expect other money managers to do in the days ahead. For them, stocks are merely tokens in a game, like the thimble and flatiron in Monopoly.

An extreme example of what their attitude leads to is "portfolio insurance," a money-management strategy that many leading investment advisors embraced in 1986-1987. This strategy - which is simply an exotically-labeled version of the small speculator's stop-loss order dictates that ever increasing portions of a stock portfolio, or their index-future equivalents, be sold as prices decline. The strategy says nothing else matters: A downtick of a given magnitude automatically produces a huge sell order. According to the Brady Report, \$60 billion to \$90 billion of equities were poised on this hair trigger in mid-October of 1987.

If you've thought that investment advisors were hired to invest, you may be bewildered by this technique. After buying a farm, would a rational owner next order his real estate agent to start selling off pieces of it whenever a neighboring property was sold at a lower price? Or would you sell your house to whatever bidder was available at 9:31 on some morning merely because at 9:30 a similar house sold for less than it would have brought on the previous day?

Moves like that, however, are what portfolio insurance tells a pension fund or university to make when it owns a portion of enterprises such as Ford or General Electric. The less these companies are being valued at, says this approach, the more vigorously they should be sold. As

a "logical" corollary, the approach commands the institutions to repurchase these companies - *I'm not making this up* - once their prices have rebounded significantly. Considering that huge sums are controlled by managers following such Alice-in-Wonderland practices, is it any surprise that markets sometimes behave in aberrational fashion?

Many commentators, however, have drawn an incorrect conclusion upon observing recent events: They are fond of saying that the small investor has no chance in a market now dominated by the erratic behavior of the big boys. This conclusion is dead wrong: Such markets are ideal for any investor - small or large - so long as he sticks to his investment knitting. Volatility caused by money managers who speculate irrationally with huge sums will offer the true investor more chances to make intelligent investment moves. He can be hurt by such volatility only if he is forced, by either financial or psychological pressures, to sell at untoward times.

At Berkshire, we have found little to do in stocks during the past few years. During the break in October, a few stocks fell to prices that interested us, but we were unable to make meaningful purchases before they rebounded. At yearend 1987 we had no major common stock investments (that is, over \$50 million) other than those we consider permanent or arbitrage holdings. However, Mr. Market will offer us opportunities - you can be sure of that - and, when he does, we will be willing and able to participate.

- o In the meantime, our major parking place for money is medium-term tax-exempt bonds, whose limited virtues I explained in last year's annual report. Though we both bought and sold some of these bonds in 1987, our position changed little overall, holding around \$900 million. A large portion of our bonds are "grandfathered" under the Tax Reform Act of 1986, which means they are fully tax-exempt. Bonds currently purchased by insurance companies are not.

As an alternative to short-term cash equivalents, our medium-term tax-exempts have - so far served us well. They have produced substantial extra income for us and are currently worth a bit above our cost. Regardless of their market price, we are ready to dispose of our bonds whenever something better comes along.

- o We continue to have an aversion to long-term bonds (and may be making a serious mistake by not disliking medium-term bonds as well). Bonds are no better than the currency in which they are denominated, and nothing we have seen in the past year - or past decade - makes us enthusiastic about the long-term future of U.S. currency.

Our enormous trade deficit is causing various forms of "claim checks" - U.S. government and corporate bonds, bank deposits, etc. - to pile up in the hands of foreigners at a distressing rate. By default, our government has adopted an approach to its finances patterned on that of Blanche DuBois, of *A Streetcar Named Desire*, who said, "I have always depended on the kindness of strangers." In this case, of course, the "strangers" are relying on the integrity of our claim checks although the plunging dollar has already made that proposition expensive for them.

The faith that foreigners are placing in us may be misfounded. When the claim checks outstanding grow sufficiently numerous and when the issuing party can unilaterally determine their purchasing power, the pressure on the issuer to dilute their value by inflating the currency becomes almost irresistible. For the debtor government, the weapon of inflation is the economic equivalent of the "H" bomb, and that is why very few countries have been allowed to swamp the world with debt denominated in their own currency. Our past, relatively good record for fiscal integrity has let us break this rule, but the generosity accorded us is likely to intensify, rather than relieve, the eventual pressure on us to inflate. If we do succumb to that pressure, it won't be just the foreign holders of our claim checks who will suffer. It will be all of us as well.

Of course, the U.S. may take steps to stem our trade deficit well before our position as a net debtor gets out of hand. (In that respect, the falling dollar will help, though unfortunately it will hurt in other ways.) Nevertheless, our government's behavior in this test of its mettle is apt to be consistent with its Scarlett O'Hara approach generally: "I'll think about it tomorrow." And, almost inevitably, procrastination in facing up to fiscal problems will have inflationary consequences.

Both the timing and the sweep of those consequences are unpredictable. But our inability to quantify or time the risk does not mean we should ignore it. While recognizing the possibility that we may be wrong and that present interest rates may adequately compensate for the inflationary risk, we retain a general fear of long-term bonds.

We are, however, willing to invest a moderate portion of our funds in this category if we think we have a significant edge in a specific security. That willingness explains our holdings of the Washington Public Power Supply Systems #1, #2 and #3 issues, discussed in our 1984 report. We added to our WPPSS position during 1987. At yearend, we had holdings with an amortized cost of \$240 million and a market value of \$316 million, paying us tax-exempt income of \$34 million annually.

- o We continued to do well in arbitrage last year, though - or perhaps because - we operated on a very limited scale. We enter into only a few arbitrage commitments each year and restrict ourselves to large transactions that have been publicly announced. We do not participate in situations in which green-mailers are attempting to put a target company "in play."

We have practiced arbitrage on an opportunistic basis for decades and, to date, our results have been quite good. Though we've never made an exact calculation, I believe that overall we have averaged annual pre-tax returns of at least 25% from arbitrage. I'm quite sure we did better than that in 1987. But it should be emphasized that a really bad experience or two - such as many arbitrage operations suffered in late 1987 - could change the figures dramatically.

Our only \$50 million-plus arbitrage position at yearend 1987 was 1,096,200 shares of Allegis, with a cost of \$76 million and a market value of \$78 million.

- o We had two other large holdings at yearend that do not fit precisely into any of our five categories. One was various Texaco, Inc. bonds with short maturities, all purchased after Texaco went into bankruptcy. Were it not for the extraordinarily strong capital position of our insurance companies, it would be inappropriate for us to buy defaulted bonds. At prices prevailing after Texaco's bankruptcy filing, however, we regarded these issues as by far the most attractive bond investment available to us.

On a worst-case basis with respect to the Pennzoil litigation, we felt the bonds were likely to be worth about what we paid for them. Given a sensible settlement, which seemed likely, we expected the bonds to be worth considerably more. At yearend our Texaco bonds were carried on our books at \$104 million and had a market value of \$119 million.

By far our largest - and most publicized - investment in 1987 was a \$700 million purchase of Salomon Inc 9% preferred stock. This preferred is convertible after three years into Salomon common stock at \$38 per share and, if not converted, will be redeemed ratably over five years beginning October 31, 1995. From most standpoints, this commitment fits into the medium-term fixed-income securities category. In addition, we have an interesting conversion possibility.

We, of course, have no special insights regarding the direction or future profitability of investment banking. By their nature, the economics of this industry are far less predictable than those of most other industries in which we have major Commitments. This unpredictability is one of the reasons why our participation is in the form of a convertible preferred.

What we do have a strong feeling about is the ability and integrity of John Gutfreund, CEO of Salomon Inc. Charlie and I like, admire and trust John. We first got to know him in 1976 when he played a key role in GEICO's escape from near-bankruptcy. Several times since, we have seen John steer clients away from transactions that would have been unwise, but that the client clearly wanted to make - even though his advice provided no fee to Salomon and acquiescence would have delivered a large fee. Such service-above-self behavior is far from automatic in Wall Street.

For the reasons Charlie outlines on page 50, at yearend we valued our Salomon investment at 98% of par, \$14 million less than our cost. However, we believe there is a reasonable likelihood that a leading, high-quality capital-raising and market-making operation can average good returns on equity. If so, our conversion right will eventually prove to be valuable.

Two further comments about our investments in marketable securities are appropriate. First, we give you our usual warning: Our holdings have changed since yearend and will continue to do so without notice.

The second comment is related: During 1987, as in some earlier years, there was speculation in the press from time to time about our purchase or sale of various securities. These stories were sometimes true, sometimes partially true, and other times completely untrue. Interestingly, there has been no correlation between the size and prestige of the publication and the accuracy of the report. One dead-wrong rumor was given considerable prominence by a major national magazine, and another leading publication misled its readers by writing about an arbitrage position as if it were a long-term investment commitment. (In not naming names, I am observing the old warning that it's not wise to pick fights with people who buy ink by the barrel.)

You should understand that we simply don't comment in any way on rumors, whether they are true or false. If we were to deny the incorrect reports and refuse comment on the correct ones, we would in effect be commenting on all.

In a world in which big investment ideas are both limited and valuable, we have no interest in telling potential competitors what we are doing except to the extent required by law. We certainly don't expect others to tell us of their investment ideas. Nor would we expect a media company to disclose news of acquisitions it was privately pursuing or a journalist to tell his competitors about stories on which he is working or sources he is using.

I find it uncomfortable when friends or acquaintances mention that they are buying X because it has been reported - incorrectly - that Berkshire is a buyer. However, I do not set them straight. If they want to participate in whatever Berkshire actually is buying, they can always purchase Berkshire stock. But perhaps that is too simple. Usually, I suspect, they find it more exciting to buy what is being talked about. Whether that strategy is more profitable is another question.

Financing

Shortly after yearend, Berkshire sold two issues of debentures, totaling \$250 million. Both issues mature in 2018 and will be retired at an even pace through sinking fund operations that begin in 1999. Our overall interest cost, after allowing for expenses of issuance, is slightly over 10%. Salomon was our investment banker, and its service was excellent.

Despite our pessimistic views about inflation, our taste for debt is quite limited. To be sure, it is likely that Berkshire could improve its return on equity by moving to a much higher, though still conventional, debt-to-business-value ratio. It's even more likely that we could handle such a ratio, without problems, under economic conditions far worse than any that have prevailed since the early 1930s.

But we do not wish it to be only likely that we can meet our obligations; we wish that to be certain. Thus we adhere to policies - both in regard to debt and all other matters - that will allow us to achieve acceptable long-term results under extraordinarily adverse conditions, rather than optimal results under a normal range of conditions.

Good business or investment decisions will eventually produce quite satisfactory economic results, with no aid from leverage. Therefore, it seems to us to be both foolish and improper to risk what is important (including, necessarily, the welfare of innocent bystanders such as policyholders and employees) for some extra returns that are relatively unimportant. This view is not the product of either our advancing age or prosperity: Our opinions about debt have remained constant.

However, we are not phobic about borrowing. (We're far from believing that there is no fate worse than debt.) We are willing to borrow an amount that we believe - on a worst-case basis - will pose no threat to Berkshire's well-being. Analyzing what that amount might be, we can look to some important strengths that would serve us well if major problems should engulf our economy: Berkshire's earnings come from many diverse and well-entrenched businesses; these businesses seldom require much capital investment; what debt we have is structured well; and we

maintain major holdings of liquid assets. Clearly, we could be comfortable with a higher debt-to-business-value ratio than we now have.

One further aspect of our debt policy deserves comment: Unlike many in the business world, we prefer to finance in anticipation of need rather than in reaction to it. A business obtains the best financial results possible by managing both sides of its balance sheet well. This means obtaining the highest-possible return on assets and the lowest-possible cost on liabilities. It would be convenient if opportunities for intelligent action on both fronts coincided. However, reason tells us that just the opposite is likely to be the case: Tight money conditions, which translate into high costs for liabilities, will create the best opportunities for acquisitions, and cheap money will cause assets to be bid to the sky. Our conclusion: Action on the liability side should sometimes be taken independent of any action on the asset side.

Alas, what is "tight" and "cheap" money is far from clear at any particular time. We have no ability to forecast interest rates and - maintaining our usual open-minded spirit - believe that no one else can. Therefore, we simply borrow when conditions seem non-oppressive and hope that we will later find intelligent expansion or acquisition opportunities, which - as we have said - are most likely to pop up when conditions in the debt market are clearly oppressive. Our basic principle is that if you want to shoot rare, fast-moving elephants, you should always carry a loaded gun.

Our fund-first, buy-or-expand-later policy almost always penalizes near-term earnings. For example, we are now earning about 6 1/2% on the \$250 million we recently raised at 10%, a disparity that is currently costing us about \$160,000 per week. This negative spread is unimportant to us and will not cause us to stretch for either acquisitions or higher-yielding short-term instruments. If we find the right sort of business elephant within the next five years or so, the wait will have been worthwhile.

Miscellaneous

We hope to buy more businesses that are similar to the ones we have, and we can use some help. If you have a business that fits the following criteria, call me or, preferably, write.

Here's what we're looking for:

- (1) large purchases (at least \$10 million of after-tax earnings),
- (2) demonstrated consistent earning power (future projections are of little interest to us, nor are "turnaround" situations),

- (3) businesses earning good returns on equity while employing little or no debt,
- (4) management in place (we can't supply it),
- (5) simple businesses (if there's lots of technology, we won't understand it),
- (6) an offering price (we don't want to waste our time or that of the seller by talking, even preliminarily, about a transaction when price is unknown).

We will not engage in unfriendly takeovers. We can promise complete confidentiality and a very fast answer - customarily within five minutes - as to whether we're interested. We prefer to buy for cash, but will consider issuing stock when we receive as much in intrinsic business value as we give. We invite potential sellers to check us out by contacting people with whom we have done business in the past. For the right business - and the right people - we can provide a good home.

On the other hand, we frequently get approached about acquisitions that don't come close to meeting our tests: new ventures, turnarounds, auction-like sales, and the ever-popular (among brokers) "I'm-sure-something-will-work-out-if-you-people-get-to-know-each-other." None of these attracts us in the least.

Besides being interested in the purchases of entire businesses as described above, we are also interested in the negotiated purchase of large, but not controlling, blocks of stock comparable to those we hold in Cap Cities and Salomon. We have a special interest in purchasing convertible preferreds as a long-term investment, as we did at Salomon.

* * *

And now a bit of *deja vu*. Most of Berkshire's major stockholders received their shares at yearend 1969 in a liquidating distribution from Buffett Partnership, Ltd. Some of these former partners will remember that in 1962 I encountered severe managerial problems at Dempster Mill Manufacturing Co., a pump and farm implement manufacturing company that BPL controlled.

At that time, like now, I went to Charlie with problems that were too tough for me to solve. Charlie suggested the solution might lie in a California friend of his, Harry Bottle, whose special knack was never forgetting the fundamental. I met Harry in Los Angeles on April 17, 1962, and

on April 23 he was in Beatrice, Nebraska, running Dempster. Our problems disappeared almost immediately. In my 1962 annual letter to partners, I named Harry "Man of the Year."

Fade to 24 years later: The scene is K & W Products, a small Berkshire subsidiary that produces automotive compounds. For years K & W did well, but in 1985-86 it stumbled badly, as it pursued the unattainable to the neglect of the achievable. Charlie, who oversees K & W, knew there was no need to consult me. Instead, he called Harry, now 68 years old, made him CEO, and sat back to await the inevitable. He didn't wait long. In 1987 K & W's profits set a record, up more than 300% from 1986. And, as profits went up, capital employed went down: K & W's investment in accounts receivable and inventories has decreased 20%.

If we run into another managerial problem ten or twenty years down the road, you know whose phone will ring.

* * *

About 97.2% of all eligible shares participated in Berkshire's 1987 shareholder-designated contributions program. Contributions made through the program were \$4.9 million, and 2,050 charities were recipients.

A recent survey reported that about 50% of major American companies match charitable contributions made by directors (sometimes by a factor of three to one). In effect, these representatives of the owners direct funds to their favorite charities, and never consult the owners as to their charitable preferences. (I wonder how they would feel if the process were reversed and shareholders could invade the directors' pockets for charities favored by the shareholders.) When A takes money from B to give to C and A is a legislator, the process is called taxation. But when A is an officer or director of a corporation, it is called philanthropy. We continue to believe that contributions, aside from those with quite clear direct benefits to the company, should reflect the charitable preferences of owners rather than those of officers and directors.

We urge new shareholders to read the description of our shareholder-designated contributions program that appears on pages 54 and 55. If you wish to participate in future programs, we strongly urge that you immediately make sure your shares are registered in the name of the actual owner, not in "street" name or nominee name. Shares not so registered on September 30, 1988 will be ineligible for the 1988 program.

* * *

Last year we again had about 450 shareholders at our annual meeting. The 60 or so questions they asked were, as always, excellent. At many companies, the annual meeting is a waste of time because exhibitionists turn it into a sideshow. Ours, however, is different. It is informative for shareholders and fun for us. (At Berkshire's meetings, the exhibitionists are on the dais.)

This year our meeting will be on May 23, 1988 in Omaha, and we hope that you come. The meeting provides the forum for you to ask any owner-related questions you may have, and we will keep answering until all (except those dealing with portfolio activities or other proprietary information) have been dealt with.

Last year we rented two buses - for \$100 - to take shareholders interested in the trip to the Furniture Mart. Your actions demonstrated your good judgment: You snapped up about \$40,000 of bargains. Mrs. B regards this expense/sales ratio as on the high side and attributes it to my chronic inattention to costs and generally sloppy managerial practices. But, gracious as always, she has offered me another chance and we will again have buses available following the meeting. Mrs. B says you must beat last year's sales figures, and I have told her she won't be disappointed.

Warren E. Buffett

Chairman of the Board

1988 Letter

BERKSHIRE HATHAWAY INC.

To the Shareholders of Berkshire Hathaway Inc.:

Our gain in net worth during 1988 was \$569 million, or 20.0%. Over the last 24 years (that is, since present management took over), our per-share book value has grown from \$19.46 to \$2,974.52, or at a rate of 23.0% compounded annually.

We've emphasized in past reports that what counts, however, is intrinsic business value - the figure, necessarily an estimate, indicating what all of our constituent businesses are worth. By our calculations, Berkshire's intrinsic business value significantly exceeds its book value. Over the 24 years, business value has grown somewhat faster than book value; in 1988, however, book value grew the faster, by a bit.

Berkshire's past rates of gain in both book value and business value were achieved under circumstances far different from those that now exist. Anyone ignoring these differences makes the same mistake that a baseball manager would were he to judge the future prospects of a 42-year-old center fielder on the basis of his lifetime batting average.

Important negatives affecting our prospects today are: (1) a less attractive stock market than generally existed over the past 24 years; (2) higher corporate tax rates on most forms of investment income; (3) a far more richly-priced market for the acquisition of businesses; and (4) industry conditions for Capital Cities/ABC, Inc., GEICO Corporation, and The Washington Post Company - Berkshire's three permanent investments, constituting about one-half of our net worth - that range from slightly to materially less favorable than those existing five to ten years ago. All of these companies have superb management and strong properties. But, at current prices, their upside potential looks considerably less exciting to us today than it did some years ago.

The major problem we face, however, is a growing capital base. You've heard that from us before, but this problem, like age, grows in significance each year. (And also, just as with age, it's better to have this problem continue to grow rather than to have it "solved.")

Four years ago I told you that we needed profits of \$3.9 billion to achieve a 15% annual return over the decade then ahead. Today, for the next decade, a 15% return demands profits of \$10.3 billion. That seems like a very big number to me and to Charlie Munger, Berkshire's Vice Chairman and my partner. (Should that number indeed prove too big, Charlie will find himself, in future reports, retrospectively identified as the senior partner.)

As a partial offset to the drag that our growing capital base exerts upon returns, we have a very important advantage now that we lacked 24 years ago. Then, all our capital was tied up in a textile business with inescapably poor economic characteristics. Today part of our capital is invested in some really exceptional businesses.

Last year we dubbed these operations the Sainted Seven: Buffalo News, Fechheimer, Kirby, Nebraska Furniture Mart, Scott Fetzer Manufacturing Group, See's, and World Book. In 1988 the Saints came marching in. You can see just how extraordinary their returns on capital were by examining the historical-cost financial statements on page 45, which combine the figures of the Sainted Seven with those of several smaller units. With no benefit from financial leverage, this group earned about 67% on average equity capital.

In most cases the remarkable performance of these units arises partially from an exceptional business franchise; in all cases an exceptional management is a vital factor. The contribution Charlie and I make is to leave these managers alone.

In my judgment, these businesses, in aggregate, will continue to produce superb returns. We'll need these: Without this help Berkshire would not have a chance of achieving our 15% goal. You can be sure that our operating managers will deliver; the question mark in our future is whether Charlie and I can effectively employ the funds that they generate.

In that respect, we took a step in the right direction early in 1989 when we purchased an 80% interest in Borsheim's, a jewelry business in Omaha. This purchase, described later in this letter, delivers exactly what we look for: an outstanding business run by people we like, admire, and trust. It's a great way to start the year.

Accounting Changes

We have made a significant accounting change that was mandated for 1988, and likely will have another to make in 1990. When we move figures around from year to year, without any change in economic reality, one of our always-thrilling discussions of accounting is necessary.

First, I'll offer my customary disclaimer: Despite the shortcomings of generally accepted accounting principles (GAAP), I would hate to have the job of devising a better set of rules. The limitations of the existing set, however, need not be inhibiting: CEOs are free to treat GAAP statements as a beginning rather than an end to their obligation to inform owners and creditors - and indeed they should. After all, any manager of a subsidiary company would find himself in hot water if he reported barebones GAAP numbers that omitted key information needed by his boss, the parent corporation's CEO. Why, then, should the CEO himself withhold information vitally useful to *his* bosses - the shareholder-owners of the corporation?

What needs to be reported is data - whether GAAP, non-GAAP, or extra-GAAP - that helps financially-literate readers answer three key questions: (1) Approximately how much is this company worth? (2) What is the likelihood that it can meet its future obligations? and (3) How good a job are its managers doing, given the hand they have been dealt?

In most cases, answers to one or more of these questions are somewhere between difficult and impossible to glean from the minimum GAAP presentation. The business world is simply too complex for a single set of rules to effectively describe economic reality for all enterprises, particularly those operating in a wide variety of businesses, such as Berkshire.

Further complicating the problem is the fact that many managements view GAAP not as a standard to be met, but as an obstacle to overcome. Too often their accountants willingly assist them. ("How much," says the client, "is two plus two?" Replies the cooperative accountant, "What number did you have in mind?") Even honest and well-intentioned managements sometimes stretch GAAP a bit in order to present figures they think will more appropriately describe their performance. Both the smoothing of earnings and the "big bath" quarter are "white lie" techniques employed by otherwise upright managements.

Then there are managers who actively use GAAP to deceive and defraud. They know that many investors and creditors accept GAAP results as gospel. So these charlatans interpret the rules "imaginatively" and record business transactions in ways that technically comply with GAAP but actually display an economic illusion to the world.

As long as investors - including supposedly sophisticated institutions - place fancy valuations on reported "earnings" that march steadily upward, you can be sure that some managers and promoters will exploit GAAP to produce such numbers, no matter what the truth may be. Over the years, Charlie and I have observed many accounting-based frauds of staggering size. Few of

the perpetrators have been punished; many have not even been censured. It has been far safer to steal large sums with a pen than small sums with a gun.

Under one major change mandated by GAAP for 1988, we have been required to fully consolidate all our subsidiaries in our balance sheet and earnings statement. In the past, Mutual Savings and Loan, and Scott Fetzer Financial (a credit company that primarily finances installment sales of World Book and Kirby products) were consolidated on a “one-line” basis. That meant we (1) showed our equity in their combined net worths as a single-entry asset on Berkshire’s consolidated balance sheet and (2) included our equity in their combined annual earnings as a single-line income entry in our consolidated statement of earnings. Now the rules require that we consolidate each asset and liability of these companies in our balance sheet and each item of their income and expense in our earnings statement.

This change underscores the need for companies also to report segmented data: The greater the number of economically diverse business operations lumped together in conventional financial statements, the less useful those presentations are and the less able investors are to answer the three questions posed earlier. Indeed, the only reason we ever prepare consolidated figures at Berkshire is to meet outside requirements. On the other hand, Charlie and I constantly study our segment data.

Now that we are required to bundle more numbers in our GAAP statements, we have decided to publish additional supplementary information that we think will help you measure both business value and managerial performance. (Berkshire’s ability to discharge its obligations to creditors - the third question we listed - should be obvious, whatever statements you examine.) In these supplementary presentations, we will not necessarily follow GAAP procedures, or even corporate structure. Rather, we will attempt to lump major business activities in ways that aid analysis but do not swamp you with detail. Our goal is to give you important information in a form that we would wish to get it if our roles were reversed.

On pages 41-47 we show separate combined balance sheets and earnings statements for: (1) our subsidiaries engaged in finance-type operations, which are Mutual Savings and Scott Fetzer Financial; (2) our insurance operations, with their major investment positions itemized; (3) our manufacturing, publishing and retailing businesses, leaving aside certain non-operating assets and purchase-price accounting adjustments; and (4) an all-other category that includes the non-

operating assets (primarily marketable securities) held by the companies in (3) as well as various assets and debts of the Wesco and Berkshire parent companies.

If you combine the earnings and the net worths of these four segments, you will derive totals matching those shown on our GAAP statements. However, we want to emphasize that our new presentation does not fall within the purview of our auditors, who in no way bless it. (In fact, they may be horrified; I don't want to ask.)

I referred earlier to a major change in GAAP that is expected in 1990. This change relates to the calculation of deferred taxes, and is both complicated and controversial - so much so that its imposition, originally scheduled for 1989, was postponed for a year.

When implemented, the new rule will affect us in various ways. Most important, we will be required to change the way we calculate our liability for deferred taxes on the unrealized appreciation of stocks held by our insurance companies.

Right now, our liability is layered. For the unrealized appreciation that dates back to 1986 and earlier years, \$1.2 billion, we have booked a 28% tax liability. For the unrealized appreciation built up since, \$600 million, the tax liability has been booked at 34%. The difference reflects the increase in tax rates that went into effect in 1987.

It now appears, however, that the new accounting rule will require us to establish the entire liability at 34% in 1990, taking the charge against our earnings. Assuming no change in tax rates by 1990, this step will reduce our earnings in that year (and thereby our reported net worth) by \$71 million. The proposed rule will also affect other items on our balance sheet, but these changes will have only a minor impact on earnings and net worth.

We have no strong views about the desirability of this change in calculation of deferred taxes. We should point out, however, that neither a 28% nor a 34% tax liability precisely depicts economic reality at Berkshire since we have no plans to sell the stocks in which we have the great bulk of our gains.

To those of you who are uninterested in accounting, I apologize for this dissertation. I realize that many of you do not pore over our figures, but instead hold Berkshire primarily because you know that: (1) Charlie and I have the bulk of our money in Berkshire; (2) we intend to run things so that your gains or losses are in direct proportion to ours; and (3) the record has so far been satisfactory. There is nothing necessarily wrong with this kind of "faith" approach to investing. Other shareholders, however, prefer an "analysis" approach and we want to supply the

information they need. In our own investing, we search for situations in which both approaches give us the same answer.

Sources of Reported Earnings

In addition to supplying you with our new four-sector accounting material, we will continue to list the major sources of Berkshire's reported earnings just as we have in the past.

In the following table, amortization of Goodwill and other major purchase-price accounting adjustments are not charged against the specific businesses to which they apply but are instead aggregated and shown separately. This procedure lets you view the earnings of our businesses as they would have been reported had we not purchased them. I've explained in past reports why this form of presentation seems to us to be more useful to investors and managers than the standard GAAP presentation, which makes purchase-price adjustments on a business-by-business basis. The total net earnings we show in the table are, of course, identical to the GAAP total in our audited financial statements.

Further information about these businesses is given in the Business Segment section on pages 32-34, and in the Management's Discussion section on pages 36-40. In these sections you also will find our segment earnings reported on a GAAP basis. For information on Wesco's businesses, I urge you to read Charlie Munger's letter, which starts on page 52. It contains the best description I have seen of the events that produced the present savings-and-loan crisis. Also, take special note of Dave Hillstrom's performance at Precision Steel Warehouse, a Wesco subsidiary. Precision operates in an extremely competitive industry, yet Dave consistently achieves good returns on invested capital. Though data is lacking to prove the point, I think it is likely that his performance, both in 1988 and years past, would rank him number one among his peers.

Operating Earnings (000s omitted)	Pre-Tax 1988	Earnings 1987	Berkshire 1988	Share 1987
Insurance Group:				
Underwriting	\$ (11,081)	\$ (55,429)	\$ (1,045)	\$ (20,696)

**Excludes interest expense of Scott Fetzer Financial Group.*

The earnings achieved by our operating businesses are superb, whether measured on an absolute basis or against those of their competitors. For that we thank our operating managers: You and I are fortunate to be associated with them.

At Berkshire, associations like these last a long time. We do not remove superstars from our lineup merely because they have attained a specified age - whether the traditional 65, or the 95 reached by Mrs. B on the eve of Hanukkah in 1988. Superb managers are too scarce a resource to be discarded simply because a cake gets crowded with candles. Moreover, our experience with newly-minted MBAs has not been that great. Their academic records always look terrific and the candidates always know just what to say; but too often they are short on personal commitment to the company and general business savvy. It’s difficult to teach a new dog old tricks.

Here’s an update on our major non-insurance operations:

o At Nebraska Furniture Mart, Mrs. B (Rose Blumkin) and her cart roll on and on. She's been the boss for 51 years, having started the business at 44 with \$500. (Think what she would have done with \$1,000!) With Mrs. B, old age will always be ten years away. The Mart, long the largest home furnishings store in the country, continues to grow. In the fall, the store opened a detached 20,000 square foot Clearance Center, which expands our ability to offer bargains in all price ranges.

Recently Dillard's, one of the most successful department store operations in the country, entered the Omaha market. In many of its stores, Dillard's runs a full furniture department, undoubtedly doing well in this line. Shortly before opening in Omaha, however, William Dillard, chairman of the company, announced that his new store would not sell furniture. Said he, referring to NFM: "We don't want to compete with them. We think they are about the best there is."

At the Buffalo News we extol the value of advertising, and our policies at NFM prove that we practice what we preach. Over the past three years NFM has been the largest ROP advertiser in the Omaha World-Herald. (ROP advertising is the kind printed in the paper, as contrasted to the preprinted-insert kind.) In no other major market, to my knowledge, is a home furnishings operation the leading customer of the newspaper. At times, we also run large ads in papers as far away as Des Moines, Sioux City and Kansas City - always with good results. It truly does pay to advertise, as long as you have something worthwhile to offer.

Mrs. B's son, Louie, and his boys, Ron and Irv, complete the winning Blumkin team. It's a joy to work with this family. All its members have character that matches their extraordinary abilities.

o Last year I stated unequivocally that pre-tax margins at The Buffalo News would fall in 1988. That forecast would have proved correct at almost any other newspaper our size or larger. But Stan Lipsey - bless him - has managed to make me look foolish.

Though we increased our prices a bit less than the industry average last year, and though our newsprint costs and wage rates rose in line with industry norms, Stan actually improved margins a tad. No one in the newspaper business has a better managerial record. He has achieved it, furthermore, while running a paper that gives readers an extraordinary amount of news. We believe that our "newshole" percentage - the portion of the paper devoted to news - is bigger than that of any other dominant paper of our size or larger. The percentage was 49.5% in 1988 versus

49.8% in 1987. We are committed to keeping it around 50%, whatever the level or trend of profit margins.

Charlie and I have loved the newspaper business since we were youngsters, and we have had great fun with the News in the 12 years since we purchased it. We were fortunate to find Murray Light, a top-flight editor, on the scene when we arrived and he has made us proud of the paper ever since.

- o See's Candies sold a record 25.1 million pounds in 1988. Prospects did not look good at the end of October, but excellent Christmas volume, considerably better than the record set in 1987, turned the tide.

As we've told you before, See's business continues to become more Christmas-concentrated. In 1988, the Company earned a record 90% of its full-year profits in December: \$29 million out of \$32.5 million before tax. (It's enough to make you believe in Santa Claus.) December's deluge of business produces a modest seasonal bulge in Berkshire's corporate earnings. Another small bulge occurs in the first quarter, when most World Book annuals are sold.

Charlie and I put Chuck Huggins in charge of See's about five minutes after we bought the company. Upon reviewing his record, you may wonder what took us so long.

- o At Fechheimer, the Heldmans - Bob, George, Gary, Roger and Fred - are the Cincinnati counterparts of the Blumkins. Neither furniture retailing nor uniform manufacturing has inherently attractive economics. In these businesses, only exceptional managements can deliver high returns on invested capital. And that's exactly what the five Heldmans do. (As Mets announcer Ralph Kiner once said when comparing pitcher Steve Trout to his father, Dizzy Trout, the famous Detroit Tigers pitcher: "There's a lot of heredity in that family.")

Fechheimer made a fairly good-sized acquisition in 1988. Charlie and I have such confidence in the business savvy of the Heldman family that we okayed the deal without even looking at it. There are very few managements anywhere - including those running the top tier companies of the Fortune 500 - in which we would exhibit similar confidence.

Because of both this acquisition and some internal growth, sales at Fechheimer should be up significantly in 1989.

- o All of the operations managed by Ralph Schey - World Book, Kirby, and The Scott Fetzer Manufacturing Group - performed splendidly in 1988. Returns on the capital entrusted to Ralph continue to be exceptional.

Within the Scott Fetzer Manufacturing Group, particularly fine progress was recorded at its largest unit, Campbell Hausfeld. This company, the country's leading producer of small and medium-sized air compressors, has more than doubled earnings since 1986.

Unit sales at both Kirby and World Book were up significantly in 1988, with export business particularly strong. World Book became available in the Soviet Union in September, when that country's largest American book store opened in Moscow. Ours is the only general encyclopedia offered at the store.

Ralph's personal productivity is amazing: In addition to running 19 businesses in superb fashion, he is active at The Cleveland Clinic, Ohio University, Case Western Reserve, and a venture capital operation that has spawned sixteen Ohio-based companies and resurrected many others. Both Ohio and Berkshire are fortunate to have Ralph on their side.

Borsheim's

It was in 1983 that Berkshire purchased an 80% interest in The Nebraska Furniture Mart. Your Chairman blundered then by neglecting to ask Mrs. B a question any schoolboy would have thought of: "Are there any more at home like you?" Last month I corrected the error: We are now 80% partners with another branch of the family.

After Mrs. B came over from Russia in 1917, her parents and five siblings followed. (Her two other siblings had preceded her.) Among the sisters was Rebecca Friedman who, with her husband, Louis, escaped in 1922 to the west through Latvia in a journey as perilous as Mrs. B's earlier odyssey to the east through Manchuria. When the family members reunited in Omaha they had no tangible assets. However, they came equipped with an extraordinary combination of brains, integrity, and enthusiasm for work - and that's all they needed. They have since proved themselves invincible.

In 1948 Mr. Friedman purchased Borsheim's, a small Omaha jewelry store. He was joined in the business by his son, Ike, in 1950 and, as the years went by, Ike's son, Alan, and his sons-in-law, Marvin Cohn and Donald Yale, came in also.

You won't be surprised to learn that this family brings to the jewelry business precisely the same approach that the Blumkins bring to the furniture business. The cornerstone for both

enterprises is Mrs. B's creed: "Sell cheap and tell the truth." Other fundamentals at both businesses are: (1) single store operations featuring huge inventories that provide customers with an enormous selection across all price ranges, (2) daily attention to detail by top management, (3) rapid turnover, (4) shrewd buying, and (5) incredibly low expenses. The combination of the last three factors lets both stores offer everyday prices that no one in the country comes close to matching.

Most people, no matter how sophisticated they are in other matters, feel like babes in the woods when purchasing jewelry. They can judge neither quality nor price. For them only one rule makes sense: If you don't know jewelry, know the jeweler.

I can assure you that those who put their trust in Ike Friedman and his family will never be disappointed. The way in which we purchased our interest in their business is the ultimate testimonial. Borsheim's had no audited financial statements; nevertheless, we didn't take inventory, verify receivables or audit the operation in any way. Ike simply told us what was so - - and on that basis we drew up a one-page contract and wrote a large check.

Business at Borsheim's has mushroomed in recent years as the reputation of the Friedman family has spread. Customers now come to the store from all over the country. Among them have been some friends of mine from both coasts who thanked me later for getting them there.

Borsheim's new links to Berkshire will change nothing in the way this business is run. All members of the Friedman family will continue to operate just as they have before; Charlie and I will stay on the sidelines where we belong. And when we say "all members," the words have real meaning. Mr. and Mrs. Friedman, at 88 and 87, respectively, are in the store daily. The wives of Ike, Alan, Marvin and Donald all pitch in at busy times, and a fourth generation is beginning to learn the ropes.

It is great fun to be in business with people you have long admired. The Friedmans, like the Blumkins, have achieved success because they have deserved success. Both families focus on what's right for the customer and that, inevitably, works out well for them, also. We couldn't have better partners.

Insurance Operations

Shown below is an updated version of our usual table presenting key figures for the insurance industry:

Year	Yearly Change in Premiums Written (%)	Statutory Combined Ratio after Policyholder Dividends	Yearly Change in Incurred Losses (%)	Inflation Rate Measured by GNP Deflator (%)
1981	3.8	106.0	6.5	9.6
1982	4.4	109.8	8.4	6.4
1983	4.6	112.0	6.8	3.9
1984	9.2	117.9	16.9	3.8
1985	22.1	116.5	16.1	3.3
1986	22.2	108.0	13.5	2.7
1987	9.4	104.6	7.8	3.3
1988 (Est.)	3.9	105.4	4.2	3.6

Source: A.M. Best Co.

The combined ratio represents total insurance costs (losses incurred plus expenses) compared to revenue from premiums: A ratio below 100 indicates an underwriting profit, and one above 100 indicates a loss. When the investment income that an insurer earns from holding on to policyholders' funds ("the float") is taken into account, a combined ratio in the 107-111 range typically produces an overall break-even result, exclusive of earnings on the funds provided by shareholders.

For the reasons laid out in previous reports, we expect the industry's incurred losses to grow by about 10% annually, even in years when general inflation runs considerably lower. If premium growth meanwhile materially lags that 10% rate, underwriting losses will mount, though the industry's tendency to underreserve when business turns bad may obscure their size for a time. As the table shows, the industry's underwriting loss grew in 1988. This trend is almost certain to continue - and probably will accelerate - for at least two more years.

The property-casualty insurance industry is not only subnormally profitable, it is subnormally popular. (As Sam Goldwyn philosophized: "In life, one must learn to take the bitter with the sour.") One of the ironies of business is that many relatively-unprofitable industries that are

plagued by inadequate prices habitually find themselves beat upon by irate customers even while other, hugely profitable industries are spared complaints, no matter how high their prices.

Take the breakfast cereal industry, whose return on invested capital is more than double that of the auto insurance industry (which is why companies like Kellogg and General Mills sell at five times book value and most large insurers sell close to book). The cereal companies regularly impose price increases, few of them related to a significant jump in their costs. Yet not a peep is heard from consumers. But when auto insurers raise prices by amounts that do not even match cost increases, customers are outraged. If you want to be loved, it's clearly better to sell high-priced corn flakes than low-priced auto insurance.

The antagonism that the public feels toward the industry can have serious consequences: Proposition 103, a California initiative passed last fall, threatens to push auto insurance prices down sharply, even though costs have been soaring. The price cut has been suspended while the courts review the initiative, but the resentment that brought on the vote has not been suspended: Even if the initiative is overturned, insurers are likely to find it tough to operate profitably in California. (Thank heavens the citizenry isn't mad at bonbons: If Proposition 103 applied to candy as well as insurance, See's would be forced to sell its product for \$5.76 per pound, rather than the \$7.60 we charge - and would be losing money by the bucketful.)

The immediate direct effects on Berkshire from the initiative are minor, since we saw few opportunities for profit in the rate structure that existed in California prior to the vote. However, the forcing down of prices would seriously affect GEICO, our 44%-owned investee, which gets about 10% of its premium volume from California. Even more threatening to GEICO is the possibility that similar pricing actions will be taken in other states, through either initiatives or legislation.

If voters insist that auto insurance be priced below cost, it eventually must be sold by government. Stockholders can subsidize policyholders for a short period, but only taxpayers can subsidize them over the long term. At most property-casualty companies, socialized auto insurance would be no disaster for shareholders. Because of the commodity characteristics of the industry, most insurers earn mediocre returns and therefore have little or no economic goodwill to lose if they are forced by government to leave the auto insurance business. But GEICO, because it is a low-cost producer able to earn high returns on equity, has a huge amount of economic goodwill at risk. In turn, so do we.

At Berkshire, in 1988, our premium volume continued to fall, and in 1989 we will experience a large decrease for a special reason: The contract through which we receive 7% of the business of Fireman's Fund expires on August 31. At that time, we will return to Fireman's Fund the unearned premiums we hold that relate to the contract. This transfer of funds will show up in our "premiums written" account as a negative \$85 million or so and will make our third-quarter figures look rather peculiar. However, the termination of this contract will not have a significant effect on profits.

Berkshire's underwriting results continued to be excellent in 1988. Our combined ratio (on a statutory basis and excluding structured settlements and financial reinsurance) was 104. Reserve development was favorable for the second year in a row, after a string of years in which it was very unsatisfactory. Details on both underwriting and reserve development appear on pages 36-38.

Our insurance volume over the next few years is likely to run very low, since business with a reasonable potential for profit will almost certainly be scarce. So be it. At Berkshire, we simply will not write policies at rates that carry the expectation of economic loss. We encounter enough troubles when we expect a gain.

Despite - or perhaps because of - low volume, our profit picture during the next few years is apt to be considerably brighter than the industry's. We are sure to have an exceptional amount of float compared to premium volume, and that augurs well for profits. In 1989 and 1990 we expect our float/premiums ratio to be at least three times that of the typical property/casualty company. Mike Goldberg, with special help from Ajit Jain, Dinos Iordanou, and the National Indemnity managerial team, has positioned us well in that respect.

At some point - we don't know when - we will be deluged with insurance business. The cause will probably be some major physical or financial catastrophe. But we could also experience an explosion in business, as we did in 1985, because large and increasing underwriting losses at other companies coincide with their recognition that they are far underreserved. In the meantime, we will retain our talented professionals, protect our capital, and try not to make major mistakes.

Marketable Securities

In selecting marketable securities for our insurance companies, we can choose among five major categories: (1) long-term common stock investments, (2) medium-term fixed-income

securities, (3) long-term fixed-income securities, (4) short-term cash equivalents, and (5) short-term arbitrage commitments.

We have no particular bias when it comes to choosing from these categories. We just continuously search among them for the highest after-tax returns as measured by “mathematical expectation,” limiting ourselves always to investment alternatives we think we understand. Our criteria have nothing to do with maximizing immediately reportable earnings; our goal, rather, is to maximize eventual net worth.

o Below we list our common stock holdings having a value over \$100 million, not including arbitrage commitments, which will be discussed later. A small portion of these investments belongs to subsidiaries of which Berkshire owns less than 100%.

Shares	Company	Cost (000's omitted)	Market (000's omitted)
3,000,000	Capital Cities/ABC, Inc.	\$517,500	\$1,086,750
14,172,500	The Coca-Cola Company	592,540	632,448
2,400,000	Federal Home Loan Mortgage Corporation Preferred*	71,729	121,200
6,850,000	GEICO Corporation.	45,713	849,400
1,727,765	The Washington Post Company	9,731	364,126

**Although nominally a preferred stock, this security is financially equivalent to a common stock.*

Our permanent holdings - Capital Cities/ABC, Inc., GEICO Corporation, and The Washington Post Company - remain unchanged. Also unchanged is our unqualified admiration of their managements: Tom Murphy and Dan Burke at Cap Cities, Bill Snyder and Lou Simpson at GEICO, and Kay Graham and Dick Simmons at The Washington Post. Charlie and I appreciate enormously the talent and integrity these managers bring to their businesses.

Their performance, which we have observed at close range, contrasts vividly with that of many CEOs, which we have fortunately observed from a safe distance. Sometimes these CEOs

clearly do not belong in their jobs; their positions, nevertheless, are usually secure. The supreme irony of business management is that it is far easier for an inadequate CEO to keep his job than it is for an inadequate subordinate.

If a secretary, say, is hired for a job that requires typing ability of at least 80 words a minute and turns out to be capable of only 50 words a minute, she will lose her job in no time. There is a logical standard for this job; performance is easily measured; and if you can't make the grade, you're out. Similarly, if new sales people fail to generate sufficient business quickly enough, they will be let go. Excuses will not be accepted as a substitute for orders.

However, a CEO who doesn't perform is frequently carried indefinitely. One reason is that performance standards for his job seldom exist. When they do, they are often fuzzy or they may be waived or explained away, even when the performance shortfalls are major and repeated. At too many companies, the boss shoots the arrow of managerial performance and then hastily paints the bullseye around the spot where it lands.

Another important, but seldom recognized, distinction between the boss and the foot soldier is that the CEO has no immediate superior whose performance is itself getting measured. The sales manager who retains a bunch of lemons in his sales force will soon be in hot water himself. It is in his immediate self-interest to promptly weed out his hiring mistakes. Otherwise, he himself may be weeded out. An office manager who has hired inept secretaries faces the same imperative.

But the CEO's boss is a Board of Directors that seldom measures itself and is infrequently held to account for substandard corporate performance. If the Board makes a mistake in hiring, and perpetuates that mistake, so what? Even if the company is taken over because of the mistake, the deal will probably bestow substantial benefits on the outgoing Board members. (The bigger they are, the softer they fall.)

Finally, relations between the Board and the CEO are expected to be congenial. At board meetings, criticism of the CEO's performance is often viewed as the social equivalent of belching. No such inhibitions restrain the office manager from critically evaluating the substandard typist.

These points should not be interpreted as a blanket condemnation of CEOs or Boards of Directors: Most are able and hard-working, and a number are truly outstanding. But the

management failings that Charlie and I have seen make us thankful that we are linked with the managers of our three permanent holdings. They love their businesses, they think like owners, and they exude integrity and ability.

- o In 1988 we made major purchases of Federal Home Loan Mortgage Pfd. (“Freddie Mac”) and Coca Cola. We expect to hold these securities for a long time. In fact, when we own portions of outstanding businesses with outstanding managements, our favorite holding period is forever. We are just the opposite of those who hurry to sell and book profits when companies perform well but who tenaciously hang on to businesses that disappoint. Peter Lynch aptly likens such behavior to cutting the flowers and watering the weeds. Our holdings of Freddie Mac are the maximum allowed by law, and are extensively described by Charlie in his letter. In our consolidated balance sheet these shares are carried at cost rather than market, since they are owned by Mutual Savings and Loan, a non-insurance subsidiary.

We continue to concentrate our investments in a very few companies that we try to understand well. There are only a handful of businesses about which we have strong long-term convictions. Therefore, when we find such a business, we want to participate in a meaningful way. We agree with Mae West: “Too much of a good thing can be wonderful.”

- o We reduced our holdings of medium-term tax-exempt bonds by about \$100 million last year. All of the bonds sold were acquired after August 7, 1986. When such bonds are held by property-casualty insurance companies, 15% of the “tax-exempt” interest earned is subject to tax.

The \$800 million position we still hold consists almost entirely of bonds “grandfathered” under the Tax Reform Act of 1986, which means they are entirely tax-exempt. Our sales produced a small profit and our remaining bonds, which have an average maturity of about six years, are worth modestly more than carrying value.

Last year we described our holdings of short-term and intermediate-term bonds of Texaco, which was then in bankruptcy. During 1988, we sold practically all of these bonds at a pre-tax profit of about \$22 million. This sale explains close to \$100 million of the reduction in fixed-income securities on our balance sheet.

We also told you last year about our holdings of another security whose predominant characteristics are those of an intermediate fixed-income issue: our \$700 million position in Salomon Inc 9% convertible preferred. This preferred has a sinking fund that will retire it in equal annual installments from 1995 to 1999. Berkshire carries this holding at cost. For reasons

discussed by Charlie on page 69, the estimated market value of our holding has improved from moderately under cost at the end of last year to moderately over cost at 1988 year end.

The close association we have had with John Gutfreund, CEO of Salomon, during the past year has reinforced our admiration for him. But we continue to have no great insights about the near, intermediate or long-term economics of the investment banking business: This is not an industry in which it is easy to forecast future levels of profitability. We continue to believe that our conversion privilege could well have important value over the life of our preferred. However, the overwhelming portion of the preferred's value resides in its fixed-income characteristics, not its equity characteristics.

- o We have not lost our aversion to long-term bonds. We will become enthused about such securities only when we become enthused about prospects for long-term stability in the purchasing power of money. And that kind of stability isn't in the cards: Both society and elected officials simply have too many higher-ranking priorities that conflict with purchasing-power stability. The only long-term bonds we hold are those of Washington Public Power Supply Systems (WPPSS). A few of our WPPSS bonds have short maturities and many others, because of their high coupons, are likely to be refunded and paid off in a few years. Overall, our WPPSS holdings are carried on our balance sheet at \$247 million and have a market value of about \$352 million.

We explained the reasons for our WPPSS purchases in the 1983 annual report, and are pleased to tell you that this commitment has worked out about as expected. At the time of purchase, most of our bonds were yielding around 17% after taxes and carried no ratings, which had been suspended. Recently, the bonds were rated AA- by Standard & Poor's. They now sell at levels only slightly below those enjoyed by top-grade credits.

In the 1983 report, we compared the economics of our WPPSS purchase to those involved in buying a business. As it turned out, this purchase actually worked out better than did the general run of business acquisitions made in 1983, assuming both are measured on the basis of unleveraged, after tax returns achieved through 1988.

Our WPPSS experience, though pleasant, does nothing to alter our negative opinion about long-term bonds. It only makes us hope that we run into some other large stigmatized issue, whose troubles have caused it to be significantly misappraised by the market.

Arbitrage

In past reports we have told you that our insurance subsidiaries sometimes engage in arbitrage as an alternative to holding short-term cash equivalents. We prefer, of course, to make major long-term commitments, but we often have more cash than good ideas. At such times, arbitrage sometimes promises much greater returns than Treasury Bills and, equally important, cools any temptation we may have to relax our standards for long-term investments. (Charlie's sign off after we've talked about an arbitrage commitment is usually: "Okay, at least it will keep you out of bars.")

During 1988 we made unusually large profits from arbitrage, measured both by absolute dollars and rate of return. Our pre-tax gain was about \$78 million on average invested funds of about \$147 million.

This level of activity makes some detailed discussion of arbitrage and our approach to it appropriate. Once, the word applied only to the simultaneous purchase and sale of securities or foreign exchange in two different markets. The goal was to exploit tiny price differentials that might exist between, say, Royal Dutch stock trading in guilders in Amsterdam, pounds in London, and dollars in New York. Some people might call this scalping; it won't surprise you that practitioners opted for the French term, arbitrage.

Since World War I the definition of arbitrage - or "risk arbitrage," as it is now sometimes called - has expanded to include the pursuit of profits from an announced corporate event such as sale of the company, merger, recapitalization, reorganization, liquidation, self-tender, etc. In most cases the arbitrageur expects to profit regardless of the behavior of the stock market. The major risk he usually faces instead is that the announced event won't happen.

Some offbeat opportunities occasionally arise in the arbitrage field. I participated in one of these when I was 24 and working in New York for Graham-Newman Corp. Rockwood & Co., a Brooklyn based chocolate products company of limited profitability, had adopted LIFO inventory valuation in 1941 when cocoa was selling for 50 cents per pound. In 1954 a temporary shortage of cocoa caused the price to soar to over 60 cents. Consequently Rockwood wished to unload its valuable inventory - quickly, before the price dropped. But if the cocoa had simply been sold off, the company would have owed close to a 50% tax on the proceeds.

The 1954 Tax Code came to the rescue. It contained an arcane provision that eliminated the tax otherwise due on LIFO profits if inventory was distributed to shareholders as part of a plan reducing the scope of a corporation's business. Rockwood decided to terminate one of its

businesses, the sale of cocoa butter, and said 13 million pounds of its cocoa bean inventory was attributable to that activity. Accordingly, the company offered to repurchase its stock in exchange for the cocoa beans it no longer needed, paying 80 pounds of beans for each share.

For several weeks I busily bought shares, sold beans, and made periodic stops at Schroeder Trust to exchange stock certificates for warehouse receipts. The profits were good and my only expense was subway tokens.

The architect of Rockwood's restructuring was an unknown, but brilliant Chicagoan, Jay Pritzker, then 32. If you're familiar with Jay's subsequent record, you won't be surprised to hear the action worked out rather well for Rockwood's continuing shareholders also. From shortly before the tender until shortly after it, Rockwood stock appreciated from 15 to 100, even though the company was experiencing large operating losses. Sometimes there is more to stock valuation than price-earnings ratios.

In recent years, most arbitrage operations have involved takeovers, friendly and unfriendly. With acquisition fever rampant, with anti-trust challenges almost non-existent, and with bids often ratcheting upward, arbitrageurs have prospered mightily. They have not needed special talents to do well; the trick, a la Peter Sellers in the movie, has simply been "Being There." In Wall Street the old proverb has been reworded: "Give a man a fish and you feed him for a day. Teach him how to arbitrage and you feed him forever." (If, however, he studied at the Ivan Boesky School of Arbitrage, it may be a state institution that supplies his meals.)

To evaluate arbitrage situations you must answer four questions: (1) How likely is it that the promised event will indeed occur? (2) How long will your money be tied up? (3) What chance is there that something still better will transpire - a competing takeover bid, for example? and (4) What will happen if the event does not take place because of anti-trust action, financing glitches, etc.?

Arcata Corp., one of our more serendipitous arbitrage experiences, illustrates the twists and turns of the business. On September 28, 1981 the directors of Arcata agreed in principle to sell the company to Kohlberg, Kravis, Roberts & Co. (KKR), then and now a major leveraged-buyout firm. Arcata was in the printing and forest products businesses and had one other thing going for it: In 1978 the U.S. Government had taken title to 10,700 acres of Arcata timber, primarily old-growth redwood, to expand Redwood National Park. The government had paid

\$97.9 million, in several installments, for this acreage, a sum Arcata was contesting as grossly inadequate. The parties also disputed the interest rate that should apply to the period between the taking of the property and final payment for it. The enabling legislation stipulated 6% simple interest; Arcata argued for a much higher and compounded rate.

Buying a company with a highly-speculative, large-sized claim in litigation creates a negotiating problem, whether the claim is on behalf of or against the company. To solve this problem, KKR offered \$37.00 per Arcata share plus two-thirds of any additional amounts paid by the government for the redwood lands.

Appraising this arbitrage opportunity, we had to ask ourselves whether KKR would consummate the transaction since, among other things, its offer was contingent upon its obtaining “satisfactory financing.” A clause of this kind is always dangerous for the seller: It offers an easy exit for a suitor whose ardor fades between proposal and marriage. However, we were not particularly worried about this possibility because KKR’s past record for closing had been good.

We also had to ask ourselves what would happen if the KKR deal did fall through, and here we also felt reasonably comfortable: Arcata’s management and directors had been shopping the company for some time and were clearly determined to sell. If KKR went away, Arcata would likely find another buyer, though of course, the price might be lower.

Finally, we had to ask ourselves what the redwood claim might be worth. Your Chairman, who can’t tell an elm from an oak, had no trouble with that one: He coolly evaluated the claim at somewhere between zero and a whole lot.

We started buying Arcata stock, then around \$33.50, on September 30 and in eight weeks purchased about 400,000 shares, or 5% of the company. The initial announcement said that the \$37.00 would be paid in January, 1982. Therefore, if everything had gone perfectly, we would have achieved an annual rate of return of about 40% - not counting the redwood claim, which would have been frosting.

All did not go perfectly. In December it was announced that the closing would be delayed a bit. Nevertheless, a definitive agreement was signed on January 4. Encouraged, we raised our stake, buying at around \$38.00 per share and increasing our holdings to 655,000 shares, or over 7% of the company. Our willingness to pay up - even though the closing had been postponed - reflected our leaning toward “a whole lot” rather than “zero” for the redwoods.

Then, on February 25 the lenders said they were taking a “second look” at financing terms “in view of the severely depressed housing industry and its impact on Arcata’s outlook.” The stockholders’ meeting was postponed again, to April. An Arcata spokesman said he “did not think the fate of the acquisition itself was imperiled.” When arbitrageurs hear such reassurances, their minds flash to the old saying: “He lied like a finance minister on the eve of devaluation.”

On March 12 KKR said its earlier deal wouldn’t work, first cutting its offer to \$33.50, then two days later raising it to \$35.00. On March 15, however, the directors turned this bid down and accepted another group’s offer of \$37.50 plus one-half of any redwood recovery. The shareholders okayed the deal, and the \$37.50 was paid on June 4.

We received \$24.6 million versus our cost of \$22.9 million; our average holding period was close to six months. Considering the trouble this transaction encountered, our 15% annual rate of return excluding any value for the redwood claim - was more than satisfactory.

But the best was yet to come. The trial judge appointed two commissions, one to look at the timber’s value, the other to consider the interest rate questions. In January 1987, the first commission said the redwoods were worth \$275.7 million and the second commission recommended a compounded, blended rate of return working out to about 14%.

In August 1987 the judge upheld these conclusions, which meant a net amount of about \$600 million would be due Arcata. The government then appealed. In 1988, though, before this appeal was heard, the claim was settled for \$519 million. Consequently, we received an additional \$29.48 per share, or about \$19.3 million. We will get another \$800,000 or so in 1989.

Berkshire’s arbitrage activities differ from those of many arbitrageurs. First, we participate in only a few, and usually very large, transactions each year. Most practitioners buy into a great many deals perhaps 50 or more per year. With that many irons in the fire, they must spend most of their time monitoring both the progress of deals and the market movements of the related stocks. This is not how Charlie nor I wish to spend our lives. (What’s the sense in getting rich just to stare at a ticker tape all day?)

Because we diversify so little, one particularly profitable or unprofitable transaction will affect our yearly result from arbitrage far more than it will the typical arbitrage operation. So far, Berkshire has not had a really bad experience. But we will - and when it happens we’ll report the gory details to you.

The other way we differ from some arbitrage operations is that we participate only in transactions that have been publicly announced. We do not trade on rumors or try to guess takeover candidates. We just read the newspapers, think about a few of the big propositions, and go by our own sense of probabilities.

At yearend, our only major arbitrage position was 3,342,000 shares of RJR Nabisco with a cost of \$281.8 million and a market value of \$304.5 million. In January we increased our holdings to roughly four million shares and in February we eliminated our position. About three million shares were accepted when we tendered our holdings to KKR, which acquired RJR, and the returned shares were promptly sold in the market. Our pre-tax profit was a better-than-expected \$64 million.

Earlier, another familiar face turned up in the RJR bidding contest: Jay Pritzker, who was part of a First Boston group that made a tax-oriented offer. To quote Yogi Berra; "It was deja vu all over again."

During most of the time when we normally would have been purchasers of RJR, our activities in the stock were restricted because of Salomon's participation in a bidding group. Customarily, Charlie and I, though we are directors of Salomon, are walled off from information about its merger and acquisition work. We have asked that it be that way: The information would do us no good and could, in fact, occasionally inhibit Berkshire's arbitrage operations.

However, the unusually large commitment that Salomon proposed to make in the RJR deal required that all directors be fully informed and involved. Therefore, Berkshire's purchases of RJR were made at only two times: first, in the few days immediately following management's announcement of buyout plans, before Salomon became involved; and considerably later, after the RJR board made its decision in favor of KKR. Because we could not buy at other times, our directorships cost Berkshire significant money.

Considering Berkshire's good results in 1988, you might expect us to pile into arbitrage during 1989. Instead, we expect to be on the sidelines.

One pleasant reason is that our cash holdings are down - because our position in equities that we expect to hold for a very long time is substantially up. As regular readers of this report know, our new commitments are not based on a judgment about short-term prospects for the stock market. Rather, they reflect an opinion about long-term business prospects for specific

companies. We do not have, never have had, and never will have an opinion about where the stock market, interest rates, or business activity will be a year from now.

Even if we had a lot of cash we probably would do little in arbitrage in 1989. Some extraordinary excesses have developed in the takeover field. As Dorothy says: "Toto, I have a feeling we're not in Kansas anymore."

We have no idea how long the excesses will last, nor do we know what will change the attitudes of government, lender and buyer that fuel them. But we do know that the less the prudence with which others conduct their affairs, the greater the prudence with which we should conduct our own affairs. We have no desire to arbitrage transactions that reflect the unbridled - and, in our view, often unwarranted - optimism of both buyers and lenders. In our activities, we will heed the wisdom of Herb Stein: "If something can't go on forever, it will end."

Efficient Market Theory

The preceding discussion about arbitrage makes a small discussion of "efficient market theory" (EMT) also seem relevant. This doctrine became highly fashionable - indeed, almost holy scripture in academic circles during the 1970s. Essentially, it said that analyzing stocks was useless because all public information about them was appropriately reflected in their prices. In other words, the market always knew everything. As a corollary, the professors who taught EMT said that someone throwing darts at the stock tables could select a stock portfolio having prospects just as good as one selected by the brightest, most hard-working security analyst. Amazingly, EMT was embraced not only by academics, but by many investment professionals and corporate managers as well. Observing correctly that the market was *frequently* efficient, they went on to conclude incorrectly that it was *always* efficient. The difference between these propositions is night and day.

In my opinion, the continuous 63-year arbitrage experience of Graham-Newman Corp. Buffett Partnership, and Berkshire illustrates just how foolish EMT is. (There's plenty of other evidence, also.) While at Graham-Newman, I made a study of its earnings from arbitrage during the entire 1926-1956 lifespan of the company. Unleveraged returns averaged 20% per year. Starting in 1956, I applied Ben Graham's arbitrage principles, first at Buffett Partnership and then Berkshire. Though I've not made an exact calculation, I have done enough work to know that the 1956-1988 returns averaged well over 20%. (Of course, I operated in an environment far more favorable than Ben's; he had 1929-1932 to contend with.)

All of the conditions are present that are required for a fair test of portfolio performance: (1) the three organizations traded hundreds of different securities while building this 63-year record; (2) the results are not skewed by a few fortunate experiences; (3) we did not have to dig for obscure facts or develop keen insights about products or managements - we simply acted on highly-publicized events; and (4) our arbitrage positions were a clearly identified universe - they have not been selected by hindsight.

Over the 63 years, the general market delivered just under a 10% annual return, including dividends. That means \$1,000 would have grown to \$405,000 if all income had been reinvested. A 20% rate of return, however, would have produced \$97 million. That strikes us as a statistically-significant differential that might, conceivably, arouse one's curiosity.

Yet proponents of the theory have never seemed interested in discordant evidence of this type. True, they don't talk quite as much about their theory today as they used to. But no one, to my knowledge, has ever said he was wrong, no matter how many thousands of students he has sent forth misinstructed. EMT, moreover, continues to be an integral part of the investment curriculum at major business schools. Apparently, a reluctance to recant, and thereby to demystify the priesthood, is not limited to theologians.

Naturally the disservice done students and gullible investment professionals who have swallowed EMT has been an extraordinary service to us and other followers of Graham. In any sort of a contest - financial, mental, or physical - it's an enormous advantage to have opponents who have been taught that it's useless to even try. From a selfish point of view, Grahamites should probably endow chairs to ensure the perpetual teaching of EMT.

All this said, a warning is appropriate. Arbitrage has looked easy recently. But this is not a form of investing that guarantees profits of 20% a year or, for that matter, profits of any kind. As noted, the market is reasonably efficient much of the time: For every arbitrage opportunity we seized in that 63-year period, many more were foregone because they seemed properly-priced.

An investor cannot obtain superior profits from stocks by simply committing to a specific investment category or style. He can earn them only by carefully evaluating facts and continuously exercising discipline. Investing in arbitrage situations, per se, is no better a strategy than selecting a portfolio by throwing darts.

New York Stock Exchange Listing

Berkshire's shares were listed on the New York Stock Exchange on November 29, 1988. On pages 50-51 we reproduce the letter we sent to shareholders concerning the listing.

Let me clarify one point not dealt with in the letter: Though our round lot for trading on the NYSE is ten shares, any number of shares from one on up can be bought or sold.

As the letter explains, our primary goal in listing was to reduce transaction costs, and we believe this goal is being achieved. Generally, the spread between the bid and asked price on the NYSE has been well below the spread that prevailed in the over-the-counter market.

Henderson Brothers, Inc., the specialist in our shares, is the oldest continuing specialist firm on the Exchange; its progenitor, William Thomas Henderson, bought his seat for \$500 on September 8, 1861. (Recently, seats were selling for about \$625,000.) Among the 54 firms acting as specialists, HBI ranks second in number of stocks assigned, with 83. We were pleased when Berkshire was allocated to HBI, and have been delighted with the firm's performance. Jim Maguire, Chairman of HBI, personally manages the trading in Berkshire, and we could not be in better hands.

In two respects our goals probably differ somewhat from those of most listed companies. First, we do not want to maximize the price at which Berkshire shares trade. We wish instead for them to trade in a narrow range centered at intrinsic business value (which we hope increases at a reasonable - or, better yet, unreasonable - rate). Charlie and I are bothered as much by significant overvaluation as significant undervaluation. Both extremes will inevitably produce results for many shareholders that will differ sharply from Berkshire's business results. If our stock price instead consistently mirrors business value, each of our shareholders will receive an investment result that roughly parallels the business results of Berkshire during his holding period.

Second, we wish for very little trading activity. If we ran a private business with a few passive partners, we would be disappointed if those partners, and their replacements, frequently wanted to leave the partnership. Running a public company, we feel the same way.

Our goal is to attract long-term owners who, at the time of purchase, have no timetable or price target for sale but plan instead to stay with us indefinitely. We don't understand the CEO who wants lots of stock activity, for that can be achieved only if many of his owners are constantly exiting. At what other organization - school, club, church, etc. - do leaders cheer when members leave? (However, if there were a broker whose livelihood depended upon the

membership turnover in such organizations, you could be sure that there would be at least one proponent of activity, as in: “There hasn’t been much going on in Christianity for a while; maybe we should switch to Buddhism next week.”)

Of course, some Berkshire owners will need or want to sell from time to time, and we wish for good replacements who will pay them a fair price. Therefore we try, through our policies, performance, and communications, to attract new shareholders who understand our operations, share our time horizons, and measure us as we measure ourselves. If we can continue to attract this sort of shareholder - and, just as important, can continue to be uninteresting to those with short-term or unrealistic expectations - Berkshire shares should consistently sell at prices reasonably related to business value.

David L. Dodd

Dave Dodd, my friend and teacher for 38 years, died last year at age 93. Most of you don’t know of him. Yet any long-time shareholder of Berkshire is appreciably wealthier because of the indirect influence he had upon our company.

Dave spent a lifetime teaching at Columbia University, and he co-authored *Security Analysis* with Ben Graham. From the moment I arrived at Columbia, Dave personally encouraged and educated me; one influence was as important as the other. Everything he taught me, directly or through his book, made sense. Later, through dozens of letters, he continued my education right up until his death.

I have known many professors of finance and investments but I have never seen any, except for Ben Graham, who was the match of Dave. The proof of his talent is the record of his students: No other teacher of investments has sent forth so many who have achieved unusual success.

When students left Dave’s classroom, they were equipped to invest intelligently for a lifetime because the principles he taught were simple, sound, useful, and enduring. Though these may appear to be unremarkable virtues, the teaching of principles embodying them has been rare.

It’s particularly impressive that Dave could practice as well as preach. just as Keynes became wealthy by applying his academic ideas to a very small purse, so, too, did Dave. Indeed, his financial performance far outshone that of Keynes, who began as a market-timer (leaning on business and credit-cycle theory) and converted, after much thought, to value investing. Dave was right from the start.

In Berkshire's investments, Charlie and I have employed the principles taught by Dave and Ben Graham. Our prosperity is the fruit of their intellectual tree.

Miscellaneous

We hope to buy more businesses that are similar to the ones we have, and we can use some help. If you have a business that fits the following criteria, call me or, preferably, write.

Here's what we're looking for:

- (1) large purchases (at least \$10 million of after-tax earnings),
- (2) demonstrated consistent earning power (future projections are of little interest to us, nor are "turnaround" situations),
- (3) businesses earning good returns on equity while employing little or no debt,
- (4) management in place (we can't supply it),
- (5) simple businesses (if there's lots of technology, we won't understand it),
- (6) an offering price (we don't want to waste our time or that of the seller by talking, even preliminarily, about a transaction when price is unknown).

We will not engage in unfriendly takeovers. We can promise complete confidentiality and a very fast answer - customarily within five minutes - as to whether we're interested. We prefer to buy for cash, but will consider issuing stock when we receive as much in intrinsic business value as we give.

Our favorite form of purchase is one fitting the Blumkin-Friedman-Heldman mold. In cases like these, the company's owner-managers wish to generate significant amounts of cash, sometimes for themselves, but often for their families or inactive shareholders. However, these managers also wish to remain significant owners who continue to run their companies just as they have in the past. We think we offer a particularly good fit for owners with these objectives and invite potential sellers to check us out by contacting people with whom we have done business in the past.

Charlie and I frequently get approached about acquisitions that don't come close to meeting our tests: We've found that if you advertise an interest in buying collies, a lot of people will call hoping to sell you their cocker spaniels. Our interest in new ventures, turnarounds, or auction-like sales can best be expressed by another Goldwynism: "Please include me out."

Besides being interested in the purchase of businesses as described above, we are also interested in the negotiated purchase of large, but not controlling, blocks of stock comparable to

those we hold in Cap Cities and Salomon. We have a special interest in purchasing convertible preferreds as a long-term investment, as we did at Salomon.

* * *

We received some good news a few weeks ago: Standard & Poor's raised our credit rating to AAA, which is the highest rating it bestows. Only 15 other U.S. industrial or property-casualty companies are rated AAA, down from 28 in 1980.

Corporate bondholders have taken their lumps in the past few years from "event risk." This term refers to the overnight degradation of credit that accompanies a heavily-leveraged purchase or recapitalization of a business whose financial policies, up to then, had been conservative. In a world of takeovers inhabited by few owner-managers, most corporations present such a risk. Berkshire does not. Charlie and I promise bondholders the same respect we afford shareholders.

* * *

About 97.4% of all eligible shares participated in Berkshire's 1988 shareholder-designated contributions program. Contributions made through the program were \$5 million, and 2,319 charities were recipients. If we achieve reasonable business results, we plan to increase the per-share contributions in 1989.

We urge new shareholders to read the description of our shareholder-designated contributions program that appears on pages 48-49. If you wish to participate in future programs, we strongly urge that you immediately make sure your shares are registered in the name of the actual owner, not in the nominee name of a broker, bank or depository. Shares not so registered on September 30, 1989 will be ineligible for the 1989 program.

* * *

Berkshire's annual meeting will be held in Omaha on Monday, April 24, 1989, and I hope you will come. The meeting provides the forum for you to ask any owner-related questions you

may have, and we will keep answering until all (except those dealing with portfolio activities or other proprietary information) have been dealt with.

After the meeting we will have several buses available to take you to visit Mrs. B at The Nebraska Furniture Mart and Ike Friedman at Borsheim's. Be prepared for bargains.

Out-of-towners may prefer to arrive early and visit Mrs. B during the Sunday store hours of noon to five. (These Sunday hours seem ridiculously short to Mrs. B, who feels they scarcely allow her time to warm up; she much prefers the days on which the store remains open from 10 a.m. to 9 p.m.) Borsheims, however, is not open on Sunday.

Ask Mrs. B the secret of her astonishingly low carpet prices. She will confide to you - as she does to everyone - how she does it: "I can sell so cheap 'cause I work for this dummy who doesn't know anything about carpet."

Warren E. Buffett

Chairman of the Board

1989 Letter

BERKSHIRE HATHAWAY INC.

To the Shareholders of Berkshire Hathaway Inc.:

Our gain in net worth during 1989 was \$1.515 billion, or 44.4%. Over the last 25 years (that is, since present management took over) our per-share book value has grown from \$19.46 to \$4,296.01, or at a rate of 23.8% compounded annually.

What counts, however, is intrinsic value - the figure indicating what all of our constituent businesses are rationally worth. With perfect foresight, this number can be calculated by taking all future cash flows of a business - in and out - and discounting them at prevailing interest rates. So valued, all businesses, from manufacturers of buggy whips to operators of cellular phones, become economic equals.

Back when Berkshire's book value was \$19.46, intrinsic value was somewhat less because the book value was entirely tied up in a textile business not worth the figure at which it was carried. Now most of our businesses are worth far more than their carrying values. This agreeable evolution from a discount to a premium means that Berkshire's intrinsic business value has compounded at a rate that somewhat exceeds our 23.8% annual growth in book value.

The rear-view mirror is one thing; the windshield is another. A large portion of our book value is represented by equity securities that, with minor exceptions, are carried on our balance sheet at current market values. At yearend these securities were valued at higher prices, relative to their own intrinsic business values, than has been the case in the past. One reason is the buoyant 1989 stock market. More important, the virtues of these businesses have been widely recognized. Whereas once their stock prices were inappropriately low, they are not now.

We will keep most of our major holdings, regardless of how they are priced relative to intrinsic business value. This 'til-death-do-us-part attitude, combined with the full prices these holdings command, means that they cannot be expected to push up Berkshire's value in the future as sharply as in the past. In other words, our performance to date has benefited from a

double-dip: (1) the exceptional gains in intrinsic value that our portfolio companies have achieved; (2) the additional bonus we realized as the market appropriately "corrected" the prices of these companies, raising their valuations in relation to those of the average business. We will continue to benefit from good gains in business value that we feel confident our portfolio companies will make. But our "catch-up" rewards have been realized, which means we'll have to settle for a single-dip in the future.

We face another obstacle: In a finite world, high growth rates must self-destruct. If the base from which the growth is taking place is tiny, this law may not operate for a time. But when the base balloons, the party ends: A high growth rate eventually forges its own anchor.

Carl Sagan has entertainingly described this phenomenon, musing about the destiny of bacteria that reproduce by dividing into two every 15 minutes. Says Sagan: "That means four doublings an hour, and 96 doublings a day. Although a bacterium weighs only about a trillionth of a gram, its descendants, after a day of wild asexual abandon, will collectively weigh as much as a mountain...in two days, more than the sun - and before very long, everything in the universe will be made of bacteria." Not to worry, says Sagan: Some obstacle always impedes this kind of exponential growth. "The bugs run out of food, or they poison each other, or they are shy about reproducing in public."

Even on bad days, Charlie Munger (Berkshire's Vice Chairman and my partner) and I do not think of Berkshire as a bacterium. Nor, to our unending sorrow, have we found a way to double its net worth every 15 minutes. Furthermore, we are not the least bit shy about reproducing - financially - in public. Nevertheless, Sagan's observations apply. From Berkshire's present base of \$4.9 billion in net worth, we will find it much more difficult to average 15% annual growth in book value than we did to average 23.8% from the \$22 million we began with.

Taxes

Our 1989 gain of \$1.5 billion was achieved after we took a charge of about \$712 million for income taxes. In addition, Berkshire's share of the income taxes paid by its five major investees totaled about \$175 million. Of this year's tax charge, about \$172 million will be paid currently; the remainder, \$540 million, is deferred. Almost all of the deferred portion relates to the 1989 increase in unrealized profits in our common stock holdings. Against this increase, we have reserved a 34% tax.

We also carry reserves at that rate against all unrealized profits generated in 1987 and 1988. But, as we explained last year, the unrealized gains we amassed before 1987 - about \$1.2 billion - carry reserves booked at the 28% tax rate that then prevailed.

A new accounting rule is likely to be adopted that will require companies to reserve against all gains at the current tax rate, whatever it may be. With the rate at 34%, such a rule would increase our deferred tax liability, and decrease our net worth, by about \$71 million - the result of raising the reserve on our pre-1987 gain by six percentage points. Because the proposed rule has sparked widespread controversy and its final form is unclear, we have not yet made this change.

As you can see from our balance sheet on page 27, we would owe taxes of more than \$1.1 billion were we to sell all of our securities at year-end market values. Is this \$1.1 billion liability equal, or even similar, to a \$1.1 billion liability payable to a trade creditor 15 days after the end of the year? Obviously not - despite the fact that both items have exactly the same effect on audited net worth, reducing it by \$1.1 billion.

On the other hand, is this liability for deferred taxes a meaningless accounting fiction because its payment can be triggered only by the sale of stocks that, in very large part, we have no intention of selling? Again, the answer is no.

In economic terms, the liability resembles an interest-free loan from the U.S. Treasury that comes due only at our election (unless, of course, Congress moves to tax gains before they are realized). This "loan" is peculiar in other respects as well: It can be used only to finance the ownership of the particular, appreciated stocks and it fluctuates in size - daily as market prices change and periodically if tax rates change. In effect, this deferred tax liability is equivalent to a very large transfer tax that is payable only if we elect to move from one asset to another. Indeed, we sold some relatively small holdings in 1989, incurring about \$76 million of "transfer" tax on \$224 million of gains.

Because of the way the tax law works, the Rip Van Winkle style of investing that we favor - if successful - has an important mathematical edge over a more frenzied approach. Let's look at an extreme comparison.

Imagine that Berkshire had only \$1, which we put in a security that doubled by yearend and was then sold. Imagine further that we used the after-tax proceeds to repeat this process in each of the next 19 years, scoring a double each time. At the end of the 20 years, the 34% capital

gains tax that we would have paid on the profits from each sale would have delivered about \$13,000 to the government and we would be left with about \$25,250. Not bad. If, however, we made a single fantastic investment that *itself* doubled 20 times during the 20 years, our dollar would grow to \$1,048,576. Were we then to cash out, we would pay a 34% tax of roughly \$356,500 and be left with about \$692,000.

The sole reason for this staggering difference in results would be the timing of tax payments. Interestingly, the government would gain from Scenario 2 in exactly the same 27:1 ratio as we - taking in taxes of \$356,500 vs. \$13,000 - though, admittedly, it would have to wait for its money.

We have not, we should stress, adopted our strategy favoring long-term investment commitments because of these mathematics. Indeed, it is possible we could earn greater after-tax returns by moving rather frequently from one investment to another. Many years ago, that's exactly what Charlie and I did.

Now we would rather stay put, even if that means slightly lower returns. Our reason is simple: We have found splendid business relationships to be so rare and so enjoyable that we want to retain all we develop. This decision is particularly easy for us because we feel that these relationships will produce good - though perhaps not optimal - financial results. Considering that, we think it makes little sense for us to give up time with people we know to be interesting and admirable for time with others we do not know and who are likely to have human qualities far closer to average. That would be akin to marrying for money - a mistake under most circumstances, insanity if one is already rich.

Sources of Reported Earnings

The table below shows the major sources of Berkshire's reported earnings. In this presentation, amortization of Goodwill and other major purchase-price accounting adjustments are not charged against the specific businesses to which they apply, but are instead aggregated and shown separately. This procedure lets you view the earnings of our businesses as they would have been reported had we not purchased them. I've explained in past reports why this form of presentation seems to us to be more useful to investors and managers than one utilizing generally accepted accounting principles (GAAP), which require purchase-price adjustments to be made on a business-by-business basis. The total net earnings we show in the table are, of course, identical to the GAAP total in our audited financial statements.

Further information about these businesses is given in the Business Segment section on pages 37-39, and in the Management's Discussion section on pages 40-44. In these sections you also will find our segment earnings reported on a GAAP basis. For information on Wesco's businesses, I urge you to read Charlie Munger's letter, which starts on page 54. In addition, we have reprinted on page 71 Charlie's May 30, 1989 letter to the U. S. League of Savings Institutions, which conveyed our disgust with its policies and our consequent decision to resign.

Operating Earnings (000s omitted)	Pre-Tax 1989	Earnings 1988	Berkshire 1989	Share 1988
Insurance Group:				
Underwriting	\$(24,400)	\$(11,081)	\$(12,259)	\$(1,045)

Total Earnings- all entities	\$617,224	\$550,121	\$447,477	\$399,270

**Excludes interest expense of Scott Fetzer Financial Group and Mutual Savings & Loan.*

We refer you also to pages 45-51, where we have rearranged Berkshire's financial data into four segments. These correspond to the way Charlie and I think about the business and should help you calculate Berkshire's intrinsic value. Shown on these pages are balance sheets and

earnings statements for: (1) our insurance operations, with their major investment positions itemized; (2) our manufacturing, publishing and retailing businesses, leaving aside certain non-operating assets and purchase-price accounting adjustments; (3) our subsidiaries engaged in finance-type operations, which are Mutual Savings and Scott Fetzer Financial; and (4) an all-other category that includes the non-operating assets (primarily marketable securities) held by the companies in segment (2), all purchase price accounting adjustments, and various assets and debts of the Wesco and Berkshire parent companies.

If you combine the earnings and net worths of these four segments, you will derive totals matching those shown on our GAAP statements. However, I want to emphasize that this four-category presentation does not fall within the purview of our auditors, who in no way bless it.

In addition to our reported earnings, we also benefit from significant earnings of investees that standard accounting rules do not permit us to report. On page 15, we list five major investees from which we received dividends in 1989 of about \$45 million, after taxes. However, our share of the *retained* earnings of these investees totaled about \$212 million last year, not counting large capital gains realized by GEICO and Coca-Cola. If this \$212 million had been distributed to us, our own operating earnings, after the payment of additional taxes, would have been close to \$500 million rather than the \$300 million shown in the table.

The question you must decide is whether these undistributed earnings are as valuable to us as those we report. We believe they are - and even think they may be more valuable. The reason for this a-bird-in-the-bush-may-be-worth-two-in-the-hand conclusion is that earnings retained by these investees will be deployed by talented, owner-oriented managers who sometimes have better uses for these funds in their own businesses than we would have in ours. I would not make such a generous assessment of most managements, but it is appropriate in these cases.

In our view, Berkshire's fundamental earning power is best measured by a "look-through" approach, in which we append our share of the operating earnings retained by our investees to our own reported operating earnings, excluding capital gains in both instances. For our intrinsic business value to grow at an average of 15% per year, our "look-through" earnings must grow at about the same pace. We'll need plenty of help from our present investees, and also need to add a new one from time to time, in order to reach this 15% goal.

Non-Insurance Operations

In the past, we have labeled our major manufacturing, publishing and retail operations "The Sainted Seven." With our acquisition of Borsheim's early in 1989, the challenge was to find a new title both alliterative and appropriate. We failed: Let's call the group "The Sainted Seven Plus One."

This divine assemblage - Borsheim's, The Buffalo News, Fechheimer Bros., Kirby, Nebraska Furniture Mart, Scott Fetzer Manufacturing Group, See's Candies, World Book - is a collection of businesses with economic characteristics that range from good to superb. Its managers range from superb to superb.

Most of these managers have no need to work for a living; they show up at the ballpark because they like to hit home runs. And that's exactly what they do. Their combined financial statements (including those of some smaller operations), shown on page 49, illustrate just how outstanding their performance is. On an historical accounting basis, after-tax earnings of these operations were 57% on average equity capital. Moreover, this return was achieved with no net leverage: Cash equivalents have matched funded debt. When I call off the names of our managers - the Blumkin, Friedman and Heldman families, Chuck Huggins, Stan Lipsey, and Ralph Schey - I feel the same glow that Miller Huggins must have experienced when he announced the lineup of his 1927 New York Yankees.

Let's take a look, business by business:

- o In its first year with Berkshire, Borsheim's met all expectations. Sales rose significantly and are now considerably better than twice what they were four years ago when the company moved to its present location. In the six years prior to the move, sales had also doubled. Ike Friedman, Borsheim's managing genius - and I mean that - has only one speed: fast-forward.

If you haven't been there, you've never seen a jewelry store like Borsheim's. Because of the huge volume it does at one location, the store can maintain an enormous selection across all price ranges. For the same reason, it can hold its expense ratio to about one-third that prevailing at jewelry stores offering comparable merchandise. The store's tight control of expenses, accompanied by its unusual buying power, enable it to offer prices far lower than those of other jewelers. These prices, in turn, generate even more volume, and so the circle goes 'round and 'round. The end result is store traffic as high as 4,000 people on seasonally-busy days.

Ike Friedman is not only a superb businessman and a great showman but also a man of integrity. We bought the business without an audit, and all of our surprises have been on the plus

side. "If you don't know jewelry, know your jeweler" makes sense whether you are buying the whole business or a tiny diamond.

A story will illustrate why I enjoy Ike so much: Every two years I'm part of an informal group that gathers to have fun and explore a few subjects. Last September, meeting at Bishop's Lodge in Santa Fe, we asked Ike, his wife Roz, and his son Alan to come by and educate us on jewels and the jewelry business.

Ike decided to dazzle the group, so he brought from Omaha about \$20 million of particularly fancy merchandise. I was somewhat apprehensive - Bishop's Lodge is no Fort Knox - and I mentioned my concern to Ike at our opening party the evening before his presentation. Ike took me aside. "See that safe?" he said. "This afternoon we changed the combination and now even the hotel management doesn't know what it is." I breathed easier. Ike went on: "See those two big fellows with guns on their hips? They'll be guarding the safe all night." I now was ready to rejoin the party. But Ike leaned closer: "And besides, Warren," he confided, "the jewels aren't in the safe."

How can we miss with a fellow like that - particularly when he comes equipped with a talented and energetic family, Alan, Marvin Cohn, and Don Yale.

- o At See's Candies we had an 8% increase in pounds sold, even though 1988 was itself a record year. Included in the 1989 performance were excellent same-store poundage gains, our first in many years.

Advertising played an important role in this outstanding performance. We increased total advertising expenditures from \$4 million to \$5 million and also got copy from our agency, Hal Riney & Partners, Inc., that was 100% on the money in conveying the qualities that make See's special.

In our media businesses, such as the Buffalo News, we sell advertising. In other businesses, such as See's, we are buyers. When we buy, we practice exactly what we preach when we sell. At See's, we more than tripled our expenditures on newspaper advertising last year, to the highest percentage of sales that I can remember. The payoff was terrific, and we thank both Hal Riney and the power of well-directed newspaper advertising for this result.

See's splendid performances have become routine. But there is nothing routine about the management of Chuck Huggins: His daily involvement with all aspects of production and sales

imparts a quality-and-service message to the thousands of employees we need to produce and distribute over 27 million pounds of candy annually. In a company with 225 shops and a massive mail order and phone business, it is no small trick to run things so that virtually every customer leaves happy. Chuck makes it look easy.

- o The Nebraska Furniture Mart had record sales and excellent earnings in 1989, but there was one sad note. Mrs. B - Rose Blumkin, who started the company 52 years ago with \$500 - quit in May, after disagreeing with other members of the Blumkin family/management about the remodeling and operation of the carpet department.

Mrs. B probably has made more smart business decisions than any living American, but in this particular case I believe the other members of the family were entirely correct: Over the past three years, while the store's other departments increased sales by 24%, carpet sales declined by 17% (but not because of any lack of sales ability by Mrs. B, who has always personally sold far more merchandise than any other salesperson in the store).

You will be pleased to know that Mrs. B continues to make Horatio Alger's heroes look like victims of tired blood. At age 96 she has started a new business selling - what else? - carpet and furniture. And as always, she works seven days a week.

At the Mart Louie, Ron, and Irv Blumkin continue to propel what is by far the largest and most successful home furnishings store in the country. They are outstanding merchants, outstanding managers, and a joy to be associated with. One reading on their acumen: In the fourth quarter of 1989, the carpet department registered a 75.3% consumer share in the Omaha market, up from 67.7% a year earlier and over six times that of its nearest competitor.

NFM and Borsheim's follow precisely the same formula for success: (1) unparalleled depth and breadth of merchandise at one location; (2) the lowest operating costs in the business; (3) the shrewdest of buying, made possible in part by the huge volumes purchased; (4) gross margins, and therefore prices, far below competitors'; and (5) friendly personalized service with family members on hand at all times.

Another plug for newspapers: NFM increased its lineage in the local paper by over 20% in 1989 - off a record 1988 - and remains the paper's largest ROP advertiser by far. (ROP advertising is the kind printed in the paper, as opposed to that in preprinted inserts.) To my knowledge, Omaha is the only city in which a home furnishings store is the advertising leader.

Many retailers cut space purchases in 1989; our experience at See's and NFM would indicate they made a major mistake.

- o The Buffalo News continued to star in 1989 in three important ways: First, among major metropolitan papers, both daily and Sunday, the News is number one in household penetration - the percentage of local households that purchase it each day. Second, in "news hole" - the portion of the paper devoted to news - the paper stood at 50.1% in 1989 vs. 49.5% in 1988, a level again making it more news-rich than any comparable American paper. Third, in a year that saw profits slip at many major papers, the News set its seventh consecutive profit record.

To some extent, these three factors are related, though obviously a high-percentage news hole, by itself, reduces profits significantly. A large and intelligently-utilized news hole, however, attracts a wide spectrum of readers and thereby boosts penetration. High penetration, in turn, makes a newspaper particularly valuable to retailers since it allows them to talk to the entire community through a single "megaphone." A low-penetration paper is a far less compelling purchase for many advertisers and will eventually suffer in both ad rates and profits.

It should be emphasized that our excellent penetration is neither an accident nor automatic. The population of Erie County, home territory of the News, has been falling - from 1,113,000 in 1970 to 1,015,000 in 1980 to an estimated 966,000 in 1988. Circulation figures tell a different story. In 1975, shortly before we started our Sunday edition, the Courier-Express, a long-established Buffalo paper, was selling 207,500 Sunday copies in Erie County. Last year - with population at least 5% lower - the News sold an average of 292,700 copies. I believe that in no other major Sunday market has there been anything close to that increase in penetration.

When this kind of gain is made - and when a paper attains an unequaled degree of acceptance in its home town - someone is doing something right. In this case major credit clearly belongs to Murray Light, our long-time editor who daily creates an informative, useful, and interesting product. Credit should go also to the Circulation and Production Departments: A paper that is frequently late, because of production problems or distribution weaknesses, will lose customers, no matter how strong its editorial content.

Stan Lipsey, publisher of the News, has produced profits fully up to the strength of our product. I believe Stan's managerial skills deliver at least five extra percentage points in profit margin compared to the earnings that would be achieved by an average manager given the same

circumstances. That is an amazing performance, and one that could only be produced by a talented manager who knows - and cares - about every nut and bolt of the business.

Stan's knowledge and talents, it should be emphasized, extend to the editorial product. His early years in the business were spent on the news side and he played a key role in developing and editing a series of stories that in 1972 won a Pulitzer Prize for the Sun Newspaper of Omaha. Stan and I have worked together for over 20 years, through some bad times as well as good, and I could not ask for a better partner.

- o At Fechheimer, the Heldman clan - Bob, George, Gary, Roger and Fred - continue their extraordinary performance. Profits in 1989 were down somewhat because of problems the business experienced in integrating a major 1988 acquisition. These problems will be ironed out in time. Meanwhile, return on invested capital at Fechheimer remains splendid.

Like all of our managers, the Heldmans have an exceptional command of the details of their business. At last year's annual meeting I mentioned that when a prisoner enters San Quentin, Bob and George probably know his shirt size. That's only a slight exaggeration: No matter what area of the country is being discussed, they know exactly what is going on with major customers and with the competition.

Though we purchased Fechheimer four years ago, Charlie and I have never visited any of its plants or the home office in Cincinnati. We're much like the lonesome Maytag repairman: The Heldman managerial product is so good that a service call is never needed.

- o Ralph Schey continues to do a superb job in managing our largest group - World Book, Kirby, and the Scott Fetzer Manufacturing Companies. Aggregate earnings of these businesses have increased every year since our purchase and returns on invested capital continue to be exceptional. Ralph is running an enterprise large enough, were it standing alone, to be on the Fortune 500. And he's running it in a fashion that would put him high in the top decile, measured by return on equity.

For some years, World Book has operated out of a single location in Chicago's Merchandise Mart. Anticipating the imminent expiration of its lease, the business is now decentralizing into four locations. The expenses of this transition are significant; nevertheless profits in 1989 held up well. It will be another year before costs of the move are fully behind us.

Kirby's business was particularly strong last year, featuring large gains in export sales. International business has more than doubled in the last two years and quintupled in the past

four; its share of unit sales has risen from 5% to 20%. Our largest capital expenditures in 1989 were at Kirby, in preparation for a major model change in 1990.

Ralph's operations contribute about 40% of the total earnings of the non-insurance group whose results are shown on page 49. When we bought Scott Fetzer at the start of 1986, our acquisition of Ralph as a manager was fully as important as our acquisition of the businesses. In addition to generating extraordinary earnings, Ralph also manages capital extremely well. These abilities have produced funds for Berkshire that, in turn, have allowed us to make many other profitable commitments.

And that completes our answer to the 1927 Yankees.

Insurance Operations

Shown below is an updated version of our usual table presenting key figures for the property-casualty insurance industry:

Year	Yearly Change in Premiums Written (%)	Statutory Combined Ratio after Policyholder Dividends	Yearly Change in Incurred Losses (%)	Inflation Rate Measured by GNP Deflator (%)
1981	3.8	106.0	6.5	9.6
1982	4.4	109.8	8.4	6.4
1983	4.6	112.0	6.8	3.9
1984	9.2	117.9	16.9	3.8
1985	22.1	116.5	16.1	3.3
1986	22.2	108.0	13.5	2.7
1987	9.4	104.6	7.8	3.1
1988	4.4	105.4	5.5	3.3
1989 (Est.)	2.1	110.4	8.7	4.2

Source: A.M. Best Co.

The combined ratio represents total insurance costs (losses incurred plus expenses) compared to revenue from premiums: A ratio below 100 indicates an underwriting profit, and one above 100 indicates a loss. When the investment income that an insurer earns from holding policyholders' funds ("the float") is taken into account, a combined ratio in the 107-111 range typically produces an overall breakeven result, exclusive of earnings on the funds provided by shareholders.

For the reasons laid out in previous reports, we expect the industry's incurred losses to grow by about 10% annually, even in years when general inflation runs considerably lower. (Actually, over the last 25 years, incurred losses have grown at a still faster rate, 11%.) If premium growth meanwhile materially lags that 10% rate, underwriting losses will mount, though the industry's tendency to underreserve when business turns bad may obscure their size for a time.

Last year we said the climb in the combined ratio was "almost certain to continue - and probably will accelerate - for at least two more years." This year we will not predict acceleration, but otherwise must repeat last year's forecast. Premium growth is running far below the 10% required annually. Remember also that a 10% rate would only stabilize the combined ratio, not bring it down.

The increase in the combined ratio in 1989 was a little more than we had expected because catastrophes (led by Hurricane Hugo) were unusually severe. These abnormalities probably accounted for about two points of the increase. If 1990 is more of a "normal" year, the combined ratio should rise only minimally from the catastrophe-swollen base of 1989. In 1991, though, the ratio is apt to climb by a greater degree.

Commentators frequently discuss the "underwriting cycle" and speculate about its next turn. If that term is used to connote rhythmic qualities, it is in our view a misnomer that leads to faulty thinking about the industry's fundamental economics.

The term was appropriate some decades ago when the industry and regulators cooperated to conduct the business in cartel fashion. At that time, the combined ratio fluctuated rhythmically for two reasons, both related to lags. First, data from the past were analyzed and then used to set new "corrected" rates, which were subsequently put into effect by virtually all insurers. Second, the fact that almost all policies were then issued for a one-to three-year term - which meant that it took a considerable time for mispriced policies to expire - delayed the impact of new rates on revenues. These two lagged responses made combined ratios behave much like

alternating current. Meanwhile, the absence of significant price competition guaranteed that industry profits, averaged out over the cycle, would be satisfactory.

The cartel period is long gone. Now the industry has hundreds of participants selling a commodity-like product at independently-established prices. Such a configuration - whether the product being sold is steel or insurance policies - is certain to cause subnormal profitability in all circumstances but one: a shortage of usable capacity. Just how often these periods occur and how long they last determines the average profitability of the industry in question.

In most industries, capacity is described in physical terms. In the insurance world, however, capacity is customarily described in financial terms; that is, it's considered appropriate for a company to write no more than X dollars of business if it has Y dollars of net worth. In practice, however, constraints of this sort have proven ineffective. Regulators, insurance brokers, and customers are all slow to discipline companies that strain their resources. They also acquiesce when companies grossly overstate their true capital. Hence, a company can write a great deal of business with very little capital if it is so inclined. At bottom, therefore, the amount of industry capacity at any particular moment primarily depends on the mental state of insurance managers.

All this understood, it is not very difficult to prognosticate the industry's profits. Good profits will be realized only when there is a shortage of capacity. Shortages will occur only when insurers are frightened. That happens rarely - and most assuredly is not happening now.

Some analysts have argued that the more onerous taxes recently imposed on the insurance industry and 1989's catastrophes - Hurricane Hugo and the California earthquake - will cause prices to strengthen significantly. We disagree. These adversities have not destroyed the eagerness of insurers to write business at present prices. Therefore, premium volume won't grow by 10% in 1990, which means the negative underwriting trend will not reverse.

The industry will meantime say it needs higher prices to achieve profitability matching that of the average American business. Of course it does. So does the steel business. But needs and desires have nothing to do with the long-term profitability of industries. Instead, economic fundamentals determine the outcome. Insurance profitability will improve only when virtually all insurers are turning away business *despite* higher prices. And we're a long way from that point.

Berkshire's premium volume may drop to \$150 million or so in 1990 (from a high of \$1 billion in 1986), partly because our traditional business continues to shrink and partly because the contract under which we received 7% of the business of Fireman's Fund expired last August.

Whatever the size of the drop, it will not disturb us. We have no interest in writing insurance that carries a mathematical expectation of loss; we experience enough disappointments doing transactions we believe to carry an expectation of profit.

However, our appetite for appropriately-priced business is ample, as one tale from 1989 will tell. It concerns "CAT covers," which are reinsurance contracts that primary insurance companies (and also reinsurers themselves) buy to protect themselves against a single catastrophe, such as a tornado or hurricane, that produces losses from a large number of policies. In these contracts, the primary insurer might retain the loss from a single event up to a maximum of, say, \$10 million, buying various layers of reinsurance above that level. When losses exceed the retained amount, the reinsurer typically pays 95% of the excess up to its contractual limit, with the primary insurer paying the remainder. (By requiring the primary insurer to keep 5% of each layer, the reinsurer leaves him with a financial stake in each loss settlement and guards against his throwing away the reinsurer's money.)

CAT covers are usually one-year policies that also provide for one automatic reinstatement, which requires a primary insurer whose coverage has been exhausted by a catastrophe to buy a second cover for the balance of the year in question by paying another premium. This provision protects the primary company from being "bare" for even a brief period after a first catastrophic event. The duration of "an event" is usually limited by contract to any span of 72 hours designated by the primary company. Under this definition, a wide-spread storm, causing damage for three days, will be classified as a single event if it arises from a single climatic cause. If the storm lasts four days, however, the primary company will file a claim carving out the 72 consecutive hours during which it suffered the greatest damage. Losses that occurred outside that period will be treated as arising from a separate event.

In 1989, two unusual things happened. First, Hurricane Hugo generated \$4 billion or more of insured loss, at a pace, however, that caused the vast damage in the Carolinas to occur slightly more than 72 hours after the equally severe damage in the Caribbean. Second, the California earthquake hit within weeks, causing insured damage that was difficult to estimate, even well after the event. Slammed by these two - or possibly three - major catastrophes, some primary insurers, and also many reinsurers that had themselves bought CAT protection, either used up their automatic second cover or became uncertain as to whether they had done so.

At that point sellers of CAT policies had lost a huge amount of money - perhaps twice because of the reinstatements - and not taken in much in premiums. Depending upon many variables, a CAT premium might generally have run 3% to 15% of the amount of protection purchased. For some years, we've thought premiums of that kind inadequate and have stayed away from the business.

But because the 1989 disasters left many insurers either actually or possibly bare, and also left most CAT writers licking their wounds, there was an immediate shortage after the earthquake of much-needed catastrophe coverage. Prices instantly became attractive, particularly for the reinsurance that CAT writers themselves buy. Just as instantly, Berkshire Hathaway offered to write up to \$250 million of catastrophe coverage, advertising that proposition in trade publications. Though we did not write all the business we sought, we did in a busy ten days book a substantial amount.

Our willingness to put such a huge sum on the line for a loss that could occur tomorrow sets us apart from any reinsurer in the world. There are, of course, companies that sometimes write \$250 million or even far more of catastrophe coverage. But they do so only when they can, in turn, reinsure a large percentage of the business with other companies. When they can't "lay off" in size, they disappear from the market.

Berkshire's policy, conversely, is to retain the business we write rather than lay it off. When rates carry an expectation of profit, we want to assume as much risk as is prudent. And in our case, that's a lot.

We will accept more reinsurance risk for our own account than any other company because of two factors: (1) by the standards of regulatory accounting, we have a net worth in our insurance companies of about \$6 billion - the second highest amount in the United States; and (2) we simply don't care what earnings we report quarterly, or even annually, just as long as the decisions leading to those earnings (or losses) were reached intelligently.

Obviously, if we write \$250 million of catastrophe coverage and retain it all ourselves, there is some probability that we will lose the full \$250 million in a single quarter. That probability is low, but it is not zero. If we had a loss of that magnitude, our after-tax cost would be about \$165 million. Though that is far more than Berkshire normally earns in a quarter, the damage would be a blow only to our pride, not to our well-being.

This posture is one few insurance managements will assume. Typically, they are willing to write scads of business on terms that almost guarantee them mediocre returns on equity. But they do not want to expose themselves to an embarrassing single-quarter loss, even if the managerial strategy that causes the loss promises, over time, to produce superior results. I can understand their thinking: What is best for their owners is not necessarily best for the managers. Fortunately Charlie and I have both total job security and financial interests that are identical with those of our shareholders. We are willing to *look* foolish as long as we don't feel we have *acted* foolishly.

Our method of operation, incidentally, makes us a stabilizing force in the industry. We add huge capacity when capacity is short and we become less competitive only when capacity is abundant. Of course, we don't follow this policy in the interest of stabilization - we follow it because we believe it to be the most sensible and profitable course of action. Nevertheless, our behavior steadies the market. In this case, Adam Smith's invisible hand works as advertised.

Currently, we hold an exceptional amount of float compared to premium volume. This circumstance should produce quite favorable insurance results for us during the next few years as it did in 1989. Our underwriting losses should be tolerable and our investment income from policyholder funds large. This pleasant situation, however, will gradually deteriorate as our float runs off.

At some point, however, there will be an opportunity for us to write large amounts of profitable business. Mike Goldberg and his management team of Rod Eldred, Dinos Iordanou, Ajit Jain, Phil Urban, and Don Wurster continue to position us well for this eventuality.

Marketable Securities

In selecting marketable securities for our insurance companies, we generally choose among five major categories: (1) long-term common stock investments, (2) medium-term fixed income securities, (3) long-term fixed income securities, (4) short-term cash equivalents, and (5) short-term arbitrage commitments.

We have no particular bias when it comes to choosing from these categories; we just continuously search among them for the highest after-tax returns as measured by "mathematical expectation," limiting ourselves always to investment alternatives we think we understand. Our criteria have nothing to do with maximizing immediately reportable earnings; our goal, rather, is to maximize eventual net worth.

o Below we list our common stock holdings having a value of over \$100 million. A small portion of these investments belongs to subsidiaries of which Berkshire owns less than 100%.

Shares	Company	Cost (000's omitted)	Market (000's omitted)
3,000,000	Capital Cities/ABC, Inc.	\$517,500	\$1,692,375
23,350,000	The Coca-Cola Company	1,023,920	1,803,787
2,400,000	Federal Home Loan Mortgage Corporation Preferred*	71,729	161,100
6,850,000	GEICO Corporation.	45,713	1,044,625
1,727,765	The Washington Post Company	9,731	486,366

This list of companies is the same as last year's and in only one case has the number of shares changed: Our holdings of Coca-Cola increased from 14,172,500 shares at the end of 1988 to 23,350,000.

This Coca-Cola investment provides yet another example of the incredible speed with which your Chairman responds to investment opportunities, no matter how obscure or well-disguised they may be. I believe I had my first Coca-Cola in either 1935 or 1936. Of a certainty, it was in 1936 that I started buying Cokes at the rate of six for 25 cents from Buffett & Son, the family grocery store, to sell around the neighborhood for 5 cents each. In this excursion into high-margin retailing, I duly observed the extraordinary consumer attractiveness and commercial possibilities of the product.

I continued to note these qualities for the next 52 years as Coke blanketed the world. During this period, however, I carefully avoided buying even a single share, instead allocating major portions of my net worth to street railway companies, windmill manufacturers, anthracite producers, textile businesses, trading-stamp issuers, and the like. (If you think I'm making this up, I can supply the names.) Only in the summer of 1988 did my brain finally establish contact with my eyes.

What I then perceived was both clear and fascinating. After drifting somewhat in the 1970's, Coca-Cola had in 1981 become a new company with the move of Roberto Goizueta to CEO. Roberto, along with Don Keough, once my across-the-street neighbor in Omaha, first rethought

and focused the company's policies and then energetically carried them out. What was already the world's most ubiquitous product gained new momentum, with sales overseas virtually exploding.

Through a truly rare blend of marketing and financial skills, Roberto has maximized both the growth of his product and the rewards that this growth brings to shareholders. Normally, the CEO of a consumer products company, drawing on his natural inclinations or experience, will cause either marketing or finance to dominate the business at the expense of the other discipline. With Roberto, the mesh of marketing and finance is perfect and the result is a shareholder's dream.

Of course, we should have started buying Coke much earlier, soon after Roberto and Don began running things. In fact, if I had been thinking straight I would have persuaded my grandfather to sell the grocery store back in 1936 and put all of the proceeds into Coca-Cola stock. I've learned my lesson: My response time to the next glaringly attractive idea will be slashed to well under 50 years.

As I mentioned earlier, the yearend prices of our major investees were much higher relative to their intrinsic values than theretofore. While those prices may not yet cause nosebleeds, they are clearly vulnerable to a general market decline. A drop in their prices would not disturb us at all - it might in fact work to our eventual benefit - but it *would* cause at least a one-year reduction in Berkshire's net worth. We think such a reduction is almost certain in at least one of the next three years. Indeed, it would take only about a 10% year-to-year decline in the aggregate value of our portfolio investments to send Berkshire's net worth down.

We continue to be blessed with extraordinary managers at our portfolio companies. They are high-grade, talented, and shareholder-oriented. The exceptional results we have achieved while investing with them accurately reflect their exceptional personal qualities.

- We told you last year that we expected to do little in arbitrage during 1989, and that's the way it turned out. Arbitrage positions are a substitute for short-term cash equivalents, and during part of the year we held relatively low levels of cash. In the rest of the year we had a fairly good-sized cash position and even so chose not to engage in arbitrage. The main reason was corporate transactions that made no economic sense to us; arbitraging such deals comes too close to playing the greater-fool game. (As Wall Streeter Ray DeVoe says: "Fools rush in where angels

fear to trade.") We will engage in arbitrage from time to time - sometimes on a large scale - but only when we like the odds.

- o Leaving aside the three convertible preferreds discussed in the next section, we substantially reduced our holdings in both medium- and long-term fixed-income securities. In the long-terms, just about our only holdings have been Washington Public Power Supply Systems (WPPSS) bonds carrying coupons ranging from low to high. During the year we sold a number of the low-coupon issues, which we originally bought at very large discounts. Many of these issues had approximately doubled in price since we purchased them and in addition had paid us 15%-17% annually, tax-free. Our prices upon sale were only slightly cheaper than typical high-grade tax-exempts then commanded. We have kept all of our high-coupon WPPSS issues. Some have been called for redemption in 1991 and 1992, and we expect the rest to be called in the early to mid-1990s.

We also sold many of our medium-term tax-exempt bonds during the year. When we bought these bonds we said we would be happy to sell them - regardless of whether they were higher or lower than at our time of purchase - if something we liked better came along. Something did - and concurrently we unloaded most of these issues at modest gains. Overall, our 1989 profit from the sale of tax-exempt bonds was about \$51 million pre-tax.

- o The proceeds from our bond sales, along with our excess cash at the beginning of the year and that generated later through earnings, went into the purchase of three convertible preferred stocks. In the first transaction, which took place in July, we purchased \$600 million of The Gillette Co. preferred with an 8 3/4% dividend, a mandatory redemption in ten years, and the right to convert into common at \$50 per share. We next purchased \$358 million of USAir Group, Inc. preferred stock with mandatory redemption in ten years, a dividend of 9 1/4%, and the right to convert into common at \$60 per share. Finally, late in the year we purchased \$300 million of Champion International Corp. preferred with mandatory redemption in ten years, a 9 1/4% dividend, and the right to convert into common at \$38 per share.

Unlike standard convertible preferred stocks, the issues we own are either non-salable or non-convertible for considerable periods of time and there is consequently no way we can gain from short-term price blips in the common stock. I have gone on the board of Gillette, but I am not on the board of USAir or Champion. (I thoroughly enjoy the boards I am on, but can't handle any more.)

Gillette's business is very much the kind we like. Charlie and I think we understand the company's economics and therefore believe we can make a reasonably intelligent guess about its future. (If you haven't tried Gillette's new Sensor razor, go right out and get one.) However, we have no ability to forecast the economics of the investment banking business (in which we have a position through our 1987 purchase of Salomon convertible preferred), the airline industry, or the paper industry. This does not mean that we predict a negative future for these industries: we're agnostics, not atheists. Our lack of strong convictions about these businesses, however, means that we must structure our investments in them differently from what we do when we invest in a business appearing to have splendid economic characteristics.

In one major respect, however, these purchases are not different: We only want to link up with people whom we like, admire, and trust. John Gutfreund at Salomon, Colman Mockler, Jr. at Gillette, Ed Colodny at USAir, and Andy Sigler at Champion meet this test in spades.

They in turn have demonstrated some confidence in us, insisting in each case that our preferreds have unrestricted voting rights on a fully-converted basis, an arrangement that is far from standard in corporate finance. In effect they are trusting us to be intelligent owners, thinking about tomorrow *instead* of today, just as we are trusting them to be intelligent managers, thinking about tomorrow *as well* as today.

The preferred-stock structures we have negotiated will provide a mediocre return for us if industry economics hinder the performance of our investees, but will produce reasonably attractive results for us if they can earn a return comparable to that of American industry in general. We believe that Gillette, under Colman's management, will far exceed that return and believe that John, Ed, and Andy will reach it unless industry conditions are harsh.

Under almost any conditions, we expect these preferreds to return us our money plus dividends. If that is all we get, though, the result will be disappointing, because we will have given up flexibility and consequently will have missed some significant opportunities that are bound to present themselves during the decade. Under that scenario, we will have obtained only a preferred-stock yield during a period when the typical preferred stock will have held no appeal for us whatsoever. The only way Berkshire can achieve satisfactory results from its four preferred issues is to have the common stocks of the investee companies do well.

Good management and at least tolerable industry conditions will be needed if that is to happen. But we believe Berkshire's investment will also help and that the other shareholders of

each investee will profit over the years ahead from our preferred-stock purchase. The help will come from the fact that each company now has a major, stable, and interested shareholder whose Chairman and Vice Chairman have, through Berkshire's investments, indirectly committed a very large amount of their own money to these undertakings. In dealing with our investees, Charlie and I will be supportive, analytical, and objective. We recognize that we are working with experienced CEOs who are very much in command of their own businesses but who nevertheless, at certain moments, appreciate the chance to test their thinking on someone without ties to their industry or to decisions of the past.

As a group, these convertible preferreds will not produce the returns we can achieve when we find a business with wonderful economic prospects that is unappreciated by the market. Nor will the returns be as attractive as those produced when we make our favorite form of capital deployment, the acquisition of 80% or more of a fine business with a fine management. But both opportunities are rare, particularly in a size befitting our present and anticipated resources.

In summation, Charlie and I feel that our preferred stock investments should produce returns moderately above those achieved by most fixed-income portfolios and that we can play a minor but enjoyable and constructive role in the investee companies.

Zero-Coupon Securities

In September, Berkshire issued \$902.6 million principal amount of Zero-Coupon Convertible Subordinated Debentures, which are now listed on the New York Stock Exchange. Salomon Brothers handled the underwriting in superb fashion, providing us helpful advice and a flawless execution.

Most bonds, of course, require regular payments of interest, usually semi-annually. A zero-coupon bond, conversely, requires no current interest payments; instead, the investor receives his yield by purchasing the security at a significant discount from maturity value. The effective interest rate is determined by the original issue price, the maturity value, and the amount of time between issuance and maturity.

In our case, the bonds were issued at 44.314% of maturity value and are due in 15 years. For investors purchasing the bonds, that is the mathematical equivalent of a 5.5% current payment compounded semi-annually. Because we received only 44.31 cents on the dollar, our proceeds from this offering were \$400 million (less about \$9.5 million of offering expenses).

The bonds were issued in denominations of \$10,000 and each bond is convertible into .4515 shares of Berkshire Hathaway. Because a \$10,000 bond cost \$4,431, this means that the conversion price was \$9,815 per Berkshire share, a 15% premium to the market price then existing. Berkshire can call the bonds at any time after September 28, 1992 at their accreted value (the original issue price plus 5.5% compounded semi-annually) and on two specified days, September 28 of 1994 and 1999, the bondholders can require Berkshire to buy the securities at their accreted value.

For tax purposes, Berkshire is entitled to deduct the 5.5% interest accrual each year, even though we make no payments to the bondholders. Thus the net effect to us, resulting from the reduced taxes, is positive cash flow. That is a very significant benefit. Some unknowable variables prevent us from calculating our exact effective rate of interest, but under all circumstances it will be well below 5.5%. There is meanwhile a symmetry to the tax law: Any taxable holder of the bonds must pay tax each year on the 5.5% interest, even though he receives no cash.

Neither our bonds nor those of certain other companies that issued similar bonds last year (notably Loews and Motorola) resemble the great bulk of zero-coupon bonds that have been issued in recent years. Of these, Charlie and I have been, and will continue to be, outspoken critics. As I will later explain, such bonds have often been used in the most deceptive of ways and with deadly consequences to investors. But before we tackle that subject, let's travel back to Eden, to a time when the apple had not yet been bitten.

If you're my age you bought your first zero-coupon bonds during World War II, by purchasing the famous Series E U. S. Savings Bond, the most widely-sold bond issue in history. (After the war, these bonds were held by one out of two U. S. households.) Nobody, of course, called the Series E a zero-coupon bond, a term in fact that I doubt had been invented. But that's precisely what the Series E was.

These bonds came in denominations as small as \$18.75. That amount purchased a \$25 obligation of the United States government due in 10 years, terms that gave the buyer a compounded annual return of 2.9%. At the time, this was an attractive offer: the 2.9% rate was higher than that generally available on Government bonds and the holder faced no market-fluctuation risk, since he could at any time cash in his bonds with only a minor reduction in interest.

A second form of zero-coupon U. S. Treasury issue, also benign and useful, surfaced in the last decade. One problem with a normal bond is that even though it pays a given interest rate - say 10% - the holder cannot be assured that a compounded 10% return will be realized. For that rate to materialize, each semi-annual coupon must be reinvested at 10% as it is received. If current interest rates are, say, only 6% or 7% when these coupons come due, the holder will be unable to compound his money over the life of the bond at the advertised rate. For pension funds or other investors with long-term liabilities, "reinvestment risk" of this type can be a serious problem. Savings Bonds might have solved it, except that they are issued only to individuals and are unavailable in large denominations. What big buyers needed was huge quantities of "Savings Bond Equivalents."

Enter some ingenious and, in this case, highly useful investment bankers (led, I'm happy to say, by Salomon Brothers). They created the instrument desired by "stripping" the semi-annual coupons from standard Government issues. Each coupon, once detached, takes on the essential character of a Savings Bond since it represents a single sum due sometime in the future. For example, if you strip the 40 semi-annual coupons from a U. S. Government Bond due in the year 2010, you will have 40 zero-coupon bonds, with maturities from six months to 20 years, each of which can then be bundled with other coupons of like maturity and marketed. If current interest rates are, say, 10% for all maturities, the six-month issue will sell for 95.24% of maturity value and the 20-year issue will sell for 14.20%. The purchaser of any given maturity is thus guaranteed a compounded rate of 10% for his entire holding period. Stripping of government bonds has occurred on a large scale in recent years, as long-term investors, ranging from pension funds to individual IRA accounts, recognized these high-grade, zero-coupon issues to be well suited to their needs.

But as happens in Wall Street all too often, what the wise do in the beginning, fools do in the end. In the last few years zero-coupon bonds (and their functional equivalent, pay-in-kind bonds, which distribute additional PIK bonds semi-annually as interest instead of paying cash) have been issued in enormous quantities by ever-junkier credits. To these issuers, zero (or PIK) bonds offer one overwhelming advantage: It is impossible to default on a promise to pay nothing. Indeed, if LDC governments had issued no debt in the 1970's other than long-term zero-coupon obligations, they would now have a spotless record as debtors.

This principle at work - that you need not default for a long time if you solemnly promise to pay nothing for a long time - has not been lost on promoters and investment bankers seeking to finance ever-shakier deals. But its acceptance by lenders took a while: When the leveraged buy-out craze began some years back, purchasers could borrow only on a reasonably sound basis, in which conservatively-estimated *free* cash flow - that is, operating earnings plus depreciation and amortization less normalized capital expenditures - was adequate to cover both interest and modest reductions in debt.

Later, as the adrenalin of deal-makers surged, businesses began to be purchased at prices so high that all free cash flow necessarily had to be allocated to the payment of interest. That left nothing for the paydown of debt. In effect, a Scarlett O'Hara "I'll think about it tomorrow" position in respect to principal payments was taken by borrowers and accepted by a new breed of lender, the buyer of original-issue junk bonds. Debt now became something to be refinanced rather than repaid. The change brings to mind a *New Yorker* cartoon in which the grateful borrower rises to shake the hand of the bank's lending officer and gushes: "I don't know how I'll ever repay you."

Soon borrowers found even the new, lax standards intolerably binding. To induce lenders to finance even sillier transactions, they introduced an abomination, EBDIT - Earnings Before Depreciation, Interest and Taxes - as the test of a company's ability to pay interest. Using this sawed-off yardstick, the borrower ignored depreciation as an expense on the theory that it did not require a current cash outlay.

Such an attitude is clearly delusional. At 95% of American businesses, capital expenditures that over time roughly approximate depreciation are a necessity and are every bit as real an expense as labor or utility costs. Even a high school dropout knows that to finance a car he must have income that covers not only interest and operating expenses, but also realistically-calculated depreciation. He would be laughed out of the bank if he started talking about EBDIT.

Capital outlays at a business can be skipped, of course, in any given month, just as a human can skip a day or even a week of eating. But if the skipping becomes routine and is not made up, the body weakens and eventually dies. Furthermore, a start-and-stop feeding policy will over time produce a less healthy organism, human or corporate, than that produced by a steady diet. As businessmen, Charlie and I relish having competitors who are unable to fund capital expenditures.

You might think that waving away a major expense such as depreciation in an attempt to make a terrible deal look like a good one hits the limits of Wall Street's ingenuity. If so, you haven't been paying attention during the past few years. Promoters needed to find a way to justify even pricier acquisitions. Otherwise, they risked - heaven forbid! - losing deals to other promoters with more "imagination."

So, stepping through the Looking Glass, promoters and their investment bankers proclaimed that EBDIT should now be measured against cash interest only, which meant that interest accruing on zero-coupon or PIK bonds could be ignored when the financial feasibility of a transaction was being assessed. This approach not only relegated depreciation expense to the let's-ignore-it corner, but gave similar treatment to what was usually a significant portion of interest expense. To their shame, many professional investment managers went along with this nonsense, though they usually were careful to do so only with clients' money, not their own. (Calling these managers "professionals" is actually too kind; they should be designated "promotees.")

Under this new standard, a business earning, say, \$100 million pre-tax and having debt on which \$90 million of interest must be paid currently, might use a zero-coupon or PIK issue to incur another \$60 million of annual interest that would accrue and compound but not come due for some years. The rate on these issues would typically be very high, which means that the situation in year 2 might be \$90 million cash interest plus \$69 million accrued interest, and so on as the compounding proceeds. Such high-rate reborrowing schemes, which a few years ago were appropriately confined to the waterfront, soon became models of modern finance at virtually all major investment banking houses.

When they make these offerings, investment bankers display their humorous side: They dispense income and balance sheet projections extending five or more years into the future for companies they barely had heard of a few months earlier. If you are shown such schedules, I suggest that you join in the fun: Ask the investment banker for the *one-year* budgets that his own firm prepared as the last few years began and then compare these with what actually happened.

Some time ago Ken Galbraith, in his witty and insightful *The Great Crash*, coined a new economic term: "the bezzle," defined as the current amount of undiscovered embezzlement. This

financial creature has a magical quality: The embezzlers are richer by the amount of the bezzle, while the embezzlees do not yet feel poorer.

Professor Galbraith astutely pointed out that this sum should be added to the National Wealth so that we might know the Psychic National Wealth. Logically, a society that wanted to *feel* enormously prosperous would both encourage its citizens to embezzle and try not to detect the crime. By this means, "wealth" would balloon though not an era of productive work had been done.

The satirical nonsense of the bezzle is dwarfed by the real-world nonsense of the zero-coupon bond. With zeros, one party to a contract can experience "income" without his opposite experiencing the pain of expenditure. In our illustration, a company capable of earning only \$100 million dollars annually - and therefore capable of paying only that much in interest - magically creates "earnings" for bondholders of \$150 million. As long as major investors willingly don their Peter Pan wings and repeatedly say "I believe," there is no limit to how much "income" can be created by the zero-coupon bond.

Wall Street welcomed this invention with the enthusiasm less-enlightened folk might reserve for the wheel or the plow. Here, finally, was an instrument that would let the Street make deals at prices no longer limited by actual earning power. The result, obviously, would be more transactions: Silly prices will always attract sellers. And, as Jesse Unruh might have put it, transactions are the mother's milk of finance.

The zero-coupon or PIK bond possesses one additional attraction for the promoter and investment banker, which is that the time elapsing between folly and failure can be stretched out. This is no small benefit. If the period before all costs must be faced is long, promoters can create a string of foolish deals - and take in lots of fees - before any chickens come home to roost from their earlier ventures.

But in the end, alchemy, whether it is metallurgical or financial, fails. A base business cannot be transformed into a golden business by tricks of accounting or capital structure. The man claiming to be a financial alchemist may become rich. But gullible investors rather than business achievements will usually be the source of his wealth.

Whatever their weaknesses, we should add, many zero-coupon and PIK bonds will not default. We have in fact owned some and may buy more if their market becomes sufficiently distressed. (We've not, however, even considered buying a new issue from a weak credit.) No

financial instrument is evil per se; it's just that some variations have far more potential for mischief than others.

The blue ribbon for mischief-making should go to the zero-coupon issuer unable to make its interest payments on a current basis. Our advice: Whenever an investment banker starts talking about EBDIT - or whenever someone creates a capital structure that does not allow all interest, both payable and accrued, to be comfortably met out of current cash flow *net of ample capital expenditures* - zip up your wallet. Turn the tables by suggesting that the promoter and his high-priced entourage accept zero-coupon fees, deferring their take until the zero-coupon bonds have been paid in full. See then how much enthusiasm for the deal endures.

Our comments about investment bankers may seem harsh. But Charlie and I - in our hopelessly old-fashioned way - believe that they should perform a gatekeeping role, guarding investors against the promoter's propensity to indulge in excess. Promoters, after all, have throughout time exercised the same judgment and restraint in accepting money that alcoholics have exercised in accepting liquor. At a minimum, therefore, the banker's conduct should rise to that of a responsible bartender who, when necessary, refuses the profit from the next drink to avoid sending a drunk out on the highway. In recent years, unfortunately, many leading investment firms have found bartender morality to be an intolerably restrictive standard. Lately, those who have traveled the high road in Wall Street have not encountered heavy traffic.

One distressing footnote: The cost of the zero-coupon folly will not be borne solely by the direct participants. Certain savings and loan associations were heavy buyers of such bonds, using cash that came from FSLIC-insured deposits. Straining to show splendid earnings, these buyers recorded - but did not receive - ultra-high interest income on these issues. Many of these associations are now in major trouble. Had their loans to shaky credits worked, the owners of the associations would have pocketed the profits. In the many cases in which the loans will fail, the taxpayer will pick up the bill. To paraphrase Jackie Mason, at these associations it was the managers who should have been wearing the ski masks.

Mistakes of the First Twenty-five Years (A Condensed Version)

To quote Robert Benchley, "Having a dog teaches a boy fidelity, perseverance, and to turn around three times before lying down." Such are the shortcomings of experience. Nevertheless, it's a good idea to review past mistakes before committing new ones. So let's take a quick look at the last 25 years.

o My first mistake, of course, was in buying control of Berkshire. Though I knew its business - textile manufacturing - to be unpromising, I was enticed to buy because the price looked cheap. Stock purchases of that kind had proved reasonably rewarding in my early years, though by the time Berkshire came along in 1965 I was becoming aware that the strategy was not ideal.

If you buy a stock at a sufficiently low price, there will usually be some hiccup in the fortunes of the business that gives you a chance to unload at a decent profit, even though the long-term performance of the business may be terrible. I call this the "cigar butt" approach to investing. A cigar butt found on the street that has only one puff left in it may not offer much of a smoke, but the "bargain purchase" will make that puff all profit.

Unless you are a liquidator, that kind of approach to buying businesses is foolish. First, the original "bargain" price probably will not turn out to be such a steal after all. In a difficult business, no sooner is one problem solved than another surfaces - never is there just one cockroach in the kitchen. Second, any initial advantage you secure will be quickly eroded by the low return that the business earns. For example, if you buy a business for \$8 million that can be sold or liquidated for \$10 million and promptly take either course, you can realize a high return. But the investment will disappoint if the business is sold for \$10 million in ten years and in the interim has annually earned and distributed only a few percent on cost. Time is the friend of the wonderful business, the enemy of the mediocre.

You might think this principle is obvious, but I had to learn it the hard way - in fact, I had to learn it several times over. Shortly after purchasing Berkshire, I acquired a Baltimore department store, Hochschild Kohn, buying through a company called Diversified Retailing that later merged with Berkshire. I bought at a substantial discount from book value, the people were first-class, and the deal included some extras - unrecorded real estate values and a significant LIFO inventory cushion. How could I miss? So-o-o - three years later I was lucky to sell the business for about what I had paid. After ending our corporate marriage to Hochschild Kohn, I had memories like those of the husband in the country song, "My Wife Ran Away With My Best Friend and I Still Miss Him a Lot."

I could give you other personal examples of "bargain-purchase" folly but I'm sure you get the picture: It's far better to buy a wonderful company at a fair price than a fair company at a wonderful price. Charlie understood this early; I was a slow learner. But now, when buying

companies or common stocks, we look for first-class businesses accompanied by first-class managements.

- o That leads right into a related lesson: Good jockeys will do well on good horses, but not on broken-down nags. Both Berkshire's textile business and Hochschild, Kohn had able and honest people running them. The same managers employed in a business with good economic characteristics would have achieved fine records. But they were never going to make any progress while running in quicksand.

I've said many times that when a management with a reputation for brilliance tackles a business with a reputation for bad economics, it is the reputation of the business that remains intact. I just wish I hadn't been so energetic in creating examples. My behavior has matched that admitted by Mae West: "I was Snow White, but I drifted."

- o A further related lesson: Easy does it. After 25 years of buying and supervising a great variety of businesses, Charlie and I have *not* learned how to solve difficult business problems. What we have learned is to avoid them. To the extent we have been successful, it is because we concentrated on identifying one-foot hurdles that we could step over rather than because we acquired any ability to clear seven-footers.

The finding may seem unfair, but in both business and investments it is usually far more profitable to simply stick with the easy and obvious than it is to resolve the difficult. On occasion, tough problems *must* be tackled as was the case when we started our Sunday paper in Buffalo. In other instances, a great investment opportunity occurs when a marvelous business encounters a one-time huge, but solvable, problem as was the case many years back at both American Express and GEICO. Overall, however, we've done better by avoiding dragons than by slaying them.

- o My most surprising discovery: the overwhelming importance in business of an unseen force that we might call "the institutional imperative." In business school, I was given no hint of the imperative's existence and I did not intuitively understand it when I entered the business world. I thought then that decent, intelligent, and experienced managers would automatically make rational business decisions. But I learned over time that isn't so. Instead, rationality frequently wilts when the institutional imperative comes into play.

For example: (1) As if governed by Newton's First Law of Motion, an institution will resist any change in its current direction; (2) Just as work expands to fill available time, corporate

projects or acquisitions will materialize to soak up available funds; (3) Any business craving of the leader, however foolish, will be quickly supported by detailed rate-of-return and strategic studies prepared by his troops; and (4) The behavior of peer companies, whether they are expanding, acquiring, setting executive compensation or whatever, will be mindlessly imitated.

Institutional dynamics, not venality or stupidity, set businesses on these courses, which are too often misguided. After making some expensive mistakes because I ignored the power of the imperative, I have tried to organize and manage Berkshire in ways that minimize its influence. Furthermore, Charlie and I have attempted to concentrate our investments in companies that appear alert to the problem.

- o After some other mistakes, I learned to go into business only with people whom I like, trust, and admire. As I noted before, this policy of itself will not ensure success: A second-class textile or department-store company won't prosper simply because its managers are men that you would be pleased to see your daughter marry. However, an owner - or investor - can accomplish wonders if he manages to associate himself with such people in businesses that possess decent economic characteristics. Conversely, we do not wish to join with managers who lack admirable qualities, no matter how attractive the prospects of their business. We've never succeeded in making a good deal with a bad person.

- o Some of my worst mistakes were not publicly visible. These were stock and business purchases whose virtues I understood and yet didn't make. It's no sin to miss a great opportunity outside one's area of competence. But I have passed on a couple of really big purchases that were served up to me on a platter and that I was fully capable of understanding. For Berkshire's shareholders, myself included, the cost of this thumb-sucking has been huge.

- o Our consistently-conservative financial policies may appear to have been a mistake, but in my view were not. In retrospect, it is clear that significantly higher, though still conventional, leverage ratios at Berkshire would have produced considerably better returns on equity than the 23.8% we have actually averaged. Even in 1965, perhaps we could have judged there to be a 99% probability that higher leverage would lead to nothing but good. Correspondingly, we might have seen only a 1% chance that some shock factor, external or internal, would cause a conventional debt ratio to produce a result falling somewhere between temporary anguish and default.

We wouldn't have liked those 99:1 odds - and never will. A small chance of distress or disgrace cannot, in our view, be offset by a large chance of extra returns. If your actions are sensible, you are certain to get good results; in most such cases, leverage just moves things along faster. Charlie and I have never been in a big hurry: We enjoy the process far more than the proceeds - though we have learned to live with those also.

* * * * *

We hope in another 25 years to report on the mistakes of the first 50. If we are around in 2015 to do that, you can count on this section occupying many more pages than it does here.

Miscellaneous

We hope to buy more businesses that are similar to the ones we have, and we can use some help. If you have a business that fits the following criteria, call me or, preferably, write.

Here's what we're looking for:

- (1) Large purchases (at least \$10 million of after-tax earnings),
- (2) demonstrated consistent earning power (future projections are of little interest to us, nor are "turnaround" situations),
- (3) businesses earning good returns on equity while employing little or no debt,
- (4) management in place (we can't supply it),
- (5) simple businesses (if there's lots of technology, we won't understand it),
- (6) an offering price (we don't want to waste our time or that of the seller by talking, even preliminarily, about a transaction when price is unknown).

We will not engage in unfriendly takeovers. We can promise complete confidentiality and a very fast answer - customarily within five minutes - as to whether we're interested. We prefer to buy for cash, but will consider issuing stock when we receive as much in intrinsic business value as we give.

Our favorite form of purchase is one fitting the Blumkin-Friedman-Heldman mold. In cases like these, the company's owner-managers wish to generate significant amounts of cash, sometimes for themselves, but often for their families or inactive shareholders. At the same time, these managers wish to remain significant owners who continue to run their companies just as they have in the past. We think we offer a particularly good fit for owners with such objectives.

We invite potential sellers to check us out by contacting people with whom we have done business in the past.

Charlie and I frequently get approached about acquisitions that don't come close to meeting our tests: We've found that if you advertise an interest in buying collies, a lot of people will call hoping to sell you their cocker spaniels. Our interest in new ventures, turnarounds, or auction-like sales can best be expressed by a Goldwynism: "Please include me out."

Besides being interested in the purchase of businesses as described above, we are also interested in the negotiated purchase of large, but not controlling, blocks of stock comparable to those we hold in Capital Cities, Salomon, Gillette, USAir and Champion. Last year we said we had a special interest in large purchases of convertible preferreds. We still have an appetite of that kind, but it is limited since we now are close to the maximum position we feel appropriate for this category of investment.

* * * * *

Two years ago, I told you about Harry Bottle, who in 1962 quickly cured a major business mess at the first industrial company I controlled, Dempster Mill Manufacturing (one of my "bargain" purchases) and who 24 years later had reappeared to again rescue me, this time from problems at K&W Products, a small Berkshire subsidiary that produces automotive compounds. As I reported, in short order Harry reduced capital employed at K&W, rationalized production, cut costs, and quadrupled profits. You might think he would then have paused for breath. But last year Harry, now 70, attended a bankruptcy auction and, for a pittance, acquired a product line that is a natural for K&W. That company's profitability may well be increased 50% by this coup. Watch this space for future bulletins on Harry's triumphs.

With more than a year behind him of trading Berkshire's stock on the New York Stock Exchange, our specialist, Jim Maguire of Henderson Brothers, Inc. ("HBI"), continues his outstanding performance. Before we listed, dealer spreads often were 3% or more of market

price. Jim has maintained the spread at 50 points or less, which at current prices is well under 1%. Shareholders who buy or sell benefit significantly from this reduction in transaction costs.

Because we are delighted by our experience with Jim, HBI and the NYSE, I said as much in ads that have been run in a series placed by the NYSE. Normally I shun testimonials, but I was pleased in this instance to publicly compliment the Exchange.

Last summer we sold the corporate jet that we purchased for \$850,000 three years ago and bought another used jet for \$6.7 million. Those of you who recall the mathematics of the multiplying bacteria on page 5 will understandably panic: If our net worth continues to increase at current rates, and the cost of replacing planes also continues to rise at the now-established rate of 100% compounded annually, it will not be long before Berkshire's entire net worth is consumed by its jet.

Charlie doesn't like it when I equate the jet with bacteria; he feels it's degrading to the bacteria. His idea of traveling in style is an air-conditioned bus, a luxury he steps up to only when bargain fares are in effect. My own attitude toward the jet can be summarized by the prayer attributed, apocryphally I'm sure, to St. Augustine as he contemplated leaving a life of secular pleasures to become a priest. Battling the conflict between intellect and glands, he pled: "Help me, Oh Lord, to become chaste - but not yet."

Naming the plane has not been easy. I initially suggested "The Charles T. Munger." Charlie countered with "The Aberration." We finally settled on "The Indefensible."

* * * * *

About 96.9% of all eligible shares participated in Berkshire's 1989 shareholder-designated contributions program. Contributions made through the program were \$5.9 million, and 2,550 charities were recipients.

We urge new shareholders to read the description of our shareholder-designated contributions program that appears on pages 52-53. If you wish to participate in future programs, we strongly urge that you immediately make sure your shares are registered in the name of the actual owner,

not in the nominee name of a broker, bank or depository. Shares not so registered on August 31, 1990 will be ineligible for the 1990 program.

* * * * *

The annual meeting this year will take place at 9:30 a.m. on Monday, April 30, 1990. Attendance grew last year to about 1,000, very close to the seating capacity of the Witherspoon Hall at Joslyn Museum. So this year's meeting will be moved to the Orpheum Theatre, which is in downtown Omaha, about one-quarter of a mile from the Red Lion Hotel. The Radisson-Redick Tower, a much smaller but nice hotel, is located across the street from the Orpheum. Or you may wish to stay at the Marriott, which is in west Omaha, about 100 yards from Borsheim's. We will have buses at the Marriott that will leave at 8:30 and 8:45 for the meeting and return after it ends.

Charlie and I always enjoy the meeting, and we hope you can make it. The quality of our shareholders is reflected in the quality of the questions we get: We have never attended an annual meeting anywhere that features such a consistently high level of intelligent, owner-related questions.

An attachment to our proxy material explains how you can obtain the card you will need for admission to the meeting. Because weekday parking can be tight around the Orpheum, we have lined up a number of nearby lots for our shareholders to use. The attachment also contains information about them.

As usual, we will have buses to take you to Nebraska Furniture Mart and Borsheim's after the meeting and to take you to downtown hotels or to the airport later. I hope that you will allow plenty of time to fully explore the attractions of both stores. Those of you arriving early can visit the Furniture Mart any day of the week; it is open from 10 a.m. to 5:30 p.m. on Saturdays, and from noon to 5:30 p.m. on Sundays.

Borsheim's normally is closed on Sunday, but we will open for shareholders and their guests from noon to 6 p.m. on Sunday, April 29th. Ike likes to put on a show, and you can rely on him to produce something very special for our shareholders.

In this letter we've had a lot to say about rates of compounding. If you can bear having your own rate turn negative for a day - not a pretty thought, I admit - visit Ike on the 29th.

Warren E. Buffett

Chairman of the Board

March 2, 1990

1990 Letter

BERKSHIRE HATHAWAY INC.

To the Shareholders of Berkshire Hathaway Inc.:

Last year we made a prediction: "A reduction [in Berkshire's net worth] is almost certain in at least one of the next three years." During much of 1990's second half, we were on the road to quickly proving that forecast accurate. But some strengthening in stock prices late in the year enabled us to close 1990 with net worth up by \$362 million, or 7.3%. Over the last 26 years (that is, since present management took over) our per-share book value has grown from \$19.46 to \$4,612.06, or at a rate of 23.2% compounded annually.

Our growth rate was lackluster in 1990 because our four major common stock holdings, in aggregate, showed little change in market value. Last year I told you that though these companies - Capital Cities/ABC, Coca-Cola, GEICO, and Washington Post - had fine businesses and superb managements, widespread recognition of these attributes had pushed the stock prices of the four to lofty levels. The market prices of the two media companies have since fallen significantly - for good reasons relating to evolutionary industry developments that I will discuss later - and the price of Coca-Cola stock has increased significantly for what I also believe are good reasons. Overall, yearend 1990 prices of our "permanent four," though far from enticing, were a bit more appealing than they were a year earlier.

Berkshire's 26-year record is meaningless in forecasting future results; so also, we hope, is the one-year record. We continue to aim for a 15% average annual gain in intrinsic value. But, as we never tire of telling you, this goal becomes ever more difficult to reach as our equity base, now \$5.3 billion, increases.

If we do attain that 15% average, our shareholders should fare well. However, Berkshire's corporate gains will produce an identical gain for a specific shareholder only if he eventually sells his shares at the same relationship to intrinsic value that existed when he bought them. For example, if you buy at a 10% premium to intrinsic value; if intrinsic value subsequently grows at 15% a year; and if you then sell at a 10% premium, your own return will correspondingly be 15% compounded. (The calculation assumes that no dividends are paid.) If, however, you buy at a premium and sell at a smaller premium, your results will be somewhat inferior to those achieved by the company.

Ideally, the results of every Berkshire shareholder would closely mirror those of the company during his period of ownership. That is why Charlie Munger, Berkshire's Vice Chairman and my partner, and I hope for Berkshire to sell consistently at about intrinsic value. We prefer such steadiness to the value-ignoring volatility of the past two years: In 1989 intrinsic value grew less than did book value, which was up 44%, while the market price rose 85%; in 1990 book value and intrinsic value increased by a small amount, while the market price fell 23%.

Berkshire's intrinsic value continues to exceed book value by a substantial margin. We can't tell you the exact differential because intrinsic value is necessarily an estimate; Charlie and I might, in fact, differ by 10% in our appraisals. We do know, however, that we own some exceptional businesses that are worth considerably more than the values at which they are carried on our books.

Much of the extra value that exists in our businesses has been created by the managers now running them. Charlie and I feel free to brag about this group because we had nothing to do with developing the skills they possess: These superstars just came that way. Our job is merely to identify talented managers and provide an environment in which they can do their stuff. Having done it, they send their cash to headquarters and we face our only other task: the intelligent deployment of these funds.

My own role in operations may best be illustrated by a small tale concerning my granddaughter, Emily, and her fourth birthday party last fall. Attending were other children, adoring relatives, and Beemer the Clown, a local entertainer who includes magic tricks in his act.

Beginning these, Beemer asked Emily to help him by waving a "magic wand" over "the box of wonders." Green handkerchiefs went into the box, Emily waved the wand, and Beemer removed blue ones. Loose handkerchiefs went in and, upon a magisterial wave by Emily, emerged knotted. After four such transformations, each more amazing than its predecessor, Emily was unable to contain herself. Her face aglow, she exulted: "Gee, I'm really good at this."

And that sums up my contribution to the performance of Berkshire's business magicians - the Blumkins, the Friedman family, Mike Goldberg, the Heldmans, Chuck Huggins, Stan Lipsey and Ralph Schey. They deserve your applause.

Sources of Reported Earnings

The table below shows the major sources of Berkshire's reported earnings. In this presentation, amortization of Goodwill and other major purchase-price accounting adjustments are not charged against the specific businesses to which they apply, but are instead aggregated and shown separately. This procedure lets you view the earnings of our businesses as they would have been reported had we not purchased them. I've explained in past reports why this form of presentation seems to us to be more useful to investors and managers than one utilizing generally accepted accounting principles (GAAP), which require purchase-price adjustments to be made on a business-by-business basis. The total net earnings we show in the table are, of course, identical to the GAAP total in our audited financial statements.

Much additional information about these businesses is given on pages 39-46, where you also will find our segment earnings reported on a GAAP basis. For information on Wesco's businesses, I urge you to read Charlie Munger's letter, which

starts on page 56. His letter also contains the clearest and most insightful discussion of the banking industry that I have seen.

Operating Earnings (000s omitted)	Pre-Tax 1990	Earnings 1989	Berkshire 1990	Share 1989
Insurance Group:				
Underwriting	\$ (26,647)	\$ (24,400)	\$ (14,936)	\$ (12,259)
Net investment income	327,048	243,599	282,613	213,642
Buffalo News	43,954	46,047	25,981	27,771

Sales of Securities	33,989	223,810	23,348	147,575
Total Earnings- All entities	\$516,466	\$617,224	\$394,093	\$447,477

**Excludes interest expense of Scott Fetzer Financial Group and Mutual Savings & Loan.*

We refer you also to pages 47-53, where we have rearranged Berkshire's financial data into four segments. These correspond to the way Charlie and I think about the business and should help you more in estimating Berkshire's intrinsic value than consolidated figures would do. Shown on these pages are balance sheets and earnings statements for: (1) our insurance operations, with their major investment positions

itemized; (2) our manufacturing, publishing and retailing businesses, leaving aside certain non- operating assets and purchase-price accounting adjustments; (3) our subsidiaries engaged in finance-type operations, which are Mutual Savings and Scott Fetzer Financial; and (4) an all-other category that includes the non-operating assets (primarily marketable securities) held by the companies in segment (2), all purchase-price accounting adjustments, and various assets and debts of the Wesco and Berkshire parent companies.

If you combine the earnings and net worths of these four segments, you will derive totals matching those shown on our GAAP statements. However, I want to emphasize that this four-category presentation does not fall within the purview of our auditors, who in no way bless it.

"Look-Through" Earnings

The term "earnings" has a precise ring to it. And when an earnings figure is accompanied by an unqualified auditor's certificate, a naive reader might think it comparable in certitude to pi, calculated to dozens of decimal places.

In reality, however, earnings can be as pliable as putty when a charlatan heads the company reporting them. Eventually truth will surface, but in the meantime a lot of money can change hands. Indeed, some important American fortunes have been created by the monetization of accounting mirages.

Funny business in accounting is not new. For connoisseurs of chicanery, I have attached as Appendix A on page 22 a previously unpublished satire on accounting practices written by Ben Graham in 1936. Alas, excesses similar to those he then lampooned have many times since found their way into the financial statements of major American corporations and been duly certified by big-name auditors. Clearly, investors must always keep their guard up and use accounting numbers as a beginning, not an end, in their attempts to calculate true "economic earnings" accruing to them.

Berkshire's own reported earnings are misleading in a different, but important, way: We have huge investments in companies ("investees") whose earnings far exceed their dividends and in which we record our share of earnings only to the extent of the dividends we receive. The extreme case is Capital Cities/ABC, Inc. Our 17% share of the company's earnings amounted to more than \$83 million last year. Yet only about \$530,000 (\$600,000 of dividends it paid us less some \$70,000 of tax) is counted in Berkshire's GAAP earnings. The residual \$82 million-plus stayed with Cap Cities as retained earnings, which work for our benefit but go unrecorded on our books.

Our perspective on such "forgotten-but-not-gone" earnings is simple: The way they are accounted for is of no importance, but their ownership and subsequent utilization is all-important. We care not whether the auditors hear a tree fall in the forest; we do care who owns the tree and what's next done with it.

When Coca-Cola uses retained earnings to repurchase its shares, the company increases our percentage ownership in what I regard to be the most valuable franchise in the world. (Coke also, of course, uses retained earnings in many other value-enhancing ways.) Instead of repurchasing stock, Coca-Cola could pay those funds to us in dividends, which we could then use to purchase more Coke shares. That would be a less efficient scenario: Because of taxes we would pay on dividend income, we would not be able to increase our proportionate ownership to the degree that Coke can, acting for us. If this less efficient procedure were followed, however, Berkshire would report far greater "earnings."

I believe the best way to think about our earnings is in terms of "look-through" results, calculated as follows: Take \$250 million, which is roughly our share of the 1990 operating earnings retained by our investees; subtract \$30 million, for the incremental taxes we would have owed had that \$250 million been paid to us in dividends; and add the remainder, \$220 million, to our reported operating earnings of \$371 million. Thus our 1990 "look-through earnings" were about \$590 million.

As I mentioned last year, we hope to have look-through earnings grow about 15% annually. In 1990 we substantially exceeded that rate but in 1991 we will fall far short of it. Our Gillette preferred has been called and we will convert it into common stock on April 1. This will reduce reported earnings by about \$35 million annually and look-through earnings by a much smaller, but still significant, amount. Additionally, our media earnings - both direct and look-through - appear sure to decline. Whatever the results, we will post you annually on how we are doing on a look-through basis.

Non-Insurance Operations

Take another look at the figures on page 51, which aggregate the earnings and balance sheets of our non-insurance operations. After-tax earnings on average equity in 1990 were 51%, a result that would have placed the group about 20th on the 1989 Fortune 500.

Two factors make this return even more remarkable. First, leverage did not produce it: Almost all our major facilities are owned, not leased, and such small debt as these operations have is basically offset by cash they hold. In fact, if the measurement was return on assets - a calculation that eliminates the effect of debt upon returns - our group would rank in Fortune's top ten.

Equally important, our return was not earned from industries, such as cigarettes or network television stations, possessing spectacular economics for all participating in them. Instead it came from a group of businesses operating in such prosaic fields as furniture retailing, candy, vacuum cleaners, and even steel warehousing. The explanation is clear: Our extraordinary returns flow from outstanding operating managers, not fortuitous industry economics.

Let's look at the larger operations:

o It was a poor year for retailing - particularly for big-ticket items - but someone forgot to tell Ike Friedman at Borsheim's. Sales were up 18%. That's both a same-stores and all-stores percentage, since Borsheim's operates but one establishment.

But, oh, what an establishment! We can't be sure about the fact (because most fine-jewelry retailers are privately owned) but we believe that this jewelry store does more volume than any other in the U.S., except for Tiffany's New York store.

Borsheim's could not do nearly that well if our customers came only from the Omaha metropolitan area, whose population is about 600,000. We have long had a huge percentage of greater Omaha's jewelry business, so growth in that market is necessarily limited. But every year business from non-Midwest customers grows dramatically. Many visit the store in person. A large number of others, however, buy through the mail in a manner you will find interesting.

These customers request a jewelry selection of a certain type and value - say, emeralds in the \$10,000 - \$20,000 range - and we then send them five to ten items meeting their specifications and from which they can pick. Last year we mailed about 1,500 assortments of all kinds, carrying values ranging from under \$1,000 to hundreds of thousands of dollars.

The selections are sent all over the country, some to people no one at Borsheim's has ever met. (They must always have been well recommended, however.) While the number of mailings in 1990 was a record, Ike has been sending merchandise far and wide for decades. Misanthropes will be crushed to learn how well our "honor-system" works: We have yet to experience a loss from customer dishonesty.

We attract business nationwide because we have several advantages that competitors can't match. The most important item in the equation is our operating costs, which run about 18% of sales compared to 40% or so at the typical competitor. (Included in the 18% are occupancy and buying costs, which some public companies include in "cost of goods sold.") Just as Wal-Mart, with its 15% operating costs, sells

at prices that high-cost competitors can't touch and thereby constantly increases its market share, so does Borsheim's. What works with diapers works with diamonds.

Our low prices create huge volume that in turn allows us to carry an extraordinarily broad inventory of goods, running ten or more times the size of that at the typical fine-jewelry store. Couple our breadth of selection and low prices with superb service and you can understand how Ike and his family have built a national jewelry phenomenon from an Omaha location.

And family it is. Ike's crew always includes son Alan and sons-in-law Marvin Cohn and Donald Yale. And when things are busy - that's often - they are joined by Ike's wife, Roz, and his daughters, Janis and Susie. In addition, Fran Blumkin, wife of Louie (Chairman of Nebraska Furniture Mart and Ike's cousin), regularly pitches in. Finally, you'll find Ike's 89-year-old mother, Rebecca, in the store most afternoons, Wall Street Journal in hand. Given a family commitment like this, is it any surprise that Borsheim's runs rings around competitors whose managers are thinking about how soon 5 o'clock will arrive?

- o While Fran Blumkin was helping the Friedman family set records at Borsheim's, her sons, Irv and Ron, along with husband Louie, were setting records at The Nebraska Furniture Mart. Sales at our one-and-only location were \$159 million, up 4% from 1989. Though again the fact can't be conclusively proved, we believe NFM does close to double the volume of any other home furnishings store in the country.

The NFM formula for success parallels that of Borsheim's. First, operating costs are rock-bottom - 15% in 1990 against about 40% for Levitz, the country's largest furniture retailer, and 25% for Circuit City Stores, the leading discount retailer of electronics and appliances. Second, NFM's low costs allow the business to price well below all competitors. Indeed, major chains, knowing what they will face, steer clear of Omaha. Third, the huge volume generated by our bargain prices allows us to carry the broadest selection of merchandise available anywhere.

Some idea of NFM's merchandising power can be gleaned from a recent report of consumer behavior in Des Moines, which showed that NFM was Number 3 in popularity among 20 furniture retailers serving that city. That may sound like no big deal until you consider that 19 of those retailers are located in Des Moines, whereas our store is 130 miles away. This leaves customers driving a distance equal to that between Washington and Philadelphia in order to shop with us, even though they have a multitude of alternatives next door. In effect, NFM, like Borsheim's, has dramatically expanded the territory it serves - not by the traditional method of opening new stores but rather by creating an irresistible magnet that employs price and selection to pull in the crowds.

Last year at the Mart there occurred an historic event: I experienced a counterrevelation. Regular readers of this report know that I have long scorned the boasts of corporate executives about synergy, deriding such claims as the last refuge of scoundrels defending foolish acquisitions. But now I know better: In Berkshire's first synergistic explosion, NFM put a See's candy cart in the store late last year and sold more candy than that moved by some of the full-fledged stores See's operates in California. This success contradicts all tenets of retailing. With the Blumkins, though, the impossible is routine.

- o At See's, physical volume set a record in 1990 - but only barely and only because of good sales early in the year. After the invasion of Kuwait, mall traffic in the West fell. Our poundage volume at Christmas dropped slightly, though our dollar sales were up because of a 5% price increase.

That increase, and better control of expenses, improved profit margins. Against the backdrop of a weak retailing environment, Chuck Huggins delivered outstanding results, as he has in each of the nineteen years we have owned See's. Chuck's imprint on the business - a virtual fanaticism about quality and service - is visible at all of our 225 stores.

One happening in 1990 illustrates the close bond between See's and its customers. After 15 years of operation, our store in Albuquerque was endangered: The landlord would not renew our lease, wanting us instead to move to an inferior location in the mall and even so to pay a much higher rent. These changes would have wiped out the store's profit. After extended negotiations got us nowhere, we set a date for closing the store.

On her own, the store's manager, Ann Filkins, then took action, urging customers to protest the closing. Some 263 responded by sending letters and making phone calls to See's headquarters in San Francisco, in some cases threatening to boycott the mall. An alert reporter at the Albuquerque paper picked up the story. Supplied with this evidence of a consumer uprising, our landlord offered us a satisfactory deal. (He, too, proved susceptible to a counterrevelation.)

Chuck subsequently wrote personal letters of thanks to every loyalist and sent each a gift certificate. He repeated his thanks in a newspaper ad that listed the names of all 263. The sequel: Christmas sales in Albuquerque were up substantially.

o Charlie and I were surprised at developments this past year in the media industry, including newspapers such as our Buffalo News. The business showed far more vulnerability to the early stages of a recession than has been the case in the past. The question is whether this erosion is just part of an aberrational cycle - to be fully made up in the next upturn - or whether the business has slipped in a way that permanently reduces intrinsic business values.

Since I didn't predict what *has* happened, you may question the value of my prediction about what *will* happen. Nevertheless, I'll proffer a judgment: While many media businesses will remain economic marvels in comparison with American industry generally, they will prove considerably less marvelous than I, the industry, or lenders thought would be the case only a few years ago.

The reason media businesses have been so outstanding in the past was not physical growth, but rather the unusual pricing power that most participants wielded. Now, however, advertising dollars are growing slowly. In addition, retailers that do little or no media advertising (though they sometimes use the Postal Service) have gradually taken market share in certain merchandise categories. Most important of all, the number of both print and electronic advertising channels has substantially increased. As a consequence, advertising dollars are more widely dispersed and the pricing power of ad vendors has diminished. These circumstances materially reduce the intrinsic value of our major media investments and also the value of our operating unit, Buffalo News - though all remain fine businesses.

Notwithstanding the problems, Stan Lipsey's management of the News continues to be superb. During 1990, our earnings held up much better than those of most metropolitan papers, falling only 5%. In the last few months of the year, however, the rate of decrease was far greater.

I can safely make two promises about the News in 1991: (1) Stan will again rank at the top among newspaper publishers; and (2) earnings will fall substantially. Despite a slowdown in the demand for newsprint, the price per ton will average significantly more in 1991 and the paper's labor costs will also be considerably higher. Since revenues may meanwhile be down, we face a real squeeze.

Profits may be off but our pride in the product remains. We continue to have a larger "news hole" - the portion of the paper devoted to news - than any comparable paper. In 1990, the proportion rose to 52.3% against 50.1% in 1989. Alas, the increase resulted from a decline in advertising pages rather than from a gain in news pages. Regardless of earnings pressures, we will maintain at least a 50% news hole. Cutting product quality is not a proper response to adversity.

o The news at Fechheimer, our manufacturer and retailer of uniforms, is all good with one exception: George Heldman, at 69, has decided to retire. I tried to talk him

out of it but he had one irrefutable argument: With four other Heldmans - Bob, Fred, Gary and Roger - to carry on, he was leaving us with an abundance of managerial talent.

Fechheimer's operating performance improved considerably in 1990, as many of the problems we encountered in integrating the large acquisition we made in 1988 were moderated or solved. However, several unusual items caused the earnings reported in the "Sources" table to be flat. In the retail operation, we continue to add stores and now have 42 in 22 states. Overall, prospects appear excellent for Fechheimer.

- o At Scott Fetzer, Ralph Schey runs 19 businesses with a mastery few bring to running one. In addition to overseeing three entities listed on page 6 - World Book, Kirby, and Scott Fetzer Manufacturing - Ralph directs a finance operation that earned a record \$12.2 million pre-tax in 1990.

Were Scott Fetzer an independent company, it would rank close to the top of the Fortune 500 in terms of return on equity, although it is not in businesses that one would expect to be economic champs. The superior results are directly attributable to Ralph.

At World Book, earnings improved on a small decrease in unit volume. The costs of our decentralization move were considerably less in 1990 than 1989 and the benefits of decentralization are being realized. World Book remains far and away the leader in United States encyclopedia sales and we are growing internationally, though from a small base.

Kirby unit volume grew substantially in 1990 with the help of our new vacuum cleaner, The Generation 3, which was an unqualified success. Earnings did not grow as fast as sales because of both start-up expenditures and "learning-curve" problems we encountered in manufacturing the new product. International business, whose

dramatic growth I described last year, had a further 20% sales gain in 1990. With the aid of a recent price increase, we expect excellent earnings at Kirby in 1991.

Within the Scott Fetzer Manufacturing Group, Campbell Hausfeld, its largest unit, had a particularly fine year. This company, the country's leading producer of small and medium-sized air compressors, achieved record sales of \$109 million, more than 30% of which came from products introduced during the last five years.

* * * * *

In looking at the figures for our non-insurance operations, you will see that net worth increased by only \$47 million in 1990 although earnings were \$133 million. This does not mean that our managers are in any way skimping on investments that strengthen their business franchises or that promote growth. Indeed, they diligently pursue both goals.

But they also never deploy capital without good reason. The result: In the past five years they have funneled well over 80% of their earnings to Charlie and me for use in new business and investment opportunities.

Insurance Operations

Shown below is an updated version of our usual table presenting key figures for the property-casualty insurance industry:

Year	Yearly Change in Premiums Written (%)	Statutory Combined Ratio after Policyholder Dividends	Yearly Change in Incurred Losses (%)	Inflation Rate Measured by GNP Deflator (%)
1981	3.8	106.0	6.5	9.6
1982	4.4	109.8	8.4	6.4
1983	4.6	112.0	6.8	3.9
1984	9.2	117.9	16.9	3.8
1985	22.1	116.5	16.1	3.3
1986	22.2	108.0	13.5	2.7
1987	9.4	104.6	7.8	3.1
1988	4.4	105.4	5.5	3.3
1989 (Revised)	3.2	109.2	7.7	4.1
1990 (Est.)	4.5	109.8	5.0	4.1

Source: A.M. Best Co.

The combined ratio represents total insurance costs (losses incurred plus expenses) compared to revenue from premiums: A ratio below 100 indicates an underwriting profit, and one above 100 indicates a loss. The higher the ratio, the worse the year. When the investment income that an insurer earns from holding policyholders' funds ("the float") is taken into account, a combined ratio in the 107 - 111 range typically produces an overall breakeven result, exclusive of earnings on the funds provided by shareholders.

For the reasons laid out in previous reports, we expect the industry's incurred losses to grow at an average of 10% annually, even in periods when general inflation runs considerably lower. (Over the last 25 years, incurred losses have in reality grown at a still faster rate, 11%.) If premium growth meanwhile materially lags that 10% rate, underwriting losses will mount, though the industry's tendency to under-reserve when business turns bad may obscure their size for a time.

Last year premium growth fell far short of the required 10% and underwriting results therefore worsened. (In our table, however, the severity of the deterioration in 1990 is masked because the industry's 1989 losses from Hurricane Hugo caused the ratio for that year to be somewhat above trendline.) The combined ratio will again increase in 1991, probably by about two points.

Results will improve only when most insurance managements become so fearful that they run from business, even though it can be done at much higher prices than now exist. At some point these managements will indeed get the message: The most important thing to do when you find yourself in a hole is to stop digging. But so far that point hasn't gotten across: Insurance managers continue to dig - sullenly but vigorously.

The picture would change quickly if a major physical or financial catastrophe were to occur. Absent such a shock, one to two years will likely pass before underwriting losses become large enough to raise management fear to a level that would spur major price increases. When that moment arrives, Berkshire will be ready - both financially and psychologically - to write huge amounts of business.

In the meantime, our insurance volume continues to be small but satisfactory. In the next section of this report we will give you a framework for evaluating insurance results. From that discussion, you will gain an understanding of why I am so enthusiastic about the performance of our insurance manager, Mike Goldberg, and his cadre of stars, Rod Eldred, Dinos Iordanou, Ajit Jain, and Don Wurster.

In assessing our insurance results over the next few years, you should be aware of one type of business we are pursuing that could cause them to be unusually volatile. If this line of business expands, as it may, our underwriting experience will deviate from the trendline you might expect: In most years we will somewhat exceed expectations and in an occasional year we will fall far below them.

The volatility I predict reflects the fact that we have become a large seller of insurance against truly major catastrophes ("super-cats"), which could for example be

hurricanes, windstorms or earthquakes. The buyers of these policies are reinsurance companies that themselves are in the business of writing catastrophe coverage for primary insurers and that wish to "lay off," or rid themselves, of part of their exposure to catastrophes of special severity. Because the need for these buyers to collect on such a policy will only arise at times of extreme stress - perhaps even chaos - in the insurance business, they seek financially strong sellers. And here we have a major competitive advantage: In the industry, our strength is unmatched.

A typical super-cat contract is complicated. But in a plain- vanilla instance we might write a one-year, \$10 million policy providing that the buyer, a reinsurer, would be paid that sum only if a catastrophe caused two results: (1) specific losses for the reinsurer above a threshold amount; and (2) aggregate losses for the insurance industry of, say, more than \$5 billion. Under virtually all circumstances, loss levels that satisfy the second condition will also have caused the first to be met.

For this \$10 million policy, we might receive a premium of, say, \$3 million. Say, also, that we take in annual premiums of \$100 million from super-cat policies of all kinds. In that case we are very likely in any given year to report either a profit of close to \$100 million or a loss of well over \$200 million. Note that we are not spreading risk as insurers typically do; we are concentrating it. Therefore, our yearly combined ratio on this business will almost never fall in the industry range of 100 - 120, but will instead be close to either zero or 300%.

Most insurers are financially unable to tolerate such swings. And if they have the ability to do so, they often lack the desire. They may back away, for example, because they write gobs of primary property insurance that would deliver them dismal results at the very time they would be experiencing major losses on super- cat reinsurance. In addition, most corporate managements believe that their shareholders dislike volatility in results.

We can take a different tack: Our business in primary property insurance is small and we believe that Berkshire shareholders, if properly informed, can handle unusual

volatility in profits so long as the swings carry with them the prospect of superior long-term results. (Charlie and I always have preferred a lumpy 15% return to a smooth 12%.)

We want to emphasize three points: (1) While we expect our super-cat business to produce satisfactory results over, say, a decade, we're sure it will produce absolutely terrible results in at least an occasional year; (2) Our expectations can be based on little more than subjective judgments - for this kind of insurance, historical loss data are of very limited value to us as we decide what rates to charge today; and (3) Though we expect to write significant quantities of super-cat business, we will do so only at prices we believe to be commensurate with risk. If competitors become optimistic, our volume will fall. This insurance has, in fact, tended in recent years to be woefully underpriced; most sellers have left the field on stretchers.

At the moment, we believe Berkshire to be the largest U.S. writer of super-cat business. So when a major quake occurs in an urban area or a winter storm rages across Europe, light a candle for us.

Measuring Insurance Performance

In the previous section I mentioned "float," the funds of others that insurers, in the conduct of their business, temporarily hold. Because these funds are available to be invested, the typical property-casualty insurer can absorb losses and expenses that exceed premiums by 7% to 11% and still be able to break even on its business. Again, this calculation excludes the earnings the insurer realizes on net worth - that is, on the funds provided by shareholders.

However, many exceptions to this 7% to 11% range exist. For example, insurance covering losses to crops from hail damage produces virtually no float at all. Premiums on this kind of business are paid to the insurer just prior to the time hailstorms are a threat, and if a farmer sustains a loss he will be paid almost immediately. Thus, a combined ratio of 100 for crop hail insurance produces no profit for the insurer.

At the other extreme, malpractice insurance covering the potential liabilities of doctors, lawyers and accountants produces a very high amount of float compared to annual premium volume. The float materializes because claims are often brought long after the alleged wrongdoing takes place and because their payment may be still further delayed by lengthy litigation. The industry calls malpractice and certain other kinds of liability insurance "long-tail" business, in recognition of the extended period during which insurers get to hold large sums that in the end will go to claimants and their lawyers (and to the *insurer's* lawyers as well).

In long-tail situations a combined ratio of 115 (or even more) can prove profitable, since earnings produced by the float will exceed the 15% by which claims and expenses overrun premiums. The catch, though, is that "long-tail" means exactly that: Liability business written in a given year and presumed at first to have produced a combined ratio of 115 may eventually smack the insurer with 200, 300 or worse when the years have rolled by and all claims have finally been settled.

The pitfalls of this business mandate an operating principle that too often is ignored: Though certain long-tail lines may prove profitable at combined ratios of 110 or 115, insurers will invariably find it unprofitable to price using those ratios as targets. Instead, prices must provide a healthy margin of safety against the societal trends that are forever springing expensive surprises on the insurance industry. Setting a target of 100 can itself result in heavy losses; aiming for 110 - 115 is business suicide.

All of that said, what should the measure of an insurer's profitability be? Analysts and managers customarily look to the combined ratio - and it's true that this yardstick usually is a good indicator of where a company ranks in profitability. We believe a better measure, however, to be a comparison of underwriting loss to float developed.

This loss/float ratio, like any statistic used in evaluating insurance results, is meaningless over short time periods: Quarterly underwriting figures and even annual ones are too heavily based on estimates to be much good. But when the ratio takes in a

period of years, it gives a rough indication of the cost of funds generated by insurance operations. A low cost of funds signifies a good business; a high cost translates into a poor business.

On the next page we show the underwriting loss, if any, of our insurance group in each year since we entered the business and relate that bottom line to the average float we have held during the year. From this data we have computed a "cost of funds developed from insurance."

(in \$ Millions)	(1) Underwriting Loss	(2) Average Float	Approximate Cost of Funds	Yearend Yield on Long-Term Govt. Bonds
1967	Profit	\$17.3	< 0	5.50%
1968	Profit	19.9	< 0	5.90%
1969	Profit	23.4	< 0	6.79%
1970	\$0.37	32.4	1.14%	6.25%
1971	Profit	52.5	< 0	5.81%
1972	Profit	69.5	< 0	5.82%
1973	Profit	73.3	< 0	7.27%
1974	7.36	79.1	9.30%	8.13%
1975	11.35	87.6	12.96%	8.03%
1976	Profit	102.6	< 0	7.30%
1977	Profit	139.0	< 0	7.97%
1978	Profit	190.4	< 0	8.93%
1979	Profit	227.3	< 0	10.08%
1980	Profit	237.0	< 0	11.94%
1981	Profit	228.4	< 0	13.61%
1982	21.56	220.6	9.77%	10.64%
1983	33.87	231.3	14.64%	11.84%
1984	48.06	253.2	18.98%	11.58%
1985	44.23	390.2	11.34%	9.34%
1986	55.84	797.5	7.00%	7.60%
1987	55.43	1,266.7	4.38%	8.95%
1988	11.08	1,497.7	0.74%	9.00%
1989	24.40	1,541.3	1.58%	7.97%
1990	26.65	1,637.3	1.63%	8.24%

The float figures are derived from the total of loss reserves, loss adjustment expense reserves and unearned premium reserves minus agents' balances, prepaid acquisition costs and deferred charges applicable to assumed reinsurance. At some

insurers other items should enter into the calculation, but in our case these are unimportant and have been ignored.

During 1990 we held about \$1.6 billion of float slated eventually to find its way into the hands of others. The underwriting loss we sustained during the year was \$27 million and thus our insurance operation produced funds for us at a cost of about 1.6%. As the table shows, we managed in some years to underwrite at a profit and in those instances our cost of funds was less than zero. In other years, such as 1984, we paid a very high price for float. In 19 years out of the 24 we have been in insurance, though, we have developed funds at a cost below that paid by the government.

There are two important qualifications to this calculation. First, the fat lady has yet to gargle, let alone sing, and we won't know our true 1967 - 1990 cost of funds until all losses from this period have been settled many decades from now. Second, the value of the float to shareholders is somewhat undercut by the fact that they must put up their own funds to support the insurance operation and are subject to double taxation on the investment income these funds earn. Direct investments would be more tax-efficient.

The tax penalty that indirect investments impose on shareholders is in fact substantial. Though the calculation is necessarily imprecise, I would estimate that the owners of the average insurance company would find the tax penalty adds about one percentage point to their cost of float. I also think that approximates the correct figure for Berkshire.

Figuring a cost of funds for an insurance business allows anyone analyzing it to determine whether the operation has a positive or negative value for shareholders. If this cost (including the tax penalty) is higher than that applying to alternative sources of funds, the value is negative. If the cost is lower, the value is positive - and if the cost is *significantly* lower, the insurance business qualifies as a very valuable asset.

So far Berkshire has fallen into the significantly-lower camp. Even more dramatic are the numbers at GEICO, in which our ownership interest is now 48% and which

customarily operates at an underwriting profit. GEICO's growth has generated an ever-larger amount of funds for investment that have an effective cost of considerably less than zero. Essentially, GEICO's policyholders, in aggregate, pay the company interest on the float rather than the other way around. (But handsome is as handsome does: GEICO's unusual profitability results from its extraordinary operating efficiency and its careful classification of risks, a package that in turn allows rock-bottom prices for policyholders.)

Many well-known insurance companies, on the other hand, incur an underwriting loss/float cost that, combined with the tax penalty, produces negative results for owners. In addition, these companies, like all others in the industry, are vulnerable to catastrophe losses that could exceed their reinsurance protection and take their cost of float right off the chart. Unless these companies can materially improve their underwriting performance - and history indicates that is an almost impossible task - their shareholders will experience results similar to those borne by the owners of a bank that pays a higher rate of interest on deposits than it receives on loans.

All in all, the insurance business has treated us very well. We have expanded our float at a cost that on the average is reasonable, and we have further prospered because we have earned good returns on these low-cost funds. Our shareholders, true, have incurred extra taxes, but they have been more than compensated for this cost (so far) by the benefits produced by the float.

A particularly encouraging point about our record is that it was achieved despite some colossal mistakes made by your Chairman prior to Mike Goldberg's arrival. Insurance offers a host of opportunities for error, and when opportunity knocked, too often I answered. Many years later, the bills keep arriving for these mistakes: In the insurance business, there is no statute of limitations on stupidity.

The intrinsic value of our insurance business will always be far more difficult to calculate than the value of, say, our candy or newspaper companies. By any measure, however, the business is worth far more than its carrying value. Furthermore, despite

the problems this operation periodically hands us, it is the one - among all the fine businesses we own - that has the greatest potential.

Marketable Securities

Below we list our common stock holdings having a value of over \$100 million. A small portion of these investments belongs to subsidiaries of which Berkshire owns less than 100%.

Shares	Company	Cost (000's omitted)	Market (000's omitted)
3,000,000	Capital Cities/ABC, Inc.	\$517,500	\$1,377,375
46,700,00	The Coca-Cola Company	1,023,920	2,171,550
2,400,000	Federal Home Loan Mortgage Corporation Preferred*	71,729	117,000
6,850,000	GEICO Corporation.	45,713	1,110,556
1,727,765	The Washington Post Company	9,731	342,097
5,000,000	Wells Fargo & Company	289,431	289,375

Lethargy bordering on sloth remains the cornerstone of our investment style: This year we neither bought nor sold a share of five of our six major holdings. The exception was Wells Fargo, a superbly-managed, high-return banking operation in which we increased our ownership to just under 10%, the most we can own without the approval of the Federal Reserve Board. About one-sixth of our position was bought in 1989, the rest in 1990.

The banking business is no favorite of ours. When assets are twenty times equity - a common ratio in this industry - mistakes that involve only a small portion of assets can destroy a major portion of equity. And mistakes have been the rule rather than the

exception at many major banks. Most have resulted from a managerial failing that we described last year when discussing the "institutional imperative:" the tendency of executives to mindlessly imitate the behavior of their peers, no matter how foolish it may be to do so. In their lending, many bankers played follow-the-leader with lemming-like zeal; now they are experiencing a lemming-like fate.

Because leverage of 20:1 magnifies the effects of managerial strengths and weaknesses, we have no interest in purchasing shares of a poorly-managed bank at a "cheap" price. Instead, our only interest is in buying into well-managed banks at fair prices.

With Wells Fargo, we think we have obtained the best managers in the business, Carl Reichardt and Paul Hazen. In many ways the combination of Carl and Paul reminds me of another - Tom Murphy and Dan Burke at Capital Cities/ABC. First, each pair is stronger than the sum of its parts because each partner understands, trusts and admires the other. Second, both managerial teams pay able people well, but abhor having a bigger head count than is needed. Third, both attack costs as vigorously when profits are at record levels as when they are under pressure. Finally, both stick with what they understand and let their abilities, not their egos, determine what they attempt. (Thomas J. Watson Sr. of IBM followed the same rule: "I'm no genius," he said. "I'm smart in spots - but I stay around those spots.")

Our purchases of Wells Fargo in 1990 were helped by a chaotic market in bank stocks. The disarray was appropriate: Month by month the foolish loan decisions of once well-regarded banks were put on public display. As one huge loss after another was unveiled - often on the heels of managerial assurances that all was well - investors understandably concluded that no bank's numbers were to be trusted. Aided by their flight from bank stocks, we purchased our 10% interest in Wells Fargo for \$290 million, less than five times after-tax earnings, and less than three times pre-tax earnings.

Wells Fargo is big - it has \$56 billion in assets - and has been earning more than 20% on equity and 1.25% on assets. Our purchase of one-tenth of the bank may be thought of as roughly equivalent to our buying 100% of a \$5 billion bank with identical financial characteristics. But were we to make such a purchase, we would have to pay about twice the \$290 million we paid for Wells Fargo. Moreover, that \$5 billion bank, commanding a premium price, would present us with another problem: We would not be able to find a Carl Reichardt to run it. In recent years, Wells Fargo executives have been more avidly recruited than any others in the banking business; no one, however, has been able to hire the dean.

Of course, ownership of a bank - or about any other business - is far from riskless. California banks face the specific risk of a major earthquake, which might wreak enough havoc on borrowers to in turn destroy the banks lending to them. A second risk is systemic - the possibility of a business contraction or financial panic so severe that it would endanger almost every highly-leveraged institution, no matter how intelligently run. Finally, the market's major fear of the moment is that West Coast real estate values will tumble because of overbuilding and deliver huge losses to banks that have financed the expansion. Because it is a leading real estate lender, Wells Fargo is thought to be particularly vulnerable.

None of these eventualities can be ruled out. The probability of the first two occurring, however, is low and even a meaningful drop in real estate values is unlikely to cause major problems for well-managed institutions. Consider some mathematics: Wells Fargo currently earns well over \$1 billion pre-tax annually after expensing more than \$300 million for loan losses. If 10% of all \$48 billion of the bank's loans - not just its real estate loans - were hit by problems in 1991, and these produced losses (including foregone interest) averaging 30% of principal, the company would roughly break even.

A year like that - which we consider only a low-level possibility, not a likelihood - would not distress us. In fact, at Berkshire we would love to acquire businesses or

invest in capital projects that produced no return for a year, but that could then be expected to earn 20% on growing equity. Nevertheless, fears of a California real estate disaster similar to that experienced in New England caused the price of Wells Fargo stock to fall almost 50% within a few months during 1990. Even though we had bought some shares at the prices prevailing before the fall, we welcomed the decline because it allowed us to pick up many more shares at the new, panic prices.

Investors who expect to be ongoing buyers of investments throughout their lifetimes should adopt a similar attitude toward market fluctuations; instead many illogically become euphoric when stock prices rise and unhappy when they fall. They show no such confusion in their reaction to food prices: Knowing they are forever going to be buyers of food, they welcome falling prices and deplore price increases. (It's the seller of food who doesn't like declining prices.) Similarly, at the Buffalo News we would cheer lower prices for newsprint - even though it would mean marking down the value of the large inventory of newsprint we always keep on hand - because we know we are going to be perpetually buying the product.

Identical reasoning guides our thinking about Berkshire's investments. We will be buying businesses - or small parts of businesses, called stocks - year in, year out as long as I live (and longer, if Berkshire's directors attend the seances I have scheduled). Given these intentions, declining prices for businesses benefit us, and rising prices hurt us.

The most common cause of low prices is pessimism - sometimes pervasive, sometimes specific to a company or industry. We *want* to do business in such an environment, not because we like pessimism but because we like the prices it produces. It's optimism that is the enemy of the rational buyer.

None of this means, however, that a business or stock is an intelligent purchase simply because it is unpopular; a contrarian approach is just as foolish as a follow-the-crowd strategy. What's required is thinking rather than polling. Unfortunately,

Bertrand Russell's observation about life in general applies with unusual force in the financial world: "Most men would rather die than think. Many do."

* * * * *

Our other major portfolio change last year was large additions to our holdings of RJR Nabisco bonds, securities that we first bought in late 1989. At yearend 1990 we had \$440 million invested in these securities, an amount that approximated market value. (As I write this, however, their market value has risen by more than \$150 million.)

Just as buying into the banking business is unusual for us, so is the purchase of below-investment-grade bonds. But opportunities that interest us and that are also large enough to have a worthwhile impact on Berkshire's results are rare. Therefore, we will look at any category of investment, so long as we understand the business we're buying into and believe that price and value may differ significantly. (Woody Allen, in another context, pointed out the advantage of open-mindedness: "I can't understand why more people aren't bi-sexual because it doubles your chances for a date on Saturday night.")

In the past we have bought a few below-investment-grade bonds with success, though these were all old-fashioned "fallen angels" - bonds that were initially of investment grade but that were downgraded when the issuers fell on bad times. In the 1984 annual report we described our rationale for buying one fallen angel, the Washington Public Power Supply System.

A kind of bastardized fallen angel burst onto the investment scene in the 1980s - "junk bonds" that were far below investment-grade when issued. As the decade progressed, new offerings of manufactured junk became ever junkier and ultimately the predictable outcome occurred: Junk bonds lived up to their name. In 1990 - even

before the recession dealt its blows - the financial sky became dark with the bodies of failing corporations.

The disciples of debt assured us that this collapse wouldn't happen: Huge debt, we were told, would cause operating managers to focus their efforts as never before, much as a dagger mounted on the steering wheel of a car could be expected to make its driver proceed with intensified care. We'll acknowledge that such an attention-getter would produce a very alert driver. But another certain consequence would be a deadly - and unnecessary - accident if the car hit even the tiniest pothole or sliver of ice. The roads of business are riddled with potholes; a plan that requires dodging them all is a plan for disaster.

In the final chapter of The Intelligent Investor Ben Graham forcefully rejected the dagger thesis: "Confronted with a challenge to distill the secret of sound investment into three words, we venture the motto, Margin of Safety." Forty-two years after reading that, I still think those are the right three words. The failure of investors to heed this simple message caused them staggering losses as the 1990s began.

At the height of the debt mania, capital structures were concocted that guaranteed failure: In some cases, so much debt was issued that even highly favorable business results could not produce the funds to service it. One particularly egregious "kill-'em-at-birth" case a few years back involved the purchase of a mature television station in Tampa, bought with so much debt that the interest on it exceeded the station's *gross revenues*. Even if you assume that all labor, programs and services were donated rather than purchased, this capital structure required revenues to explode - or else the station was doomed to go broke. (Many of the bonds that financed the purchase were sold to now-failed savings and loan associations; as a taxpayer, you are picking up the tab for this folly.)

All of this seems impossible now. When these misdeeds were done, however, dagger-selling investment bankers pointed to the "scholarly" research of academics, which reported that over the years the higher interest rates received from low-grade

bonds had more than compensated for their higher rate of default. Thus, said the friendly salesman, a diversified portfolio of junk bonds would produce greater net returns than would a portfolio of high-grade bonds. (Beware of past-performance "proofs" in finance: If history books were the key to riches, the Forbes 400 would consist of librarians.)

There was a flaw in the salesman's logic - one that a first-year student in statistics is taught to recognize. An assumption was being made that the universe of newly-minted junk bonds was identical to the universe of low-grade fallen angels and that, therefore, the default experience of the latter group was meaningful in predicting the default experience of the new issues. (That was an error similar to checking the historical death rate from Kool-Aid before drinking the version served at Jonestown.)

The universes were of course dissimilar in several vital respects. For openers, the manager of a fallen angel almost invariably yearned to regain investment-grade status and worked toward that goal. The junk-bond operator was usually an entirely different breed. Behaving much as a heroin user might, he devoted his energies not to finding a cure for his debt-ridden condition, but rather to finding another fix. Additionally, the fiduciary sensitivities of the executives managing the typical fallen angel were often, though not always, more finely developed than were those of the junk-bond-issuing financiopath.

Wall Street cared little for such distinctions. As usual, the Street's enthusiasm for an idea was proportional not to its merit, but rather to the revenue it would produce. Mountains of junk bonds were sold by those who didn't care to those who didn't think - and there was no shortage of either.

Junk bonds remain a mine field, even at prices that today are often a small fraction of issue price. As we said last year, we have never bought a new issue of a junk bond. (The only time to buy these is on a day with no "y" in it.) We are, however, willing to look at the field, now that it is in disarray.

In the case of RJR Nabisco, we feel the Company's credit is considerably better than was generally perceived for a while and that the yield we receive, as well as the potential for capital gain, more than compensates for the risk we incur (though that is far from nil). RJR has made asset sales at favorable prices, has added major amounts of equity, and in general is being run well.

However, as we survey the field, most low-grade bonds still look unattractive. The handiwork of the Wall Street of the 1980s is even worse than we had thought: Many important businesses have been mortally wounded. We will, though, keep looking for opportunities as the junk market continues to unravel.

Convertible Preferred Stocks

We continue to hold the convertible preferred stocks described in earlier reports: \$700 million of Salomon Inc, \$600 million of The Gillette Company, \$358 million of USAir Group, Inc. and \$300 million of Champion International Corp. Our Gillette holdings will be converted into 12 million shares of common stock on April 1. Weighing interest rates, credit quality and prices of the related common stocks, we can assess our holdings in Salomon and Champion at yearend 1990 as worth about what we paid, Gillette as worth somewhat more, and USAir as worth substantially less.

In making the USAir purchase, your Chairman displayed exquisite timing: I plunged into the business at almost the exact moment that it ran into severe problems. (No one pushed me; in tennis parlance, I committed an "unforced error.") The company's troubles were brought on both by industry conditions and by the post-merger difficulties it encountered in integrating Piedmont, an affliction I should have expected since almost all airline mergers have been followed by operational turmoil.

In short order, Ed Colodny and Seth Schofield resolved the second problem: The airline now gets excellent marks for service. Industry-wide problems have proved to be far more serious. Since our purchase, the economics of the airline industry have

deteriorated at an alarming pace, accelerated by the kamikaze pricing tactics of certain carriers. The trouble this pricing has produced for all carriers illustrates an important truth: In a business selling a commodity-type product, it's impossible to be a lot smarter than your dumbest competitor.

However, unless the industry is decimated during the next few years, our USAir investment should work out all right. Ed and Seth have decisively addressed the current turbulence by making major changes in operations. Even so, our investment is now less secure than at the time I made it.

Our convertible preferred stocks are relatively simple securities, yet I should warn you that, if the past is any guide, you may from time to time read inaccurate or misleading statements about them. Last year, for example, several members of the press calculated the value of all our preferreds as equal to that of the common stock into which they are convertible. By their logic, that is, our Salomon preferred, convertible into common at \$38, would be worth 60% of face value if Salomon common were selling at \$22.80. But there is a small problem with this line of reasoning: Using it, one must conclude that all of the value of a convertible preferred resides in the conversion privilege and that the value of a *non*-convertible preferred of Salomon would be zero, no matter what its coupon or terms for redemption.

The point you should keep in mind is that most of the value of our convertible preferreds is derived from their fixed-income characteristics. That means the securities cannot be worth less than the value they would possess as non-convertible preferreds and may be worth more because of their conversion options.

* * * * *

I deeply regret having to end this section of the report with a note about my friend, Colman Mockler, Jr., CEO of Gillette, who died in January. No description better fitted Colman than "gentleman" - a word signifying integrity, courage and modesty.

Couple these qualities with the humor and exceptional business ability that Colman possessed and you can understand why I thought it an undiluted pleasure to work with him and why I, and all others who knew him, will miss Colman so much.

A few days before Colman died, Gillette was richly praised in a Forbes cover story. Its theme was simple: The company's success in shaving products has come not from marketing savvy (though it exhibits that talent repeatedly) but has instead resulted from its devotion to quality. This mind-set has caused it to consistently focus its energies on coming up with something better, even though its existing products already ranked as the class of the field. In so depicting Gillette, Forbes in fact painted a portrait of Colman.

Help! Help!

Regular readers know that I shamelessly utilize the annual letter in an attempt to acquire businesses for Berkshire. And, as we constantly preach at the Buffalo News, advertising does work: Several businesses have knocked on our door because someone has read in these pages of our interest in making acquisitions. (Any good ad salesman will tell you that trying to sell something without advertising is like winking at a girl in the dark.)

In Appendix B (on pages 26-27) I've reproduced the essence of a letter I wrote a few years back to the owner/manager of a desirable business. If you have no personal connection with a business that might be of interest to us but have a friend who does, perhaps you can pass this report along to him.

Here's the sort of business we are looking for:

- (1) Large purchases (at least \$10 million of after-tax earnings),
- (2) Demonstrated consistent earning power (future projections are of little interest to us, nor are "turnaround" situations),
- (3) Businesses earning good returns on equity while employing little or no debt,
- (4) Management in place (we can't supply it),

(5) Simple businesses (if there's lots of technology, we won't understand it),

(6) An offering price (we don't want to waste our time or that of the seller by talking, even preliminarily, about a transaction when price is unknown).

We will not engage in unfriendly takeovers. We can promise complete confidentiality and a very fast answer - customarily within five minutes - as to whether we're interested. We prefer to buy for cash, but will consider issuing stock when we receive as much in intrinsic business value as we give.

Our favorite form of purchase is one fitting the Blumkin- Friedman-Heldman mold. In cases like these, the company's owner- managers wish to generate significant amounts of cash, sometimes for themselves, but often for their families or inactive shareholders. At the same time, these managers wish to remain significant owners who continue to run their companies just as they have in the past. We think we offer a particularly good fit for owners with such objectives. We invite potential sellers to check us out by contacting people with whom we have done business in the past.

Charlie and I frequently get approached about acquisitions that don't come close to meeting our tests: We've found that if you advertise an interest in buying collies, a lot of people will call hoping to sell you their cocker spaniels. A line from a country song expresses our feeling about new ventures, turnarounds, or auction-like sales: "When the phone don't ring, you'll know it's me."

Besides being interested in the purchase of businesses as described above, we are also interested in the negotiated purchase of large, but not controlling, blocks of stock comparable to those we hold in Capital Cities, Salomon, Gillette, USAir, and Champion. We are not interested, however, in receiving suggestions about purchases we might make in the general stock market.

Miscellaneous

Ken Chace has decided not to stand for reelection as a director at our upcoming annual meeting. We have no mandatory retirement age for directors at Berkshire (and won't!), but Ken, at 75 and living in Maine, simply decided to cut back his activities.

Ken was my immediate choice to run the textile operation after Buffett Partnership, Ltd. assumed control of Berkshire early in 1965. Although I made an economic mistake in sticking with the textile business, I made no mistake in choosing Ken: He ran the operation well, he was always 100% straight with me about its problems, and he generated the funds that allowed us to diversify into insurance.

My wife, Susan, will be nominated to succeed Ken. She is now the second largest shareholder of Berkshire and if she outlives me will inherit all of my stock and effectively control the company. She knows, and agrees, with my thoughts on successor management and also shares my view that neither Berkshire nor its subsidiary businesses and important investments should be sold simply because some very high bid is received for one or all.

I feel strongly that the fate of our businesses and their managers should not depend on my health - which, it should be added, is excellent - and I have planned accordingly. Neither my estate plan nor that of my wife is designed to preserve the family fortune; instead, both are aimed at preserving the character of Berkshire and returning the fortune to society.

Were I to die tomorrow, you could be sure of three things: (1) None of my stock would have to be sold; (2) Both a controlling shareholder and a manager with philosophies similar to mine would follow me; and (3) Berkshire's earnings would increase by \$1 million annually, since Charlie would immediately sell our corporate jet, The Indefensible (ignoring my wish that it be buried with me).

* * * * *

About 97.3% of all eligible shares participated in Berkshire's 1990 shareholder-designated contributions program. Contributions made through the program were \$5.8 million, and 2,600 charities were recipients.

We suggest that new shareholders read the description of our shareholder-designated contributions program that appears on pages 54-55. To participate in future programs, you must make sure your shares are registered in the name of the actual owner, not in the nominee name of a broker, bank or depository. Shares not so registered on August 31, 1991 will be ineligible for the 1991 program.

In addition to the shareholder-designated contributions that Berkshire distributes, managers of our operating businesses make contributions, including merchandise, averaging about \$1.5 million annually. These contributions support local charities, such as The United Way, and produce roughly commensurate benefits for our businesses.

However, neither our operating managers nor officers of the parent company use Berkshire funds to make contributions to broad national programs or charitable activities of special personal interest to them, except to the extent they do so as shareholders. If your employees, including your CEO, wish to give to their alma maters or other institutions to which they feel a personal attachment, we believe they should use their own money, not yours.

* * * * *

The annual meeting this year will be held at the Orpheum Theater in downtown Omaha at 9:30 a.m. on Monday, April 29, 1991. Attendance last year grew to a record 1,300, about a 100-fold increase from ten years ago.

We recommend getting your hotel reservations early at one of these hotels: (1) The Radisson-Redick Tower, a small (88 rooms) but nice hotel across the street from the Orpheum; (2) the much larger Red Lion Hotel, located about a five-minute walk

from the Orpheum; or (3) the Marriott, located in West Omaha about 100 yards from Borsheim's and a twenty minute drive from downtown. We will have buses at the Marriott that will leave at 8:30 and 8:45 for the meeting, and return after it ends.

Charlie and I always enjoy the meeting, and we hope you can make it. The quality of our shareholders is reflected in the quality of the questions we get: We have never attended an annual meeting anywhere that features such a consistently high level of intelligent, owner-related questions.

An attachment to our proxy material explains how you can obtain the card you will need for admission to the meeting. Because weekday parking can be tight around the Orpheum, we have lined up a number of nearby lots for our shareholders to use. The attachment also contains information about them.

As usual, we will have buses to take you to Nebraska Furniture Mart and Borsheim's after the meeting and to take you to downtown hotels or to the airport later. I hope that you will allow plenty of time to fully explore the attractions of both stores. Those of you arriving early can visit the Furniture Mart any day of the week; it is open from 10 a.m. to 5:30 p.m. on Saturdays, and from noon to 5:30 p.m. on Sundays. While there, stop at the See's Candy cart and see for yourself the dawn of synergism at Berkshire.

Borsheim's normally is closed on Sunday, but we will open for shareholders and their guests from noon to 6 p.m. on Sunday, April 28. At our Sunday opening last year you made Ike very happy: After totaling the day's volume, he suggested to me that we start holding annual meetings quarterly. Join us at Borsheim's even if you just come to watch; it's a show you shouldn't miss.

Last year the first question at the annual meeting was asked by 11-year-old Nicholas Kenner, a third-generation shareholder from New York City. Nicholas plays rough: "How come the stock is down?" he fired at me. My answer was not memorable.

We hope that other business engagements won't keep Nicholas away from this year's meeting. If he attends, he will be offered the chance to again ask the first question; Charlie and I want to tackle him while we're *fresh*. This year, however, it's Charlie's turn to answer.

Warren E. Buffett

Chairman of the Board

March 1, 1991

APPENDIX A

U. S. STEEL ANNOUNCES SWEEPING MODERNIZATION SCHEME*

* An unpublished satire by Ben Graham, written in 1936 and given by the author to Warren Buffett in 1954.

Myron C. Taylor, Chairman of U. S. Steel Corporation, today announced the long awaited plan for completely modernizing the world's largest industrial enterprise. Contrary to expectations, no changes will be made in the company's manufacturing or selling policies. Instead, the bookkeeping system is to be entirely revamped. By adopting and further improving a number of modern accounting and financial devices the corporation's earning power will be amazingly transformed. Even under the subnormal conditions of 1935, it is estimated that the new bookkeeping methods would have yielded a reported profit of close to \$50 per share on the common stock. The scheme of improvement is the result of a comprehensive survey made by Messrs. Price, Bacon, Guthrie & Colpitts; it includes the following six points:

1. Writing down of Plant Account to Minus \$1,000,000,000.
2. Par value of common stock to be reduced to 1¢.
3. Payment of all wages and salaries in option warrants.
4. Inventories to be carried at \$1.
5. Preferred Stock to be replaced by non-interest bearing bonds redeemable at 50% discount.

6. A \$1,000,000,000 Contingency Reserve to be established.

The official statement of this extraordinary Modernization Plan follows in full:

The Board of Directors of U. S. Steel Corporation is pleased to announce that after intensive study of the problems arising from changed conditions in the industry, it has approved a comprehensive plan for remodeling the Corporation's accounting methods. A survey by a Special Committee, aided and abetted by Messrs. Price, Bacon, Guthrie & Colpitts, revealed that our company has lagged somewhat behind other American business enterprises in utilizing certain advanced bookkeeping methods, by means of which the earning power may be phenomenally enhanced without requiring any cash outlay or any changes in operating or sales conditions. It has been decided not only to adopt these newer methods, but to develop them to a still higher stage of perfection. The changes adopted by the Board may be summarized under six heads, as follows:

1. Fixed Assets to be written down to Minus \$1,000,000,000.

Many representative companies have relieved their income accounts of all charges for depreciation by writing down their plant account to \$1. The Special Committee points out that if their plants are worth only \$1, the fixed assets of U. S. Steel Corporation are worth a good deal less than that sum. It is now a well-recognized fact that many plants are in reality a liability rather than an asset, entailing not only depreciation charges, but taxes, maintenance, and other expenditures. Accordingly, the Board has decided to extend the write-down policy initiated in the 1935 report, and to mark down the Fixed Assets from \$1,338,522,858.96 to a round Minus \$1,000,000,000.

The advantages of this move should be evident. As the plant wears out, the liability becomes correspondingly reduced. Hence, instead of the present depreciation charge of some \$47,000,000 yearly there will be an annual appreciation credit of 5%, or \$50,000,000. This will increase earnings by no less than \$97,000,000 per annum.

2. Reduction of Par Value of Common Stock to 1¢, and

3. Payment of Salaries and Wages in Option Warrants.

Many corporations have been able to reduce their overhead expenses substantially by paying a large part of their executive salaries in the form of options to buy stock, which carry no charge against earnings. The full possibilities of this modern device have apparently not been adequately realized. The Board of Directors has adopted the following advanced form of this idea:

The entire personnel of the Corporation are to receive their compensation in the form of rights to buy common stock at \$50 per share, at the rate of one purchase right for each \$50 of salary and/or wages in their present amounts. The par value of the common stock is to be reduced to 1¢.

The almost incredible advantages of this new plan are evident from the following:

A. The payroll of the Corporation will be entirely eliminated, a saving of \$250,000,000 per annum, based on 1935 operations.

B. At the same time, the effective compensation of all our employees will be increased severalfold. Because of the large earnings per share to be shown on our common stock under the new methods, it is certain that the shares will command a price in the market far above the option level of \$50 per share, making the readily realizable value of these option warrants greatly in excess of the present cash wages that they will replace.

C. The Corporation will realize an additional large annual profit through the exercise of these warrants. Since the par value of the common stock will be fixed at 1¢, there will be a gain of \$49.99 on each share subscribed for. In the interest of conservative accounting, however, this profit will not be included in the income account, but will be shown separately as a credit to Capital Surplus.

D. The Corporation's cash position will be enormously strengthened. In place of the present annual cash outgo of \$250,000,000 for wages (1935 basis), there will be annual cash inflow of \$250,000,000 through exercise of the subscription warrants for 5,000,000 shares of common stock. The Company's large earnings and strong cash position will permit the payment of a liberal dividend which, in turn, will result in the

exercise of these option warrants immediately after issuance which, in turn, will further improve the cash position which, in turn, will permit a higher dividend rate -- and so on, indefinitely.

4. Inventories to be carried at \$1.

Serious losses have been taken during the depression due to the necessity of adjusting inventory value to market. Various enterprises -- notably in the metal and cotton-textile fields -- have successfully dealt with this problem by carrying all or part of their inventories at extremely low unit prices. The U. S. Steel Corporation has decided to adopt a still more progressive policy, and to carry its entire inventory at \$1. This will be effected by an appropriate write-down at the end of each year, the amount of said write-down to be charged to the Contingency Reserve hereinafter referred to.

The benefits to be derived from this new method are very great. Not only will it obviate all possibility of inventory depreciation, but it will substantially enhance the annual earnings of the Corporation. The inventory on hand at the beginning of the year, valued at \$1, will be sold during the year at an excellent profit. It is estimated that our income will be increased by means of this method to the extent of at least \$150,000,000 per annum which, by a coincidence, will about equal the amount of the write-down to be made each year against Contingency Reserve.

A minority report of the Special Committee recommends that Accounts Receivable and Cash also be written down to \$1, in the interest of consistency and to gain additional advantages similar to those just discussed. This proposal has been rejected for the time being because our auditors still require that any recoveries of receivables and cash so charged off be credited to surplus instead of to the year's income. It is expected, however, that this auditing rule -- which is rather reminiscent of the horse-and-buggy days -- will soon be changed in line with modern tendencies. Should this occur, the minority report will be given further and favorable consideration.

5. Replacement of Preferred Stock by Non-Interest-Bearing Bonds Redeemable at 50% Discount.

During the recent depression many companies have been able to offset their operating losses by including in income profits arising from repurchases of their own bonds at a substantial discount from par. Unfortunately the credit of U. S. Steel Corporation has always stood so high that this lucrative source of revenue has not hitherto been available to it. The Modernization Scheme will remedy this condition.

It is proposed that each share of preferred stock be exchanged for \$300 face value of non-interest-bearing sinking-fund notes, redeemable by lot at 50% of face value in 10 equal annual installments. This will require the issuance of \$1,080,000,000 of new notes, of which \$108,000,000 will be retired each year at a cost to the Corporation of only \$54,000,000, thus creating an annual profit of the same amount.

Like the wage-and/or-salary plan described under 3. above, this arrangement will benefit both the Corporation and its preferred stockholders. The latter are assured payment for their present shares at 150% of par value over an average period of five years. Since short-term securities yield practically no return at present, the non-interest-bearing feature is of no real importance. The Corporation will convert its present annual charge of \$25,000,000 for preferred dividends into an annual bond-retirement profit of \$54,000,000 -- an aggregate yearly gain of \$79,000,000.

6. Establishment of a Contingency Reserve of \$1,000,000,000.

The Directors are confident that the improvements hereinbefore described will assure the Corporation of a satisfactory earning power under all conditions in the future. Under modern accounting methods, however, it is unnecessary to incur the slightest risk of loss through adverse business developments of any sort, since all these may be provided for in advance by means of a Contingency Reserve.

The Special Committee has recommended that the Corporation create such a Contingency Reserve in the fairly substantial amount of \$1,000,000,000. As previously set forth, the annual write-down of inventory to \$1 will be absorbed by this

reserve. To prevent eventual exhaustion of the Contingency Reserve, it has been further decided that it be replenished each year by transfer of an appropriate sum from Capital Surplus. Since the latter is expected to increase each year by not less than \$250,000,000 through the exercise of the Stock Option Warrants (see 3. above), it will readily make good any drains on the Contingency Reserve.

In setting up this arrangement, the Board of Directors must confess regretfully that they have been unable to improve upon the devices already employed by important corporations in transferring large sums between Capital, Capital Surplus, Contingency Reserves and other Balance Sheet Accounts. In fact, it must be admitted that our entries will be somewhat too simple, and will lack that element of extreme mystification that characterizes the most advanced procedure in this field. The Board of Directors, however, have insisted upon clarity and simplicity in framing their Modernization Plan, even at the sacrifice of possible advantage to the Corporation's earning power.

In order to show the combined effect of the new proposals upon the Corporation's earning power, we submit herewith a condensed Income Account for 1935 on two bases, viz:

	A. As Reported	B. Pro-Forma Giving Effect to Changes Proposed Herewith
Gross Receipts from all Sources (Including Inter-Company)	\$765,000,000	\$765,000,000
Salaries and Wages	251,000,000	--
Other Operating Expenses and Taxes	461,000,000	311,000,000
Depreciation	47,000,000	(50,000,000)
Interest	5,000,000	5,000,000
Discount on Bonds Retired	--	(54,000,000)
Preferred Dividends	25,000,000	--

Balance for Common	(24,000,000)	553,000,000
Average Shares Outstanding	8,703,252	11,203,252
Earned Per Share	(\$2.76)	\$49.80

In accordance with a somewhat antiquated custom there is appended herewith a condensed pro-forma Balance Sheet of the U. S. Steel Corporation as of December 31, 1935, after giving effect to proposed changes in asset and liability accounts.

Assets

Fixed Assets, net	(\$1,000,000,000)
Cash Assets	142,000,000
Receivables	56,000,000
Inventory	1
Miscellaneous Assets	27,000,000
Total	(\$774,999,999)

Liabilities

Common Stock Par 1¢ (Par Value \$87,032.52)	(\$3,500,000,000)
Stated Value*	
Subsidiaries' Bonds and Stocks	113,000,000
New Sinking Fund Notes	1,080,000,000
Current Liabilities	69,000,000
Contingency Reserve	1,000,000,000
Other Reserves	74,000,000
Initial Surplus	389,000,001
Total	(\$774,999,999)

*Given a Stated Value differing from Par Value, in accordance with the laws of the State of Virginia, where the company will be re-incorporated.

It is perhaps unnecessary to point out to our stockholders that modern accounting methods give rise to balance sheets differing somewhat in appearance from those of a less advanced period. In view of the very large earning power that will result from

these changes in the Corporation's Balance Sheet, it is not expected that undue attention will be paid to the details of assets and liabilities.

In conclusion, the Board desires to point out that the combined procedure, whereby plant will be carried at a minus figure, our wage bill will be eliminated, and inventory will stand on our books at virtually nothing, will give U. S. Steel Corporation an enormous competitive advantage in the industry. We shall be able to sell our products at exceedingly low prices and still show a handsome margin of profit. It is the considered view of the Board of Directors that under the Modernization Scheme we shall be able to undersell all competitors to such a point that the anti-trust laws will constitute the only barrier to 100% domination of the industry.

In making this statement, the Board is not unmindful of the possibility that some of our competitors may seek to offset our new advantages by adopting similar accounting improvements. We are confident, however, that U. S. Steel will be able to retain the loyalty of its customers, old and new, through the unique prestige that will accrue to it as the originator and pioneer in these new fields of service to the user of steel. Should necessity arise, moreover, we believe we shall be able to maintain our deserved superiority by introducing still more advanced bookkeeping methods, which are even now under development in our Experimental Accounting Laboratory.

APPENDIX B

Some Thoughts on Selling Your Business*

*This is an edited version of a letter I sent some years ago to a man who had indicated that he might want to sell his family business. I present it here because it is a message I would like to convey to other prospective sellers. -- W.E.B.

Dear _____:

Here are a few thoughts pursuant to our conversation of the other day.

Most business owners spend the better part of their lifetimes building their businesses. By experience built upon endless repetition, they sharpen their skills in merchandising, purchasing, personnel selection, etc. It's a learning process, and mistakes made in one year often contribute to competence and success in succeeding years.

In contrast, owner-managers sell their business only once -- frequently in an emotionally-charged atmosphere with a multitude of pressures coming from different directions. Often, much of the pressure comes from brokers whose compensation is contingent upon consummation of a sale, regardless of its consequences for both buyer and seller. The fact that the decision is so important, both financially and personally, to the owner can make the process more, rather than less, prone to error. And, mistakes made in the once-in-a-lifetime sale of a business are not reversible.

Price is very important, but often is not the most critical aspect of the sale. You and your family have an extraordinary business -- one of a kind in your field -- and any buyer is going to recognize that. It's also a business that is going to get more valuable as the years go by. So if you decide not to sell now, you are very likely to realize more money later on. With that knowledge you can deal from strength and take the time required to select the buyer you want.

If you should decide to sell, I think Berkshire Hathaway offers some advantages that most other buyers do not. Practically all of these buyers will fall into one of two categories:

- (1) A company located elsewhere but operating in your business or in a business somewhat akin to yours. Such a buyer -- no matter what promises are made -- will usually have managers who feel they know how to run your business operations and, sooner or later, will want to apply some hands-on "help." If the acquiring company is much larger, it often will have squads of managers, recruited over the years in part by promises that they will get to run future acquisitions. They will have their own way of doing things and, even though your business record undoubtedly will be far better

than theirs, human nature will at some point cause them to believe that their methods of operating are superior. You and your family probably have friends who have sold their businesses to larger companies, and I suspect that their experiences will confirm the tendency of parent companies to take over the running of their subsidiaries, particularly when the parent knows the industry, or thinks it does.

(2) A financial maneuverer, invariably operating with large amounts of borrowed money, who plans to resell either to the public or to another corporation as soon as the time is favorable. Frequently, this buyer's major contribution will be to change accounting methods so that earnings can be presented in the most favorable light just prior to his bailing out. I'm enclosing a recent article that describes this sort of transaction, which is becoming much more frequent because of a rising stock market and the great supply of funds available for such transactions.

If the sole motive of the present owners is to cash their chips and put the business behind them -- and plenty of sellers fall in this category -- either type of buyer that I've just described is satisfactory. But if the sellers' business represents the creative work of a lifetime and forms an integral part of their personality and sense of being, buyers of either type have serious flaws.

Berkshire is another kind of buyer -- a rather unusual one. We buy to keep, but we don't have, and don't expect to have, operating people in our parent organization. All of the businesses we own are run autonomously to an extraordinary degree. In most cases, the managers of important businesses we have owned for many years have not been to Omaha or even met each other. When we buy a business, the sellers go on running it just as they did before the sale; we adapt to their methods rather than vice versa.

We have no one -- family, recently recruited MBAs, etc. -- to whom we have promised a chance to run businesses we have bought from owner-managers. And we won't have.

You know of some of our past purchases. I'm enclosing a list of everyone from whom we have ever bought a business, and I invite you to check with them as to our performance versus our promises. You should be particularly interested in checking with the few whose businesses did not do well in order to ascertain how we behaved under difficult conditions.

Any buyer will tell you that he needs you personally -- and if he has any brains, he most certainly does need you. But a great many buyers, for the reasons mentioned above, don't match their subsequent actions to their earlier words. We will behave exactly as promised, both because we have so promised, and because we need to in order to achieve the best business results.

This need explains why we would want the operating members of your family to retain a 20% interest in the business. We need 80% to consolidate earnings for tax purposes, which is a step important to us. It is equally important to us that the family members who run the business remain as owners. Very simply, we would not want to buy unless we felt key members of present management would stay on as our partners. Contracts cannot guarantee your continued interest; we would simply rely on your word.

The areas I get involved in are capital allocation and selection and compensation of the top man. Other personnel decisions, operating strategies, etc. are his bailiwick. Some Berkshire managers talk over some of their decisions with me; some don't. It depends upon their personalities and, to an extent, upon their own personal relationship with me.

If you should decide to do business with Berkshire, we would pay in cash. Your business would not be used as collateral for any loan by Berkshire. There would be no brokers involved.

Furthermore, there would be no chance that a deal would be announced and that the buyer would then back off or start suggesting adjustments (with apologies, of course, and with an explanation that banks, lawyers, boards of directors, etc. were to

be blamed). And finally, you would know exactly with whom you are dealing. You would not have one executive negotiate the deal only to have someone else in charge a few years later, or have the president regretfully tell you that his board of directors required this change or that (or possibly required sale of your business to finance some new interest of the parent's).

It's only fair to tell you that you would be no richer after the sale than now. The ownership of your business already makes you wealthy and soundly invested. A sale would change the form of your wealth, but it wouldn't change its amount. If you sell, you will have exchanged a 100%-owned valuable asset that you understand for another valuable asset -- cash -- that will probably be invested in small pieces (stocks) of other businesses that you understand less well. There is often a sound reason to sell but, if the transaction is a fair one, the reason is not so that the seller can become wealthier.

I will not pester you; if you have any possible interest in selling, I would appreciate your call. I would be extraordinarily proud to have Berkshire, along with the key members of your family, own _____; I believe we would do very well financially; and I believe you would have just as much fun running the business over the next 20 years as you have had during the past 20.

Sincerely

/s/ Warren Buffett

1991 Letter

BERKSHIRE HATHAWAY INC.

To the Shareholders of Berkshire Hathaway Inc.:

Our gain in net worth during 1991 was \$2.1 billion, or 39.6%. Over the last 27 years (that is, since present management took over) our per-share book value has grown from \$19 to \$6,437, or at a rate of 23.7% compounded annually.

The size of our equity capital - which now totals \$7.4 billion - makes it certain that we cannot maintain our past rate of gain or, for that matter, come close to doing so. As Berkshire grows, the universe of opportunities that can significantly influence the company's performance constantly shrinks. When we were working with capital of \$20 million, an idea or business producing \$1 million of profit added five percentage points to our return for the year. Now we need a \$370 million idea (i.e., one contributing over \$550 million of pre-tax profit) to achieve the same result. And there are many more ways to make \$1 million than to make \$370 million.

Charlie Munger, Berkshire's Vice Chairman, and I have set a goal of attaining a 15% average annual increase in Berkshire's intrinsic value. If our growth in *book* value is to keep up with a 15% pace, we must earn \$22 billion during the next decade. Wish us luck - we'll need it.

Our outsized gain in book value in 1991 resulted from a phenomenon not apt to be repeated: a dramatic rise in the price-earnings ratios of Coca-Cola and Gillette. These two stocks accounted for nearly \$1.6 billion of our \$2.1 billion growth in net worth last year. When we loaded up on Coke three years ago, Berkshire's net worth was \$3.4 billion; now our Coke stock alone is worth more than that.

Coca-Cola and Gillette are two of the best companies in the world and we expect their earnings to grow at hefty rates in the years ahead. Over time, also, the value of our holdings in these stocks should grow in rough proportion. Last year, however, the valuations of these two companies rose far faster than their earnings. In effect, we got a double-dip benefit, delivered partly by the excellent earnings growth and even more so by the market's reappraisal of these stocks. We believe this reappraisal was warranted. But it can't recur annually: We'll have to settle for a single dip in the future.

A Second Job

In 1989 when I - a happy consumer of five cans of Cherry Coke daily - announced our purchase of \$1 billion worth of Coca-Cola stock, I described the move as a rather extreme example of putting our money where my mouth was. On August 18 of last year, when I was elected Interim Chairman of Salomon Inc, it was a different story: I put my mouth where our money was.

You've all read of the events that led to my appointment. My decision to take the job carried with it an implicit but important message: Berkshire's operating managers are so outstanding that I knew I could materially reduce the time I was spending at the company and yet remain confident that its economic progress would not skip a beat. The Blumkins, the Friedman family, Mike Goldberg, the Heldmans, Chuck Huggins, Stan Lipsey, Ralph Schey and Frank Rooney (CEO of H.H. Brown, our latest acquisition, which I will describe later) are all masters of their operations and need no help from me. My job is merely to treat them right and to allocate the capital they generate. Neither function is impeded by my work at Salomon.

The role that Charlie and I play in the success of our operating units can be illustrated by a story about George Mira, the one-time quarterback of the University of Miami, and his coach, Andy Gustafson. Playing Florida and near its goal line, Mira dropped back to pass. He spotted an open receiver but found his right shoulder in the unshakable grasp of a Florida linebacker. The right-handed Mira thereupon switched the ball to his other hand and threw the only left-handed pass of his life - for a touchdown. As the crowd erupted, Gustafson calmly turned to a reporter and declared: "Now that's what I call coaching."

Given the managerial stars we have at our operating units, Berkshire's performance is not affected if Charlie or I slip away from time to time. You should note, however, the "interim" in my Salomon title. Berkshire is my first love and one that will never fade: At the Harvard Business School last year, a student asked me when I planned to retire and I replied, "About five to ten years after I die."

Sources of Reported Earnings

The table below shows the major sources of Berkshire's reported earnings. In this presentation, amortization of Goodwill and other major purchase-price accounting adjustments are not charged against the specific businesses to which they apply, but are instead aggregated and shown separately. This procedure lets you view the earnings of our businesses as they would

have been reported had we not purchased them. I've explained in past reports why this form of presentation seems to us to be more useful to investors and managers than one utilizing generally accepted accounting principles (GAAP), which require purchase-price adjustments to be made on a business-by-business basis. The total net earnings we show in the table are, of course, identical to the GAAP total in our audited financial statements.

A large amount of additional information about these businesses is given on pages 33-47, where you also will find our segment earnings reported on a GAAP basis. However, we will not in this letter discuss each of our non-insurance operations, as we have in the past. Our businesses have grown in number - and will continue to grow - so it now makes sense to rotate coverage, discussing one or two in detail each year.

Operating Earnings (000s omitted)	Pre-Tax 1991	Earnings 1990	Berkshire 1991	Share 1990
Insurance Group:				
Underwriting	\$(119,593)	\$(26,647)	\$(77,229)	\$(14,936)

**Excludes interest expense of Scott Fetzer Financial Group and Mutual Savings & Loan.*

"Look-Through" Earnings

We've previously discussed look-through earnings, which consist of: (1) the operating earnings reported in the previous section, plus; (2) the retained operating earnings of major investees that, under GAAP accounting, are not reflected in our profits, less; (3) an allowance for the tax that would be paid by Berkshire if these retained earnings of investees had instead been distributed to us.

I've told you that over time look-through earnings must increase at about 15% annually if our intrinsic business value is to grow at that rate. Indeed, since present management took over in 1965, our look-through earnings have grown at almost the identical 23% rate of gain recorded for book value.

Last year, however, our look-through earnings did not grow at all but rather declined by 14%. To an extent, the decline was precipitated by two forces that I discussed in last year's report and that I warned you would have a negative effect on look-through earnings.

First, I told you that our media earnings - both direct and look-through - were "sure to decline" and they in fact did. The second force came into play on April 1, when the call of our Gillette preferred stock required us to convert it into common. The after-tax earnings in 1990

from our preferred had been about \$45 million, an amount somewhat higher than the combination in 1991 of three months of dividends on our preferred plus nine months of look-through earnings on the common.

Two other outcomes that I did not foresee also hurt look-through earnings in 1991. First, we had a break-even result from our interest in Wells Fargo (dividends we received from the company were offset by negative retained earnings). Last year I said that such a result at Wells was "a low-level possibility - not a likelihood." Second, we recorded significantly lower - though still excellent - insurance profits.

The following table shows you how we calculate look-through earnings, although I warn you that the figures are necessarily very rough. (The dividends paid to us by these investees have been included in the operating earnings itemized on page 6, mostly under "Insurance Group: Net Investment Income.")

Berkshire's Major Investees	Berkshire's	Approximate at	Berkshire's	Share of
	Ownership	Yearend	Undistributed	Operating Earnings
	1991	1990	1991	1990
Capitla Cities / ABC Inc.	18.1%	17.9%	\$61	\$85
The Coca-Cola Company	7.0%	7.0%	69	58
Federal Home Loan Mortgage Corp	3.4% (1)	3.2% (1)	15	10
The Gillette Compnay	11.0%	---	23 (2)	---
GEICO Corp.	48.2%	46.1%	69	76
The Washington Post Company	14.6%	14.6%	10	18
Wells Fargo & Company	9.6%	9.7%	(17)	19 (3)
Berkshire's share of undistributed earnings of major investees			\$230	\$266
Hypothetical tax on these undistributed investee earnings			(30)	(35)
Reported operating earnings of Berkshire			316	371
Total look-through earnings of Bekrshire			\$516	\$602

- (1) Net of minority interest at Wesco
- (2) For the nine months after Berkshire converted its preferred on April 1
- (3) Calculated on average ownership for the year

* * * * *

We also believe that investors can benefit by focusing on their own look-through earnings. To calculate these, they should determine the underlying earnings attributable to the shares they hold in their portfolio and total these. The goal of each investor should be to create a portfolio (in effect, a "company") that will deliver him or her the highest possible look-through earnings a decade or so from now.

An approach of this kind will force the investor to think about long-term business prospects rather than short-term stock market prospects, a perspective likely to improve results. It's true, of course, that, in the long run, the scoreboard for investment decisions is market price. But prices will be determined by future earnings. In investing, just as in baseball, to put runs on the scoreboard one must watch the playing field, not the scoreboard.

A Change in Media Economics and Some Valuation Math

In last year's report, I stated my opinion that the decline in the profitability of media companies reflected secular as well as cyclical factors. The events of 1991 have fortified that case: The economic strength of once-mighty media enterprises continues to erode as retailing patterns change and advertising and entertainment choices proliferate. In the business world, unfortunately, the rear-view mirror is always clearer than the windshield: A few years back no one linked to the media business - neither lenders, owners nor financial analysts - saw the economic deterioration that was in store for the industry. (But give me a few years and I'll probably convince myself that I did.)

The fact is that newspaper, television, and magazine properties have begun to resemble *businesses* more than *franchises* in their economic behavior. Let's take a quick look at the characteristics separating these two classes of enterprise, keeping in mind, however, that many operations fall in some middle ground and can best be described as weak franchises or strong businesses.

An economic franchise arises from a product or service that: (1) is needed or desired; (2) is thought by its customers to have no close substitute and; (3) is not subject to price regulation. The existence of all three conditions will be demonstrated by a company's ability to regularly price its product or service aggressively and thereby to earn high rates of return on capital. Moreover, franchises can tolerate mis-management. Inept managers may diminish a franchise's profitability, but they cannot inflict mortal damage.

In contrast, "a business" earns exceptional profits only if it is the low-cost operator or if supply of its product or service is tight. Tightness in supply usually does not last long. With superior management, a company may maintain its status as a low-cost operator for a much longer time, but even then unceasingly faces the possibility of competitive attack. And a business, unlike a franchise, can be killed by poor management.

Until recently, media properties possessed the three characteristics of a franchise and consequently could both price aggressively and be managed loosely. Now, however, consumers looking for information and entertainment (their primary interest being the latter) enjoy greatly broadened choices as to where to find them. Unfortunately, demand can't expand in response to this new supply: 500 million American eyeballs and a 24-hour day are all that's available. The result is that competition has intensified, markets have fragmented, and the media industry has lost some - though far from all - of its franchise strength.

* * * * *

The industry's weakened franchise has an impact on its value that goes far beyond the immediate effect on earnings. For an understanding of this phenomenon, let's look at some much over-simplified, but relevant, math.

A few years ago the conventional wisdom held that a newspaper, television or magazine property would forever increase its earnings at 6% or so annually and would do so *without the employment of additional capital*, for the reason that depreciation charges would roughly match capital expenditures and working capital requirements would be minor. Therefore, reported earnings (before amortization of intangibles) were also freely-distributable earnings, which meant that ownership of a media property could be construed as akin to owning a perpetual annuity set to grow at 6% a year. Say, next, that a discount rate of 10% was used to determine

the present value of that earnings stream. One could then calculate that it was appropriate to pay a whopping \$25 million for a property with current after-tax earnings of \$1 million. (This after-tax multiplier of 25 translates to a multiplier on pre-tax earnings of about 16.)

Now change the assumption and posit that the \$1 million represents "normal earning power" and that earnings will bob around this figure cyclically. A "bob-around" pattern is indeed the lot of most businesses, whose income stream grows only if their owners are willing to commit more capital (usually in the form of retained earnings). Under our revised assumption, \$1 million of earnings, discounted by the same 10%, translates to a \$10 million valuation. Thus a seemingly modest shift in assumptions reduces the property's valuation to 10 times after-tax earnings (or about 6 1/2 times pre-tax earnings).

Dollars are dollars whether they are derived from the operation of media properties or of steel mills. What in the past caused buyers to value a dollar of earnings from media far higher than a dollar from steel was that the earnings of a media property were expected to constantly grow (without the business requiring much additional capital), whereas steel earnings clearly fell in the bob-around category. Now, however, expectations for media have moved toward the bob-around model. And, as our simplified example illustrates, valuations must change dramatically when expectations are revised.

We have a significant investment in media - both through our direct ownership of Buffalo News and our shareholdings in The Washington Post Company and Capital Cities/ABC - and the intrinsic value of this investment has declined materially because of the secular transformation that the industry is experiencing. (Cyclical factors have also hurt our current look-through earnings, but these factors do not reduce intrinsic value.) However, as our Business Principles on page 2-3 note, one of the rules by which we run Berkshire is that we do not sell businesses - or investee holdings that we have classified as permanent - simply because we see ways to use the money more advantageously elsewhere. (We did sell certain other media holdings sometime back, but these were relatively small.)

The intrinsic value losses that we have suffered have been moderated because the Buffalo News, under Stan Lipsey's leadership, has done far better than most newspapers and because both Cap Cities and Washington Post are exceptionally well-managed. In particular, these companies stayed on the sidelines during the late 1980's period in which purchasers of media properties regularly paid irrational prices. Also, the debt of both Cap Cities and Washington Post

is small and roughly offset by cash that they hold. As a result, the shrinkage in the value of their assets has not been accentuated by the effects of leverage. Among publicly-owned media companies, our two investees are about the only ones essentially free of debt. Most of the other companies, through a combination of the aggressive acquisition policies they pursued and shrinking earnings, find themselves with debt equal to five or more times their current net income.

The strong balance sheets and strong managements of Cap Cities and Washington Post leave us more comfortable with these investments than we would be with holdings in any other media companies. Moreover, most media properties continue to have far better economic characteristics than those possessed by the average American business. But gone are the days of bullet-proof franchises and cornucopian economics.

Twenty Years in a Candy Store

We've just passed a milestone: Twenty years ago, on January 3, 1972, Blue Chip Stamps (then an affiliate of Berkshire and later merged into it) bought control of See's Candy Shops, a West Coast manufacturer and retailer of boxed-chocolates. The nominal price that the sellers were asking - calculated on the 100% ownership we ultimately attained - was \$40 million. But the company had \$10 million of excess cash, and therefore the true offering price was \$30 million. Charlie and I, not yet fully appreciative of the value of an economic franchise, looked at the company's mere \$7 million of tangible net worth and said \$25 million was as high as we would go (and we meant it). Fortunately, the sellers accepted our offer.

The sales of trading stamps by Blue Chip thereafter declined from \$102.5 million in 1972 to \$1.2 million in 1991. But See's candy sales in the same period increased from \$29 million to \$196 million. Moreover, profits at See's grew even faster than sales, from \$4.2 million pre-tax in 1972 to \$42.4 million last year.

For an increase in profits to be evaluated properly, it must be compared with the incremental capital investment required to produce it. On this score, See's has been astounding: The company now operates comfortably with only \$25 million of net worth, which means that our beginning base of \$7 million has had to be supplemented by only \$18 million of reinvested earnings. Meanwhile, See's remaining pre-tax profits of \$410 million were distributed to Blue Chip/Berkshire during the 20 years for these companies to deploy (after payment of taxes) in whatever way made most sense.

In our See's purchase, Charlie and I had one important insight: We saw that the business had untapped pricing power. Otherwise, we were lucky twice over. First, the transaction was not derailed by our dumb insistence on a \$25 million price. Second, we found Chuck Huggins, then See's executive vice-president, whom we instantly put in charge. Both our business and personal experiences with Chuck have been outstanding. One example: When the purchase was made, we shook hands with Chuck on a compensation arrangement - conceived in about five minutes and never reduced to a written contract - that remains unchanged to this day.

In 1991, See's sales volume, measured in dollars, matched that of 1990. In pounds, however, volume was down 4%. All of that slippage took place in the last two months of the year, a period that normally produces more than 80% of annual profits. Despite the weakness in sales, profits last year grew 7%, and our pre-tax profit margin was a record 21.6%.

Almost 80% of See's sales come from California and our business clearly was hurt by the recession, which hit the state with particular force late in the year. Another negative, however, was the mid-year initiation in California of a sales tax of 7%-8% (depending on the county involved) on "snack food" that was deemed applicable to our candy.

Shareholders who are students of epistemological shadings will enjoy California's classifications of "snack" and "non-snack" foods:

Taxable "Snack" Foods	Non-Taxable "Non-Snack" Foods
Ritz Crackers	Soda Crackers
Popped Popcorn	Unpopped Popcorn
Granola Bars	Granola Cereal
Slice of Pie (Wrapped)	Whole Pie
Milky Way Candy Bar	Milky Way Ice Cream Bar

What - you are sure to ask - is the tax status of a *melted* Milky Way ice cream bar? In that androgynous form, does it more resemble an ice cream bar or a candy bar that has been left in the sun? It's no wonder that Brad Sherman, Chairman of California's State Board of Equalization,

who opposed the snack food bill but must now administer it, has said: "I came to this job as a specialist in tax law. Now I find my constituents should have elected Julia Child."

Charlie and I have many reasons to be thankful for our association with Chuck and See's. The obvious ones are that we've earned exceptional returns and had a good time in the process. Equally important, ownership of See's has taught us much about the evaluation of franchises. We've made significant money in certain common stocks because of the lessons we learned at See's.

H. H. Brown

We made a sizable acquisition in 1991 - the H. H. Brown Company - and behind this business is an interesting history. In 1927 a 29-year-old businessman named Ray Heffernan purchased the company, then located in North Brookfield, Massachusetts, for \$10,000 and began a 62-year career of running it. (He also found time for other pursuits: At age 90 he was still joining new golf clubs.) By Mr. Heffernan's retirement in early 1990 H. H. Brown had three plants in the United States and one in Canada; employed close to 2,000 people; and earned about \$25 million annually before taxes.

Along the way, Frances Heffernan, one of Ray's daughters, married Frank Rooney, who was sternly advised by Mr. Heffernan before the wedding that he had better forget any ideas he might have about working for his father-in-law. That was one of Mr. Heffernan's few mistakes: Frank went on to become CEO of Melville Shoe (now Melville Corp.). During his 23 years as boss, from 1964 through 1986, Melville's earnings averaged more than 20% on equity and its stock (adjusted for splits) rose from \$16 to \$960. And a few years after Frank retired, Mr. Heffernan, who had fallen ill, asked him to run Brown.

After Mr. Heffernan died late in 1990, his family decided to sell the company - and here we got lucky. I had known Frank for a few years but not well enough for him to think of Berkshire as a possible buyer. He instead gave the assignment of selling Brown to a major investment banker, which failed also to think of us. But last spring Frank was playing golf in Florida with John Loomis, a long-time friend of mine as well as a Berkshire shareholder, who is always on the alert for something that might fit us. Hearing about the impending sale of Brown, John told Frank that the company should be right up Berkshire's alley, and Frank promptly gave me a call. I thought right away that we would make a deal and before long it was done.

Much of my enthusiasm for this purchase came from Frank's willingness to continue as CEO. Like most of our managers, he has no financial need to work but does so because he loves the game and likes to excel. Managers of this stripe cannot be "hired" in the normal sense of the word. What we must do is provide a concert hall in which business artists of this class will wish to perform.

Brown (which, by the way, has no connection to Brown Shoe of St. Louis) is the leading North American manufacturer of work shoes and boots, and it has a history of earning unusually fine margins on sales and assets. Shoes are a tough business - of the billion pairs purchased in the United States each year, about 85% are imported - and most manufacturers in the industry do poorly. The wide range of styles and sizes that producers offer causes inventories to be heavy; substantial capital is also tied up in receivables. In this kind of environment, only outstanding managers like Frank and the group developed by Mr. Heffernan can prosper.

A distinguishing characteristic of H. H. Brown is one of the most unusual compensation systems I've encountered - but one that warms my heart: A number of key managers are paid an annual salary of \$7,800, to which is added a designated percentage of the profits of the company after these are reduced by a charge for capital employed. These managers therefore truly stand in the shoes of owners. In contrast, most managers talk the talk but don't walk the walk, choosing instead to employ compensation systems that are long on carrots but short on sticks (and that almost invariably treat equity capital as if it were cost-free). The arrangement at Brown, in any case, has served both the company and its managers exceptionally well, which should be no surprise: Managers eager to bet heavily on their abilities usually have plenty of ability to bet on.

* * * * *

It's discouraging to note that though we have on four occasions made major purchases of companies whose sellers were represented by prominent investment banks, we were in only one of these instances contacted by the investment bank. In the other three cases, I myself or a friend initiated the transaction at some point after the investment bank had solicited its own list of prospects. We would love to see an intermediary earn its fee by thinking of us - and therefore repeat here what we're looking for:

- (1) Large purchases (at least \$10 million of after-tax earnings),

(2) Demonstrated consistent earning power (future projections are of little interest to us, nor are "turnaround" situations),

(3) Businesses earning good returns on equity while employing little or no debt,

(4) Management in place (we can't supply it),

(5) Simple businesses (if there's lots of technology, we won't understand it),

(6) An offering price (we don't want to waste our time or that of the seller by talking, even preliminarily, about a transaction when price is unknown).

We will not engage in unfriendly takeovers. We can promise complete confidentiality and a very fast answer - customarily within five minutes - as to whether we're interested. (With Brown, we didn't even need to take five.) We prefer to buy for cash, but will consider issuing stock when we receive as much in intrinsic business value as we give.

Our favorite form of purchase is one fitting the pattern through which we acquired Nebraska Furniture Mart, Fechheimer's and Borsheim's. In cases like these, the company's owner-managers wish to generate significant amounts of cash, sometimes for themselves, but often for their families or inactive shareholders. At the same time, these managers wish to remain significant owners who continue to run their companies just as they have in the past. We think we offer a particularly good fit for owners with such objectives and we invite potential sellers to check us out by contacting people with whom we have done business in the past.

Charlie and I frequently get approached about acquisitions that don't come close to meeting our tests: We've found that if you advertise an interest in buying collies, a lot of people will call hoping to sell you their cocker spaniels. A line from a country song expresses our feeling about new ventures, turnarounds, or auction-like sales: "When the phone don't ring, you'll know it's me."

Besides being interested in the purchase of businesses as described above, we are also interested in the negotiated purchase of large, but not controlling, blocks of stock comparable to those we hold in Capital Cities, Salomon, Gillette, USAir, Champion, and American Express. We are not interested, however, in receiving suggestions about purchases we might make in the general stock market.

Insurance Operations

Shown below is an updated version of our usual table presenting key figures for the property-casualty insurance industry:

Year	Yearly Change in Premiums Written (%)	Statutory Combined Ratio after Policyholder Dividends	Yearly Change in Incurred Losses (%)	Inflation Rate Measured by GNP Deflator (%)
1981	3.8	106.0	6.5	9.6
1982	4.4	109.8	8.4	6.4
1983	4.6	112.0	6.8	3.9
1984	9.2	117.9	16.9	3.8
1985	22.1	116.5	16.1	3.3
1986	22.2	108.0	13.5	2.7
1987	9.4	104.6	7.8	3.1
1988	4.4	105.4	5.5	3.3
1989	3.2	109.2	7.7	4.1
1990 (Revised)	4.4	109.6	4.8	4.1
1991 (Est.)	3.1	109.1	2.9	3.7

The combined ratio represents total insurance costs (losses incurred plus expenses) compared to revenue from premiums: A ratio below 100 indicates an underwriting profit, and one above 100 indicates a loss. The higher the ratio, the worse the year. When the investment income that an insurer earns from holding policyholders' funds ("the float") is taken into account, a combined ratio in the 107 - 111 range typically produces an overall break-even result, exclusive of earnings on the funds provided by shareholders.

For the reasons laid out in previous reports, we expect the industry's incurred losses to grow at close to 10% annually, even in periods when general inflation runs considerably lower. (Over the last 25 years, incurred losses have in reality grown at a still faster rate, 11%.) If premium growth meanwhile materially lags that 10% rate, underwriting losses will mount.

However, the industry's tendency to under-reserve when business turns bad may obscure the picture for a time - and that could well describe the situation last year. Though premiums did not

come close to growing 10%, the combined ratio failed to deteriorate as I had expected but instead slightly improved. Loss-reserve data for the industry indicate that there is reason to be skeptical of that outcome, and it may turn out that 1991's ratio should have been worse than was reported. In the long run, of course, trouble awaits managements that paper over operating problems with accounting maneuvers. Eventually, managements of this kind achieve the same result as the seriously-ill patient who tells his doctor: "I can't afford the operation, but would you accept a small payment to touch up the x-rays?"

Berkshire's insurance business has changed in ways that make combined ratios, our own or the industry's, largely irrelevant to our performance. What counts with us is the "cost of funds developed from insurance," or in the vernacular, "the cost of float."

Float - which we generate in exceptional amounts - is the total of loss reserves, loss adjustment expense reserves and unearned premium reserves minus agents balances, prepaid acquisition costs and deferred charges applicable to assumed reinsurance. And the cost of float is measured by our underwriting loss.

The table below shows our cost of float since we entered the business in 1967.

(in \$ Millions)	(1) Underwriting Loss	(2) Average Float	Approximate Cost of Funds	Yearend Yield on Long-Term Govt. Bonds
1967	Profit	\$17.3	< 0	5.50%
1968	Profit	19.9	< 0	5.90%
1969	Profit	23.4	< 0	6.79%
1970	\$0.37	32.4	1.14%	6.25%
1971	Profit	52.5	< 0	5.81%
1972	Profit	69.5	< 0	5.82%
1973	Profit	73.3	< 0	7.27%

1974	7.36	79.1	9.30%	8.13%
1975	11.35	87.6	12.96%	8.03%
1976	Profit	102.6	< 0	7.30%
1977	Profit	139.0	< 0	7.97%
1978	Profit	190.4	< 0	8.93%
1979	Profit	227.3	< 0	10.08%
1980	Profit	237.0	< 0	11.94%
1981	Profit	228.4	< 0	13.61%
1982	21.56	220.6	9.77%	10.64%
1983	33.87	231.3	14.64%	11.84%
1984	48.06	253.2	18.98%	11.58%
1985	44.23	390.2	11.34%	9.34%
1986	55.84	797.5	7.00%	7.60%
1987	55.43	1,266.7	4.38%	8.95%
1988	11.08	1,497.7	0.74%	9.00%
1989	24.40	1,541.3	1.58%	7.97%
1990	26.65	1,637.3	1.63%	8.24%
1991	119.6	1,895.0	6.31%	7.40%

As you can see, our cost of funds in 1991 was well below the U. S. Government's cost on newly-issued long-term bonds. We have in fact beat the government's rate in 20 of the 25 years we have been in the insurance business, often by a wide margin. We have over that time also substantially increased the amount of funds we hold, which counts as a favorable development but only because the cost of funds has been satisfactory. Our float should continue to grow; the challenge will be to garner these funds at a reasonable cost.

Berkshire continues to be a very large writer - perhaps the largest in the world - of "super-cat" insurance, which is coverage that other insurance companies buy to protect themselves against major catastrophic losses. Profits in this business are enormously volatile. As I mentioned last year, \$100 million in super-cat premiums, which is roughly our annual expectation, could deliver us anything from a \$100 million profit (in a year with no big catastrophe) to a \$200 million loss (in a year in which a couple of major hurricanes and/or earthquakes come along).

We price this business expecting to pay out, over the long term, about 90% of the premiums we receive. In any given year, however, we are likely to appear either enormously profitable or

enormously unprofitable. That is true in part because GAAP accounting does not allow us to set up reserves in the catastrophe-free years for losses that are certain to be experienced in other years. In effect, a one-year accounting cycle is ill-suited to the nature of this business - and that is a reality you should be aware of when you assess our annual results.

Last year there appears to have been, by our definition, one super-cat, but it will trigger payments from only about 25% of our policies. Therefore, we currently estimate the 1991 underwriting profit from our catastrophe business to have been about \$11 million. (You may be surprised to learn the identity of the biggest catastrophe in 1991: It was neither the Oakland fire nor Hurricane Bob, but rather a September typhoon in Japan that caused the industry an insured loss now estimated at about \$4-\$5 billion. At the higher figure, the loss from the typhoon would surpass that from Hurricane Hugo, the previous record-holder.)

Insurers will always need huge amounts of reinsurance protection for marine and aviation disasters as well as for natural catastrophes. In the 1980's much of this reinsurance was supplied by "innocents" - that is, by insurers that did not understand the risks of the business - but they have now been financially burned beyond recognition. (Berkshire itself was an innocent all too often when I was personally running the insurance operation.) Insurers, though, like investors, eventually repeat their mistakes. At some point - probably after a few catastrophe-scarce years - innocents will reappear and prices for super-cat policies will plunge to silly levels.

As long as apparently-adequate rates prevail, however, we will be a major participant in super-cat coverages. In marketing this product, we enjoy a significant competitive advantage because of our premier financial strength. Thinking insurers know that when "the big one" comes, many reinsurers who found it easy to write policies will find it difficult to write checks. (Some reinsurers can say what Jackie Mason does: "I'm fixed for life - as long as I don't buy anything.") Berkshire's ability to fulfill all its commitments under conditions of even extreme adversity is unquestioned.

Overall, insurance offers Berkshire its greatest opportunities. Mike Goldberg has accomplished wonders with this operation since he took charge and it has become a very valuable asset, albeit one that can't be appraised with any precision.

Marketable Common Stocks

On the next page we list our common stock holdings having a value of over \$100 million. A small portion of these investments belongs to subsidiaries of which Berkshire owns less than 100%.

Shares	Company	Cost (000's omitted)	Market (000's omitted)
3,000,000	Capital Cities/ABC, Inc.	\$517,500	\$1,300,500
46,700,00	The Coca-Cola Company	1,023,920	3,747,675
2,495,200	Federal Home Loan Mortgage Corp	77,245	343,090
6,850,000	GEICO Corporation.	45,713	1,363,150
24,000,000	The Gillette Company	600,000	1,347,000
31,247,000	Guinness PLC	264,782	296,755
1,727,765	The Washington Post Company	9,731	336,050
5,000,000	Wells Fargo & Company	289,431	290,000

As usual the list reflects our Rip Van Winkle approach to investing. Guinness is a new position. But we held the other seven stocks a year ago (making allowance for the conversion of our Gillette position from preferred to common) and in six of those we hold an unchanged number of shares. The exception is Federal Home Loan Mortgage ("Freddie Mac"), in which our shareholdings increased slightly. Our stay-put behavior reflects our view that the stock market serves as a relocation center at which money is moved from the active to the patient. (With tongue only partly in check, I suggest that recent events indicate that the much-maligned "idle rich" have received a bad rap: They have maintained or increased their wealth while many of the "energetic rich" - aggressive real estate operators, corporate acquirers, oil drillers, etc. - have seen their fortunes disappear.)

Our Guinness holding represents Berkshire's first significant investment in a company domiciled outside the United States. Guinness, however, earns its money in much the same fashion as Coca-Cola and Gillette, U.S.-based companies that garner most of their profits from international operations. Indeed, in the sense of where they earn their profits - continent-by-continent - Coca-Cola and Guinness display strong similarities. (But you'll never get their drinks confused - and your Chairman remains unmovably in the Cherry Coke camp.)

We continually search for large businesses with understandable, enduring and mouth-watering economics that are run by able and shareholder-oriented managements. This focus doesn't guarantee results: We both have to buy at a sensible price and get business performance from our companies that validates our assessment. But this investment approach - searching for the superstars - offers us our only chance for real success. Charlie and I are simply not smart enough, considering the large sums we work with, to get great results by adroitly buying and selling portions of far-from-great businesses. Nor do we think many others can achieve long-term investment success by flitting from flower to flower. Indeed, we believe that according the name "investors" to institutions that trade actively is like calling someone who repeatedly engages in one-night stands a romantic.

If my universe of business possibilities was limited, say, to private companies in Omaha, I would, first, try to assess the long-term economic characteristics of each business; second, assess the quality of the people in charge of running it; and, third, try to buy into a few of the best operations at a sensible price. I certainly would not wish to own an equal part of every business in town. Why, then, should Berkshire take a different tack when dealing with the larger universe of public companies? And since finding great businesses and outstanding managers is so difficult, why should we discard proven products? (I was tempted to say "the real thing.") Our motto is: "If at first you do succeed, quit trying."

John Maynard Keynes, whose brilliance as a practicing investor matched his brilliance in thought, wrote a letter to a business associate, F. C. Scott, on August 15, 1934 that says it all: "As time goes on, I get more and more convinced that the right method in investment is to put fairly large sums into enterprises which one thinks one knows something about and in the management of which one thoroughly believes. It is a mistake to think that one limits one's risk by spreading too much between enterprises about which one knows little and has no reason for special confidence. . . . One's knowledge and experience are definitely limited and there are seldom more than two or three enterprises at any given time in which I personally feel myself entitled to put *full* confidence."

Mistake Du Jour

In the 1989 annual report I wrote about "Mistakes of the First 25 Years" and promised you an update in 2015. My experiences in the first few years of this second "semester" indicate that my backlog of matters to be discussed will become unmanageable if I stick to my original plan.

Therefore, I will occasionally unburden myself in these pages in the hope that public confession may deter further bumbings. (Post-mortems prove useful for hospitals and football teams; why not for businesses and investors?)

Typically, our most egregious mistakes fall in the omission, rather than the commission, category. That may spare Charlie and me some embarrassment, since you don't see these errors; but their invisibility does not reduce their cost. In this mea culpa, I am not talking about missing out on some company that depends upon an esoteric invention (such as Xerox), high-technology (Apple), or even brilliant merchandising (Wal-Mart). We will never develop the competence to spot such businesses early. Instead I refer to business situations that Charlie and I can understand and that seem clearly attractive - but in which we nevertheless end up sucking our thumbs rather than buying.

Every writer knows it helps to use striking examples, but I wish the one I now present wasn't quite so dramatic: In early 1988, we decided to buy 30 million shares (adjusted for a subsequent split) of Federal National Mortgage Association (Fannie Mae), which would have been a \$350-\$400 million investment. We had owned the stock some years earlier and understood the company's business. Furthermore, it was clear to us that David Maxwell, Fannie Mae's CEO, had dealt superbly with some problems that he had inherited and had established the company as a financial powerhouse - with the best yet to come. I visited David in Washington and confirmed that he would not be uncomfortable if we were to take a large position.

After we bought about 7 million shares, the price began to climb. In frustration, I stopped buying (a mistake that, thankfully, I did not repeat when Coca-Cola stock rose similarly during our purchase program). In an even sillier move, I surrendered to my distaste for holding small positions and sold the 7 million shares we owned.

I wish I could give you a halfway rational explanation for my amateurish behavior vis-a-vis Fannie Mae. But there isn't one. What I *can* give you is an estimate as of yearend 1991 of the approximate gain that Berkshire *didn't* make because of your Chairman's mistake: about \$1.4 billion.

Fixed-Income Securities

We made several significant changes in our fixed-income portfolio during 1991. As I noted earlier, our Gillette preferred was called for redemption, which forced us to convert to common

stock; we eliminated our holdings of an RJR Nabisco issue that was subject to an exchange offer and subsequent call; and we purchased fixed-income securities of American Express and First Empire State Corp., a Buffalo-based bank holding company. We also added to a small position in ACF Industries that we had established in late 1990. Our largest holdings at yearend were:

Issuer (000's omitted)	Cost of Preferreds and Amortized Value of Bonds	Market
ACF Industries	\$ 93,918(2)	\$118,683
American Express	300,000	263,265(1)(2)
Champion International	300,000(2)	300,000(1)
First Empire State	40,000	50,000(1)(2)
RJR Nabisco	222,148(2)	285,683
Salomon	700,000(2)	714,000(1)
USAir	358,000(2)	232,700(1)
Washington Public Power Systems	158,553(2)	203,071

(1) Fair value as determined by Charlie and me

(2) Carrying value in our financial statements

Our \$40 million of First Empire State preferred carries a 9% coupon, is non-callable until 1996 and is convertible at \$78.91 per share. Normally I would think a purchase of this size too small for Berkshire, but I have enormous respect for Bob Wilmers, CEO of First Empire, and like being his partner on any scale.

Our American Express preferred is not a normal fixed-income security. Rather it is a "Perc," which carries a fixed dividend of 8.85% on our \$300 million cost. Absent one exception mentioned later, our preferred must be converted three years after issuance, into a maximum of 12,244,898 shares. If necessary, a downward adjustment in the conversion ratio will be made in order to limit to \$414 million the total value of the common we receive. Though there is thus a ceiling on the value of the common stock that we will receive upon conversion, there is no floor. The terms of the preferred, however, include a provision allowing us to extend the conversion date by one year if the common stock is below \$24.50 on the third anniversary of our purchase.

Overall, our fixed-income investments have treated us well, both over the long term and recently. We have realized large capital gains from these holdings, including about \$152 million in 1991. Additionally, our after-tax yields have considerably exceeded those earned by most fixed-income portfolios.

Nevertheless, we have had some surprises, none greater than the need for me to involve myself personally and intensely in the Salomon situation. As I write this letter, I am also writing a letter for inclusion in Salomon's annual report and I refer you to that report for an update on the company. (Write to: Corporate Secretary, Salomon Inc, Seven World Trade Center, New York, NY 10048) Despite the company's travails, Charlie and I believe our Salomon preferred stock increased slightly in value during 1991. Lower interest rates and a higher price for Salomon's common produced this result.

Last year I told you that our USAir investment "should work out all right unless the industry is decimated during the next few years." Unfortunately 1991 was a decimating period for the industry, as Midway, Pan Am and America West all entered bankruptcy. (Stretch the period to 14 months and you can add Continental and TWA.)

The low valuation that we have given USAir in our table reflects the risk that the industry will remain unprofitable for virtually all participants in it, a risk that is far from negligible. The risk is heightened by the fact that the courts have been encouraging bankrupt carriers to continue operating. These carriers can temporarily charge fares that are below the industry's costs because the bankrupts don't incur the capital costs faced by their solvent brethren and because they can fund their losses - and thereby stave off shutdown - by selling off assets. This burn-the-furniture-to-provide-firewood approach to fare-setting by bankrupt carriers contributes to the toppling of previously-marginal carriers, creating a domino effect that is perfectly designed to bring the industry to its knees.

Seth Schofield, who became CEO of USAir in 1991, is making major adjustments in the airline's operations in order to improve its chances of being one of the few industry survivors. There is no tougher job in corporate America than running an airline: Despite the huge amounts of equity capital that have been injected into it, the industry, in aggregate, has posted a net loss since its birth after Kitty Hawk. Airline managers need brains, guts, and experience - and Seth possesses all three of these attributes.

Miscellaneous

About 97.7% of all eligible shares participated in Berkshire's 1991 shareholder-designated contributions program. Contributions made through the program were \$6.8 million, and 2,630 charities were recipients.

We suggest that new shareholders read the description of our shareholder-designated contributions program that appears on pages 48-49. To participate in future programs, you must make sure your shares are registered in the name of the actual owner, not in the nominee name of a broker, bank or depository. Shares not so registered on August 31, 1992 will be ineligible for the 1992 program.

In addition to the shareholder-designated contributions that Berkshire distributes, managers of our operating businesses make contributions, including merchandise, averaging about \$1.5 million annually. These contributions support local charities, such as The United Way, and produce roughly commensurate benefits for our businesses.

However, neither our operating managers nor officers of the parent company use Berkshire funds to make contributions to broad national programs or charitable activities of special personal interest to them, except to the extent they do so as shareholders. If your employees, including your CEO, wish to give to their alma maters or other institutions to which they feel a personal attachment, we believe they should use their own money, not yours.

* * * * *

The faithful will notice that, for the first time in some years, Charlie's annual letter to Wesco shareholders is not reprinted in this report. Since his letter is relatively barebones this year, Charlie said he saw no point in including it in these pages; my own recommendation, however, is that you get a copy of the Wesco report. Simply write: Corporate Secretary, Wesco Financial Corporation, 315 East Colorado Boulevard, Pasadena, CA 91101.

* * * * *

Malcolm G. Chace, Jr., now 88, has decided not to stand for election as a director this year. But the association of the Chace family with Berkshire will not end: Malcolm III (Kim), Malcolm's

son, will be nominated to replace him.

In 1931, Malcolm went to work for Berkshire Fine Spinning Associates, which merged with Hathaway Manufacturing Co. in 1955 to form our present company. Two years later, Malcolm became Berkshire Hathaway's Chairman, a position he held as well in early 1965 when he made it possible for Buffett Partnership, Ltd. to buy a key block of Berkshire stock owned by some of his relatives. This purchase gave our partnership effective control of the company. Malcolm's immediate family meanwhile kept its Berkshire stock and for the last 27 years has had the second-largest holding in the company, trailing only the Buffett family. Malcolm has been a joy to work with and we are delighted that the long-running relationship between the Chace family and Berkshire is continuing to a new generation.

* * * * *

The annual meeting this year will be held at the Orpheum Theater in downtown Omaha at 9:30 a.m. on Monday, April 27, 1992. Attendance last year grew to a record 1,550, but that still leaves plenty of room at the Orpheum.

We recommend that you get your hotel reservations early at one of these hotels: (1) The Radisson-Redick Tower, a small (88 rooms) but nice hotel across the street from the Orpheum; (2) the much larger Red Lion Hotel, located about a five-minute walk from the Orpheum; or (3) the Marriott, located in West Omaha about 100 yards from Borsheim's and a twenty minute drive from downtown. We will have buses at the Marriott that will leave at 8:30 and 8:45 for the meeting and return after it ends.

Charlie and I always enjoy the meeting, and we hope you can make it. The quality of our shareholders is reflected in the quality of the questions we get: We have never attended an annual meeting anywhere that features such a consistently high level of intelligent, owner-related questions.

An attachment to our proxy material explains how you can obtain the card you will need for admission to the meeting. With the admission card, we will enclose information about parking facilities located near the Orpheum. If you are driving, come a little early. Nearby lots fill up quickly and you may have to walk a few blocks.

As usual, we will have buses to take you to Nebraska Furniture Mart and Borsheim's after the meeting and to take you from there to downtown hotels or the airport later. I hope that you will allow plenty of time to fully explore the attractions of both stores. Those of you arriving early can visit the Furniture Mart any day of the week; it is open from 10 a.m. to 5:30 p.m. on Saturdays and from noon to 5:30 p.m. on Sundays. While there, stop at the See's Candy Cart and find out for yourself why Americans ate 26 million pounds of See's products last year.

Borsheim's normally is closed on Sunday, but we will be open for shareholders and their guests from noon to 6 p.m. on Sunday, April 26. Borsheim's will also have a special party the previous evening at which shareholders are welcome. (You must, however, write Mrs. Gladys Kaiser at our office for an invitation.) On display that evening will be a 150-year retrospective of the most exceptional timepieces made by Patek Philippe, including watches once owned by Queen Victoria, Pope Pius IX, Rudyard Kipling, Madame Curie and Albert Einstein. The centerpiece of the exhibition will be a \$5 million watch whose design and manufacture required nine years of labor by Patek Philippe craftsmen. Along with the rest of the collection, this watch will be on display at the store on Sunday - unless Charlie has by then impulsively bought it.

Nicholas Kenner nailed me - again - at last year's meeting, pointing out that I had said in the 1990 annual report that he was 11 in May 1990, when actually he was 9. So, asked Nicholas rather caustically: "If you can't get that straight, how do I know the numbers in the back [the financials] are correct?" I'm still searching for a snappy response. Nicholas will be at this year's meeting - he spurned my offer of a trip to Disney World on that day - so join us to watch a continuation of this lop-sided battle of wits.

Warren E. Buffett

Chairman of the Board

1992 Letter

BERKSHIRE HATHAWAY INC.

To the Shareholders of Berkshire Hathaway Inc.:

Our per-share book value increased 20.3% during 1992. Over the last 28 years (that is, since present management took over) book value has grown from \$19 to \$7,745, or at a rate of 23.6% compounded annually.

During the year, Berkshire's net worth increased by \$1.52 billion. More than 98% of this gain came from earnings and appreciation of portfolio securities, with the remainder coming from the issuance of new stock. These shares were issued as a result of our calling our convertible debentures for redemption on January 4, 1993, and of some holders electing to receive common shares rather than the cash that was their alternative. Most holders of the debentures who converted into common waited until January to do it, but a few made the move in December and therefore received shares in 1992. To sum up what happened to the \$476 million of bonds we had outstanding: \$25 million were converted into shares before yearend; \$46 million were converted in January; and \$405 million were redeemed for cash. The conversions were made at \$11,719 per share, so altogether we issued 6,106 shares.

Berkshire now has 1,152,547 shares outstanding. That compares, you will be interested to know, to 1,137,778 shares outstanding on October 1, 1964, the beginning of the fiscal year during which Buffett Partnership, Ltd. acquired control of the company.

We have a firm policy about issuing shares of Berkshire, doing so only when we receive as much value as we give. Equal value, however, has not been easy to obtain, since we have always valued our shares highly. So be it: We wish to increase Berkshire's size only when doing that also increases the wealth of its owners.

Those two objectives do not necessarily go hand-in-hand as an amusing but value-destroying experience in our past illustrates. On that occasion, we had a significant investment in a bank whose management was hell-bent on expansion. (Aren't they all?) When our bank wooed a

smaller bank, its owner demanded a stock swap on a basis that valued the acquiree's net worth and earning power at over twice that of the acquirer's. Our management - visibly in heat - quickly capitulated. The owner of the acquiree then insisted on one other condition: "You must promise me," he said in effect, "that once our merger is done and I have become a major shareholder, you'll never again make a deal this dumb."

You will remember that our goal is to increase our per-share intrinsic value - for which our book value is a conservative, but useful, proxy - at a 15% annual rate. This objective, however, cannot be attained in a smooth manner. Smoothness is particularly elusive because of the accounting rules that apply to the common stocks owned by our insurance companies, whose portfolios represent a high proportion of Berkshire's net worth. Since 1979, generally accepted accounting principles (GAAP) have required that these securities be valued at their market prices (less an adjustment for tax on any net unrealized appreciation) rather than at the lower of cost or market. Run-of-the-mill fluctuations in equity prices therefore cause our annual results to gyrate, especially in comparison to those of the typical industrial company.

To illustrate just how volatile our progress has been - and to indicate the impact that market movements have on short-term results - we show on the facing page our annual change in per-share net worth and compare it with the annual results (including dividends) of the S&P 500.

You should keep at least three points in mind as you evaluate this data. The first point concerns the many businesses we operate whose annual earnings are unaffected by changes in stock market valuations. The impact of these businesses on both our absolute and relative performance has changed over the years. Early on, returns from our textile operation, which then represented a significant portion of our net worth, were a major drag on performance, averaging far less than would have been the case if the money invested in that business had instead been invested in the S&P 500. In more recent years, as we assembled our collection of exceptional businesses run by equally exceptional managers, the returns from our operating businesses have been high - usually well in excess of the returns achieved by the S&P.

A second important factor to consider - and one that significantly hurts our relative performance - is that both the income and capital gains from our securities are burdened by a substantial corporate tax liability whereas the S&P returns are pre-tax. To comprehend the damage, imagine that Berkshire had owned nothing other than the S&P index during the 28-year period covered. In that case, the tax bite would have caused our corporate performance to be

appreciably below the record shown in the table for the S&P. Under present tax laws, a gain for the S&P of 18% delivers a corporate holder of that index a return well short of 13%. And this problem would be intensified if corporate tax rates were to rise. This is a structural disadvantage we simply have to live with; there is no antidote for it.

The third point incorporates two predictions: Charlie Munger, Berkshire's Vice Chairman and my partner, and I are virtually certain that the return over the next decade from an investment in the S&P index will be far less than that of the past decade, and we are dead certain that the drag exerted by Berkshire's expanding capital base will substantially reduce our historical advantage relative to the index.

Making the first prediction goes somewhat against our grain: We've long felt that the only value of stock forecasters is to make fortune tellers look good. Even now, Charlie and I continue to believe that short-term market forecasts are poison and should be kept locked up in a safe place, away from children and also from grown-ups who behave in the market like children. However, it is clear that stocks cannot forever overperform their underlying businesses, as they have so dramatically done for some time, and that fact makes us quite confident of our forecast that the rewards from investing in stocks over the next decade will be significantly smaller than they were in the last. Our second conclusion - that an increased capital base will act as an anchor on our relative performance - seems incontestable. The only open question is whether we can drag the anchor along at some tolerable, though slowed, pace.

We will continue to experience considerable volatility in our annual results. That's assured by the general volatility of the stock market, by the concentration of our equity holdings in just a few companies, and by certain business decisions we have made, most especially our move to commit large resources to super-catastrophe insurance. We not only accept this volatility but welcome it: A tolerance for short-term swings improves our long-term prospects. In baseball lingo, our performance yardstick is slugging percentage, not batting average.

The Salomon Interlude

Last June, I stepped down as Interim Chairman of Salomon Inc after ten months in the job. You can tell from Berkshire's 1991-92 results that the company didn't miss me while I was gone. But the reverse isn't true: I missed Berkshire and am delighted to be back full-time. There is no job in the world that is more fun than running Berkshire and I count myself lucky to be where I am.

The Salomon post, though far from fun, was interesting and worthwhile: In Fortune's annual survey of America's Most Admired Corporations, conducted last September, Salomon ranked second among 311 companies in the degree to which it improved its reputation. Additionally, Salomon Brothers, the securities subsidiary of Salomon Inc, reported record pre-tax earnings last year - 34% above the previous high.

Many people helped in the resolution of Salomon's problems and the righting of the firm, but a few clearly deserve special mention. It is no exaggeration to say that without the combined efforts of Salomon executives Deryck Maughan, Bob Denham, Don Howard, and John Macfarlane, the firm very probably would not have survived. In their work, these men were tireless, effective, supportive and selfless, and I will forever be grateful to them.

Salomon's lead lawyer in its Government matters, Ron Olson of Munger, Tolles & Olson, was also key to our success in getting through this trouble. The firm's problems were not only severe, but complex. At least five authorities - the SEC, the Federal Reserve Bank of New York, the U.S. Treasury, the U.S. Attorney for the Southern District of New York, and the Antitrust Division of the Department of Justice - had important concerns about Salomon. If we were to resolve our problems in a coordinated and prompt manner, we needed a lawyer with exceptional legal, business and human skills. Ron had them all.

Acquisitions

Of all our activities at Berkshire, the most exhilarating for Charlie and me is the acquisition of a business with excellent economic characteristics and a management that we like, trust and admire. Such acquisitions are not easy to make but we look for them constantly. In the search, we adopt the same attitude one might find appropriate in looking for a spouse: It pays to be active, interested and open-minded, but it does not pay to be in a hurry.

In the past, I've observed that many acquisition-hungry managers were apparently mesmerized by their childhood reading of the story about the frog-kissing princess. Remembering her success, they pay dearly for the right to kiss corporate toads, expecting wondrous transfigurations. Initially, disappointing results only deepen their desire to round up new toads. ("Fanaticism," said Santyana, "consists of redoubling your effort when you've forgotten your aim.") Ultimately, even the most optimistic manager must face reality. Standing knee-deep in unresponsive toads, he then announces an enormous "restructuring" charge. In this

corporate equivalent of a Head Start program, the CEO receives the education but the stockholders pay the tuition.

In my early days as a manager I, too, dated a few toads. They were cheap dates - I've never been much of a sport - but my results matched those of acquirers who courted higher-priced toads. I kissed and they croaked.

After several failures of this type, I finally remembered some useful advice I once got from a golf pro (who, like all pros who have had anything to do with my game, wishes to remain anonymous). Said the pro: "Practice doesn't make perfect; practice makes permanent." And thereafter I revised my strategy and tried to buy good businesses at fair prices rather than fair businesses at good prices.

Last year, in December, we made an acquisition that is a prototype of what we now look for. The purchase was 82% of Central States Indemnity, an insurer that makes monthly payments for credit-card holders who are unable themselves to pay because they have become disabled or unemployed. Currently the company's annual premiums are about \$90 million and profits about \$10 million. Central States is based in Omaha and managed by Bill Kizer, a friend of mine for over 35 years. The Kizer family - which includes sons Bill, Dick and John - retains 18% ownership of the business and will continue to run things just as it has in the past. We could not be associated with better people.

Coincidentally, this latest acquisition has much in common with our first, made 26 years ago. At that time, we purchased another Omaha insurer, National Indemnity Company (along with a small sister company) from Jack Ringwalt, another long-time friend. Jack had built the business from scratch and, as was the case with Bill Kizer, thought of me when he wished to sell. (Jack's comment at the time: "If I don't sell the company, my executor will, and I'd rather pick the home for it.") National Indemnity was an outstanding business when we bought it and continued to be under Jack's management. Hollywood has had good luck with sequels; I believe we, too, will.

Berkshire's acquisition criteria are described on page 23. Beyond purchases made by the parent company, however, our subsidiaries sometimes make small "add-on" acquisitions that extend their product lines or distribution capabilities. In this manner, we enlarge the domain of managers we already know to be outstanding - and that's a low-risk and high-return proposition. We made five acquisitions of this type in 1992, and one was not so small: At yearend, H. H. Brown purchased Lowell Shoe Company, a business with \$90 million in sales that makes

Nursemates, a leading line of shoes for nurses, and other kinds of shoes as well. Our operating managers will continue to look for add-on opportunities, and we would expect these to contribute modestly to Berkshire's value in the future.

Then again, a trend has emerged that may make further acquisitions difficult. The parent company made one purchase in 1991, buying H. H. Brown, which is run by Frank Rooney, who has eight children. In 1992 our only deal was with Bill Kizer, father of nine. It won't be easy to keep this string going in 1993.

Sources of Reported Earnings

The table below shows the major sources of Berkshire's reported earnings. In this presentation, amortization of Goodwill and other major purchase-price accounting adjustments are not charged against the specific businesses to which they apply, but are instead aggregated and shown separately. This procedure lets you view the earnings of our businesses as they would have been reported had we not purchased them. I've explained in past reports why this form of presentation seems to us to be more useful to investors and managers than one utilizing GAAP, which requires purchase-price adjustments to be made on a business-by-business basis. The total net earnings we show in the table are, of course, identical to the GAAP total in our audited financial statements.

Operating Earnings (000s omitted)	Pre-Tax 1992	Earnings 1991	Berkshire 1992	Share 1991
Insurance Group:				
Underwriting	\$(108,961)	\$(119,593)	\$(71,141)	\$(77,229)
Net investment income	355,067	331,846	305,763	285,173
H. H. Brown (acquired 7/1/91)	27,883	13,616	17,340	8,611

Other Purchase Price Accounting charges	(7,385)	(6,021)	(8,383)	(7,019)
Interest Expense*	(98,643)	(89,250)	(62,899)	(57,165)
Shareholder-Designated Contributions	(7,634)	(6,772)	(4,913)	(4,388)
Other	72,223	77,399	36,267	47,896
Operating Earnings	460,680	400,508	347,726	315,753
Sales of Securities	89,937	192,478	59,559	124,155
Total Earnings- All entities	\$550,617	\$592,986	\$407,285	\$439,908

**Excludes interest expense of Scott Fetzer Financial Group and Mutual Savings & Loan. Includes \$22.5 million in 1992 and \$5.7 million in 1991 of premiums paid on the early redemption of debt.*

A large amount of additional information about these businesses is given on pages 37-47, where you will also find our segment earnings reported on a GAAP basis. Our goal is to give you

all of the financial information that Charlie and I consider significant in making our own evaluation of Berkshire.

"Look-Through" Earnings

We've previously discussed look-through earnings, which consist of: (1) the operating earnings reported in the previous section, plus; (2) the retained operating earnings of major investees that, under GAAP accounting, are not reflected in our profits, less; (3) an allowance for the tax that would be paid by Berkshire if these retained earnings of investees had instead been distributed to us. Though no single figure can be perfect, we believe that the look-through number more accurately portrays the earnings of Berkshire than does the GAAP number.

I've told you that over time look-through earnings must increase at about 15% annually if our intrinsic business value is to grow at that rate. Our look-through earnings in 1992 were \$604 million, and they will need to grow to more than \$1.8 billion by the year 2000 if we are to meet that 15% goal. For us to get there, our operating subsidiaries and investees must deliver excellent performances, and we must exercise some skill in capital allocation as well.

We cannot promise to achieve the \$1.8 billion target. Indeed, we may not even come close to it. But it does guide our decision-making: When we allocate capital today, we are thinking about what will maximize look-through earnings in 2000.

We do not, however, see this long-term focus as eliminating the need for us to achieve decent short-term results as well. After all, we were thinking long-range thoughts five or ten years ago, and the moves we made then should now be paying off. If plantings made confidently are repeatedly followed by disappointing harvests, something is wrong with the farmer. (Or perhaps with the farm: Investors should understand that for certain companies, and even for some industries, there simply is *no* good long-term strategy.) Just as you should be suspicious of managers who pump up short-term earnings by accounting maneuvers, asset sales and the like, so also should you be suspicious of those managers who fail to deliver for extended periods and blame it on their long-term focus. (Even Alice, after listening to the Queen lecture her about "jam tomorrow," finally insisted, "It must come sometimes to jam today.")

The following table shows you how we calculate look-through earnings, though I warn you that the figures are necessarily *very* rough. (The dividends paid to us by these investees have been included in the operating earnings itemized on page 8, mostly under "Insurance Group: Net Investment Income.")

Berkshire's Major Investees	Berkshire's	Approximate at	Berkshire's	Share of
	Ownership	Yearend	Undistributed	Operating Earnings
	1992	1991	1992	1991
Capitla Cities / ABC Inc.	18.2%	18.1%	\$70	\$61
The Coca-Cola Company	7.1%	7.0%	82	69
Federal Home Loan Mortgage Corp.	8.2% (1)	3.4% (1)	29 (2)	15

The Washington Post Company	14.6%	14.6%	11	10
Wells Fargo & Company	11.5%	9.6%	16 (2)	(17)
Berkshire's share of undistributed earnings of major investees			\$298	\$230
Hypothetical tax on these undistributed investee earnings			(42)	(30)
Reported operating earnings of Berkshire			348	316
Total look-through earnings of Bekrshire			\$604	\$516

(1) Net of minority interest at Wesco

(2) Calculated on average ownership for the year

(3) Excludes realized capital gains, which have been both recurring and significant

Insurance Operations

Shown below is an updated version of our usual table presenting key figures for the property-casualty insurance industry:

Year	Yearly Change in Premiums Written (%)	Combined Ratio after Policyholder Dividends
1981	3.8	106.0
1982	4.4	109.8
1983	4.6	112.0
1984	9.2	117.9
1985	22.1	116.5
1986	22.2	108.0
1987	9.4	104.6
1988	4.4	105.4
1989	3.2	109.2
1990	4.5	109.6
1991 (Revised)	2.4	108.8
1992 (Est.)	2.7	114.8

The combined ratio represents total insurance costs (losses incurred plus expenses) compared to revenue from premiums: A ratio below 100 indicates an underwriting profit, and one above 100 indicates a loss. The higher the ratio, the worse the year. When the investment income that an insurer earns from holding policyholders' funds ("the float") is taken into account, a combined ratio in the 106 - 110 range typically produces an overall break-even result, exclusive of earnings on the funds provided by shareholders.

About four points in the industry's 1992 combined ratio can be attributed to Hurricane Andrew, which caused the largest insured loss in history. Andrew destroyed a few small insurers. Beyond that, it awakened some larger companies to the fact that their reinsurance protection against catastrophes was far from adequate. (It's only when the tide goes out that you learn who's been swimming naked.) One major insurer escaped insolvency solely because it had a wealthy parent that could promptly supply a massive transfusion of capital.

Bad as it was, however, Andrew could easily have been far more damaging if it had hit Florida 20 or 30 miles north of where it actually did and had hit Louisiana further east than was

the case. All in all, many companies will rethink their reinsurance programs in light of the Andrew experience.

As you know we are a large writer - perhaps the largest in the world - of "super-cat" coverages, which are the policies that other insurance companies buy to protect themselves against major catastrophic losses. Consequently, we too took our lumps from Andrew, suffering losses from it of about \$125 million, an amount roughly equal to our 1992 super-cat premium income. Our other super-cat losses, though, were negligible. This line of business therefore produced an overall loss of only \$2 million for the year. (In addition, our investee, GEICO, suffered a net loss from Andrew, after reinsurance recoveries and tax savings, of about \$50 million, of which our share is roughly \$25 million. This loss did not affect our operating earnings, but did reduce our look-through earnings.)

In last year's report I told you that I hoped that our super-cat business would over time achieve a 10% profit margin. But I also warned you that in any given year the line was likely to be "either enormously profitable or enormously unprofitable." Instead, both 1991 and 1992 have come in close to a break-even level. Nonetheless, I see these results as aberrations and stick with my prediction of huge annual swings in profitability from this business.

Let me remind you of some characteristics of our super-cat policies. Generally, they are activated only when two things happen. First, the direct insurer or reinsurer we protect must suffer losses of a given amount - that's the policyholder's "retention" - from a catastrophe; and second, industry-wide insured losses from the catastrophe must exceed some minimum level, which usually is \$3 billion or more. In most cases, the policies we issue cover only a specific geographical area, such as a portion of the U.S., the entire U.S., or everywhere other than the U.S. Also, many policies are not activated by the first super-cat that meets the policy terms, but instead cover only a "second-event" or even a third- or fourth-event. Finally, some policies are triggered only by a catastrophe of a specific type, such as an earthquake. Our exposures are large: We have one policy that calls for us to pay \$100 million to the policyholder if a specified catastrophe occurs. (Now you know why I suffer eyestrain: from watching The Weather Channel.)

Currently, Berkshire is second in the U.S. property-casualty industry in net worth (the leader being State Farm, which neither buys nor sells reinsurance). Therefore, we have the capacity to

assume risk on a scale that interests virtually no other company. We have the appetite as well: As Berkshire's net worth and earnings grow, our willingness to write business increases also. But let me add that means good business. The saying, "a fool and his money are soon invited everywhere," applies in spades in reinsurance, and we actually reject more than 98% of the business we are offered. Our ability to choose between good and bad proposals reflects a management strength that matches our financial strength: Ajit Jain, who runs our reinsurance operation, is simply the best in this business. In combination, these strengths guarantee that we will stay a major factor in the super-cat business so long as prices are appropriate.

What constitutes an appropriate price, of course, is difficult to determine. Catastrophe insurers can't simply extrapolate past experience. If there is truly "global warming," for example, the odds would shift, since tiny changes in atmospheric conditions can produce momentous changes in weather patterns. Furthermore, in recent years there has been a mushrooming of population and insured values in U.S. coastal areas that are particularly vulnerable to hurricanes, the number one creator of super-cats. A hurricane that caused x dollars of damage 20 years ago could easily cost $10x$ now.

Occasionally, also, the unthinkable happens. Who would have guessed, for example, that a major earthquake could occur in Charleston, S.C.? (It struck in 1886, registered an estimated 6.6 on the Richter scale, and caused 60 deaths.) And who could have imagined that our country's most serious quake would occur at New Madrid, Missouri, which suffered an estimated 8.7 shocker in 1812. By comparison, the 1989 San Francisco quake was a 7.1 - and remember that each one-point Richter increase represents a ten-fold increase in strength. Someday, a U.S. earthquake occurring far from California will cause enormous losses for insurers.

When viewing our quarterly figures, you should understand that our accounting for super-cat premiums differs from our accounting for other insurance premiums. Rather than recording our super-cat premiums on a pro-rata basis over the life of a given policy, we defer recognition of revenue until a loss occurs or until the policy expires. We take this conservative approach because the likelihood of super-cats causing us losses is particularly great toward the end of the year. It is then that weather tends to kick up: Of the ten largest insured losses in U.S. history, nine occurred in the last half of the year. In addition, policies that are not triggered by a first event are unlikely, by their very terms, to cause us losses until late in the year.

The bottom-line effect of our accounting procedure for super-cats is this: Large losses may be reported in any quarter of the year, but significant profits will only be reported in the fourth quarter.

* * * * *

As I've told you in each of the last few years, what counts in our insurance business is "the cost of funds developed from insurance," or in the vernacular, "the cost of float." Float - which we generate in exceptional amounts - is the total of loss reserves, loss adjustment expense reserves and unearned premium reserves minus agents' balances, prepaid acquisition costs and deferred charges applicable to assumed reinsurance. The cost of float is measured by our underwriting loss.

The table below shows our cost of float since we entered the business in 1967.

(in \$ Millions)	(1) Underwriting Loss	(2) Average Float	Approximate Cost of Funds	Yearend Yield on Long- Term Govt. Bonds
1967	Profit	\$17.3	< 0	5.50%
1968	Profit	19.9	< 0	5.90%
1969	Profit	23.4	< 0	6.79%
1970	\$0.37	32.4	1.14%	6.25%
1971	Profit	52.5	< 0	5.81%
1972	Profit	69.5	< 0	5.82%
1973	Profit	73.3	< 0	7.27%
1974	7.36	79.1	9.30%	8.13%
1975	11.35	87.6	12.96%	8.03%
1976	Profit	102.6	< 0	7.30%
1977	Profit	139.0	< 0	7.97%
1978	Profit	190.4	< 0	8.93%
1979	Profit	227.3	< 0	10.08%
1980	Profit	237.0	< 0	11.94%
1981	Profit	228.4	< 0	13.61%
1982	21.56	220.6	9.77%	10.64%
1983	33.87	231.3	14.64%	11.84%
1984	48.06	253.2	18.98%	11.58%
1985	44.23	390.2	11.34%	9.34%
1986	55.84	797.5	7.00%	7.60%
1987	55.43	1,266.7	4.38%	8.95%
1988	11.08	1,497.7	0.74%	9.00%
1989	24.40	1,541.3	1.58%	7.97%
1990	26.65	1,637.3	1.63%	8.24%
1991	119.6	1,895.0	6.31%	7.40%
1992	108.9	2,290.4	4.76%	7.39%

Last year, our insurance operation again generated funds at a cost below that incurred by the U.S. Government on its newly-issued long-term bonds. This means that in 21 years out of the 26 years we have been in the insurance business we have beaten the Government's rate, and often we have done so by a wide margin. (If, on average, we didn't beat the Government's rate, there would be no economic reason for us to be in the business.)

In 1992, as in previous years, National Indemnity's commercial auto and general liability business, led by Don Wurster, and our homestate operation, led by Rod Eldred, made excellent

contributions to our low cost of float. Indeed, both of these operations recorded an underwriting profit last year, thereby generating float at a less-than-zero cost. The bulk of our float, meanwhile, comes from large transactions developed by Ajit. His efforts are likely to produce a further growth in float during 1993.

Charlie and I continue to like the insurance business, which we expect to be our main source of earnings for decades to come. The industry is huge; in certain sectors we can compete worldwide; and Berkshire possesses an important competitive advantage. We will look for ways to expand our participation in the business, either indirectly as we have done through GEICO or directly as we did by acquiring Central States Indemnity.

Common Stock Investments

Below we list our common stock holdings having a value of over \$100 million. A small portion of these investments belongs to subsidiaries of which Berkshire owns less than 100%.

Shares	Company	Cost (000's omitted)	Market (000's omitted)
3,000,000	Capital Cities/ABC, Inc.	\$517,500	\$1,523,500
93,400,000	The Coca-Cola Company	1,023,920	3,911,125
16,196,700	Federal Home Loan Mortgage Corp. ("Freddie Mac")	414,257	783,515
34,250,000	GEICO Corporation.	45,713	2,226,250
4,350,000	General Dynamics Corp	312,438	450,769
24,000,000	The Gillette Company	600,000	1,365,000
38,335,000	Guinness PLC	333,019	299,581
1,727,765	The Washington Post Company	9,731	396,954
6,358,418	Wells Fargo & Company	380,983	485,624

Leaving aside splits, the number of shares we held in these companies changed during 1992 in only four cases: We added moderately to our holdings in Guinness and Wells Fargo, we more than doubled our position in Freddie Mac, and we established a new holding in General Dynamics. We like to buy.

Selling, however, is a different story. There, our pace of activity resembles that forced upon a traveler who found himself stuck in tiny Podunk's only hotel. With no T.V. in his room, he faced an evening of boredom. But his spirits soared when he spied a book on the night table entitled "Things to do in Podunk." Opening it, he found just a single sentence: "You're doing it."

We were lucky in our General Dynamics purchase. I had paid little attention to the company until last summer, when it announced it would repurchase about 30% of its shares by way of a Dutch tender. Seeing an arbitrage opportunity, I began buying the stock for Berkshire, expecting to tender our holdings for a small profit. We've made the same sort of commitment perhaps a half-dozen times in the last few years, reaping decent rates of return for the short periods our money has been tied up.

But then I began studying the company and the accomplishments of Bill Anders in the brief time he'd been CEO. And what I saw made my eyes pop: Bill had a clearly articulated and rational strategy; he had been focused and imbued with a sense of urgency in carrying it out; and the results were truly remarkable.

In short order, I dumped my arbitrage thoughts and decided that Berkshire should become a long-term investor with Bill. We were helped in gaining a large position by the fact that a tender greatly swells the volume of trading in a stock. In a one-month period, we were able to purchase 14% of the General Dynamics shares that remained outstanding after the tender was completed.

* * * * *

Our equity-investing strategy remains little changed from what it was fifteen years ago, when we said in the 1977 annual report: "We select our marketable equity securities in much the way we would evaluate a business for acquisition in its entirety. We want the business to be one (a) that we can understand; (b) with favorable long-term prospects; (c) operated by honest and competent people; and (d) available at a very attractive price." We have seen cause to make only one change in this creed: Because of both market conditions and our size, we now substitute "an attractive price" for "a very attractive price."

But how, you will ask, does one decide what's "attractive"? In answering this question, most analysts feel they must choose between two approaches customarily thought to be in opposition:

"value" and "growth." Indeed, many investment professionals see any mixing of the two terms as a form of intellectual cross-dressing.

We view that as fuzzy thinking (in which, it must be confessed, I myself engaged some years ago). In our opinion, the two approaches are joined at the hip: Growth is *always* a component in the calculation of value, constituting a variable whose importance can range from negligible to enormous and whose impact can be negative as well as positive.

In addition, we think the very term "value investing" is redundant. What is "investing" if it is not the act of seeking value at least sufficient to justify the amount paid? Consciously paying more for a stock than its calculated value - in the hope that it can soon be sold for a still-higher price - should be labeled speculation (which is neither illegal, immoral nor - in our view - financially fattening).

Whether appropriate or not, the term "value investing" is widely used. Typically, it connotes the purchase of stocks having attributes such as a low ratio of price to book value, a low price-earnings ratio, or a high dividend yield. Unfortunately, such characteristics, even if they appear in combination, are far from determinative as to whether an investor is indeed buying something for what it is worth and is therefore truly operating on the principle of obtaining value in his investments. Correspondingly, opposite characteristics - a high ratio of price to book value, a high price-earnings ratio, and a low dividend yield - are in no way inconsistent with a "value" purchase.

Similarly, business growth, per se, tells us little about value. It's true that growth often has a positive impact on value, sometimes one of spectacular proportions. But such an effect is far from certain. For example, investors have regularly poured money into the domestic airline business to finance profitless (or worse) growth. For these investors, it would have been far better if Orville had failed to get off the ground at Kitty Hawk: The more the industry has grown, the worse the disaster for owners.

Growth benefits investors only when the business in point can invest at incremental returns that are enticing - in other words, only when each dollar used to finance the growth creates over a dollar of long-term market value. In the case of a low-return business requiring incremental funds, growth hurts the investor.

In *The Theory of Investment Value*, written over 50 years ago, John Burr Williams set forth the equation for value, which we condense here: *The value of any stock, bond or business today*

is determined by the cash inflows and outflows - discounted at an appropriate interest rate - that can be expected to occur during the remaining life of the asset. Note that the formula is the same for stocks as for bonds. Even so, there is an important, and difficult to deal with, difference between the two: A bond has a coupon and maturity date that define future cash flows; but in the case of equities, the investment analyst must himself estimate the future "coupons." Furthermore, the quality of management affects the bond coupon only rarely - chiefly when management is so inept or dishonest that payment of interest is suspended. In contrast, the ability of management can dramatically affect the equity "coupons."

The investment shown by the discounted-flows-of-cash calculation to be the cheapest is the one that the investor should purchase - irrespective of whether the business grows or doesn't, displays volatility or smoothness in its earnings, or carries a high price or low in relation to its current earnings and book value. Moreover, though the value equation has usually shown equities to be cheaper than bonds, that result is not inevitable: When bonds are calculated to be the more attractive investment, they should be bought.

Leaving the question of price aside, the best business to own is one that over an extended period can employ large amounts of incremental capital at very high rates of return. The worst business to own is one that must, or *will*, do the opposite - that is, consistently employ ever-greater amounts of capital at very low rates of return. Unfortunately, the first type of business is very hard to find: Most high-return businesses need relatively little capital. Shareholders of such a business usually will benefit if it pays out most of its earnings in dividends or makes significant stock repurchases.

Though the mathematical calculations required to evaluate equities are not difficult, an analyst - even one who is experienced and intelligent - can easily go wrong in estimating future "coupons." At Berkshire, we attempt to deal with this problem in two ways. First, we try to stick to businesses we believe we understand. That means they must be relatively simple and stable in character. If a business is complex or subject to constant change, we're not smart enough to predict future cash flows. Incidentally, that shortcoming doesn't bother us. What counts for most people in investing is not how much they know, but rather how realistically they define what they don't know. An investor needs to do very few things right as long as he or she avoids big mistakes.

Second, and equally important, we insist on a margin of safety in our purchase price. If we calculate the value of a common stock to be only slightly higher than its price, we're not interested in buying. We believe this margin-of-safety principle, so strongly emphasized by Ben Graham, to be the cornerstone of investment success.

Fixed-Income Securities

Below we list our largest holdings of fixed-income securities:

Issuer (000's omitted)	Cost of Preferreds and Amortized Value of Bonds	Market
ACF Industries	\$133,065(1)	\$163,327
American Express "Percs"	300,000	309,000(1)(2)
Champion International Conv. Pfd.	300,000(1)	309,000(2)
First Empire State Conv. Pfd	40,000	68,000(1)(2)
Salomon Conv. Pfd	700,000(1)	756,000(2)
Salomon	700,000(2)	714,000(1)
USAir Conv. Pfd	358,000(1)	268,500(2)
Washington Public Power Systems Bonds	58,768(1)	81,002

(1) Carrying value in our financial statements

(2) Fair value as determined by Charlie and me

During 1992 we added to our holdings of ACF debentures, had some of our WPPSS bonds called, and sold our RJR Nabisco position.

Over the years, we've done well with fixed-income investments, having realized from them both large capital gains (including \$80 million in 1992) and exceptional current income. Chrysler Financial, Texaco, Time-Warner, WPPSS and RJR Nabisco were particularly good investments for us. Meanwhile, our fixed-income losses have been negligible: We've had thrills but so far no spills.

Despite the success we experienced with our Gillette preferred, which converted to common stock in 1991, and despite our reasonable results with other negotiated purchases of preferreds, our overall performance with such purchases has been inferior to that we have achieved with

purchases made in the secondary market. This is actually the result we expected. It corresponds with our belief that an intelligent investor in common stocks will do better in the secondary market than he will do buying new issues.

The reason has to do with the way prices are set in each instance. The secondary market, which is periodically ruled by mass folly, is constantly setting a "clearing" price. No matter how foolish that price may be, it's what counts for the holder of a stock or bond who needs or wishes to sell, of whom there are always going to be a few at any moment. In many instances, shares worth x in business value have sold in the market for $1/2x$ or less.

The new-issue market, on the other hand, is ruled by controlling stockholders and corporations, who can usually select the timing of offerings or, if the market looks unfavorable, can avoid an offering altogether. Understandably, these sellers are not going to offer any bargains, either by way of a public offering or in a negotiated transaction: It's rare you'll find x for $1/2x$ here. Indeed, in the case of common-stock offerings, selling shareholders are often motivated to unload *only* when they feel the market is overpaying. (These sellers, of course, would state that proposition somewhat differently, averring instead that they simply resist selling when the market is underpaying for their goods.)

To date, our negotiated purchases, as a group, have fulfilled but not exceeded the expectation we set forth in our 1989 Annual Report: "Our preferred stock investments should produce returns modestly above those achieved by most fixed-income portfolios." In truth, we would have done better if we could have put the money that went into our negotiated transactions into open-market purchases of the type we like. But both our size and the general strength of the markets made that difficult to do.

There was one other memorable line in the 1989 Annual Report: "We have no ability to forecast the economics of the investment banking business, the airline industry, or the paper industry." At the time some of you may have doubted this confession of ignorance. Now, however, even my mother acknowledges its truth.

In the case of our commitment to USAir, industry economics had soured before the ink dried on our check. As I've previously mentioned, it was I who happily jumped into the pool; no one pushed me. Yes, I knew the industry would be ruggedly competitive, but I did not expect its leaders to engage in prolonged kamikaze behavior. In the last two years, airline companies have

acted as if they are members of a competitive tontine, which they wish to bring to its conclusion as rapidly as possible.

Amidst this turmoil, Seth Schofield, CEO of USAir, has done a truly extraordinary job in repositioning the airline. He was particularly courageous in accepting a strike last fall that, had it been lengthy, might well have bankrupted the company. Capitulating to the striking union, however, would have been equally disastrous: The company was burdened with wage costs and work rules that were considerably more onerous than those encumbering its major competitors, and it was clear that over time any high-cost producer faced extinction. Happily for everyone, the strike was settled in a few days.

A competitively-beset business such as USAir requires far more managerial skill than does a business with fine economics. Unfortunately, though, the near-term reward for skill in the airline business is simply survival, not prosperity.

In early 1993, USAir took a major step toward assuring survival - and eventual prosperity - by accepting British Airways' offer to make a substantial, but minority, investment in the company. In connection with this transaction, Charlie and I were asked to join the USAir board. We agreed, though this makes five outside board memberships for me, which is more than I believe advisable for an active CEO. Even so, if an investee's management and directors believe it particularly important that Charlie and I join its board, we are glad to do so. We expect the managers of our investees to work hard to increase the value of the businesses they run, and there are times when large owners should do their bit as well.

Two New Accounting Rules and a Plea for One More

A new accounting rule having to do with deferred taxes becomes effective in 1993. It undoes a dichotomy in our books that I have described in previous annual reports and that relates to the accrued taxes carried against the unrealized appreciation in our investment portfolio. At yearend 1992, that appreciation amounted to \$7.6 billion. Against \$6.4 billion of that, we carried taxes at the current 34% rate. Against the remainder of \$1.2 billion, we carried an accrual of 28%, the tax rate in effect when that portion of the appreciation occurred. The new accounting rule says we must henceforth accrue all deferred tax at the current rate, which to us seems sensible.

The new marching orders mean that in the first quarter of 1993 we will apply a 34% rate to all of our unrealized appreciation, thereby increasing the tax liability and reducing net worth by \$70

million. The new rule also will cause us to make other minor changes in our calculation of deferred taxes.

Future changes in tax rates will be reflected immediately in the liability for deferred taxes and, correspondingly, in net worth. The impact could well be substantial. Nevertheless, what is important in the end is the tax rate at the time we sell securities, when unrealized appreciation becomes realized.

Another major accounting change, whose implementation is required by January 1, 1993, mandates that businesses recognize their present-value liability for post-retirement health benefits. Though GAAP has previously required recognition of pensions to be paid in the future, it has illogically ignored the costs that companies will then have to bear for health benefits. The new rule will force many companies to record a huge balance-sheet liability (and a consequent reduction in net worth) and also henceforth to recognize substantially higher costs when they are calculating annual profits.

In making acquisitions, Charlie and I have tended to avoid companies with significant post-retirement liabilities. As a result, Berkshire's present liability and future costs for post-retirement health benefits - though we now have 22,000 employees - are inconsequential. I need to admit, though, that we had a near miss: In 1982 I made a huge mistake in committing to buy a company burdened by extraordinary post-retirement health obligations. Luckily, though, the transaction fell through for reasons beyond our control. Reporting on this episode in the 1982 annual report, I said: "If we were to introduce graphics to this report, illustrating favorable business developments of the past year, two blank pages depicting this blown deal would be the appropriate centerfold." Even so, I wasn't expecting things to get as bad as they did. Another buyer appeared, the business soon went bankrupt and was shut down, and thousands of workers found those bountiful health-care promises to be largely worthless.

In recent decades, no CEO would have dreamed of going to his board with the proposition that his company become an insurer of uncapped post-retirement health benefits that other corporations chose to install. A CEO didn't need to be a medical expert to know that lengthening life expectancies and soaring health costs would guarantee an insurer a financial battering from such a business. Nevertheless, many a manager blithely committed his own company to a self-insurance plan embodying precisely the same promises - and thereby doomed his shareholders to suffer the inevitable consequences. In health-care, open-ended promises have created open-

ended liabilities that in a few cases loom so large as to threaten the global competitiveness of major American industries.

I believe part of the reason for this reckless behavior was that accounting rules did not, for so long, require the booking of post-retirement health costs as they were incurred. Instead, the rules allowed cash-basis accounting, which vastly understated the liabilities that were building up. In effect, the attitude of both managements and their accountants toward these liabilities was "out-of-sight, out-of-mind." Ironically, some of these same managers would be quick to criticize Congress for employing "cash-basis" thinking in respect to Social Security promises or other programs creating future liabilities of size.

Managers thinking about accounting issues should never forget one of Abraham Lincoln's favorite riddles: "How many legs does a dog have if you call his tail a leg?" The answer: "Four, because calling a tail a leg does not make it a leg." It behooves managers to remember that Abe's right even if an auditor is willing to certify that the tail is a leg.

* * * * *

The most egregious case of let's-not-face-up-to-reality behavior by executives and accountants has occurred in the world of stock options. In Berkshire's 1985 annual report, I laid out my opinions about the use and misuse of options. But even when options are structured properly, they are accounted for in ways that make no sense. The lack of logic is not accidental: For decades, much of the business world has waged war against accounting rulemakers, trying to keep the costs of stock options from being reflected in the profits of the corporations that issue them.

Typically, executives have argued that options are hard to value and that therefore their costs should be ignored. At other times managers have said that assigning a cost to options would injure small start-up businesses. Sometimes they have even solemnly declared that "out-of-the-money" options (those with an exercise price equal to or above the current market price) have no value when they are issued.

Oddly, the Council of Institutional Investors has chimed in with a variation on that theme, opining that options should not be viewed as a cost because they "aren't dollars out of a company's coffers." I see this line of reasoning as offering exciting possibilities to American

corporations for instantly improving their reported profits. For example, they could eliminate the cost of insurance by paying for it with options. So if you're a CEO and subscribe to this "no cash-no cost" theory of accounting, I'll make you an offer you can't refuse: Give us a call at Berkshire and we will happily sell you insurance in exchange for a bundle of long-term options on your company's stock.

Shareholders should understand that companies incur costs when they deliver something of value to another party and not just when cash changes hands. Moreover, it is both silly and cynical to say that an important item of cost should not be recognized simply because it can't be quantified with pinpoint precision. Right now, accounting abounds with imprecision. After all, no manager or auditor knows how long a 747 is going to last, which means he also does not know what the yearly depreciation charge for the plane should be. No one knows with any certainty what a bank's annual loan loss charge ought to be. And the estimates of losses that property-casualty companies make are notoriously inaccurate.

Does this mean that these important items of cost should be ignored simply because they can't be quantified with absolute accuracy? Of course not. Rather, these costs should be estimated by honest and experienced people and then recorded. When you get right down to it, what other item of major but hard-to-precisely-calculate cost - other, that is, than stock options - does the accounting profession say should be ignored in the calculation of earnings?

Moreover, options are just not that difficult to value. Admittedly, the difficulty is increased by the fact that the options given to executives are restricted in various ways. These restrictions affect value. They do not, however, eliminate it. In fact, since I'm in the mood for offers, I'll make one to any executive who is granted a restricted option, even though it may be out of the money: On the day of issue, Berkshire will pay him or her a substantial sum for the right to any future gain he or she realizes on the option. So if you find a CEO who says his newly-issued options have little or no value, tell him to try us out. In truth, we have far more confidence in our ability to determine an appropriate price to pay for an option than we have in our ability to determine the proper depreciation rate for our corporate jet.

It seems to me that the realities of stock options can be summarized quite simply: If options aren't a form of compensation, what are they? If compensation isn't an expense, what is it? And, if expenses shouldn't go into the calculation of earnings, where in the world should they go?

The accounting profession and the SEC should be shamed by the fact that they have long let themselves be muscled by business executives on the option-accounting issue. Additionally, the lobbying that executives engage in may have an unfortunate by-product: In my opinion, the business elite risks losing its credibility on issues of significance to society - about which it may have much of value to say - when it advocates the incredible on issues of significance to itself.

Miscellaneous

We have two pieces of regrettable news this year. First, Gladys Kaiser, my friend and assistant for twenty-five years, will give up the latter post after the 1993 annual meeting, though she will certainly remain my friend forever. Gladys and I have been a team, and though I knew her retirement was coming, it is still a jolt.

Secondly, in September, Verne McKenzie relinquished his role as Chief Financial Officer after a 30-year association with me that began when he was the outside auditor of Buffett Partnership, Ltd. Verne is staying on as a consultant, and though that job description is often a euphemism, in this case it has real meaning. I expect Verne to continue to fill an important role at Berkshire but to do so at his own pace. Marc Hamburg, Verne's understudy for five years, has succeeded him as Chief Financial Officer.

I recall that one woman, upon being asked to describe the perfect spouse, specified an archeologist: "The older I get," she said, "the more he'll be interested in me." She would have liked my tastes: I treasure those extraordinary Berkshire managers who are working well past normal retirement age and who concomitantly are achieving results much superior to those of their younger competitors. While I understand and empathize with the decision of Verne and Gladys to retire when the calendar says it's time, theirs is not a step I wish to encourage. It's hard to teach a new dog old tricks.

* * * * *

I am a moderate in my views about retirement compared to Rose Blumkin, better known as Mrs. B. At 99, she continues to work seven days a week. And about her, I have some particularly good news.

You will remember that after her family sold 80% of Nebraska Furniture Mart (NFM) to Berkshire in 1983, Mrs. B continued to be Chairman and run the carpet operation. In 1989,

however, she left because of a managerial disagreement and opened up her own operation next door in a large building that she had owned for several years. In her new business, she ran the carpet section but leased out other home-furnishings departments.

At the end of last year, Mrs. B decided to sell her building and land to NFM. She'll continue, however, to run her carpet business at its current location (no sense slowing down just when you're hitting full stride). NFM will set up shop alongside her, in that same building, thereby making a major addition to its furniture business.

I am delighted that Mrs. B has again linked up with us. Her business story has no parallel and I have always been a fan of hers, whether she was a partner or a competitor. But believe me, partner is better.

This time around, Mrs. B graciously offered to sign a non-compete agreement - and I, having been incautious on this point when she was 89, snapped at the deal. Mrs. B belongs in the Guinness Book of World Records on many counts. Signing a non-compete at 99 merely adds one more.

* * * * *

Ralph Schey, CEO of Scott Fetzer and a manager who I hope is with us at 99 also, hit a grand slam last year when that company earned a record \$110 million pre-tax. What's even more impressive is that Scott Fetzer achieved such earnings while employing only \$116 million of equity capital. This extraordinary result is not the product of leverage: The company uses only minor amounts of borrowed money (except for the debt it employs - appropriately - in its finance subsidiary).

Scott Fetzer now operates with a significantly smaller investment in both inventory and fixed assets than it had when we bought it in 1986. This means the company has been able to distribute more than 100% of its earnings to Berkshire during our seven years of ownership while concurrently increasing its earnings stream - which was excellent to begin with - by a lot. Ralph just keeps on outdoing himself, and Berkshire shareholders owe him a great deal.

* * * * *

Those readers with particularly sharp eyes will note that our corporate expense fell from \$5.6 million in 1991 to \$4.2 million in 1992. Perhaps you will think that I have sold our corporate jet, The Indefensible. Forget it! I find the thought of retiring the plane even more revolting than the thought of retiring the Chairman. (In this matter I've demonstrated uncharacteristic flexibility: For years I argued passionately against corporate jets. But finally my dogma was run over by my karma.)

Our reduction in corporate overhead actually came about because those expenses were especially high in 1991, when we incurred a one-time environmental charge relating to alleged pre-1970 actions of our textile operation. Now that things are back to normal, our after-tax overhead costs are under 1% of our reported operating earnings and less than 1/2 of 1% of our look-through earnings. We have no legal, personnel, public relations, investor relations, or strategic planning departments. In turn this means we don't need support personnel such as guards, drivers, messengers, etc. Finally, except for Verne, we employ no consultants. Professor Parkinson would like our operation - though Charlie, I must say, still finds it outrageously fat.

At some companies, corporate expense runs 10% or more of operating earnings. The tithing that operations thus makes to headquarters not only hurts earnings, but more importantly slashes capital values. If the business that spends 10% on headquarters' costs achieves earnings at its operating levels identical to those achieved by the business that incurs costs of only 1%, shareholders of the first enterprise suffer a 9% loss in the value of their holdings simply because of corporate overhead. Charlie and I have observed no correlation between high corporate costs and good corporate performance. In fact, we see the simpler, low-cost operation as more likely to operate effectively than its bureaucratic brethren. We're admirers of the Wal-Mart, Nucor, Dover, GEICO, Golden West Financial and Price Co. models.

* * * * *

Late last year Berkshire's stock price crossed \$10,000. Several shareholders have mentioned to me that the high price causes them problems: They like to give shares away each year and find themselves impeded by the tax rule that draws a distinction between annual gifts of \$10,000 or under to a single individual and those above \$10,000. That is, those gifts no greater than \$10,000 are completely tax-free; those above \$10,000 require the donor to use up a portion of his

or her lifetime exemption from gift and estate taxes, or, if that exemption has been exhausted, to pay gift taxes.

I can suggest three ways to address this problem. The first would be useful to a married shareholder, who can give up to \$20,000 annually to a single recipient, as long as the donor files a gift tax return containing his or her spouse's written consent to gifts made during the year.

Secondly, a shareholder, married or not, can make a bargain sale. Imagine, for example, that Berkshire is selling for \$12,000 and that one wishes to make only a \$10,000 gift. In that case, sell the stock to the giftee for \$2,000. (Caution: You will be taxed on the amount, if any, by which the sales price to your giftee exceeds your tax basis.)

Finally, you can establish a partnership with people to whom you are making gifts, fund it with Berkshire shares, and simply give percentage interests in the partnership away each year. These interests can be for any value that you select. If the value is \$10,000 or less, the gift will be tax-free.

We issue the customary warning: Consult with your own tax advisor before taking action on any of the more esoteric methods of gift-making.

We hold to the view about stock splits that we set forth in the 1983 Annual Report. Overall, we believe our owner-related policies - including the no-split policy - have helped us assemble a body of shareholders that is the best associated with any widely-held American corporation. Our shareholders think and behave like rational long-term owners and view the business much as Charlie and I do. Consequently, our stock consistently trades in a price range that is sensibly related to intrinsic value.

Additionally, we believe that our shares turn over far less actively than do the shares of any other widely-held company. The frictional costs of trading - which act as a major "tax" on the owners of many companies - are virtually non-existent at Berkshire. (The market-making skills of Jim Maguire, our New York Stock Exchange specialist, definitely help to keep these costs low.) Obviously a split would not change this situation dramatically. Nonetheless, there is no way that our shareholder group would be upgraded by the new shareholders enticed by a split. Instead we believe that modest degradation would occur.

* * * * *

As I mentioned earlier, on December 16th we called our zero-coupon, convertible debentures for payment on January 4, 1993. These obligations bore interest at 5 1/2%, a low cost for funds when they were issued in 1989, but an unattractive rate for us at the time of call.

The debentures could have been redeemed at the option of the holder in September 1994, and 5 1/2% money available for no longer than that is not now of interest to us. Furthermore, Berkshire shareholders are disadvantaged by having a conversion option outstanding. At the time we issued the debentures, this disadvantage was offset by the attractive interest rate they carried; by late 1992, it was not.

In general, we continue to have an aversion to debt, particularly the short-term kind. But we are willing to incur modest amounts of debt when it is both properly structured and of significant benefit to shareholders.

* * * * *

About 97% of all eligible shares participated in Berkshire's 1992 shareholder-designated contributions program. Contributions made through the program were \$7.6 million, and 2,810 charities were recipients. I'm considering increasing these contributions in the future at a rate greater than the increase in Berkshire's book value, and I would be glad to hear from you as to your thinking about this idea.

We suggest that new shareholders read the description of our shareholder-designated contributions program that appears on pages 48-49. To participate in future programs, you must make sure your shares are registered in the name of the actual owner, not in the nominee name of a broker, bank or depository. Shares not so registered on August 31, 1993 will be ineligible for the 1993 program.

In addition to the shareholder-designated contributions that Berkshire distributes, managers of our operating businesses make contributions, including merchandise, averaging about \$2.0 million annually. These contributions support local charities, such as The United Way, and produce roughly commensurate benefits for our businesses.

However, neither our operating managers nor officers of the parent company use Berkshire funds to make contributions to broad national programs or charitable activities of special personal interest to them, except to the extent they do so as shareholders. If your employees,

including your CEO, wish to give to their alma maters or other institutions to which they feel a personal attachment, we believe they should use their own money, not yours.

* * * * *

This year the Annual Meeting will be held at the Orpheum Theater in downtown Omaha at 9:30 a.m. on Monday, April 26, 1993. A record 1,700 people turned up for the meeting last year, but that number still leaves plenty of room at the Orpheum.

We recommend that you get your hotel reservations early at one of these hotels: (1) The Radisson-Redick Tower, a small (88 rooms) but nice hotel across the street from the Orpheum; (2) the much larger Red Lion Hotel, located about a five-minute walk from the Orpheum; or (3) the Marriott, located in West Omaha about 100 yards from Borsheim's, which is a twenty minute drive from downtown. We will have buses at the Marriott that will leave at 8:30 and 8:45 for the meeting and return after it ends.

Charlie and I always enjoy the meeting, and we hope you can make it. The quality of our shareholders is reflected in the quality of the questions we get: We have never attended an annual meeting anywhere that features such a consistently high level of intelligent, owner-related questions.

An attachment to our proxy material explains how you can obtain the card you will need for admission to the meeting. With the admission card, we will enclose information about parking facilities located near the Orpheum. If you are driving, come a little early. Nearby lots fill up quickly and you may have to walk a few blocks.

As usual, we will have buses to take you to Nebraska Furniture Mart and Borsheim's after the meeting and to take you from there to downtown hotels or the airport later. I hope that you will allow plenty of time to fully explore the attractions of both stores. Those of you arriving early can visit the Furniture Mart any day of the week; it is open from 10 a.m. to 5:30 p.m. on Saturdays and from noon to 5:30 p.m. on Sundays. While there, stop at the See's Candy Cart and find out for yourself why Charlie and I are a good bit wider than we were back in 1972 when we bought See's.

Borsheim's normally is closed on Sunday but will be open for shareholders and their guests from noon to 6 p.m. on Sunday, April 25. Charlie and I will be in attendance, sporting our

jeweler's loupes, and ready to give advice about gems to anyone foolish enough to listen. Also available will be plenty of Cherry Cokes, See's candies, and other lesser goodies. I hope you will join us.

Warren E. Buffett

Chairman of the Board

March 1, 1993

1993 Letter

BERKSHIRE HATHAWAY INC.

To the Shareholders of Berkshire Hathaway Inc.:

Our per-share book value increased 14.3% during 1993. Over the last 29 years (that is, since present management took over) book value has grown from \$19 to \$8,854, or at a rate of 23.3% compounded annually.

During the year, Berkshire's net worth increased by \$1.5 billion, a figure affected by two negative and two positive non-operating items. For the sake of completeness, I'll explain them here. If you aren't thrilled by accounting, however, feel free to fast-forward through this discussion:

1. The first negative was produced by a change in Generally Accepted Accounting Principles (GAAP) having to do with the taxes we accrue against unrealized appreciation in the securities we carry at market value. The old rule said that the tax rate used should be the one in effect when the appreciation took place. Therefore, at the end of 1992, we were using a rate of 34% on the \$6.4 billion of gains generated after 1986 and 28% on the \$1.2 billion of gains generated before that. The new rule stipulates that the current tax rate should be applied to all gains. The rate in the first quarter of 1993, when this rule went into effect, was 34%. Applying that rate to our pre-1987 gains reduced net worth by \$70 million.

2. The second negative, related to the first, came about because the corporate tax rate was raised in the third quarter of 1993 to 35%. This change required us to make an additional charge of 1% against all of our unrealized gains, and that charge penalized net worth by \$75 million. Oddly, GAAP required both this charge and the one described above to be deducted from the earnings we report, even though the unrealized appreciation that gave rise to the charges was never included in earnings, but rather was credited directly to net worth.

3. Another 1993 change in GAAP affects the value at which we carry the securities that we own. In recent years, both the common stocks and certain common-equivalent securities held by

our insurance companies have been valued at market, whereas equities held by our non-insurance subsidiaries or by the parent company were carried at their aggregate cost or market, whichever was lower. Now GAAP says that *all* common stocks should be carried at market, a rule we began following in the fourth quarter of 1993. This change produced a gain in Berkshire's reported net worth of about \$172 million.

4. Finally, we issued some stock last year. In a transaction described in last year's Annual Report, we issued 3,944 shares in early January, 1993 upon the conversion of \$46 million convertible debentures that we had called for redemption. Additionally, we issued 25,203 shares when we acquired Dexter Shoe, a purchase discussed later in this report. The overall result was that our shares outstanding increased by 29,147 and our net worth by about \$478 million. Per-share book value also grew, because the shares issued in these transactions carried a price above their book value.

Of course, it's per-share intrinsic value, not book value, that counts. Book value is an accounting term that measures the capital, including retained earnings, that has been put into a business. Intrinsic value is a present-value estimate of the cash that can be taken out of a business during its remaining life. At most companies, the two values are unrelated. Berkshire, however, is an exception: Our book value, though significantly below our intrinsic value, serves as a useful device for tracking that key figure. In 1993, each measure grew by roughly 14%, advances that I would call satisfactory but unexciting.

These gains, however, were outstripped by a much larger gain - 39% - in Berkshire's market price. Over time, of course, market price and intrinsic value will arrive at about the same destination. But in the short run the two often diverge in a major way, a phenomenon I've discussed in the past. Two years ago, Coca-Cola and Gillette, both large holdings of ours, enjoyed market price increases that dramatically outpaced their earnings gains. In the 1991 Annual Report, I said that the stocks of these companies could not continuously over perform their businesses.

From 1991 to 1993, Coke and Gillette increased their annual operating earnings per share by 38% and 37% respectively, but their market prices moved up only 11% and 6%. In other words, the companies overperformed their stocks, a result that no doubt partly reflects Wall Street's new apprehension about brand names. Whatever the reason, what will count over time is the earnings

performance of these companies. If they prosper, Berkshire will also prosper, though not in a lock-step manner.

Let me add a lesson from history: Coke went public in 1919 at \$40 per share. By the end of 1920 the market, coldly reevaluating Coke's future prospects, had battered the stock down by more than 50%, to \$19.50. At yearend 1993, that single share, with dividends reinvested, was worth more than \$2.1 million. As Ben Graham said: "In the short-run, the market is a voting machine - reflecting a voter-registration test that requires only money, not intelligence or emotional stability - but in the long-run, the market is a weighing machine."

So how should Berkshire's over-performance in the market last year be viewed? Clearly, Berkshire was selling at a higher percentage of intrinsic value at the end of 1993 than was the case at the beginning of the year. On the other hand, in a world of 6% or 7% long-term interest rates, Berkshire's market price was not inappropriate if - and you should understand that this is a huge if - Charlie Munger, Berkshire's Vice Chairman, and I can attain our long-standing goal of increasing Berkshire's per-share intrinsic value at an average annual rate of 15%. We have not retreated from this goal. But we again emphasize, as we have for many years, that the growth in our capital base makes 15% an ever-more difficult target to hit.

What we have going for us is a growing collection of good-sized operating businesses that possess economic characteristics ranging from good to terrific, run by managers whose performance ranges from terrific to terrific. You need have no worries about this group.

The capital-allocation work that Charlie and I do at the parent company, using the funds that our managers deliver to us, has a less certain outcome: It is not easy to find new businesses and managers comparable to those we have. Despite that difficulty, Charlie and I relish the search, and we are happy to report an important success in 1993.

Dexter Shoe

What we did last year was build on our 1991 purchase of H. H. Brown, a superbly-run manufacturer of work shoes, boots and other footwear. Brown has been a real winner: Though we had high hopes to begin with, these expectations have been considerably exceeded thanks to Frank Rooney, Jim Issler and the talented managers who work with them. Because of our confidence in Frank's team, we next acquired Lowell Shoe, at the end of 1992. Lowell was a long-established manufacturer of women's and nurses' shoes, but its business needed some fixing. Again, results have surpassed our expectations. So we promptly jumped at the chance

last year to acquire Dexter Shoe of Dexter, Maine, which manufactures popular-priced men's and women's shoes. Dexter, I can assure you, needs *no* fixing: It is one of the best-managed companies Charlie and I have seen in our business lifetimes.

Harold Alfond, who started working in a shoe factory at 25 cents an hour when he was 20, founded Dexter in 1956 with \$10,000 of capital. He was joined in 1958 by Peter Lunder, his nephew. The two of them have since built a business that now produces over 7.5 million pairs of shoes annually, most of them made in Maine and the balance in Puerto Rico. As you probably know, the domestic shoe industry is generally thought to be unable to compete with imports from low-wage countries. But someone forgot to tell this to the ingenious managements of Dexter and H. H. Brown and to their skilled labor forces, which together make the U.S. plants of both companies highly competitive against all comers.

Dexter's business includes 77 retail outlets, located primarily in the Northeast. The company is also a major manufacturer of golf shoes, producing about 15% of U.S. output. Its bread and butter, though, is the manufacture of traditional shoes for traditional retailers, a job at which it excels: Last year both Nordstrom and J.C. Penney bestowed special awards upon Dexter for its performance as a supplier during 1992.

Our 1993 results include Dexter only from our date of merger, November 7th. In 1994, we expect Berkshire's shoe operations to have more than \$550 million in sales, and we would not be surprised if the combined pre-tax earnings of these businesses topped \$85 million. Five years ago we had no thought of getting into shoes. Now we have 7,200 employees in that industry, and I sing "There's No Business Like Shoe Business" as I drive to work. So much for strategic plans.

At Berkshire, we have no view of the future that dictates what businesses or industries we will enter. Indeed, we think it's usually poison for a corporate giant's shareholders if it embarks upon new ventures pursuant to some grand vision. We prefer instead to focus on the economic characteristics of businesses that we wish to own and the personal characteristics of managers with whom we wish to associate - and then to hope we get lucky in finding the two in combination. At Dexter, we did.

* * * * *

And now we pause for a short commercial: Though they owned a business jewel, we believe that Harold and Peter (who were not interested in cash) made a sound decision in exchanging their Dexter stock for shares of Berkshire. What they did, in effect, was trade a 100% interest in a single terrific business for a smaller interest in a large group of terrific businesses. They incurred no tax on this exchange and now own a security that can be easily used for charitable or personal gifts, or that can be converted to cash in amounts, and at times, of their own choosing. Should members of their families desire to, they can pursue varying financial paths without running into the complications that often arise when assets are concentrated in a private business.

For tax and other reasons, private companies also often find it difficult to diversify outside their industries. Berkshire, in contrast, can diversify with ease. So in shifting their ownership to Berkshire, Dexter's shareholders solved a reinvestment problem. Moreover, though Harold and Peter now have non-controlling shares in Berkshire, rather than controlling shares in Dexter, they know they will be treated as partners and that we will follow owner-oriented practices. If they elect to retain their Berkshire shares, their investment result from the merger date forward will exactly parallel my own result. Since I have a huge percentage of my net worth committed for life to Berkshire shares - and since the company will issue me neither restricted shares nor stock options - my gain-loss equation will always match that of all other owners.

Additionally, Harold and Peter know that at Berkshire we can keep our promises: There will be no changes of control or culture at Berkshire for many decades to come. Finally, and of paramount importance, Harold and Peter can be sure that they will get to run their business - an activity they dearly love - exactly as they did before the merger. At Berkshire, we do not tell .400 hitters how to swing.

What made sense for Harold and Peter probably makes sense for a few other owners of large private businesses. So, if you have a business that might fit, let me hear from you. Our acquisition criteria are set forth in the appendix on page 22.

Sources of Reported Earnings

The table below shows the major sources of Berkshire's reported earnings. In this presentation, amortization of Goodwill and other major purchase-price accounting adjustments are not charged against the specific businesses to which they apply, but are instead aggregated and shown separately. This procedure lets you view the earnings of our businesses as they would have been reported had we not purchased them. I've explained in past reports why this

form of presentation seems to us to be more useful to investors and managers than one utilizing GAAP, which requires purchase-price adjustments to be made on a business-by-business basis. The total net earnings we show in the table are, of course, identical to the GAAP total in our audited financial statements.

Operating Earnings (000s omitted)	Pre-Tax 1993	Earnings 1992	Berkshire 1993	Share 1992

* *Includes Dexter's earnings only from the date it was acquired, November 7, 1993.*

***Excludes interest expense of Commercial and Consumer Finance businesses. In 1992 includes \$22.5 million of premiums paid on the early redemption of debt.*

A large amount of information about these businesses is given on pages 38-49, where you will also find our segment earnings reported on a GAAP basis. In addition, on pages 52-59, we have rearranged Berkshire's financial data into four segments on a non-GAAP basis, a presentation that corresponds to the way Charlie and I think about the company. Our intent is to supply you with the financial information that we would wish you to give us if our positions were reversed.

"Look-Through" Earnings

We've previously discussed look-through earnings, which we believe more accurately portray the earnings of Berkshire than does our GAAP result. As we calculate them, look-through earnings consist of: (1) the operating earnings reported in the previous section, plus; (2) the retained operating earnings of major investees that, under GAAP accounting, are not reflected in our profits, less; (3) an allowance for the tax that would be paid by Berkshire if these retained earnings of investees had instead been distributed to us. The "operating earnings" of which we speak here exclude capital gains, special accounting items and major restructuring charges.

Over time, our look-through earnings need to increase at about 15% annually if our intrinsic value is to grow at that rate. Last year, I explained that we had to increase these earnings to about \$1.8 billion in the year 2000, were we to meet the 15% goal. Because we issued additional shares in 1993, the amount needed has risen to about \$1.85 billion.

That is a tough goal, but one that we expect you to hold us to. In the past, we've criticized the managerial practice of shooting the arrow of performance and *then* painting the target, centering it on whatever point the arrow happened to hit. We will instead risk embarrassment by painting first and shooting later.

If we are to hit the bull's-eye, we will need markets that allow the purchase of businesses and securities on sensible terms. Right now, markets are difficult, but they can - and will - change in unexpected ways and at unexpected times. In the meantime, we'll try to resist the temptation to do something marginal simply because we are long on cash. There's no use running if you're on the wrong road.

The following table shows how we calculate look-through earnings, though I warn you that the figures are necessarily *very* rough. (The dividends paid to us by these investees have been included in the operating earnings itemized on page 8, mostly under "Insurance Group: Net Investment Income.")

Berkshire's Major Investees	Berkshire's	Approximate at	Berkshire's	Share of
	Ownership	Yearend	Undistributed	Operating Earnings
	1993	1992	1993	1992
Capitla Cities / ABC Inc.	13.0%	18.2%	\$83 (2)	\$70
The Coca-Cola Company	7.2%	7.1%	94	82
Federal Home Loan Mortgage Corp.	6.8% (1)	8.2% (1)	41 (2)	29 (2)
GEICO Corp.	48.4%	48.1%	76 (3)	34 (3)
General Dynamics Corp.	13.9%	14.1%	25	11 (2)
The Gillette Compnay	10.9%	10.9%	44	38
Guinness PLC	1.9%	2.0%	8	7
The Washington Post Company	14.8%	14.6%	15	11
Wells Fargo & Company	12.2%	11.5%	53 (2)	16 (2)
Berkshire's share of undistributed earnings of major investees			\$439	\$298
Hypothetical tax on these undistributed investee earnings (4)			(61)	(42)
Reported operating earnings of Berkshire			478	348
Total look-through earnings of Bekrshire			\$856	\$516

- (1) Does not include shares allocable to the minority interest at Wesco
- (2) Calculated on average ownership for the year
- (3) Excludes realized capital gains, which have been both recurring and significant
- (4) The tax rate used is 14%, which is the rate Berkshire pays on the dividends it receives

We have told you that we expect the undistributed, hypothetically-taxed earnings of our investees to produce at least equivalent gains in Berkshire's intrinsic value. To date, we have far exceeded that expectation. For example, in 1986 we bought three million shares of Capital Cities/ABC for \$172.50 per share and late last year sold one-third of that holding for \$630 per share. After paying 35% capital gains taxes, we realized a \$297 million profit from the sale. In contrast, during the eight years we held these shares, the retained earnings of Cap Cities

attributable to them - hypothetically taxed at a lower 14% in accordance with our look-through method - were only \$152 million. In other words, we paid a much larger tax bill than our look-through presentations to you have assumed and nonetheless realized a gain that far exceeded the undistributed earnings allocable to these shares.

We expect such pleasant outcomes to recur often in the future and therefore believe our look-through earnings to be a conservative representation of Berkshire's true economic earnings.

Taxes

As our Cap Cities sale emphasizes, Berkshire is a substantial payer of federal income taxes. In aggregate, we will pay 1993 federal income taxes of \$390 million, about \$200 million of that attributable to operating earnings and \$190 million to realized capital gains. Furthermore, our share of the 1993 federal and foreign income taxes paid by our investees is well over \$400 million, a figure you don't see on our financial statements but that is nonetheless real. Directly and indirectly, Berkshire's 1993 federal income tax payments will be about 1/2 of 1% of the total paid last year by all American corporations.

Speaking for our own shares, Charlie and I have absolutely no complaint about these taxes. We know we work in a market-based economy that rewards our efforts far more bountifully than it does the efforts of others whose output is of equal or greater benefit to society. Taxation should, and does, partially redress this inequity. But we still remain extraordinarily well-treated.

Berkshire and its shareholders, in combination, would pay a much smaller tax if Berkshire operated as a partnership or "S" corporation, two structures often used for business activities. For a variety of reasons, that's not feasible for Berkshire to do. However, the penalty our corporate form imposes is mitigated - though far from eliminated - by our strategy of investing for the long term. Charlie and I would follow a buy-and-hold policy even if we ran a tax-exempt institution. We think it the soundest way to invest, and it also goes down the grain of our personalities. A third reason to favor this policy, however, is the fact that taxes are due only when gains are realized.

Through my favorite comic strip, Li'l Abner, I got a chance during my youth to see the benefits of delayed taxes, though I missed the lesson at the time. Making his readers feel superior, Li'l Abner bungled happily, but moronically, through life in Dogpatch. At one point he became infatuated with a New York temptress, Appassionata Van Climax, but despaired of marrying her because he had only a single silver dollar and she was interested solely in

millionaires. Dejected, Abner took his problem to Old Man Mose, the font of all knowledge in Dogpatch. Said the sage: Double your money 20 times and Appassionatta will be yours (1, 2, 4, 8 1,048,576).

My last memory of the strip is Abner entering a roadhouse, dropping his dollar into a slot machine, and hitting a jackpot that spilled money all over the floor. Meticulously following Mose's advice, Abner picked up two dollars and went off to find his next double. Whereupon I dumped Abner and began reading Ben Graham.

Mose clearly was overrated as a guru: Besides failing to anticipate Abner's slavish obedience to instructions, he also forgot about taxes. Had Abner been subject, say, to the 35% federal tax rate that Berkshire pays, and had he managed one double annually, he would after 20 years only have accumulated \$22,370. Indeed, had he kept on both getting his annual doubles and paying a 35% tax on each, he would have needed 7 1/2 years more to reach the \$1 million required to win Appassionatta.

But what if Abner had instead put his dollar in a single investment and held it until it doubled the same 27 1/2 times? In that case, he would have realized about \$200 million pre-tax or, after paying a \$70 million tax in the final year, about \$130 million after-tax. For that, Appassionatta would have crawled to Dogpatch. Of course, with 27 1/2 years having passed, how Appassionatta would have looked to a fellow sitting on \$130 million is another question.

What this little tale tells us is that tax-paying investors will realize a far, far greater sum from a single investment that compounds internally at a given rate than from a succession of investments compounding at the same rate. But I suspect many Berkshire shareholders figured that out long ago.

Insurance Operations

At this point in the report we've customarily provided you with a table showing the annual "combined ratio" of the insurance industry for the preceding decade. This ratio compares total insurance costs (losses incurred plus expenses) to revenue from premiums. For many years, the ratio has been above 100, a level indicating an underwriting loss. That is, the industry has taken in less money each year from its policyholders than it has had to pay for operating expenses and for loss events that occurred during the year.

Offsetting this grim equation is a happier fact: Insurers get to hold on to their policyholders' money for a time before paying it out. This happens because most policies require that

premiums be prepaid and, more importantly, because it often takes time to resolve loss claims. Indeed, in the case of certain lines of insurance, such as product liability or professional malpractice, many years may elapse between the loss event and payment.

To oversimplify the matter somewhat, the total of the funds prepaid by policyholders and the funds earmarked for incurred-but-not-yet-paid claims is called "the float." In the past, the industry was able to suffer a combined ratio of 107 to 111 and still break even from its insurance writings because of the earnings derived from investing this float.

As interest rates have fallen, however, the value of float has substantially declined. Therefore, the data that we have provided in the past are no longer useful for year-to-year comparisons of industry profitability. A company writing at the same combined ratio now as in the 1980's today has a far less attractive business than it did then.

Only by making an analysis that incorporates both underwriting results and the current risk-free earnings obtainable from float can one evaluate the true economics of the business that a property-casualty insurer writes. Of course, the *actual* investment results that an insurer achieves from the use of both float and stockholders' funds is also of major importance and should be carefully examined when an investor is assessing managerial performance. But that should be a separate analysis from the one we are discussing here. The value of float funds - in effect, their transfer price as they move from the insurance operation to the investment operation - should be determined simply by the risk-free, long-term rate of interest.

On the next page we show the numbers that count in an evaluation of Berkshire's insurance business. We calculate our float - which we generate in exceptional amounts relative to our premium volume - by adding loss reserves, loss adjustment reserves and unearned premium reserves and then subtracting agent's balances, prepaid acquisition costs and deferred charges applicable to assumed reinsurance. Our cost of float is determined by our underwriting loss or profit. In those years when we have had an underwriting profit, which includes 1993, our cost of float has been negative, and we have determined our insurance earnings by adding underwriting profit to float income.

(in \$ Millions)	(1) Underwriting Loss	(2) Average Float	Approximate Cost of Funds	Yearend Yield on Long- Term Govt. Bonds
1967	Profit	\$17.3	< 0	5.50%
1968	Profit	19.9	< 0	5.90%

1992	108.9	2,290.4	4.76%	7.39%
1993	Profit	2,624.7	< 0	6.35%

As you can see, in our insurance operation last year we had the use of \$2.6 billion at no cost; in fact we were paid \$31 million, our underwriting profit, to hold these funds. This sounds good - is good - but is far from as good as it sounds.

We temper our enthusiasm because we write a large volume of "super-cat" policies (which other insurance and reinsurance companies buy to recover part of the losses they suffer from

mega-catastrophes) and because last year we had no losses of consequence from this activity. As that suggests, the truly catastrophic Midwestern floods of 1993 did not trigger super-cat losses, the reason being that very few flood policies are purchased from private insurers.

It would be fallacious, however, to conclude from this single-year result that the super-cat business is a wonderful one, or even a satisfactory one. A simple example will illustrate the fallacy: Suppose there is an event that occurs 25 times in every century. If you annually give 5-for-1 odds against its occurrence *that* year, you will have many more winning years than losers. Indeed, you may go a straight six, seven or more years without loss. You also will eventually go broke.

At Berkshire, we naturally believe we are obtaining adequate premiums and giving more like 3 1/2-for-1 odds. But there is no way for us - or anyone else - to calculate the true odds on super-cat coverages. In fact, it will take decades for us to find out whether our underwriting judgment has been sound.

What we do know is that when a loss comes, it's likely to be a lulu. There may well be years when Berkshire will suffer losses from the super-cat business equal to three or four times what we earned from it in 1993. When Hurricane Andrew blew in 1992, we paid out about \$125 million. Because we've since expanded our super-cat business, a similar storm today could cost us \$600 million.

So far, we have been lucky in 1994. As I write this letter, we are estimating that our losses from the Los Angeles earthquake will be nominal. But if the quake had been a 7.5 instead of a 6.8, it would have been a different story.

Berkshire is ideally positioned to write super-cat policies. In Ajit Jain, we have by far the best manager in this business. Additionally, companies writing these policies need enormous capital, and our net worth is ten to twenty times larger than that of our main competitors. In most lines of insurance, huge resources aren't that important: An insurer can diversify the risks it writes and, if necessary, can lay off risks to reduce concentration in its portfolio. That isn't possible in the super-cat business. So these competitors are forced into offering far smaller limits than those we can provide. Were they bolder, they would run the risk that a mega-catastrophe - or a confluence of smaller catastrophes - would wipe them out.

One indication of our premier strength and reputation is that each of the four largest reinsurance companies in the world buys very significant reinsurance coverage from Berkshire.

Better than anyone else, these giants understand that the test of a reinsurer is its ability and willingness to pay losses under trying circumstances, not its readiness to accept premiums when things look rosy.

One caution: There has recently been a substantial increase in reinsurance capacity. Close to \$5 billion of equity capital has been raised by reinsurers, almost all of them newly-formed entities. Naturally these new entrants are hungry to write business so that they can justify the projections they utilized in attracting capital. This new competition won't affect our 1994 operations; we're filled up there, primarily with business written in 1993. But we are now seeing signs of price deterioration. If this trend continues, we will resign ourselves to much-reduced volume, keeping ourselves available, though, for the large, sophisticated buyer who requires a super-cat insurer with large capacity and a sure ability to pay losses.

In other areas of our insurance business, our home state operation, led by Rod Eldred; our workers' compensation business, headed by Brad Kinstler; our credit-card operation, managed by the Kizer family; and National Indemnity's traditional auto and general liability business, led by Don Wurster, all achieved excellent results. In combination, these four units produced a significant underwriting profit and substantial float.

All in all, we have a first-class insurance business. Though its results will be highly volatile, this operation possesses an intrinsic value that exceeds its book value by a large amount - larger, in fact, than is the case at any other Berkshire business.

Common Stock Investments

Below we list our common stockholdings having a value of over \$250 million. A small portion of these investments belongs to subsidiaries of which Berkshire owns less than 100%.

Shares	Company	Cost (000's omitted)	Market (000's omitted)
3,000,000	Capital Cities/ABC, Inc.	\$345,000	\$1,239,000
93,400,000	The Coca-Cola Company	1,023,920	4,167,975
13,654,600	Federal Home Loan Mortgage Corp. ("Freddie Mac")	307,505	681,023
34,250,000	GEICO Corporation.	45,713	1,759,594
4,350,000	General Dynamics Corp	94,938	401,287
24,000,000	The Gillette Company	600,000	1,431,000
38,335,000	Guinness PLC	333,019	270,822
1,727,765	The Washington Post Company	9,731	440,148
6,791,218	Wells Fargo & Company	423,680	878,614

Considering the similarity of this year's list and the last, you may decide your management is hopelessly comatose. But we continue to think that it is usually foolish to part with an interest in a business that is both understandable and durably wonderful. Business interests of that kind are simply too hard to replace.

Interestingly, corporate managers have no trouble understanding that point when they are focusing on a business they operate: A parent company that owns a subsidiary with superb long-term economics is not likely to sell that entity regardless of price. "Why," the CEO would ask, "should I part with my crown jewel?" Yet that same CEO, when it comes to running his personal investment portfolio, will offhandedly - and even impetuously - move from business to business when presented with no more than superficial arguments by his broker for doing so. The worst of these is perhaps, "You can't go broke taking a profit." Can you imagine a CEO using this line to urge his board to sell a star subsidiary? In our view, what makes sense in business also makes sense in stocks: An investor should ordinarily hold a small piece of an outstanding business with the same tenacity that an owner would exhibit if he owned all of that business.

Earlier I mentioned the financial results that could have been achieved by investing \$40 in The Coca-Cola Co. in 1919. In 1938, more than 50 years after the introduction of Coke, and long after the drink was firmly established as an American icon, *Fortune* did an excellent story

on the company. In the second paragraph the writer reported: "Several times every year a weighty and serious investor looks long and with profound respect at Coca-Cola's record, but comes regretfully to the conclusion that he is looking too late. The specters of saturation and competition rise before him."

Yes, competition there was in 1938 and in 1993 as well. But it's worth noting that in 1938 The Coca-Cola Co. sold 207 million cases of soft drinks (if its gallonage then is converted into the 192-ounce cases used for measurement today) and in 1993 it sold about 10.7 billion cases, a 50-fold increase in physical volume from a company that in 1938 was already dominant in its very major industry. Nor was the party over in 1938 for an investor: Though the \$40 invested in 1919 in one share had (with dividends reinvested) turned into \$3,277 by the end of 1938, a fresh \$40 then invested in Coca-Cola stock would have grown to \$25,000 by yearend 1993.

I can't resist one more quote from that 1938 *Fortune* story: "It would be hard to name any company comparable in size to Coca-Cola and selling, as Coca-Cola does, an unchanged product that can point to a ten-year record anything like Coca-Cola's." In the 55 years that have since passed, Coke's product line has broadened somewhat, but it's remarkable how well that description still fits.

Charlie and I decided long ago that in an investment lifetime it's just too hard to make hundreds of smart decisions. That judgment became ever more compelling as Berkshire's capital mushroomed and the universe of investments that could significantly affect our results shrank dramatically. Therefore, we adopted a strategy that required our being smart - and not too smart at that - only a very few times. Indeed, we'll now settle for one good idea a year. (Charlie says it's my turn.)

The strategy we've adopted precludes our following standard diversification dogma. Many pundits would therefore say the strategy must be riskier than that employed by more conventional investors. We disagree. We believe that a policy of portfolio concentration may well *decrease* risk if it raises, as it should, both the intensity with which an investor thinks about a business and the comfort-level he must feel with its economic characteristics before buying into it. In stating this opinion, we define risk, using dictionary terms, as "the possibility of loss or injury."

Academics, however, like to define investment "risk" differently, averring that it is the relative volatility of a stock or portfolio of stocks - that is, their volatility as compared to that of a

large universe of stocks. Employing data bases and statistical skills, these academics compute with precision the "beta" of a stock - its relative volatility in the past - and then build arcane investment and capital-allocation theories around this calculation. In their hunger for a single statistic to measure risk, however, they forget a fundamental principle: It is better to be approximately right than precisely wrong.

For owners of a business - and that's the way we think of shareholders - the academics' definition of risk is far off the mark, so much so that it produces absurdities. For example, under beta-based theory, a stock that has dropped very sharply compared to the market - as had Washington Post when we bought it in 1973 - becomes "riskier" at the lower price than it was at the higher price. Would that description have then made any sense to someone who was offered the entire company at a vastly-reduced price?

In fact, the true investor *welcomes* volatility. Ben Graham explained why in Chapter 8 of *The Intelligent Investor*. There he introduced "Mr. Market," an obliging fellow who shows up every day to either buy from you or sell to you, whichever you wish. The more manic-depressive this chap is, the greater the opportunities available to the investor. That's true because a wildly fluctuating market means that irrationally low prices will periodically be attached to solid businesses. It is impossible to see how the availability of such prices can be thought of as increasing the hazards for an investor who is totally free to either ignore the market or exploit its folly.

In assessing risk, a beta purist will disdain examining what a company produces, what its competitors are doing, or how much borrowed money the business employs. He may even prefer not to know the company's name. What he treasures is the price history of its stock. In contrast, we'll happily forgo knowing the price history and instead will seek whatever information will further our understanding of the company's business. After we buy a stock, consequently, we would not be disturbed if markets closed for a year or two. We don't need a daily quote on our 100% position in See's or H. H. Brown to validate our well-being. Why, then, should we need a quote on our 7% interest in Coke?

In our opinion, the real risk that an investor must assess is whether his aggregate after-tax receipts from an investment (including those he receives on sale) will, over his prospective holding period, give him at least as much purchasing power as he had to begin with, plus a modest rate of interest on that initial stake. Though this risk cannot be calculated with

engineering precision, it can in some cases be judged with a degree of accuracy that is useful. The primary factors bearing upon this evaluation are:

- 1) The certainty with which the long-term economic characteristics of the business can be evaluated;
- 2) The certainty with which management can be evaluated, both as to its ability to realize the full potential of the business and to wisely employ its cash flows;
- 3) The certainty with which management can be counted on to channel the rewards from the business to the shareholders rather than to itself;
- 4) The purchase price of the business;
- 5) The levels of taxation and inflation that will be experienced and that will determine the degree by which an investor's purchasing-power return is reduced from his gross return.

These factors will probably strike many analysts as unbearably fuzzy, since they cannot be extracted from a data base of any kind. But the difficulty of precisely quantifying these matters does not negate their importance nor is it insuperable. Just as Justice Stewart found it impossible to formulate a test for obscenity but nevertheless asserted, "I know it when I see it," so also can investors - in an inexact but useful way - "see" the risks inherent in certain investments without reference to complex equations or price histories.

Is it really so difficult to conclude that Coca-Cola and Gillette possess far less business risk over the long term than, say, *any* computer company or retailer? Worldwide, Coke sells about 44% of all soft drinks, and Gillette has more than a 60% share (in value) of the blade market. Leaving aside chewing gum, in which Wrigley is dominant, I know of no other significant businesses in which the leading company has long enjoyed such global power.

Moreover, both Coke and Gillette have actually increased their worldwide shares of market in recent years. The might of their brand names, the attributes of their products, and the strength of their distribution systems give them an enormous competitive advantage, setting up a protective moat around their economic castles. The average company, in contrast, does battle daily without any such means of protection. As Peter Lynch says, stocks of companies selling commodity-like products should come with a warning label: "Competition may prove hazardous to human wealth."

The competitive strengths of a Coke or Gillette are obvious to even the casual observer of business. Yet the beta of their stocks is similar to that of a great many run-of-the-mill companies

who possess little or no competitive advantage. Should we conclude from this similarity that the competitive strength of Coke and Gillette gains them nothing when business risk is being measured? Or should we conclude that the risk in owning a piece of a company - its stock - is somehow divorced from the long-term risk inherent in its business operations? We believe neither conclusion makes sense and that equating beta with investment risk also makes no sense.

The theoretician bred on beta has no mechanism for differentiating the risk inherent in, say, a single-product toy company selling pet rocks or hula hoops from that of another toy company whose sole product is Monopoly or Barbie. But it's quite possible for ordinary investors to make such distinctions if they have a reasonable understanding of consumer behavior and the factors that create long-term competitive strength or weakness. Obviously, every investor will make mistakes. But by confining himself to a relatively few, easy-to-understand cases, a reasonably intelligent, informed and diligent person can judge investment risks with a useful degree of accuracy.

In many industries, of course, Charlie and I can't determine whether we are dealing with a "pet rock" or a "Barbie." We couldn't solve this problem, moreover, even if we were to spend years intensely studying those industries. Sometimes our own intellectual shortcomings would stand in the way of understanding, and in other cases the nature of the industry would be the roadblock. For example, a business that must deal with fast-moving technology is not going to lend itself to reliable evaluations of its long-term economics. Did we foresee thirty years ago what would transpire in the television-manufacturing or computer industries? Of course not. (Nor did most of the investors and corporate managers who enthusiastically entered those industries.) Why, then, should Charlie and I now think we can predict the future of other rapidly-evolving businesses? We'll stick instead with the easy cases. Why search for a needle buried in a haystack when one is sitting in plain sight?

Of course, some investment strategies - for instance, our efforts in arbitrage over the years - require wide diversification. If significant risk exists in a single transaction, overall risk should be reduced by making that purchase one of many mutually-independent commitments. Thus, you may consciously purchase a risky investment - one that indeed has a significant possibility of causing loss or injury - if you believe that your gain, weighted for probabilities, considerably exceeds your loss, comparably weighted, and if you can commit to a number of similar, but unrelated opportunities. Most venture capitalists employ this strategy. Should you choose to

pursue this course, you should adopt the outlook of the casino that owns a roulette wheel, which will want to see lots of action because it is favored by probabilities, but will refuse to accept a single, huge bet.

Another situation requiring wide diversification occurs when an investor who does not understand the economics of specific businesses nevertheless believes it in his interest to be a long-term owner of American industry. That investor should both own a large number of equities and space out his purchases. By periodically investing in an index fund, for example, the know-nothing investor can actually out-perform most investment professionals. Paradoxically, when "dumb" money acknowledges its limitations, it ceases to be dumb.

On the other hand, if you are a know-*something* investor, able to understand business economics and to find five to ten sensibly-priced companies that possess important long-term competitive advantages, conventional diversification makes no sense for you. It is apt simply to hurt your results and increase your risk. I cannot understand why an investor of that sort elects to put money into a business that is his 20th favorite rather than simply adding that money to his top choices - the businesses he understands best and that present the least risk, along with the greatest profit potential. In the words of the prophet Mae West: "Too much of a good thing can be wonderful."

Corporate Governance

At our annual meetings, someone usually asks "What happens to this place if you get hit by a truck?" I'm glad they are still asking the question in this form. It won't be too long before the query becomes: "What happens to this place if you *don't* get hit by a truck?"

Such questions, in any event, raise a reason for me to discuss corporate governance, a hot topic during the past year. In general, I believe that directors have stiffened their spines recently and that shareholders are now being treated somewhat more like true owners than was the case not long ago. Commentators on corporate governance, however, seldom make any distinction among three fundamentally different manager/owner situations that exist in publicly-held companies. Though the legal responsibility of directors is identical throughout, their ability to effect change differs in each of the cases. Attention usually falls on the first case, because it prevails on the corporate scene. Since Berkshire falls into the second category, however, and will someday fall into the third, we will discuss all three variations.

The first, and by far most common, board situation is one in which a corporation has no controlling shareholder. In that case, I believe directors should behave as if there is a single absentee owner, whose long-term interest they should try to further in all proper ways. Unfortunately, "long-term" gives directors a lot of wiggle room. If they lack either integrity or the ability to think independently, directors can do great violence to shareholders while still claiming to be acting in their long-term interest. But assume the board is functioning well and must deal with a management that is mediocre or worse. Directors then have the responsibility for changing that management, just as an intelligent owner would do if he were present. And if able but greedy managers over-reach and try to dip too deeply into the shareholders' pockets, directors must slap their hands.

In this plain-vanilla case, a director who sees something he doesn't like should attempt to persuade the other directors of his views. If he is successful, the board will have the muscle to make the appropriate change. Suppose, though, that the unhappy director can't get other directors to agree with him. He should then feel free to make his views known to the absentee owners. Directors seldom do that, of course. The temperament of many directors would in fact be incompatible with critical behavior of that sort. But I see nothing improper in such actions, assuming the issues are serious. Naturally, the complaining director can expect a vigorous rebuttal from the unpersuaded directors, a prospect that should discourage the dissenter from pursuing trivial or non-rational causes.

For the boards just discussed, I believe the directors ought to be relatively few in number - say, ten or less - and ought to come mostly from the outside. The outside board members should establish standards for the CEO's performance and should also periodically meet, without his being present, to evaluate his performance against those standards.

The requisites for board membership should be business savvy, interest in the job, and owner-orientation. Too often, directors are selected simply because they are prominent or add diversity to the board. That practice is a mistake. Furthermore, mistakes in selecting directors are particularly serious because appointments are so hard to undo: The pleasant but vacuous director need never worry about job security.

The second case is that existing at Berkshire, where the controlling owner is also the manager. At some companies, this arrangement is facilitated by the existence of two classes of stock endowed with disproportionate voting power. In these situations, it's obvious that the board does

not act as an agent between owners and management and that the directors cannot effect change except through persuasion. Therefore, if the owner/manager is mediocre or worse - or is over-reaching - there is little a director can do about it except object. If the directors having no connections to the owner/manager make a unified argument, it may well have some effect. More likely it will not.

If change does not come, and the matter is sufficiently serious, the outside directors should resign. Their resignation will signal their doubts about management, and it will emphasize that no outsider is in a position to correct the owner/manager's shortcomings.

The third governance case occurs when there is a controlling owner who is not involved in management. This case, examples of which are Hershey Foods and Dow Jones, puts the outside directors in a potentially useful position. If they become unhappy with either the competence or integrity of the manager, they can go directly to the owner (who may also be on the board) and report their dissatisfaction. This situation is ideal for an outside director, since he need make his case only to a single, presumably interested owner, who can forthwith effect change if the argument is persuasive. Even so, the dissatisfied director has only that single course of action. If he remains unsatisfied about a critical matter, he has no choice but to resign.

Logically, the third case should be the most effective in insuring first-class management. In the second case the owner is not going to fire himself, and in the first case, directors often find it very difficult to deal with mediocrity or mild over-reaching. Unless the unhappy directors can win over a majority of the board - an awkward social and logistical task, particularly if management's behavior is merely odious, not egregious - their hands are effectively tied. In practice, directors trapped in situations of this kind usually convince themselves that by staying around they can do at least some good. Meanwhile, management proceeds unfettered.

In the third case, the owner is neither judging himself nor burdened with the problem of garnering a majority. He can also insure that outside directors are selected who will bring useful qualities to the board. These directors, in turn, will know that the good advice they give will reach the right ears, rather than being stifled by a recalcitrant management. If the controlling owner is intelligent and self-confident, he will make decisions in respect to management that are meritocratic and pro-shareholder. Moreover - and this is critically important - he can readily correct any mistake he makes.

At Berkshire we operate in the second mode now and will for as long as I remain functional. My health, let me add, is excellent. For better or worse, you are likely to have me as an owner/manager for some time.

After my death, all of my stock will go to my wife, Susie, should she survive me, or to a foundation if she dies before I do. In neither case will taxes and bequests require the sale of consequential amounts of stock.

When my stock is transferred to either my wife or the foundation, Berkshire will enter the third governance mode, going forward with a vitally interested, but non-management, owner and with a management that must perform for that owner. In preparation for that time, Susie was elected to the board a few years ago, and in 1993 our son, Howard, joined the board. These family members will not be managers of the company in the future, but they will represent the controlling interest should anything happen to me. Most of our other directors are also significant owners of Berkshire stock, and each has a strong owner-orientation. All in all, we're prepared for "the truck."

Shareholder-Designated Contributions

About 97% of all eligible shares participated in Berkshire's 1993 shareholder-designated contributions program. Contributions made through the program were \$9.4 million and 3,110 charities were recipients.

Berkshire's practice in respect to discretionary philanthropy - as contrasted to its policies regarding contributions that are clearly related to the company's business activities - differs significantly from that of other publicly-held corporations. There, most corporate contributions are made pursuant to the wishes of the CEO (who often will be responding to social pressures), employees (through matching gifts), or directors (through matching gifts or requests they make of the CEO).

At Berkshire, we believe that the company's money is the owners' money, just as it would be in a closely-held corporation, partnership, or sole proprietorship. Therefore, if funds are to be given to causes unrelated to Berkshire's business activities, it is the charities favored by our owners that should receive them. We've yet to find a CEO who believes he should personally fund the charities favored by his shareholders. Why, then, should they foot the bill for his picks?

Let me add that our program is easy to administer. Last fall, for two months, we borrowed one person from National Indemnity to help us implement the instructions that came from our

7,500 registered shareholders. I'd guess that the average corporate program in which employee gifts are matched incurs far greater administrative costs. Indeed, our entire corporate overhead is less than half the size of our charitable contributions. (*Charlie, however, insists that I tell you that \$1.4 million of our \$4.9 million overhead is attributable to our corporate jet, The Indefensible.*)

Below is a list showing the largest categories to which our shareholders have steered their contributions.

- (a) 347 churches and synagogues received 569 gifts
- (b) 283 colleges and universities received 670 gifts
- (c) 244 K-12 schools (about two-thirds secular, one-third religious) received 525 gifts
- (d) 288 institutions dedicated to art, culture or the humanities received 447 gifts
- (e) 180 religious social-service organizations (split about equally between Christian and Jewish) received 411 gifts
- (f) 445 secular social-service organizations (about 40% youth-related) received 759 gifts
- (g) 153 hospitals received 261 gifts
- (h) 186 health-related organizations (American Heart Association, American Cancer Society, etc.) received 320 gifts

Three things about this list seem particularly interesting to me. First, to some degree it indicates what people choose to give money to when they are acting of their own accord, free of pressure from solicitors or emotional appeals from charities. Second, the contributions programs of publicly-held companies almost never allow gifts to churches and synagogues, yet clearly these institutions are what many shareholders would like to support. Third, the gifts made by our shareholders display conflicting philosophies: 130 gifts were directed to organizations that believe in making abortions readily available for women and 30 gifts were directed to organizations (other than churches) that discourage or are opposed to abortion.

Last year I told you that I was thinking of raising the amount that Berkshire shareholders can give under our designated-contributions program and asked for your comments. We received a few well-written letters opposing the entire idea, on the grounds that it was our job to run the business and not our job to force shareholders into making charitable gifts. Most of the shareholders responding, however, noted the tax efficiency of the plan and urged us to increase

the designated amount. Several shareholders who have given stock to their children or grandchildren told me that they consider the program a particularly good way to get youngsters thinking at an early age about the subject of giving. These people, in other words, perceive the program to be an educational, as well as philanthropic, tool. The bottom line is that we did raise the amount in 1993, from \$8 per share to \$10.

In addition to the shareholder-designated contributions that Berkshire distributes, our operating businesses make contributions, including merchandise, averaging about \$2.5 million annually. These contributions support local charities, such as The United Way, and produce roughly commensurate benefits for our businesses.

We suggest that new shareholders read the description of our shareholder-designated contributions program that appears on pages 50-51. *To participate in future programs, you must make sure your shares are registered in the name of the actual owner, not in the nominee name of a broker, bank or depository. Shares not so registered on August 31, 1994 will be ineligible for the 1994 program.*

A Few Personal Items

Mrs. B - Rose Blumkin - had her 100th birthday on December 3, 1993. (The candles cost more than the cake.) That was a day on which the store was scheduled to be open in the evening. Mrs. B, who works seven days a week, for however many hours the store operates, found the proper decision quite obvious: She simply postponed her party until an evening when the store was closed.

Mrs. B's story is well-known but worth telling again. She came to the United States 77 years ago, unable to speak English and devoid of formal schooling. In 1937, she founded the Nebraska Furniture Mart with \$500. Last year the store had sales of \$200 million, a larger amount by far than that recorded by any other home furnishings store in the United States. Our part in all of this began ten years ago when Mrs. B sold control of the business to Berkshire Hathaway, a deal we completed without obtaining audited financial statements, checking real estate records, or getting any warranties. In short, her word was good enough for us.

Naturally, I was delighted to attend Mrs. B's birthday party. After all, she's promised to attend *my* 100th.

* * * * *

Katharine Graham retired last year as the chairman of The Washington Post Company, having relinquished the CEO title three years ago. In 1973, we purchased our stock in her company for about \$10 million. Our holding now garners \$7 million a year in dividends and is worth over \$400 million. At the time of our purchase, we knew that the economic prospects of the company were good. But equally important, Charlie and I concluded that Kay would prove to be an outstanding manager and would treat all shareholders honorably. That latter consideration was particularly important because The Washington Post Company has two classes of stock, a structure that we've seen some managers abuse.

All of our judgments about this investment have been validated by events. Kay's skills as a manager were underscored this past year when she was elected by *Fortune's* Board of Editors to the Business Hall of Fame. On behalf of our shareholders, Charlie and I had long ago put her in Berkshire's Hall of Fame.

* * * * *

Another of last year's retirees was Don Keough of Coca-Cola, although, as he puts it, his retirement lasted "about 14 hours." Don is one of the most extraordinary human beings I've ever known - a man of enormous business talent, but, even more important, a man who brings out the absolute best in everyone lucky enough to associate with him. Coca-Cola wants its product to be present at the happy times of a person's life. Don Keough, as an individual, invariably increases the happiness of those around him. It's impossible to think about Don without feeling good.

I will edge up to how I met Don by slipping in a plug for my neighborhood in Omaha: Though Charlie has lived in California for 45 years, his home as a boy was about 200 feet away from the house where I now live; my wife, Susie, grew up 1 1/2 blocks away; and we have about 125 Berkshire shareholders in the zip code. As for Don, in 1958 he bought the house directly across the street from mine. He was then a coffee salesman with a big family and a small income.

The impressions I formed in those days about Don were a factor in my decision to have Berkshire make a record \$1 billion investment in Coca-Cola in 1988-89. Roberto Goizueta had become CEO of Coke in 1981, with Don alongside as his partner. The two of them took hold of

a company that had stagnated during the previous decade and moved it from \$4.4 billion of market value to \$58 billion in less than 13 years. What a difference a pair of managers like this makes, even when their product has been around for 100 years.

* * * * *

Frank Rooney did double duty last year. In addition to leading H. H. Brown to record profits - 35% above the 1992 high - he also was key to our merger with Dexter.

Frank has known Harold Alfond and Peter Lunder for decades, and shortly after our purchase of H. H. Brown, told me what a wonderful operation they managed. He encouraged us to get together and in due course we made a deal. Frank told Harold and Peter that Berkshire would provide an ideal corporate "home" for Dexter, and that assurance undoubtedly contributed to their decision to join with us.

I've told you in the past of Frank's extraordinary record in building Melville Corp. during his 23 year tenure as CEO. Now, at 72, he's setting an even faster pace at Berkshire. Frank has a low-key, relaxed style, but don't let that fool you. When he swings, the ball disappears far over the fence.

The Annual Meeting

This year the Annual Meeting will be held at the Orpheum Theater in downtown Omaha at 9:30 a.m. on Monday, April 25, 1994. A record 2,200 people turned up for the meeting last year, but the theater can handle many more. We will have a display in the lobby featuring many of our consumer products - candy, spray guns, shoes, cutlery, encyclopedias, and the like. Among my favorites slated to be there is a See's candy assortment that commemorates Mrs. B's 100th birthday and that features her picture, rather than Mrs. See's, on the package.

We recommend that you promptly get hotel reservations at one of these hotels: (1) The Radisson-Redick Tower, a small (88 rooms) but nice hotel across the street from the Orpheum; (2) the much larger Red Lion Hotel, located about a five-minute walk from the Orpheum; or (3) the Marriott, located in West Omaha about 100 yards from Borsheim's, which is a twenty-minute drive from downtown. We will have buses at the Marriott that will leave at 8:30 and 8:45 for the meeting and return after it ends.

An attachment to our proxy material explains how you can obtain the card you will need for admission to the meeting. With the admission card, we will enclose information about parking facilities located near the Orpheum. If you are driving, come a little early. Nearby lots fill up quickly and you may have to walk a few blocks.

As usual, we will have buses to take you to Nebraska Furniture Mart and Borsheim's after the meeting and to take you from there to downtown hotels or the airport later. Those of you arriving early can visit the Furniture Mart any day of the week; it is open from 10 a.m. to 5:30 p.m. on Saturdays and from noon to 5:30 p.m. on Sundays. Borsheim's normally is closed on Sunday but will be open for shareholders and their guests from noon to 6 p.m. on Sunday, April 24.

In past trips to Borsheim's, many of you have met Susan Jacques. Early in 1994, Susan was made President and CEO of the company, having risen in 11 years from a \$4-an-hour job that she took at the store when she was 23. Susan will be joined at Borsheim's on Sunday by many of the managers of our other businesses, and Charlie and I will be there as well.

On the previous evening, Saturday, April 23, there will be a baseball game at Rosenblatt Stadium between the Omaha Royals and the Nashville Sounds (which could turn out to be Michael Jordan's team). As you may know, a few years ago I bought 25% of the Royals (a capital-allocation decision for which I will not become famous) and this year the league has cooperatively scheduled a home stand at Annual Meeting time.

I will throw the first pitch on the 23rd, and it's a certainty that I will improve on last year's humiliating performance. On that occasion, the catcher inexplicably called for my "sinker" and I dutifully delivered a pitch that barely missed my foot. This year, I will go with my high hard one regardless of what the catcher signals, so bring your speed-timing devices. The proxy statement will include information about obtaining tickets to the game. I regret to report that you won't have to buy them from scalpers.

Warren E. Buffett

Chairman of the Board

March 1, 1994

Morning Session - 1994 Meeting

1. Bigger meeting venue needed next year

WARREN BUFFETT: Put this over here.

CHARLIE MUNGER:

WARREN BUFFETT: Am I live yet? Yeah.

Morning.

AUDIENCE: Morning.

WARREN BUFFETT: We were a little worried today because we weren't sure from the reservations whether we can handle everybody, but it looks to me like there may be a couple seats left up there.

But I think next year, we're going to have to find a different spot because it looks to me like we're up about 600 this year from last year, and to be on the safe side we will seek out a larger spot.

Now, there are certain implications to that because, as some of the more experienced of you know, a few years ago we were holding this meeting at the Joslyn Museum, which is a temple of culture. (Laughter)

And we've now, of course, moved to an old vaudeville theater. And the only place in town that can hold us next year, I think, is the Ak-Sar-Ben Coliseum where they have keno and racetracks. (Laughter)

We are sliding down the cultural chain — (laughter) — just as Charlie predicted years ago. He saw all this coming. (Laughter)

2. Buffett loses "Miss Congeniality" title to Munger

WARREN BUFFETT: Charlie — I have some rather distressing news to report. There are always a few people that vote against everyone on the slate for directors and there's maybe a dozen or so people do that. And then there are others that single shot it, and they pick out people to vote against.

And, this will come as news to Charlie, I haven't told him yet. But he is the only one among our candidates for directors that received no negative votes this year. (Applause).

Hold it — hold it. No need to applaud.

I tell you, when you lose out the title of Miss Congeniality to Charlie, you know you're in trouble. (Laughter)

3. Meeting timetable

WARREN BUFFETT: Now, I'd like to tell you a little bit how we'll run this. We will have the business meeting in a hurry with the cooperation of all of you, and then we will introduce our managers who are here, and then we will have a Q&A period.

We will run that until 12 o'clock, at which point we'll break, and then at 12:15, if the hardcore want to stick around, we will have another hour or so until about 1:15 of questions.

So, you're free to leave, of course, any time and I've pointed out in the past that it's much better form if you leave while Charlie is talking rather than when I'm talking, but — (Laughter)

Feel free anytime, but you can — if you're panicked and you're worried about being conspicuous by leaving, you will be able to leave at noon.

We will have buses out front that will take you to the hotels or the airport or to any place in town in which we have a commercial interest. (Laughter)

We encourage you staying around on that basis.

4. Berkshire directors introduced

WARREN BUFFETT: Let's have the — let's get the business of the meeting out of the way. Then we can get on to more interesting things.

I will first introduce the Berkshire Hathaway directors that are present in addition to myself and —

First of all, there's Charlie, who is the vice chairman of Berkshire, and if the rest of you will stand.

We have Susan T. Buffett, Howard Buffett, Malcolm Chase III, and Walter Scott Jr. And that's it. (Applause)

5. Meeting quorum

WARREN BUFFETT: Also with us today are partners in the firm of Deloitte and Touche, our auditors, Mr. Ron Burgess and Mr. Craig Christiansen (PH).

They are available to respond to appropriate questions you might have concerning their firm's audit of the accounts of Berkshire.

Mr. Forrest Krutter, secretary of Berkshire. He will make a written record of the proceedings.

Mr. Robert M. Fitzsimmons has been appointed inspector of election at this meeting. He will certify to the count of votes cast in the election for directors.

The named proxy holders for this meeting are Walter Scott Jr. and Marc D. Hamburg.

Proxy cards have been returned through last Friday representing 1,035,680 Berkshire shares to be voted by the proxy holders as indicated on the cards. That number of shares represents a quorum and we will therefore directly proceed with the meeting.

We will conduct the business of the meeting and then adjourn to the formal meeting — and then adjourn the formal meeting. After that, we will entertain questions that you might have.

First order of business will be a reading of the minutes of the last meeting of shareholders.

I recognize Mr. Walter Scott Jr. who will place a motion before the meeting.

WALTER SCOTT: I move that the reading of the minutes of the last meeting of the shareholders be dispensed with.

WARREN BUFFETT: Do I hear a second?

VOICES: Seconded.

Motion has been moved and seconded. Are there any comments or questions? Hearing none, we will vote on the motion by voice vote. (Laughter)

All those in favor say aye.

VOICES: Aye.

WARREN BUFFETT: Opposed? The motion is carried and it's a vote.

Does the secretary have a report of the number of Berkshire shares outstanding entitled to vote and represented at the meeting?

FORREST KRUTTER: Yes, I do. As indicated in the proxy statement that accompanied the notice of this meeting that was sent by first class mail to all shareholders of record on March 8, 1994, being the record date for this meeting, there were 1,177,750 shares of Berkshire common stock outstanding, with each share entitled to one vote on motions considered at the meeting. Of

that number, 1,035,680 shares are represented at this meeting by proxies returned through last Friday.

6. Directors elected

WARREN BUFFETT: Thank you. We will proceed to elect directors.

If a shareholder is present who wishes to withdraw a proxy previously sent in and vote in person, he or she may do so.

Also, if any shareholder that's present has not turned in a proxy and desires a ballot in order to vote in person, you may do so.

If you wish to do this, please identify yourself to meeting officials in the aisles who will furnish a ballot to you.

Would those persons desiring ballots please identify themselves so that we may distribute them? Just raise your hand.

I now recognize Mr. Walter Scott Jr. to place a motion before the meeting with respect to election of directors.

WALTER SCOTT: I move that Warren Buffett, Susan Buffett, Howard Buffett, Malcolm Chase, Charles Munger, and Walter Scott be elected as directors.

WARREN BUFFETT: Is there a second?

VOICE: Seconded.

WARREN BUFFETT: It's been moved and seconded that Warren E. Buffett, Susan T. Buffett, Howard G. Buffett, Malcolm G. Chase III, Charles T. Munger, and Walter Scott Jr. be elected as directors.

Are there any other nominations? Is there any discussion? Motions and nominations are ready to be acted upon.

If there are any shareholders voting in person, they should now mark their ballots and allow the ballots to be delivered to the inspector of elections.

Seeing none, will the proxy holders please also submit to the inspector of elections the ballot voting the proxies in accordance with the instructions they have received.

Mr. Fitzsimmons, when you're ready you may give your report.

ROBERT FITZSIMMONS: My report is ready. The ballot of the proxy holders received through last Friday cast not less than a 1,035,407 votes for each nominee.

That number far exceeds a majority of the number of all shares outstanding and a more precise count cannot change the results of the election.

However, the certification required by Delaware law regarding the precise count of the votes, including the votes cast in person at this meeting, will be given to the secretary to be placed with the minutes of this meeting.

WARREN BUFFETT: Thank you, Mr. Fitzsimmons.

Warren E. Buffett, Susan T. Buffett, Howard G. Buffett, Malcolm G. Chase III, Charles T. Munger, and Walter Scott Jr. have been elected as directors. (Applause)

7. Formal meeting adjourns

WARREN BUFFETT: Does anyone have any further business to come before this meeting before we adjourn?

If not, I recognize Mr. Walter Scott Jr. to place a motion before the meeting.

WALTER SCOTT: I move the meeting be adjourned.

WARREN BUFFETT: Second?

VOICES: Seconded.

The motion to adjourn has been made and seconded. We will vote by voice. Is there any discussion? If not, all in favor say aye?

VOICES: Aye

WARREN BUFFETT: Opposed say no, the meeting is adjourned. (Laughter)

It's democracy in Middle America. (Laughter)

8. Berkshire managers introduced

WARREN BUFFETT: Now, I'd like to introduce some of the people that make this place work to you. And if you would hold your applause until the end because there are quite a number of our managers here.

I'm not sure which ones for sure are here, some of them may be out tending the store as well.

But, first of all, from Nebraska Furniture Mart, Louie, Ron, and Irv Blumkin. I'm not sure who's here, but would you stand please, any of the Blumkins that are present?

OK, we've — looks like Irv. I can't quite see it.

From Borsheims, is Susan Jacques here? Susan? There she is. Susan had a record day yesterday. She just — (applause) — Susan became CEO just a few months ago and she's turning in records already. Keep it up. (Laughter)

And from Central States Indemnity, we have the Kizers. I'm not sure which ones are here, but there's Bill Sr., Bill Jr., John, and Dick.

Kizers, stand up. I think I can see him — John.

Don Wurster from National Indemnity.

Rod Eldred from the Homestate Companies.

Brad Kinstler from Cypress, our worker's comp company.

Ajit Jain, the big ticket writer in the East.

And Mike Goldberg, who runs our real estate finance group and also generally oversees the insurance group. Mike.

Gary Heldman from Fechheimers.

Chuck Huggins from See's, the candy man.

Stan Lipsey from the Buffalo News.

Chuck's been with us, incidentally, twenty-odd years. Stan's been working with me for well over 25 years.

Frank Rooney and Jim Issler from H.H. Brown.

Dave Hillstrom from Precision Steel.

Ralph Schey from Scott Fetzer.

Peter Lunder, who is with our newest acquisition, Dexter Shoe. And Harold Alford, his partner, couldn't be with us because his wife is ill.

And finally, the manager that's been with Charlie and me the longest, Harry Bottle from K&W. Harry, you here? There's Harry.

Harry saved our bacon back in 19 — what? — 62 or so, when in some mad moment I went into the windmill business. And Harry got me out of it. (Laughter)

That's our group of managers and I appreciate it if you give them a hand. (Applause)

9. Midwest Express adding flights to Omaha

WARREN BUFFETT: I have one piece of good news about next year for you.

In addition to moving to larger quarters, they're going to add nonstop air service from New York, Washington, and Los Angeles here in the next few months, Midwest Express.

So, I hope they do very well with it and I hope that makes it easier for you to get into town.

10. Q&A logistics

WARREN BUFFETT: Now, in this — for the next two hours and 15 minutes or so, we'll have a session where we will take questions.

We have seven zones, three on the main floor. We'll go start over there with zone one and work across.

On the main floor, if you'll raise your hand, the person who is handling the mic will pass it to you and we'll try to not repeat any individual in any one zone till everyone in that zone has had a chance to ask one question. So, after you've been on once, let other people get a shot.

When we move up to the loge, we have one person there and in the case — and then we have three in the balcony, which is essentially full now.

And we would, up there, we would appreciate it if you would you leave your seat and go to the person with the mic. It'll be a little easier in both the loge and the balcony to handle it that way.

And if you'll go a little ahead of time, that way if there's a line of two or three you can you can line up for questions in both the loge and balcony.

So, whatever you'd care to ask. If you want an optimistic answer you'll, of course, direct your question to Charlie. If you'd like a little more realism you'll come to me and — (laughter).

11. Derivatives: dangerous combination of "ignorance and borrowed money"

WARREN BUFFETT: Let's start over in zone 1.

Sometimes we can't see too well from up here, but —

In fact, I can't even see the monitor right now, but do we have one over there?

And if you'll identify yourself by name and your hometown, we'd appreciate it.

AUDIENCE MEMBER: My name is Michael Mullen (PH) from Omaha.

Would you comment on the use of derivatives? I noticed that Dell computer stock was off 2 1/2 points Friday with the loss of derivatives.

WARREN BUFFETT: Question is about derivatives. We have in this room the author of the best thing you can read on that. There was an article in Fortune about a month ago or so by Carol Loomis on derivatives, and far and away it's the best article that has been written.

We also have some people in the room that do business in derivatives from Salomon.

And it's a very broad subject. It — as we said last year, I think someone asked what might be the big financial story of the '90s and we said we obviously don't know, but that if we had to pick a topic that it could well be derivatives because they lend themselves to the use of unusual amounts of leverage and they're sometimes not completely understood by the people involved.

And any time you combine ignorance and borrowed money — (laughter) — you can get some pretty interesting consequences. (Laughter)

Particularly when the numbers get vague. And you've seen that, of course, recently with the recent Procter and Gamble announcement.

Now, I don't know the details of the P&G derivatives, but I understand, at least from press reports, that what started out as interest rate swaps ended up with P&G writing puts on large quantities of U.S. and, I think, one other country's bonds. And any time you go from selling soap to writing puts on bonds, you've made a big jump. (Laughter)

And it — the ability to borrow enormous amounts of money combined with a chance to get either very rich or very poor very quickly, has historically been a recipe for trouble at some point.

Derivatives are not going to go away. They serve useful purposes and all that, but I'm just saying that it has that potential. We've seen a little bit of that.

I can't think of anything that we've done that would — can you think of anything we do that approaches derivatives, Charlie? Directly?

CHARLIE MUNGER: No. (Laughter)

WARREN BUFFETT: I may have to cut him off if he talks too long. (Laughter)

Is there anything you would like to add to your already extensive remarks? (Laughter)

CHARLIE MUNGER: No. (Laughter)

WARREN BUFFETT: OK.

12. Berkshire participated in Cap Cities stock buyback

WARREN BUFFETT: In that case we'll go to zone 2. (Laughter)

AUDIENCE MEMBER: My name is Hugh Stevenson (PH). I'm a shareholder from Atlanta.

My question involves the company's investment in the stock of Cap Cities. It's been my understanding in the past that that was regarded as one of the four, quote unquote, "permanent" holdings of the company.

So I was a little bit confused by the disposition of one million shares. Could you clarify that? Was my previous misunderstanding — was my previous understanding incorrect? Or has there been some change or is there a third possibility?

WARREN BUFFETT: Well, we have classified the Washington Post Company and Cap Cities and GEICO and Coke in the category of permanent holdings. And —

But in the case of three of those four, The Washington Post Company, I don't know, maybe seven or eight years ago, GEICO some years back, and now Cap Cities, we have participated in tenders where the company has repurchased shares.

Now the first two, the Post and GEICO, we participated proportionally. That was not feasible, and incidentally, not as attractive taxwise anymore.

The 1968 Tax Act changed the desirability of proportional redemptions of shares, from our standpoint. That point has been missed by a lot of journalists in commenting on it, but it just so happens that the commentary that has been written has been obsolete, in some cases, by six or seven years.

But, we did participate in the Cap Cities tender offer, just as we did in the Post and GEICO.

We still are, by far, the largest shareholder of Cap Cities. We think it's a superbly run operation in a business that looks a little tougher than it did 15 years ago, but looks a little bit better than it did 15 months ago.

Charlie, you have anything?

CHARLIE MUNGER: Uh, no. (Laughter)

WARREN BUFFETT: He's thinking it over now though before — (Laughter)

13. Unlikely we'd buy company with no current cash flow

WARREN BUFFETT: Zone 3.

AUDIENCE MEMBER: Good morning. My name is Howard Bask (PH) and I'm from Kansas City. And I've got a theoretical value question for you.

If you were to buy a business and you bought it at its intrinsic value, what's the minimum after-tax free cash flow yield you'd need to get?

WARREN BUFFETT: Well, your question is if we were buying all of a business and we're buying at what we thought was intrinsic value, what was the minimum —

AUDIENCE MEMBER: Correct.

WARREN BUFFETT: — present earning power or what the present — the minimum discount rate of future streams?

AUDIENCE MEMBER: No, what's the minimum current after-tax free cash flow yield you'd...

WARREN BUFFETT: We could conceivably buy a business — I don't think we would be likely to — but we could we could conceivably buy a business that had no current after-tax cash flow. But, we would have to think it had a tremendous future.

But we would not find — obviously the current figures, particularly in the kind of businesses we buy, tend to be representative, we think, of what's going to happen in the future.

But that would not necessarily have to be the case. You can argue, for example, in buying stocks, we bought GEICO at a time when it was losing significant money. We didn't expect it to continue to lose significant money.

But if we think the present value of the future earning power is attractive enough compared to the purchase price, we would not be overwhelmed by what the first year's figure would be.

Charlie, you want to add to that?

CHARLIE MUNGER: Yeah. We don't care what we report in the first year or two of — after buying anything.

AUDIENCE MEMBER OFF MIC: (INAUDIBLE) on average over the years (INAUDIBLE).

WARREN BUFFETT: Well, I would say that in a world of 7 percent long-term bond rates that we would certainly want to think we were discounting future after-tax streams of cash at at least a 10 percent rate.

But that will depend on the certainty we feel about the business. The more certain we feel about a business, the closer we are willing to play it.

We have to feel pretty certain about any business before we're even interested at all. But there are still degrees of certainty, and —

If we thought we were getting a stream of cash over the next 30 years that we felt extremely certain about, we would use a discount rate that would be somewhat less than if it was one where we thought we might get some surprises in five or 10 years — possibility existed. Charlie?

CHARLIE MUNGER: Nothing to add.

14. Insurance business intrinsic value is well above book value

WARREN BUFFETT: OK. Zone 4.

AUDIENCE MEMBER: Morris Spence (PH) from Omaha, Nebraska.

You've made comments on several occasions about the intrinsic business value of the insurance operations. And in this year's report you state that the insurance business possesses an intrinsic value that exceeds book value by a large amount, larger, in fact, than is the case at any Berkshire — other Berkshire business.

I was wondering if you would explain in greater detail why you believe that to be true.

WARREN BUFFETT: Well, I — it's very hard to quantify, as we've said many times in the report. But, I think that it's clear that even taking fairly pessimistic assumptions, that the excess of intrinsic value over carrying value is higher, by some margin, for the insurance business.

And I think that the table in the report that shows you what our cost to float has been over the years, and also what the trend of float has been over the years, would, unless you thought that table had no validity for the future, I think that that table would tend to the point you in the direction of saying the insurance business does have a very significant excess of intrinsic value over carrying value.

Very hard number to put something on. But — and you don't want to extrapolate that table out. But I think that table shows that we started with maybe 20 million of float and that we're up to something close to three billion of float. And that that float has come to us at a cost that's extremely attractive, on average, over the years.

And just to pick an example, last year, when we actually had an underwriting profit, the value of that float was something over \$200 million. And that figure was a lot bigger than it was 10 years ago or 20 years ago.

So that's — that is a stream — last year was unusually favorable, but that is a — that's a very significant stream of earnings, and it's one we feel we have reasonably good prospects in. So we feel very good about the insurance business.

15. Why Berkshire doesn't split its stock

WARREN BUFFETT: OK. Zone 5?

AUDIENCE MEMBER: My name is Cy Rademacher (PH) from Omaha.

Is there any point at which your stock would rise to the point where you might split the stock?

WARREN BUFFETT: Surprise, surprise. (Laughter)

I think I'll let Charlie answer that this year. (Laughs)

He's so popular with the shareholders that I can afford to let him take the tough questions. (Laughter)

CHARLIE MUNGER: I think the answer is no. (Laughter and applause)

I think the idea of carving ownerships in an enterprise into little, tiny \$20 pieces is almost insane. And it's quite inefficient to service a \$20 account and I don't see why there shouldn't be a minimum as a condition of joining some enterprise. Certainly we'd all feel that way if we were organizing a private enterprise.

WARREN BUFFETT: Yeah, we would not carve it up in \$20 units.

We find it very — it's interesting because every company finds a way to fill up its common shareholder list. And you can start with the As and work through to the Zs and you'll — every company in the New York Stock Exchange, one way or another, has attracted some constituency of shareholders.

And frankly, we can't imagine a better constituency than is in this room. I mean, we have — we don't think we can improve on this group, and we followed certain policies that we think attracted certain types of shareholders and actually pushed away others.

And that is part of our eugenics program here at Berkshire. (Laughter)

CHARLIE MUNGER: Yeah, just look around this room and as you mingle with one another. This is a very outstanding group of people. And why would anybody want a different kind of a group?

WARREN BUFFETT: Yeah, if we cause — if we follow some policies that cause a whole bunch of people to buy Berkshire for the wrong reason, the only way they can buy it is to replace somebody in this room, or in this larger metaphorical room, of shareholders that we have.

So someone in one of these seats gets up and somebody else walks in. The question is do we have a better audience?

I don't think so. So I think that — I think Charlie said it very well.

16. Buffett is keeping his private jet

WARREN BUFFETT: Zone 6.

AUDIENCE MEMBER: Mr. Buffett, my name is Rob Na (PH) and I'm from Omaha, Nebraska.

My question is, given the recent announcement of Midwest Express and their nonstop jet service between East and West Coasts, will this cut down on your use of "The Indefensible?" (Laughter)

And will you use more commercial air travel?

WARREN BUFFETT: This is a question planted by Charlie. (Laughter)

I think you should know, I take it to the drugstore at the moment, and I — (Laughter)

No, it's just a question when I start sleeping in it at the hangar.

Nothing will cut back on "The Indefensible." It's being painted right now, but I told them to make it last a long time.

Charlie, though, was pointing out the merits of other kinds of transportation last night at the meeting of our managers. He might want to repeat those here.

CHARLIE MUNGER: Well, I just pointed out that the back of the plane arrived at the same time as the front of the plane, invariably. (Laughter)

WARREN BUFFETT: He's even more of an authority on buses, incidentally, if anybody has his — (Laughter)

17. Buffett's next goal in life

WARREN BUFFETT: Zone 7.

AUDIENCE MEMBER: Mr. Buffett, my name's Allan Maxwell from Omaha. I've got two questions.

What is your next goal in life now that you're the richest man in the country?

WARREN BUFFETT: That's easy. It's to be the oldest man in the country. (Laughter and applause)

18. "Two yardsticks" for judging management

AUDIENCE MEMBER: Secondly, you talk about good management with corporations and that you try and buy companies with good management.

I feel that I have about as much chance of meeting good managers, other than yourself, as I do bringing Richard Nixon back to life.

How do I, as an average investor, find out what good management is?

WARREN BUFFETT: Well, I think you judge management by two yardsticks.

One is how well they run the business and I think you can learn a lot about that by reading about both what they've accomplished and what their competitors have accomplished, and seeing how they have allocated capital over time.

You have to have some understanding of the hand they were dealt when they themselves got a chance to play the hand.

But, if you understand something about the business they're in — and you can't understand it in every business, but you can find industries or companies where you can understand it — then you simply want to look at how well they have been doing in playing the hand, essentially, that's been dealt with them.

And then the second thing you want to figure out is how well that they treat their owners. And I think you can get a handle on that, oftentimes. A lot of times you can't. I mean it — they're many companies that obviously fall in — somewhere — in that 20th to 80th percentile and it's a little hard to pick out where they do fall.

But, I think you can usually figure out — I mean, it's not hard to figure out that, say, Bill Gates, or Tom Murphy, or Don Keough, or people like that, are really outstanding managers. And it's not hard to figure out who they're working for.

And I can give you some cases on the other end of the spectrum, too.

It's interesting how often the ones that, in my view, are the poor managers also turn out to be the ones that really don't think that much about the shareholders, too. The two often go hand in hand.

But, I think reading of reports — reading of competitors' reports — I think you'll get a fix on that in some cases. You don't have to — you know, you don't have to make a hundred correct judgments in this business or 50 correct judgments. You only have to make a few. And that's all we try to do.

And, generally speaking, the conclusions I've come to about managers have really come about the same way you can make yours. I mean they come about by reading reports rather than any intimate personal knowledge or — and knowing them personally at all.

So it — you know, read the proxy statements, see what they think of — see how they treat themselves versus how they treat the shareholders, look at what they have accomplished, considering what the hand was that they were dealt when they took over compared to what is going on in the industry.

And I think you can figure it out sometimes. You don't have to figure out very often.

Charlie?

CHARLIE MUNGER: Nothing to add.

19. How Berkshire keeps great managers

WARREN BUFFETT: Ok, we're back to zone 1.

AUDIENCE MEMBER: Hi there. My name is Lee. I'm from Palo Alto, California.

In meeting Ajit Jain, I've been very impressed over the years. And I think I even met his parents once they came from India.

Please comment on your deepest impressions of his personality and managerial skills, and also how you go about exactly keeping somebody who has such fine skills within the fold. He might go to Walt Disney someday and, you know, pull down 200 million.

WARREN BUFFETT: Well, if he gets offered 200 million — (laughs) — we may not compete too vigorously at that level. (Laughter)

We basically try to run a business so that — Charlie and I have two jobs. We have to identify and keep good managers interested after we've figured out who they are.

And that often is a little different here, because I would say a majority of our managers are financially independent, so that they don't go to work because they are worried about putting kids through school or putting food on the table. So they have to have some reason to go to work aside from that.

They have to be treated fairly in terms of compensation, but they also have to figure it is better than playing golf every day or whatever it may be.

And, so that's one of the jobs we have and we basically attack that the same way — we look at what they do the same way we look at what we do.

We've got a wonderful group of shareholders. Before I ran this, I had a partnership. I had a great group of partners. And essentially, I like to be left alone to do what I did. I like to be judged on the scorecard at the end of the year rather than on every stroke, and not second guessed in a way that was inappropriate.

I like to have people who understood the environment in which I was operating.

And so the important thing we do with managers, generally, is to find the .400 hitters and then not tell them how to swing, as I put in the report.

The second thing we do is allocate capital. And aside from that, we play bridge. (Laughter)

Pretty much what happens at Berkshire.

So, with any of the managers you might name here, we try to make it interesting and fun for them to run their business. We try to have a compensation arrangement that's appropriate for the kind of business they're in.

We have no company-wide compensation plan. We wouldn't dream of having some compensation expert or consultant come in and screw it up. (Laughter)

We try to — some businesses require a lot of capital that we're in, some require no capital. Some are easy businesses where good profit margins are a cinch to come by, but we're really paying for the extra beyond that. Some are very tough businesses to make money in.

And it would be crazy to have some huge framework that we try to place everybody in that — where one size would fit all.

People, generally, are compensated relating in some manner that relates to how their business does as opposed to — there's no reason to pay anybody based on how Berkshire does, because no one has responsibility for Berkshire except for Charlie and me.

And we try to make them responsible for their own units, compensated based on how those units do.

We try to understand the businesses they're in, so we know what the difference between a good performance and a bad performance —

And that's about — that's how we work with people.

We've had terrific luck over the years in retaining the managers that we wanted to retain. I think, largely, it's because — particularly if they sell us a business — to a great extent, the next day they're running it just as they were the day before. And they're having as much fun running their business as I am running Berkshire.

Charlie?

CHARLIE MUNGER: Well, I've got nothing to add, but I think that concept of treating the other fellow the way you'd like to be treated if the roles were reversed — it's so simple, when you stop to think about it, but —

It's a rare evening when Ajit and Warren aren't talking once on the phone. It's more than a business relationship, at least it seems that way to me.

WARREN BUFFETT: Yeah, well, it is. It will stay that way, too.

CHARLIE MUNGER: And by the way, we like our businesses — our relationships — to be more than a business relationship

WARREN BUFFETT: Charlie and I are very — we basically — it's a luxury but it's a luxury that we should try to nurture — we get to work with people we like. And it makes life a lot simpler.

It probably helps in that goal of being the oldest living American, too. (Laughter)

CHARLIE MUNGER: Yeah, and we tend to like people we admire. (Laughter)

WARREN BUFFETT: Yeah, who do we like that we don't admire, Charlie? (Laughter)

Start naming names. These people have names. (Laughter)

20. Guinness hurt by weak demand for scotch

WARREN BUFFETT: Zone 2.

AUDIENCE MEMBER: My name is Peter Bevelin from Sweden.

How do you perceive Guinness long-term, economics growth-wise?

WARREN BUFFETT: Fitz — would you repeat that please, Fitz. What was it? What firm growth-wise?

VOICE: Guinness.

AUDIENCE MEMBER: Guinness.

WARREN BUFFETT: Oh, Guinness.

I'm not as much of an expert on Guinness' products as Charlie is.

CHARLIE MUNGER: We approved that. (Laughter)

WARREN BUFFETT: You didn't hear him. He said, "I approved that."

I made the decision to buy Guinness and Guinness has — it's down somewhat from — actually, the price in pounds is about the same but the pound is at about \$1.46 or -7 against an average of \$1.80-something, so we've had a significant exchange loss on that.

The — Guinness' — despite the name — you know, the main product, of course, is scotch. And that's where most of the money is made, although they make good money in brewing.

But, distilling is the main business. And, you know, the usage of scotch, particularly in this country, the trends have not been strong at all, but that was true when we bought it, too.

There are some countries around the world where it's grown and there are certain countries where it's a huge prestige item.

I mean, in certain parts of the Far East, the more you pay for scotch, the better you think people think of you. Which I don't understand completely, but I hope it continues. (Laughter)

But — the scotch — worldwide scotch consumption has not been anything to write home about.

Guinness makes a lot of money in the business. But, I would not — I don't see anything in the — in published history that would lead you to believe that the growth prospects, in terms of physical volume, are high for scotch.

The — Guinness itself, the beer, actually has shown pretty good growth rates in some countries. Actually, from a very tiny base in the U.S. as well.

But, they will have to do well in distilling or — I mean that will govern the outcome of Guinness.

I think Guinness is well run and it's a very important company in that business. But, I wouldn't count on a lot of physical growth.

Charlie, what — any consumer insights?

CHARLIE MUNGER: No. (Laughter)

21. Why Berkshire will be OK if Buffett dies suddenly

WARREN BUFFETT: Zone 3.

AUDIENCE MEMBER: Mr. Buffett, my name is Arthur Coleus (PH) from Canton, Massachusetts.

And I'd like to know how you'd respond to the question that my associates ask me when they say that Berkshire Hathaway has been a good investment up to now, but what happens to your investment if, God forbid, something happens to Mr. Warren Buffett?

WARREN BUFFETT: Well, I'm glad you didn't say Charlie Munger. (Laughter)

No, there — Berkshire will do just fine. We've got a wonderful group of businesses.

I've told you the two things I do in life. And, in terms of the managers we have, you have to come in and really want to mess it up, I would think. And we don't have anybody like that, in terms of succession plans at Berkshire.

And then there's the question of allocation of capital. And, you could do worse than just adding it to some of the positions that we already had.

The ownership is — if I die tonight, the ownership structure does not change. So, you've the same large block of stock that has every interest in having good successor management as I would.

I mean, there's no — there would be no greater interest. And it is not a complicated business. I mean, you ought to worry more about, if you own Microsoft, about Bill Gates, I think, or something of the sort.

But, this place is, you know, we've got a group down here that are running these. You didn't see me out at Borsheims selling any jewelry the other day. I mean, that's somebody else's job. So, I — it is not — it's not very complicated.

Incidentally, I think I'm in pretty good health. I mean this stuff (Coca-Cola) will do wonders for you if you'll just try it. (Laughter)

Charlie, do you want to add anything as the —?

CHARLIE MUNGER: Yeah. I think the prospects of Berkshire would be diminished — obviously diminished — if Warren were to drop off tomorrow morning. But it would still be one hell of a company and I think it would still do quite well.

I used to do legal work, when I was young, for Charlie Skouras. I heard him once say, my business, which was movie theaters like this one, was off 25 percent last year, and last year was off 25 percent from the year before, and that was off 25 percent from the year before, and then he pounded the table and he'd say, "But it's still one hell of a business."

WARREN BUFFETT: It's not a formula we want to test, incidentally.

CHARLIE MUNGER: No, no. (Laughter)

WARREN BUFFETT: It is one hell of a business that we've got here. I mean — and if you saw what happened at Berkshire headquarters, you would not worry as much. There's very little going on there that contributes to things. (Laughter)

We're, right now, at our peak of activity. This is it.

22. Easy answer: no reverse split, either

WARREN BUFFETT: Zone 4.

AUDIENCE MEMBER: First of all, my name is Al Martin (PH) and my wife Terry (PH) is here with me. And I appreciate the invitation to attend this meeting.

I was a little bit dubious and quite excited at that game Saturday night. I didn't know which side was going to throw the game to the other one. But I did find out at the end.

The first question, actually, was somewhat answered, but not fully. Has the board considered a reverse split? My experience has been that —

WARREN BUFFETT: Would you like to make that a motion? There was a motion for a reserve — reverse split. (Laughter)

AUDIENCE MEMBER: I would say a two-for-one because if it were three or four-for-one I might end up with no shares. Or fractional shares.

But, anyway, my experience has been that all of the stocks that have split have gone down in the next two or three months or the next two or three years, including one which you are drinking, which is a flat Coke.

Also, I have observed Merck over the last several years to be hitting a low, which split three-for-one.

So, I think that, you know, the reasons for splitting stocks are to make it affordable. I found that every stock I ever bought was never affordable. I found the reason I bought it was because I couldn't afford not to buy it.

So that's a different philosophy, I guess, as somewhat shared indirectly with the boards running the stock.

The second question, which is — has to do with —

WARREN BUFFETT: Hope it's as easy as the first question. (Laughter)

AUDIENCE MEMBER: Well, I didn't want to wait for an answer of the first question for that reason, because it could be complicated and confusing and so forth.

23. Hillary Clinton's success as commodities trader

AUDIENCE MEMBER: The second question has to do with, could the board consider looking into a commodity broker, or a lawyer, or both, that could take action similar to Hillary Clinton's?

I think, you know, making your net worth go up by a factor of five overnight is more than enticing. Some of us might even want to wait for ten months to get a 100-to-1 return on the money.

WARREN BUFFETT: Well, I want to say — I want to say to you, when I saw that 530 percent in one day, it — Charlie has never done that for us.

I mean — (laughter) — it really caused me to reassess succession plans at Berkshire. (Laughter)

And Hillary may be free in a few years. (Laughter and applause)

I hope you're applauding over her coming to Berkshire, not — but I'll leave that up — (Laughter)

OK, that was their second question. (Laughs)

AUDIENCE MEMBER: That was my second question.

Of course, in my experience, it's been that most of us have thought through this situation and I guess it's pretty speculative, but I found out that the rules and laws that are made for trading are interpreted rather than enforced. And I think that applied to this particular case, so let's go on to the third question. (Laughter)

WARREN BUFFETT: Alright. They're getting easier. (Laughter)

24. Blue Chip Stamps is a disaster under Buffett and Munger

AUDIENCE MEMBER: This one is real easy. My wife was a collector of Blue Chip stamps for many, many years. And she brought some stamps with her. What should she do with them?

WARREN BUFFETT: Well, that — we can give you a definitive answer to that. Charlie and I entered the trading stamp business to apply our wizardry to it in what, 1969 or so, Charlie?

CHARLIE MUNGER: Yes.

WARREN BUFFETT: We were doing what then, about 110 million?

CHARLIE MUNGER: No, it went up to 120.

WARREN BUFFETT: OK. And then we arrived on the scene and we're going to do what, about 400,000 this year?

CHARLIE MUNGER: Yes.

WARREN BUFFETT: Yeah. (Laughter)

That shows you what can be done when your management gets active. (Laughter)

CHARLIE MUNGER: We have presided over a decline of 99 1/2 percent. (Laughter)

WARREN BUFFETT: Yeah. Yeah. But, we're waiting for a bounce — (Laughter)

I would say this. The trading stamp business, as those of you who have followed all know, it only works because of the float.

I mean, there — a very, very high percentage of the stamps in the '60s were cashed in. We have some years that we've gone up to 99 percent, I believe — we sampled the returns — because they were given out in such quantity.

But, our advice to anyone who has stamps is to save them because they're going to be collector's items, and besides if you bring them to us we have to give you merchandise for them.

Tell her to keep them. They'll do nothing but gain in value over years. (Laughter)

25. Stock split wouldn't raise long-term average price

WARREN BUFFETT: Going back, incidentally, to your point on the split.

I think most people think that the stock would sell for more money split.

A, we wouldn't necessarily think that was advisable in the first place.

But we — in the second place, we don't think it would necessarily be true over a period of time.

We think our stock is more likely to be rationally priced over time following the present policies than if we were to split it in some major way.

And we don't think the average price would necessarily be higher. We think that the volatility would probably be somewhat greater, and we see no way that volatility helps our shareholders as a group.

26. Fed Chairman Greenspan's actions are "quite sound"

WARREN BUFFETT: Zone 5.

AUDIENCE MEMBER: I am Peg Gallagher from Omaha.

Mr. Buffett, are you interested in influencing Mr. Greenspan at the Fed to stop raising interest rates?

WARREN BUFFETT: Well, I wouldn't have any influence with him. He was on the board of Cap Cities some years ago and I know him a bit. But I don't think anyone would have any influence with Mr. Greenspan on that point.

But, I generally think that his actions have been quite sound during his period as Fed chief.

I mean, it's part of the job of the Fed, as Mr. Martin said many years ago, was to take away the punchbowl at the party, occasionally. And that's a very difficult, difficult policy to quantify working with markets day-by-day.

And, of course, it's always been the job of the Fed, basically, to lean against the wind. Which, of course, means if the wind changes, you fall flat on your face. But that's another question.

But the — I don't — I think what he has done is probably been somewhat appropriate. I think he's probably been surprised, a little bit, as to what has happened with long-term rates as he's nudged up short-term rates.

I think he was hoping that — this is just a guess on my part — that action, sort of early in the cycle on the short-term rate front, would — might make people feel more confident about the longer-term rates and therefore that the yield curve would flatten some. I don't know that. And, he may have been a little surprised on that.

But it's not an easy job he has. So, I would not second guess him myself.

Charlie, how do you feel about him?

CHARLIE MUNGER: Fine. (Laughter)

WARREN BUFFETT: Greenspan is safe. (Laughter)

27. Don't pay attention to what people say about stocks

WARREN BUFFETT: Zone 6.

MILLER: Mr. Buffett, I'm Lee Miller (PH) from St Louis.

There was an article in the April 18th Barron's that attempted to calculate the value behind each Berkshire Hathaway share.

I'm sure you have some views on that and I'd be very interested in your perspective on that issue.

WARREN BUFFETT: Yeah, there was an article about a week or so ago in Barron's. The same fellow wrote an article about four years ago reaching pretty much the same conclusion, and I hope he hasn't been short in between, but the — (Laughter)

I would say this. It is not the way I would calculate the intrinsic value of Berkshire.

But everyone in securities markets make choices on that. Every day somebody sells a few shares of Berkshire and someone sell — buys — and, you know, they are probably coming to differing opinions about valuation.

I would say that I found it strange that apparently he forgot we were in the insurance business, but that — that's not — (Applause).

It really doesn't make any difference. I mean, what — we don't pay any attention to what people say about Coca-Cola stock or Gillette stock or any of those things.

I mean, on any given day, two million shares of Coca-Cola may trade. That's a lot of people selling, a lot of people buying. If you talk to one person, you'd hear one thing, and you'd talk to another — you really should not make decisions in securities based on what other people think.

If you're doing that, you should think about doing something else, because it's —

A public opinion poll will just — it will not get you rich on Wall Street. So you really want to stick with businesses that you feel you can somehow evaluate yourself.

And, I don't think — I mean Charlie and I, we don't read anything about what business is going to be — the economy is going to do, or the market's going to do, or what anybody —

Anytime I see some article that says, you know, these analysts say this or that about some business, it just — it doesn't mean anything to us.

You cannot get rich with a weather vane.

28. Judge bank stock buybacks on case-by-case basis

WARREN BUFFETT: Zone 7.

AUDIENCE MEMBER: I'm Edward Barr from Lexington, Kentucky, and I'd like to ask, given the amount of capital in the banking industry, do you think that more banks should be buying back significant amounts of their stock, like SunTrust, versus just the token amounts that they're buying back or just the authorized amounts?

And then also, related question in banking. Are they — are banks too focused on goodwill amortization when declining to buy other banks for cash, thereby using purchase accounting versus the normal practice in the industry of pooling accounting even when the stock they issue may be depressed or undervalued?

WARREN BUFFETT: Well, the first question about the capital in the industry — that — you really have to look at that on a bank-by-bank basis and there is a lot more repurchasing of shares by banks taking place.

You mentioned SunTrust, but National City is — they bought it back, I think, 5 percent of their — National City of Cleveland — bought back 5 percent of their stock in the first quarter.

There's much more repurchasing going on, and that's simply a judgment call by management that — as to the level of capital they need going forward, and what level of capital enables them to earn the return on equity that they think appropriate and whether they — what they feel like paying for their own shares.

So, I think you have to look at that on case-by-case.

We certainly like it, if we were to own a bank, we would — or own shares in a bank — we would like the idea of the bank repurchasing its stock at a price that we thought was attractive. We would think that they probably knew more about their own bank than some other bank they were going to buy and that if the numbers are right, it's an attractive way to use capital.

29. We don't pay attention to accounting of a transaction

WARREN BUFFETT: Your second question about goodwill amortization and purchase accounting versus pooling: we care not — at Berkshire, it absolutely makes no difference to us what accounting treatment we get on something. We are interested in the economics of a transaction.

Some banks — some businesses generally, most businesses perhaps — prefer pooling because they don't like to take a goodwill amortization charge.

We think our shareholders are smart enough, particularly if we make it clear to them — the accounting consequences — we think they're smart enough to look through to the economic reality of what Berkshire's businesses are all about.

And I think that some managements sell short their own ownership group by doing various kinds of financial acrobatics in order to have the charges come in a certain way rather than, as you point out, often they might be better off buying for cash rather than using their own stock as currency, but they may prefer to use their own stock because they avoid goodwill charges.

We've written a few things on goodwill in the past and past annual reports that might get to that subject.

We don't care what accounting — we sort of rewrite the accounting for any business that we're looking at, because in our heads we want to have, in effect, a standardized way of looking at businesses.

And if one company goes through pooling transactions and another goes through purchase transactions, we're going to recast them in our own minds so that there is comparability.

Charlie?

CHARLIE MUNGER: Yeah, the published accounting results are in accordance with standard convention and they're a place to start economic analysis. The figures are frequently quite silly on a functional basis. I'm not criticizing accounting conventions except for some. (Laughter)

WARREN BUFFETT: Yeah.

CHARLIE MUNGER: But, I think it's just a place to start thinking about economic reality.

By their nature, they can't tie perfectly — they can't even tie very well — to economic reality.

WARREN BUFFETT: We regard it is a negative when we find a management that's preoccupied with accounting considerations. But, we find it so frequent that we can't afford to use it as a total exclusionary factor.

It really surprises me how many managements focus on accounting, and the time they spend on it, the — it's really unproductive.

If you find a management that doesn't care about the accounting but does explain to you in clear terms what's going on, I think you should regard that as a plus in owning a security.

30. Buffett praises new Salomon Brothers management

WARREN BUFFETT: Zone 1.

AUDIENCE MEMBER: Mr. Buffett, my name is Bill Ackman. I'm from New York City. And my question relates to the appeal of Salomon Brothers as an investment.

You talked earlier about leverage and the dangers of leverage. Salomon is a business which is levered 30-to-1, which has very narrow margins, and earns a relatively modest return on equity, in light of the amount of leverage that they use. What is the appeal of the business to you?

WARREN BUFFETT: We have here today the chief executive of Salomon, Inc., the parent company, and also the chief executive of Salomon Brothers, the investment banking arm.

And, I would say one of the things we — Charlie and I — feel extraordinarily good about are the two fellows that are running that operation. They did an exceptional job under extraordinarily difficult circumstances, as did John Macfarlane, who's also here today.

The three of them — I mentioned four people in the annual report — and Salomon wouldn't be here today without those three. And it wouldn't be the company in the future that it's going to be without them. They did an absolutely fabulous job.

It's the sort of business that, as you point out, uses a lot of leverage. It doesn't — in one way it doesn't use as much as it looks like and in another way it uses even more than it looks like.

But — it — the test will be: A, whether they control that business in a way that that leverage does not prove dangerous, and secondly, what kind of returns on equity they earn while using it.

You certainly should expect to earn somewhat higher returns on equity when you are necessarily exposed to a small amount of systemic risk and significant amounts of borrowed money, than you would in a business that's an extremely plain vanilla business.

But, I don't know whether you've met Bob and Deryck, but, I think you'd feel better about having a leverage in their hands than about any other hand you can imagine.

Charlie?

CHARLIE MUNGER: Why don't we have those three gentlemen stand up?

WARREN BUFFETT: Yeah, you ought to give them a hand.

CHARLIE MUNGER: They really have done a job for Berkshire in this last year.

WARREN BUFFETT: Yeah, I'll lead the applause for them. Where are they? There they are.
(Applause).

I mentioned this before, but it's worth mentioning again. Deryck took on the job of being the operating head of Salomon Brothers on what, August 18th, 1991.

He didn't know what — he couldn't know what he was getting into, exactly. He — two months later or three months later, we'd never had a conversation about compensation. He did not ask me for Berkshire, or my, guarantee for indemnification because he was walking in not knowing legal problems. We didn't know what we would finally uncover.

And he worked incredible hours to keep that place together, which was not easy.

Bob Denham, I called — I guess on the 23rd or so, 20th. I called him on a Friday. I got home on a Saturday, the 24th of August.

He was living a nice pleasant peaceful life in California. And had a first class law firm, a good group of clients, wife had a good job there.

And I told him I was in a mess and there wasn't any second choice and three days later he was back in New York and living in a small apartment in Battery City and handling the general counsel's job at Salomon.

They found John Macfarlane on that Sunday, on the 18th. I think he was running a triathlon or something.

Not a practice that Charlie and I follow, but, ah — (Laughter)

And he was yanked from that and came down, and I think John was over in New Jersey, but he holed up in the Downtown Athletic Club. And it was his job to keep funding what was then \$150 billion balance sheet during a period when people right and left were canceling.

It's not because we weren't a good credit, but because they just didn't want to have anything to do with us for a while.

And the World Bank and the State of Texas pension fund and CalPERS, all these people were shutting off funding at a time — and funding in a business is — gentleman just indicated — is the lifeblood of an enterprise like Salomon.

And so those three deserve an enormous hand by — really by the Salomon shareholders — but by this group in turn because we have an important investment. So I thank them publicly. (Applause)

31. Wesco sold small savings and loan as regulations tightened after crisis

WARREN BUFFETT: Zone 2.

AUDIENCE MEMBER: I'm Kelly Ranson from San Antonio, Texas.

And I wondered if you could comment on the Mutual Savings and Loan. There was just a footnote that the deposits have been assumed by a federal savings bank.

And also, what about the annual report for Wesco Financial that I know it used to be in the annual report for Berkshire. Just wondered if you could comment on that, please.

WARREN BUFFETT: The question is about — we — our 80 percent-owned subsidiary Wesco Financial sold its ownership in Mutual Savings and Loan of Pasadena last year. I'll let Charlie comment on that.

And then the second question is about the Wesco report, which is available to any Berkshire shareholder simply by writing Wesco. But, we found that the stapling problems and other things made it a little difficult to keep adding that every year to the report. So, now we just — we make it available to anyone who would, at Berkshire, who would like to have it.

But Charlie, want to comment on the sale of Mutual?

CHARLIE MUNGER: Yes. The savings and loan business became very much more heavily regulated after the huge nationwide collection of scandal and insolvency and so on.

And meanwhile, we had a very small savings and loan association. And the combination of the new regulation, and the fact that it was a very small part of our operation, made us decide that we were better off without it.

That does happen from time to time in Berkshire. We do exit once in a while.

And, by the way, we would reserve the right to change our mind. I always liked Lord Keynes when he said that he got new facts or new insights, why he changed his mind and then he'd say, what do you do? So we changed our mind.

WARREN BUFFETT: They start — they asked our directors at Mutual to start going to school on Saturday, didn't they, Charlie? Or something? I think that helped change our mind about Mutual.

CHARLIE MUNGER: There's a time to vote with your feet. (Laughter)

WARREN BUFFETT: And even your wallet.

32. Shoe industry is tough, but Dexter has great managers

WARREN BUFFETT: Zone 3.

AUDIENCE MEMBER: (Inaudible) Chicago. Can you speak to some of the economic characteristics of the shoe industry that allow the business to be profitable and, in your view, attractive?

WARREN BUFFETT: I didn't hear that. Did you hear that, Charlie?

CHARLIE MUNGER: He wanted you to comment on the merits of the shoe industry.

WARREN BUFFETT: Well, I think our feelings for the shoe industry are very clear from what's been happening the last few years.

We think it's a great business to be in as long as you're in with Frank Rooney and Jim Issler and Peter Lunder and Harold Alford. Otherwise, it hasn't been too good.

The — we have a couple of extraordinary shoe operations, but they're not extraordinary because we get our leather from different steers or anything of the sort.

It's — we have two companies, really three now that Lowell's been brought in, too, but that have truly extraordinary records. I think those same managements would have been enormous successes in any business they'd gone into.

But, they have gone into the — they are in the shoe business and the companies earn unusual returns on equity. They earn unusual returns on sale. They've got terrific trade reputations.

And I think that to the extent we can find ways to expand in the shoe business while employing those managements, we'll be very excited about doing so.

It isn't because we think that the shoe industry is any cinch, you know, per se, or anything of the sort. But we've got a lot of talent employed in the shoe business and whenever we've got talent we like to try and figure out a way to give them as big a domain as we can.

And it's not inconceivable that we would expand the shoe business, perhaps even significantly over time.

33. Buffett on investing in tobacco companies

WARREN BUFFETT: Zone 4.

AUDIENCE MEMBER: Yeah, thanks Mr. Buffett. My name is Stewart Hartman from Sioux City. After the brevity of the last question from section 4, I'll try to be extremely brief.

The — given the scrutiny that the tobacco business is going under right now, number one, what do you see as the business prospects for those huge cash cows? And, at any point, would that be attractive to you given their liability?

WARREN BUFFETT: The question is about the future of the tobacco business?

I don't — I probably know no more about that than you do because it's fraught with questions that relate to societal attitudes and you can form an opinion on that just as well as I could.

But, I would not like to have a significant percentage of my net worth in the tobacco business myself, but —

They may have better futures than I envision. I don't really think that I have special insights on that.

Charlie, you —?

CHARLIE MUNGER: No.

WARREN BUFFETT: You have to come to a conclusion as to how society is going to want to treat — and the present administration for that matter. And the economics of the business may be fine, but that doesn't mean it has a great future.

34. "Hard to argue with the market"

WARREN BUFFETT: Zone 5.

AUDIENCE MEMBER: I'm Harriet Morton from Seattle, Washington.

I'm wondering, when you are considering an acquisition, how you look at the usefulness of the product?

WARREN BUFFETT: In looking at any business?

AUDIENCE MEMBER: Yes.

WARREN BUFFETT: Yeah. Well, obviously we look at what the market says is the utility. And the market has voted very heavily for Dexter Shoe, just to be an example.

I don't know many how many pairs of shoes they were turning out back in 1958 or thereabouts, but year after year, people have essentially voted for the utility of that product.

There are 750 million or so 8-ounce servings of one product or another from the Coca-Cola Company consumed every day around the world. And there are those of us who think the utility is very high. I can't make it through the day without a few. But there are other people that might rate it differently.

But essentially, people are going to get thirsty and if this is the way they take care of their thirst better than — and they prefer that to other forms — then I would rate the utility high of the product. But, I think it's hard to argue with the market on that.

I mean, people — some people may think that, you know, listening to a rock concert is not something of high utility. Other people might think it's terrific.

And so, we would judge that — I don't think we would come to an independent decision that there was some great utility residing in some product that had been available to the public for a long time, but that the public and not endorsed in any way.

Charlie?

CHARLIE MUNGER: Well, I think that's right. But, that's averaged out.

We're in a bunch of high-utility products. I mean, nurses' shoes, work shoes, casual shoes. We don't have a lot of, what, Italian pumps? (Laughter)

WARREN BUFFETT: Don't rule it out, Charlie. We may be here next year defending it. (Laughter)

CHARLIE MUNGER: Yeah, right, well.

No, I'm just saying, if you judge the existing portfolio as indicating what the future's likely to be like, why —

WARREN BUFFETT: Well, certainly a lot of essentials were sold out of Borsheims yesterday.

CHARLIE MUNGER: Yes. (Laughter and applause)

WARREN BUFFETT: I hear my family clapping.

35. No question from zone 6

WARREN BUFFETT: Zone 6.

VOICE: We have no question up here.

36. Insurers have “head in the sand” on catastrophes

WARREN BUFFETT: OK, zone 7.

AUDIENCE MEMBER: Good morning, Mr. Berkshire, uh, Buffett. (Laughter)

WARREN BUFFETT: I have a niece here who has a son named Berkshire so it —

AUDIENCE MEMBER: I’m Chris Blunt (PH) from Omaha.

My first question is, in years past, we’ve had samples of various products. When are we going to have some Guinness?

WARREN BUFFETT: Some what now?

AUDIENCE MEMBER: Guinness samples?

WARREN BUFFETT: (Laughs)

AUDIENCE MEMBER: And my second question is, in light of the multiple disasters that have taken place in LA, has that had any impact on the cats for Berkshire?

WARREN BUFFETT: On our super-cat business?

AUDIENCE MEMBER: Yes.

WARREN BUFFETT: The LA earthquake, which is originally — I believe the first estimate of insured damage was a billion-five, which struck us as kind of ludicrous, but has now escalated.

The last official estimate, the one we use that’s a trigger in our policies, I think is either 4.5 billion or 4.8 billion. But it’s going to be higher than that.

Our losses are fairly minor. If it gets to eight billion of insured damage, that would trigger another policy or two. But, I would say that the LA quake — which did considerably more damage, I think, than people would have anticipated from a 6.7 for various reasons having to do with how quakes operate — that quake is not going to turn out to be of any real — it’s not the kind of super-cat that a 15 or \$20 billion hurricane which hit Florida or Long Island or New England would be.

That’s the kind of — we could lose — or we could pay out — 6 or \$700 million in sort of a worst case super-cat. Now our total premiums this year might be, say, 250 million or something in that area.

So one super-cat in the wrong place would produce — and there could be more than one — could produce, we'll say, a \$400 million or thereabouts underwriting loss from that business.

The LA quake is peanuts on that scale, but it wouldn't have taken a whole lot more in terms of numbers on the Richter scale, if it happened to have an epicenter where it did, and be of the type that it was, relatively shallow, that we could have had that sort of thing happen.

I think that the insurance industry has vastly underestimated — maybe not now, but up till a few years ago — the full potential of what a super-cat could do. But Hurricane Andrew and the LA quake may have been something of a wake-up call.

They were far from a worst-case situation. A really big Type Five hurricane on Long Island would end up leaving a lot of very major insurance companies in significant trouble.

We define our losses — essentially, 700 million sounds like a lot of money. It is a lot of money. But, there are limits on our policies. That is not true of people that are just writing the basic homeowners or business. Those losses could go off the chart.

There were certain companies in the LA quake that thought they had a — what they call a “probable maximum loss” for California quakes. And the LA quake, which was far from the worst case you can imagine, turned out to far exceed those probable maximum losses.

So, I think the industry has had, and may still have, its head in the sand a little bit, in terms of what can happen, either in terms of a quake in California or, more probably, in terms of a hurricane along the East Coast.

So far this year we're in reasonable shape, but that doesn't mean much because, by far, the larger exposure is in hurricanes and essentially 50 percent of the hurricanes hit in September. And about — I think it's about 15 percent would be in August. Close to 15 percent in October. So you have 80 percent, roughly, in those three months and there's a little tail on both sides.

But that's when you find out whether you've had a good or bad year in the super-cat business, basically.

It's a business we like at the right rates because there are very few people who can afford to write it at the level that the underlying company, the reinsured companies, need it. And we're in a position, if the rates are right, to do significant business.

Charlie?

CHARLIE MUNGER: Nothing to add.

37. Book recommendations

WARREN BUFFETT: Zone 1,

AUDIENCE MEMBER: Clayton Riley (PH) from Jacksonville, Florida.

This is a little different than all the other questions, but what were the three best books you read last year outside of the investment field? Why don't — even one will do.

WARREN BUFFETT: I'll give you — I'll tout a book first that I've read but that isn't available yet. But it will be in September.

The woman who wrote it, I believe, is in the audience and it's Ben Graham's biography, which will be available in September, by Janet Lowe. And I've read it and I think those of you who are interested in investments, for sure, will enjoy it. She's done a good job of capturing Ben.

One of the books I enjoyed a lot was written also by a shareholder who is not here because he's being sworn in, I believe today or tomorrow, maybe tomorrow, as head of the Voice of America.

And that's Geoff Cowan's book, which is on "The People v. Clarence Darrow." It's the story of the Clarence Darrow trial for, essentially, jury bribery in Los Angeles back around 1912, when the McNamara brothers had bombed the LA Times.

It's a fascinating book. Geoff uncovered a lot of information that the previous biographies of Darrow didn't have. I think you'd enjoy that.

Charlie?

CHARLIE MUNGER: Well, I very much enjoyed Connie Bruck's biography Master of the Game, which was a biography of Steve Ross, who headed Warner and later was, what, co-chairman of Time Warner.

WARREN BUFFETT: Yeah, he's a little more than co-chairman. (Laughs)

CHARLIE MUNGER: Yeah, and — she's a very insightful writer and it's a very interesting story.

I am rereading a book I really like, which is Van Doren's biography of Benjamin Franklin, which came out in 1952, and I'd almost forgotten how good a book it was. And that's available in paperback everywhere. We've never had anybody quite like Franklin in this country. Never again.

WARREN BUFFETT: He believed in compound interest, too, incidentally, as you may remember. (Laughter)

What did he — he set up those two little funds, one in Philadelphia, one in Boston?

CHARLIE MUNGER: Right.

WARREN BUFFETT: Yeah, to demonstrate the advantages of compound interest. I think that's the part Charlie's rereading. (Laughter)

38. Nike and Reebok

WARREN BUFFETT: Zone 2.

AUDIENCE MEMBER: Thank you for teaching me — teaching so much to all of us about business. My name is Mike Assail (PH) from New York City.

You mentioned earlier that Berkshire's shoe business was great, but that other shoe businesses were not so good.

What are the uncertainties of the global brand leaders that Berkshire seems to like? They like Coke and Gillette. The global brand leaders in the shoe business being Nike and Reebok.

What are their uncertainties, in terms of long-term competitive advantage, business economics, consumer behavior, and the other risk factors that you mentioned in the annual report this year? Thank you.

WARREN BUFFETT: So, you're really asking about the future prospects of Nike and Reebok?

Yeah. I don't know that much about those businesses. We do have one person in this audience, at least, who owns a lot of Reebok.

But I am not expressing a negative view in any way on that. I just — I don't understand that — I don't understand their competitive position and the likelihood of permanence of their competitive position over a 10 or 20 year period as well as I think I understand the position of Brown and Dexter.

That doesn't mean I think that it's inferior. Doesn't mean I think that we've got better businesses or anything.

I think we've got very good businesses. But I — I'm not — I haven't done the work and I'm not sure if I did the work I would understand them.

I think they are harder to understand, frankly, and to develop a fix on, than our kinds. But, they may be easier for other people who just have a better insight into that kind of business.

39. "You don't have to do exceptional things to get exceptional results"

WARREN BUFFETT: Some businesses are a lot easier to understand than others. And Charlie and I don't like difficult problems. I mean, we — if something is hard to figure, you know, we'd rather multiply by three than by pi. I mean it's just easier for us. (Laughter)

Charlie, you have any —?

CHARLIE MUNGER: Well, that is such an obvious point. And yet so many people think if they just hire somebody with the appropriate labels they can do something very difficult. That is one of the most dangerous ideas a human being can have.

All kinds of things just intrinsically create problems. The other day I was dealing with a problem and I said, this thing — it's a new building — and I said this thing has three things I've learned to fear: an architect, a contractor, and a hill. (Laughter)

And — if you go at life like that, I think you, at least, make fewer mistakes than people who think they can do anything by just hiring somebody with a label.

WARREN BUFFETT: We don't comment — excuse me, go ahead.

CHARLIE MUNGER: You don't have to hire out your thinking if you keep it simple.

WARREN BUFFETT: You don't have to do — we've said this before — but you don't have to do exceptional things to get exceptional results.

And some people think that if you jump over a seven-foot bar that the ribbon they pin on you is going to be worth more money than if you step over a one-foot bar. And it just isn't true in the investment world, at all.

So, you can do very ordinary things. I mean, what is complicated about this? But, you know, we're \$3 billion pretax better off than we were a few years ago because of it.

There's nothing that I know about that product, or its distribution system, its finances, or anything, that, really, hundreds of thousands — or millions — of people aren't capable of, that they don't already know. They just don't do anything about it.

And similarly, if you get into some complicated business, you can get a report that's a thousand pages thick and you got Ph.D.s working on it, but it doesn't mean anything.

You know, what you've got is a report but you don't — it — you won't understand that business, what it's going to look like in 10 or 15 years.

The big thing to do is avoid being wrong. (Laughter)

CHARLIE MUNGER: There are some things that are so intrinsically dangerous. Another of my heroes is Mark Twain, who looked at the promoters of his day and he said, "A mine is a hole in the ground owned by a liar." (Laughter)

And that's the way I've come to look at projections. I mean, basically, I can remember, Warren and I were offered \$2 million worth of projections once in the course of buying a business and the book was this thick.

WARREN BUFFETT: For nothing.

CHARLIE MUNGER: And, if we were given it for nothing, and we wouldn't open it.

WARREN BUFFETT: We almost paid 2 million not to look at it. (Laughter)

It's ridiculous. I do not understand why any buyer of a business looks at a bunch of projections put together by a seller or —

CHARLIE MUNGER: Or his agent.

WARREN BUFFETT: — or his agent.

I mean, it — you can almost say that it's naive to think that that has any utility whatsoever. We just are not interested.

If we don't have some idea ourselves of what we think the future is, to sit there and listen to some other guy who's trying to sell us the business or get a commission on it tell us what the future's going to be — it — like I say, it's very naive.

CHARLIE MUNGER: Yeah, and five years out.

WARREN BUFFETT: Yeah. We had a line in the report one time, "Don't ask the barber whether you need a haircut." And — (laughter) — it's quite applicable to projections of — by sellers — of businesses.

40. Cutting USAir's costs will be "enormously tough"

WARREN BUFFETT: Zone 3.

AUDIENCE MEMBER: Mr. Buffett, Greg Elright (PH) from Washington, DC.

In the last year, United Airlines and Northwest have resolved some of their financial problems by moving ownership over to the employees.

With USAir's current positions — uh, problems — what do you see as occurring with USAir and do you see any movement toward employee ownership? And how will that affect Berkshire's interest in the company?

WARREN BUFFETT: USAir has a cost structure which is non-viable in today's airline business. Now that, in an important way, involves its labor cost, but it involves other things, too. But it certainly involves its labor costs.

And they've stated this publicly. And I think — and they have — they are talking with their unions about it and they're talking with other people about other parts of their cost structure.

And I think you'll just see what unfolds in the next relatively few months, because there isn't any question that the cost structure is out of line. I think the cost structure could be brought into line. But whether it will be brought into line or not is another is another question.

And, looking backwards, the answer is not to get into businesses that need to solve problems like that. It's to — but — that was a mistake I made.

And I think in Seth Schofield you've got a manager who understands that business extremely well, who probably is as — in my view, anyway — is as well regarded and trusted by people who are going to have to make changes as anyone could be in that position. But that may not be enough. I mean that — there's enormous tensions when you need to take hundreds and hundreds of millions of dollars out of the cost structure of any business.

And when you need cooperative action, all by various groups, each one of which feels that maybe they're having to give a little more than some other group, and understandably feels that way, you know that is an enormously tough negotiating job.

I think Seth is as well-equipped for that as anyone. But I would not want to — you know, I cannot predict the outcome.

WARREN BUFFETT: Charlie, do you —?

CHARLIE MUNGER: Well, if I were a union leader, I would give Seth whatever he wants because he's not the kind of a fellow who would ask for more than he needs. And, it's perfectly obvious that's the correct decision on the labor side. But whether the obvious will be done or not is in the lap of the gods.

WARREN BUFFETT: It's a lot of people with a lot of different motivations and, I mean, those are really tough questions. I mean, we — Charlie and I've been involved in that sort of thing a few times and frequently it works out, but it's not preordained.

41. We're "not in any hurry" to retire

WARREN BUFFETT: Zone 4.

AUDIENCE MEMBER: My name is Sheldon Scizick (PH) from Chicago, Illinois. I have two questions.

The first one is concerning Mr. Munger. We know what Mr. Buffett's retirement plans are. I was wondering what yours — your plans for the future concerning Berkshire are?

CHARLIE MUNGER: I have always preferred the system of retirement where you can't quite tell from observing from the outside whether the man is working or retired. (Laughter)

WARREN BUFFETT: He does it well, too. (Laughter)

CHARLIE MUNGER: You know, a problem in many businesses, particularly the more bureaucratic ones, is that your employees retire, but they don't tell you. (Laughter)

WARREN BUFFETT: I think I can speak for Charlie on this one.

Charlie and I are not in any hurry to retire. He's trying to outlast me, actually. (Laughter)

AUDIENCE MEMBER: Thank you.

42. Berkshire sold some Cap Cities shares in tender offer

AUDIENCE MEMBER: My second question is, I was just curious why you sold a portion of Cap Cities?

WARREN BUFFETT: We thought that — we thought it was a good idea for Cap Cities to have a tender offer. They had cash that we thought that they could not use in any — they were not likely to be able to use — in a better way than repurchasing their own shares because they do have some very good businesses.

They, and we, felt that a tender offer would not be successful, in terms of attracting a number of shares unless Berkshire were tendering. We felt the price was reasonable to tender at.

It turned out that the business was getting stronger during that period and various things were happening in media, so there were only 100,000 shares or so tendered outside of our million. That isn't necessarily what we thought was going to happen going in, but that is what happened.

It's acceptable to us, but that doesn't mean that it was the desired outcome. We would not have tendered all of our shares or anything of the sort.

We want to remain a substantial shareholder of Cap Cities. We've always — most of the time we favored Cap Cities buying in its stock and it's bought in a fair amount of stock since the ABC merger took place in 19 — started in 1986.

43. Structured settlements business isn't big, but is "perfectly satisfactory"

WARREN BUFFETT: Zone 5.

AUDIENCE MEMBER: Good morning. My name is Matt Voke (PH). I'm from Omaha.

In last year's meeting you made reference to structured settlements. I was wondering, how is that business progressing for you?

WARREN BUFFETT: Question's about the structured settlement business, which is a business in which Berkshire guarantees, in effect, an annuity to some claimant of another — usually — of another insurance company, who suffered an injury and instead of getting a lump sum now wants to get a stream of payments over many years in the future, sometimes going out 75 years.

We have set up a life company to do that business. We formerly did it all through our property-casualty companies. And, we have done some business, but it's not been a big business yet, and it may never be a big business.

It's a perfectly satisfactory business, but it's not an important item at present in the analysis of Berkshire's value.

Are you getting — having a problem with sound out there on this or no? Just — no?

44. No comment on Wrigley

WARREN BUFFETT: Zone 6.

AUDIENCE MEMBER: My name is David Samra. I'm from San Francisco, California.

In your annual report, I noticed you mention Wrigley as being a company that has worldwide dominance, somewhat like Coca-Cola and Gillette. And, was curious to know if you had looked at the company in any detail. And, if so, whether or not — if you decided not to invest, what were the reasons why?

WARREN BUFFETT: Well, we wouldn't want to comment on a company like that because we might or might not be buying it. We might or might not be selling it. We might or might not buy or sell it in the future. (Laughter)

And, since it falls under that narrow definition of things that we don't talk about —

It's a good illustration of a company that has a high market share worldwide, but you can understand the Wrigley Company just as well as I can. I have no insights in the — into the Wrigley Company that you wouldn't have and I don't — I wouldn't want to go beyond that in giving you our evaluation of the company.

I hate to disappoint you on those, but on specific securities, we are not too forthcoming sometimes.

Charlie?

CHARLIE MUNGER: I'm good at not being forthcoming. (Laughter)

45. "No specific desire" to buy companies in certain parts of the world

WARREN BUFFETT: Zone 7.

AUDIENCE MEMBER: Mr. Buffett, Kathleen Ambrose (PH) from Omaha.

I have a question regarding global diversification. Just in general, what do you look for in a company and, if so, as far as Europe or Latin America, if you'd like to be specific?

WARREN BUFFETT: The question is about global diversification.

All we want to be in is businesses that we understand, run by people that we like, and priced attractively compared to the future prospects.

So, there is no specific desire to either be in the rest of Europe, or the rest of the world, or Far East, or to avoid it.

It's simply a factor that — it's not a big factor. There may be more chances for growth in some countries.

We — 80 percent of Coca-Cola's earnings, roughly, will come from outside the United States. Eighty percent of Guinness's earnings will come from outside the United States, but they're domiciled outside the United States, whereas Coca-Cola is domiciled here.

Certainly, in many cases, there are markets outside the United States that have way better prospects for growth than the U.S. market would have, but they probably have some other risks to them that this market may not have.

But, we, you know, we like the international prospects, obviously, of a company like Coke. We like the international prospects of a company like Gillette. Gillette earned 70 percent of its money outside this country.

So, if you look — on a look-through basis — Coke — we might this year get something like \$150 million of earnings, indirectly, for Berkshire's interest from the rest of the world just through Coca-Cola alone.

But, we don't make any specific — we don't think in terms of, I like this region so I want to be there or something of a sort.

It's something that's specific to the companies we're looking at, then we'll try to evaluate that.

Coke is expanding in China. Well, it — you know — I think that — I forget what they showed last year, maybe 38 percent growth, or something like that, in cases. Maybe —

It's nice to have markets like that that are relatively untapped.

Actually, Gillette is expanding in China in a big way and the Chinese don't shave as often. And more of them are what they call "dry shavers" than "wet shavers" there, which is electric shavers.

But you know, maybe we could stick something in the Coke that would — (laughter)

Maybe a little synergy at Berkshire, finally. Who knows?

46. Hurricanes are bigger insurance risk than riots

WARREN BUFFETT: Zone 1.

AUDIENCE MEMBER: Good morning. I'm Marshall Patton (PH) from Bandera, Texas.

And back to the insurance losses. What is the comparison between natural disasters, such as the earthquake, and so on, and the LA riots?

WARREN BUFFETT: Well, I'm not sure what the connection —

They, you know, they obviously can both lead to super-cats that we insure against, because if there is enough insured damage, it's likely to trigger a payment under some of our policies.

It would take some really big riot damage to get to our levels, because normally we don't kick in now until an event gets up to at least, you know, \$5 billion or so of insured damage under a very large majority of our policies.

Something like a quake causes a fair amount of damage that is not insured, because of the extent that it's highways and things of that sort, public buildings. A lot of that is not insured.

But you get interesting questions on this. Usually we insure an event, but what's an event? If you go back to the riots that occurred after Martin Luther King was shot, you had riots in dozens of cities.

Is that one event or is that a multiple number of events? I mean, it was started by different people, but maybe arising from a common cause. Some of those things aren't actually very well-defined, even after hundreds of years of insurance law and custom, the experience of that. But I would say that rioting is very unlikely to get to a level that triggers our policy.

The big risks we face are quake and hurricanes, and hurricanes are a more significant risk than quake. They call them typhoons in the Pacific Ocean.

But floods, tremendous damage from floods last year. But basically there's not a lot of private flood insurance bought, so the insured losses do not get large.

Just watch the Weather Channel. (Laughter)

47. Why we have no short-term opinion on stocks

WARREN BUFFETT: Zone 2.

AUDIENCE MEMBER: Diane West (PH) from Corona Del Mar, California.

I know, Mr. Buffett, that you said that you don't read what other people say about the market or the economy, but do either you or Charlie have an opinion about how you think things are going to go? Are you bullish or bearish?

WARREN BUFFETT: You may have trouble believing this, but Charlie and I never have an opinion about the market because it wouldn't be any good and it might interfere with the opinions we have that are good. (Laughter)

If we're right about a business, if we think a business is attractive, it would be very foolish for us to not take action on that because we thought something about what the market was going to do, or anything of that sort.

Because we just don't know. And to give up something that you do know and that is profitable for something that you don't know and won't know because of that, it just doesn't make any sense to us, and it doesn't really make any difference to us.

I mean, I bought my first stock in, probably, April of 1942 when I was 11. And since then, I mean, actually World War II didn't look so good at that time. I mean, the prospects, they really didn't. I mean, you know, we were not doing well in the Pacific. I'm not sure I calculated that into my purchase of my three shares. (Laughter)

But I mean, just think of all the things that have happened since then, you know? Atomic weapons and major wars, presidents resigning, and all kinds of things, massive inflation at certain times.

To give up what you're doing well because of guesses about what's going to happen in some macro way just doesn't make any sense to us. The best thing that can happen from Berkshire's standpoint — we don't wish this on anybody — but is that over time is to have markets that go down a tremendous amount.

I mean, we are going to be buyers of things over time. And if you're going to be buyers of groceries over time, you like grocery prices to go down. If you're going to be buying cars over time, you like car prices to go down.

We buy businesses. We buy pieces of businesses: stocks. And we're going to be much better off if we can buy those things at an attractive price than if we can't.

So we don't have any fear at all. I mean, what we fear is an irrational bull market that's sustained for some long period of time.

You, as shareholders of Berkshire, unless you own your shares on borrowed money or are going to sell them in a very short period of time, are better off if stocks get cheaper, because it means that we can be doing more intelligent things on your behalf than would be the case otherwise.

But we have no idea what — and we wouldn't care what anybody thought about it. I mean, most of all ourselves. (Laughter)

Charlie, do you have anything?

CHARLIE MUNGER: No. I think the — if you're agnostic about those macro factors and therefore devote all your time to thinking about the individual businesses and the individual opportunities, it's just, it's a way more efficient way to behave, at least with our particular talents and lacks thereof.

WARREN BUFFETT: If you're right about the businesses, you'll end up doing fine.

We don't know, and we don't think about when something will happen. We think about what will happen. It's fairly, it's not so difficult to figure out what will happen. It's impossible, in our view, to figure out when it will happen. So we focus on what will happen.

This company in 1890 or thereabouts, the whole company sold for \$2,000. It's got a market value now of about 50-odd-billion, you know?

Somebody could've said to the fellow who was buying this in 1890, you know, "You're going to have a couple of great World Wars, and you know, you'll have the panic of 1907, all these things will happen. And wouldn't it be a better idea to wait?" (Laughter)

We can't afford that mistake, basically. Yeah.

48. We'd rather buy an entire company, but stocks offer more bargains

WARREN BUFFETT: Zone 3.

AUDIENCE MEMBER: Mr. Buffett, Mr. Munger, last year — I'm Tim Medley from Jackson, Mississippi — last year the question was asked about your preference for purchasing entire businesses versus parts of public companies.

You mentioned you prefer to buy private businesses because of the tax advantages and your attraction to the people in those businesses.

Are you finding today that there are better purchases within the private market versus in the public securities market?

WARREN BUFFETT: Well, I would answer that no.

We do not — we very seldom find something to buy on a negotiated basis for an entire business. We have certain size requirements. A big limiting factor is it has to be something we can understand. I mean, that eliminates 95 percent of the businesses.

And we don't pay any attention to them, but we get lots of proposals for things that just are totally outside the boundaries of what we've already said we're interested in.

We prefer to buy entire businesses, or 80 percent or greater interest in businesses, partly for the tax reasons you mentioned, and frankly, we like it better. We just, it's the kind of business we would like to build if we had our absolute druthers on it.

Counter to that is we can usually get more for our money in wonderful businesses, in terms of buying little pieces of them in the market, because the market is far more inefficient in pricing businesses than is the negotiated market.

You're not going to buy any bargains, and I mean, you shouldn't even approach the idea of buying a bargain in a negotiated purchase.

You want to buy it from people who are going to run it for you. You want to buy it from people who are intelligent enough to price their business properly, and they are. I mean, that's the way things are.

The market does not do that. The market — in the stock market, you get a chance to buy businesses at foolish prices, and that is why we end up with a lot of money in marketable securities.

If we absolutely had our choice, we would own a group of — we would own three times the number of businesses we own outright.

We're unlikely to get that opportunity over time, but periodically we'll get the chance to find something that fits our test.

And in between we will, when the market offers us the right prices, we will buy more, either businesses we already own pieces of, or we'll buy one or two new ones. Something's usually going on.

There are tax advantages to owning all of them, but that's more than offset by the fact that you'll never get a chance to buy the whole Coca-Cola Company or the whole Gillette company.

I mean, businesses like that, sensational businesses, are just not available. Sometimes you get a chance to make a sensible purchase in the market of such businesses.

Charlie?

CHARLIE MUNGER: Well, I think that's exactly right. And if you stop to think about it, if a hundred percent of a business is for sale, you've got — the average corporate buyer is being run by people who have the mindset of people buying with somebody else's money. And we have the mindset of people buying with our own money.

And there's also a class of buyers for a hundred percent of businesses who are basically able and assured financial promoters. I'm talking about the leveraged buyout funds and so on.

And those people tend to have the upside, but not the downside, in the private arrangements they've made with their investors. And naturally, they tend to be somewhat optimistic.

And so we have formidable competition when we try and buy a hundred percent of businesses.

WARREN BUFFETT: Most managers are better off, in terms of their personal equation, if they're running something larger. And they're also better off if they're running something larger and more profitable.

But the first condition alone will usually leave them better off. We're only better off if we're running something that's more profitable. We also like it if it's larger, too.

But our equation, actually, our personal equation is actually different than a great many managers in that respect. Even if that didn't operate, I think most managers psychically would

enjoy running something larger. And if you can pay for it with other people's money, I mean, that gets pretty attractive.

You know, how much would — and let's just say you're a baseball fan — well, how much would you pay to own whatever your hometown, the Yankees?

You might pay more if you were writing a check on someone else's bank account than if you were writing it on your own. It's been known to happen. (Laughter)

And in corporate America, animal spirits are there. And those are our competitors on buying entire businesses. In terms of buying securities, most managers don't even think about it.

It's very interesting to me, because they'll say that — they'll have somebody else manage their money in terms of portfolio securities. Well, all that is is a portfolio of businesses.

And I'll say, "Well, why don't you pick out your own portfolio?" And they'll say, "That's much too difficult."

And then some guy will come along with some business that they never heard of a week before and give them some figures and a few projections, and the guy thinks he knows enough to buy that business. It's very puzzling to me sometimes.

49. Revealing Wesco's estimated intrinsic value was a "quirk"

WARREN BUFFETT: Zone 4.

Could you hold it a little closer to you? I can't hear too well.

It's hard to hear. Is the mic on there?

AUDIENCE MEMBER: It's on.

WARREN BUFFETT: OK, I can hear that fine.

AUDIENCE MEMBER: Let's try it one more time. Dan Raider (PH) —

WARREN BUFFETT: Got it.

AUDIENCE MEMBER: — San Mateo, California. This is a question for Mr. Munger.

In your most recent letter to shareholders in Wesco's annual report, you calculated the intrinsic value of Wesco at about \$100 per share, and compared that to the then-current market price of Wesco of about \$130 per share.

In the same letter, you stated that it was unclear whether at then-current market prices Berkshire or Wesco presented a better value to prospective purchasers.

In light of that, would you compare the intrinsic value of Berkshire to its current market price?

CHARLIE MUNGER: Well, the answer to that is no. (Laughter)

Berkshire has never calculated intrinsic value per share and reported it to the shareholders, and Wesco never did before this year.

We changed our mind at Wesco because we really thought some of the buyers had gone a little crazy, and a lot of things were being said to prospective shareholders that, in our opinion, were unwise.

And we don't really like attracting — even though we've had nothing to do with it — we don't like attracting people in at high prices that may not be wise.

So we departed from our long precedent, and we did in the Wesco report make an estimate of intrinsic value per share.

But we're not changing the general policy. That was just a one-time quirk.

WARREN BUFFETT: Well, and also I think it's true that the Wesco intrinsic value per share can be estimated by anyone within fairly close limits.

It just isn't that complicated because there aren't a number of businesses there that have values different than carrying values, or where they are, they're all footnoted, in terms of numbers.

So it would be almost impossible to come up with numbers that are significantly different than the number Charlie put in there.

Berkshire has assets that, number one of which would be the insurance business, that it's clear have very significant excess values, but one person might estimate those at maybe three times what somebody else would estimate them at. That's less true of our other businesses, but it's still true in a way, so that Berkshire's range would be somewhat greater.

And as Charlie — we basically — we don't want to disappoint people, but we also don't want to disappoint ourselves. But we have our own yardsticks for what we think is doable.

We try to convey that as well as we can to the people who are partners in the business, and I think that we saw some things being published about Wesco that simply might have led to, and probably did lead to, some expectations that simply weren't consonant with our own personal expectations. And that leaves us uncomfortable.

50. Risk is “inextricably wound up” in how long an asset is held

WARREN BUFFETT: Zone 5.

AUDIENCE MEMBER: Hello, my name is Charles Pyle (PH) from Ann Arbor, Michigan.

I'd like to ask you to expound on your view of risk in the financial world, and I ask that against the background of what appear to be a number of inconsistencies between your view of risk and the conventional view of risk.

I mention that in a recent article you pointed out inconsistency in the use of beta as a measure of risk, which is a common standard.

And I mention that derivatives are dangerous, and yet you feel comfortable playing at derivatives through Salomon Brothers. And betting on hurricanes is dangerous, and yet you feel comfortable playing with hurricanes through insurance companies.

So it appears that you have some view of risk that's inconsistent with what would appear on the face of it to be the conventional view of risk.

WARREN BUFFETT: Well, we do define risk as the possibility of harm or injury. And in that respect we think it's inextricably wound up in your time horizon for holding an asset.

I mean, if your risk is that you're going — if you intend to buy XYZ Corporation at 11:30 this morning and sell it out before the close today, I mean, that is, in our view, that is a very risky transaction. Because we think 50 percent of the time you're going to suffer some harm or injury.

If you have a time horizon on a business, we think the risk of buying something like Coca-Cola at the price we bought it at a few years ago is essentially, is so close to nil, in terms of our perspective holding period. But if you asked me the risk of buying Coca-Cola this morning and you're going to sell it tomorrow morning, I say that is a very risky transaction.

Now, as I pointed out in the annual report, it became very fashionable in the academic world, and then that spilled over into the financial markets, to define risk in terms of volatility, of which beta became a measure.

But that is no measure of risk to us. The risk, in terms of our super-cat business, is not that we lose money in any given year. We know we're going to lose money in some given day, that is for certain. And we're extremely likely to lose money in a given year.

Our time horizon of writing that business, you know, would be at least a decade. And we think the probability of losing money over a decade is low. So we feel that, in terms of our horizon of

investment, that that is not a risky business. And it's a whole lot less risky than writing something that's much more predictable.

Interesting thing is that using conventional measures of risk, something whose return varies from year to year between plus-20 percent and plus-80 percent is riskier, as defined, than something whose return is 5 percent a year every year.

We just think the financial world has gone haywire in terms of measures of risk.

We look at what we do — we are perfectly willing to lose money on a given transaction, arbitrage being an example, any given insurance policy being another example. We are perfectly willing to lose money on any given transaction.

We are not willing to enter into transactions in which we think the probability of doing a number of mutually independent events, but of a similar type, has an expectancy of loss. And we hope that we are entering into our transactions where our calculations of those probabilities have validity.

And to do so, we try to narrow it down. There are a whole bunch of things we just won't do because we don't think we can write the equation on them.

But we, basically, Charlie and I by nature are pretty risk-averse. But we are very willing to enter into transactions —

We, if we knew it was an honest coin, and someone wanted to give us seven-to-five or something of the sort on one flip, how much of Berkshire's net worth would we put on that flip?

Well we would — it would sound like a big number to you. It would not be a huge percentage of the net worth, but it would be a significant number. We will do things when probabilities favor us.

Charlie?

CHARLIE MUNGER: Yeah, we, I would say we try and think like Fermat and Pascal as if they'd never heard of modern finance theory.

I really think that a lot of modern finance theory can only be described as disgusting. (Laughter)

51. Buffett favors a “steeply progressive” consumption tax

WARREN BUFFETT: Zone 6.

AUDIENCE MEMBER: Good morning, I'm Paul Miller (PH) from Kansas City, Missouri. I've got two questions.

First, not too long ago, I believe it was Fortune Magazine that ran an article regarding personal tax rates.

And at the risk of misquoting you, my recollection is that you favored higher personal rates, rates even higher than those proposed by those in Washington.

The second question is, I've heard Berkshire Hathaway referred to as nothing more than a high-priced rich man's mutual fund. Would you care to comment on that also?

WARREN BUFFETT: Well, on tax rates, if you ask me what I personally favor, I personally favor a steeply progressive consumption tax.

That has a little more attention being paid to it now, although the "steeply progressive" might be modified by most of the advocates of the consumption tax, maybe to "mildly progressive" or something of the sort.

There's a Nunn-Domenici proposal along that line, and there are other people that are talking about it more. It may be examined by the new Kerrey-Danforth Commission, of which we've got a member in the audience.

But I believe, in one way or another, I believe in progressive taxes. So I am not shocked in terms of my own situation, and I don't think Charlie is particularly, about having a progressive income tax.

Although, like I say, I think society would run better over time if it were a progressive consumption tax instead.

Do you want the comment on the tax situation, Charlie?

CHARLIE MUNGER: Well, I think there is a point at which income taxes become quite counterproductive if their progression is too high. But I don't think we're there yet.

WARREN BUFFETT: We think — at least I think — I'm extraordinarily well treated by this society, and I think most people with high incomes are. I think if you transported most of them to Bangladesh or Peru or something, they would find out how much of it is them and how much is the society.

And I think there's nothing better than a market system, in terms of motivating people and in terms of producing the goods and services that the society wants.

But I do think it gets a little out of whack, in terms of what the productivity may be of an outstanding teacher compared to somebody who is good at figuring out the intrinsic value of businesses.

I don't have a better system on the income side, but I think society should figure out some way to make those who are particularly blessed, in a sense, that have talents that get paid off enormously in a market system, to give back a fair amount of that to the society that produces that.

52. Berkshire isn't a "rich man's mutual fund"

WARREN BUFFETT: The question about Berkshire being I think it was, was it rich man's mutual fund or something like that?

We don't look at it that way at all. We look at it as a collection of businesses, and ideally we would own all of those businesses.

So it's, to the extent that a mutual fund owns stock in a lot of companies and diversifies among businesses and we try to own a lot of businesses ourselves, I guess that's true. But I guess you could say the same thing of General Electric, or an operation like that.

We are more prone to buy pieces of businesses than the typical manager, but we are trying to do, in a sense, the same thing Jack Welch is trying to do at General Electric, which is try to own a number of first-class businesses.

He gets to put the imprint of his own management, which I think is very good, on those businesses, and we are more hands-off, both in the businesses we own outright and in the ones that we own pieces of.

But we're going at it the same way. And General Electric has been very successful under Jack's leadership, and doing it his way.

We think, in terms of what we bring to the game, and the problems of putting money to work all the time, that our own system will work best for us.

Charlie?

CHARLIE MUNGER: Yeah, I've got nothing to add to that.

53. Don't need interest rate outlook to value companies

WARREN BUFFETT: Zone 1.

CHRISTOPHER DAVIS: Hello, I'm Christopher Davis from New York City.

I'm interested in that many of the holdings of Berkshire are in industries that are perceived as interest rate-sensitive industries, including Wells Fargo, Salomon, Freddie Mac, even GEICO. And yet you have an admitted sort of ambivalence towards interest rates or changes in interest rates.

And it therefore seems that you don't feel that those changes affect the fundamental attractiveness of those businesses.

I thought maybe you could share your thoughts on what you see in these businesses that the investment community as a whole is ignoring.

WARREN BUFFETT: Well, the value of every business, the value of a farm, the value of an apartment house, the value of any economic asset, is 100 percent sensitive to interest rates, because all you are doing in investing is transferring some money to somebody now in exchange for what you expect the stream of money to be, to come in, over a period of time. And the higher interest rates are, the less that present value is going to be.

So every business, by its nature, whether it's Coca-Cola or Gillette or Wells Fargo, is in its intrinsic valuation, is a hundred percent sensitive to interest rates.

Now, the question as to whether a Wells Fargo or a Freddie Mac or whatever it may be, whether their business gets better or worse internally, as opposed to the valuation process, because of higher interest rates, that is not easy to figure.

I mean, GEICO, if they write their insurance business at the same underwriting ratio — in other words they have the same loss and expense experience relative to premiums — they benefit by higher interest rates, obviously, over time, because they're a float business, and the float is worth more to them.

Now, externally, getting back to the valuation part, the present value of those earnings also becomes less then.

But the present value of Coke's earnings becomes less in a higher interest rate environment.

Wells Fargo, it's — whether they earn more or less money under any given interest rate scenario is hard to figure. There may be one short-term effect and there may be another long-term effect.

So I do not have to have a view on interest rates — and I don't have a view on interest rates — to make a decision as to an insurance business, or a mortgage guarantor business, or a banking business, or something of the sort, relative to making a judgment about Coke or Gillette.

Charlie?

CHARLIE MUNGER: I've got nothing to add.

54. "Retroactive" insurance is small part of our business

WARREN BUFFETT: Zone two?

AUDIENCE MEMBER: Hello, I'm Benjamin Baron (PH) from New York.

Could you speak about your insurance business a little bit? And especially the retroactive policies you've been writing.

WARREN BUFFETT: Can we speak about the — you say the reinsurance business?

CHARLIE MUNGER: Retroactive —

WARREN BUFFETT: I heard the retroactive part, but the first part.

BENJAMIN BARON: The reinsurance and the retroactive, and also the market in Bermuda and how you see it as one of your potential markets.

WARREN BUFFETT: I think the retroactive market is, what's called "retroactive insurance," has been pretty well eliminated by developments in accounting.

So I would not expect us to really have any volume in retroactive-type policies.

Now, when we write workers' comp with a policy holder dividend, in effect that's a retroactive policy. But that's a relative — that's small part of Berkshire's business.

Did I answer what you were driving at there?

AUDIENCE MEMBER: (Inaudible)

WARREN BUFFETT: Pardon me?

AUDIENCE MEMBER: (Inaudible)

WARREN BUFFETT: Did you get that, Charlie?

55. "You don't find out who's been swimming naked until the tide goes out"

CHARLIE MUNGER: Just comment on the development of the insurance business in Bermuda.

WARREN BUFFETT: Oh, Bermuda is simply a, you know, a new competitor. They're not so new, I mean, there've been companies in Bermuda before.

But in the last 15 months, 18 months, maybe there's been 4 billion-plus raised. And because, for tax reasons — maybe other reasons as well, but certainly for tax reasons — that capacity has been concentrated in Bermuda-based, Bermuda-domiciled reinsurers.

But essentially there's no great difference between that type of competition and other reinsurers competition, except for the fact that that capacity is new and the money's just been raised, and so there may be some greater pressure on the managers of those businesses to go out and write business promptly than on somebody that's been around for 50 years.

But it's no plus for us any time new capacity enters any business that we're in, and that certainly goes for the reinsurance business.

Reinsurance business, by its nature, will be a business in which some very stupid things are done en masse periodically. I mean, you can be doing dumb things and not know it in reinsurance, and then all of a sudden wake up and find out, you know, the money is gone.

And it's what people have found out — and I used that line in the report a year ago — it's what people have found out that were speculating on bonds with (inaudible) margins recently, that, you know, you don't find out who's been swimming naked until the tide goes out. And — (laughter) — essentially that's what happens in reinsurance. You don't, you really don't find out who's been swimming naked until the wind blows at them.

56. When cash “piles up,” it's not through choice

WARREN BUFFETT: Zone 3.

AUDIENCE MEMBER: I'm Whitney Anderson (PH) from Miami, Florida. And my question is, right now, we are reading about various analysts and how you should, in their individual opinion, adjust your more cash, more stocks, more bonds because of ...

How does Berkshire Hathaway feel about times of relative financial insecurity? Do you arrange for more cash reserves looking forward to a time when you might be able to buy? Or do you go along your path?

WARREN BUFFETT: I think the question is do we sort of get into asset allocation by maintaining given levels of cash, depending on some kind of outlook or something of the sort?

We don't really think that way at all. If we have cash, it's because we haven't found anything intelligent to do with it that day, in the way of buying into the kind of businesses we like.

And when we can't find anything for a while, the cash piles up. But that's not through choice, that's because we're failing at what we essentially are trying to do, which is to find things to buy, and —

We make no attempt to guess whether cash is going to be worth more three months from now or six months from now or a year from now.

So it is — you will never see — we don't have any meetings of any kind anyway at Berkshire, but we would never have an asset allocation meeting. We would — (laughter) — keep looking. I mean, Charlie's looking, I'm looking. Some of our managers are looking.

We're looking for things to buy that meet our tests, and if we showed no cash or short-term securities at year-end, we would love it, because it would mean that we'd found ways to employ the money in ways that we like.

I think I would have to admit that if we have a lot of money around, we are a little dumber than usual. I mean, it tends to make you careless.

And I would say that the best purchases are usually made when you have to sell something to raise the money to get them, because it just raises the bar a little bit that you jump over in the mental decisions.

But we have, I don't know what we'll show, but certainly well over a billion dollars of cash around, and that's not through choice. That is a — you can look at that as an index of failure on the part of your management.

And we will be happy when we can buy businesses, or small pieces of businesses, that use up that money.

57. Fannie Mae and Freddie Mac as investments

WARREN BUFFETT: Zone 4.

AUDIENCE MEMBER: Gentlemen, my name is Richard Sercer from Tucson, Arizona.

I understand that 40 percent of all home mortgages have been securitized by Fannie Mae and Freddie Mac, the duopoly.

I would, at the risk of asking you for a projection, since you've talked about projections before, I'd be interested in understanding what you think will happen to that market share over time for this duopoly. Thank you.

WARREN BUFFETT: Well, the answer to that doesn't involve much of a prediction. That market share is essentially certain to go up.

That doesn't mean that those are wonderful businesses to buy, but the market share is essentially certain to go up because the economics that those two entities possess, compared

to other ways of intermediating money between investors and people who want to borrow, no one else has those economics.

So what holds the share of Freddie Mac and Fannie Mae down is the fact that they are only allowed to loan roughly \$200,000 on any mortgage. That's a limiting factor. It's probably been a good thing for them that it has been a limiting factor, but they are shut out of part of the market.

But the market that they are in, they essentially have economics that other people can't touch for intermediating money, including the savings and loan business that we were in.

We had a business that intermediated money, went out and got it from depositors and lent it to people who wanted to borrow on a home.

Freddie Mac and Fannie Mae do it the same way. They don't do it exactly the same way, but they perform the same function. And they could do it so much more cheaply than we could do it by having branches or anything of the sort and paying the insurance fee we paid.

They're going to get the business. They should get the business. And so their market share will grow.

Charlie?

CHARLIE MUNGER: Well, I think that's right. (Laughter)

WARREN BUFFETT: You're doing great. (Laughter)

58. Increased information speed doesn't affect our decisions

WARREN BUFFETT: Zone 5.

AUDIENCE MEMBER: Good morning, I'm Sarah Pruitt (PH) from Milwaukee, Wisconsin.

And I wondered if you feel that the speed with which information is available and disseminated today has affected your business-buying decision process. And do you believe that speed has caused you to miss opportunities?

WARREN BUFFETT: Question about seas expanding?

CHARLIE MUNGER: No. Does the speed of information today affect our decision-making process?

WARREN BUFFETT: No, we — I would say that we perform about like we were doing 30 or 40 years ago.

I mean — (laughter) — we read annual reports.

It isn't the — the speed of information really doesn't make any difference to us. It's the processing and finally coming to some judgment that actually has some utility, that is, that it's a judgment about the price of a business or a part of a business, a security, versus what it's essentially worth.

And none of that involves anything to do, really, with quick information. It involves getting good information.

But usually that — it's not — we're not looking for needles in haystacks or anything of the sort. You know, we like haystacks, not needles, basically. And we want it to shout at us.

And I would say that, well, virtually everything we've done has been reading public reports, and then maybe asking questions around to ascertain trade positions or product strengths or something of that sort.

But we never have to — we can make decisions very fast. I mean, we get called on a business — or we can make up our mind whether we're interested in two or three minutes. That takes no time. We may have to do a little checking on a few things subsequently.

But we don't need to get — I can't think of anything where we really need lots of price data or things like that extremely fast to make any decisions.

We've got good management information systems in our operating businesses, but that's just another — that's a question of keeping inventories where they should be and all of that sort of thing.

I don't think the invest — I think you could be in someplace where the mails were delayed three weeks, and the quotations were delayed three weeks, and I think you could do just fine in investing.

59. Why a stock buyback is unlikely

WARREN BUFFETT: Zone 6.

AUDIENCE MEMBER: James Pan (PH), New York City. I have a two-parter question.

One, do you think the stock price of Berkshire Hathaway is trading within 15 percent of its intrinsic value currently?

And two, if you think Berkshire Hathaway is undervalued with the amount of cash you have on your balance sheet, would you consider a buyback?

WARREN BUFFETT: The answer about a buyback is that we generally have felt that market conditions that would make Berkshire attractively priced is probably going to make other things even more attractively priced, because we think our shareholders are more rational than the shareholders of many companies.

It's more likely that we will find some wonderful business at a silly price than we will find Berkshire at a silly price as we go along. So — (applause) that tends to eliminate repurchases.

But it doesn't rule them out, but it explains why the circumstances will not arise very often where repurchases would make good sense.

60. Why we don't estimate our intrinsic value

WARREN BUFFETT: In terms of giving you a number on intrinsic value, I don't want to spoil your fun. I mean, you really should work that one out for yourself. (Laughter)

Charlie is the expert on intrinsic —

Do you have any comment for him, Charlie?

CHARLIE MUNGER: Well, your attitude on that subject reminds me of a famous headmaster who used to address the graduating class every year. And he'd say, "You know," he says, "Five percent of you people are going to end up criminals." And he says, "I know exactly who you are." (Laughter)

And he said, "But I'm not going to tell you, because it would deprive your lives of a sense of excitement." (Laughter)

If you stop to think about it, the companies that constantly told their shareholders what the intrinsic value was were the real estate holding companies in corporate form.

And I must say, that the amount of folly and misbehavior that crept into that process was disgusting. We would be just associating with a bad group if we were to change our ways.

WARREN BUFFETT: Bill Zeckendorf Sr. I think was probably the first one to do that, with Webb and Knapp back in the late '50s. I still have those annual reports. And he would announce, you know, like, to eight decimal places what the intrinsic value of Webb and Knapp was. And he did it right till the day they filed for Chapter 11. (Laughter)

CHARLIE MUNGER: I remember that well, because somebody said that he fell into bankruptcy. And somebody else said, "How can you fall off a pancake?" (Laughter)

WARREN BUFFETT: Beware of people that give you a lot of numbers about their businesses. I mean, in terms of projections or valuations or that sort of thing.

We try to give you all of the numbers that we would use ourselves in making our own calculations of value.

We really — if you read the Berkshire reports, you essentially — you have all the information that Charlie and I would use in making a decision about the security.

And if there's anything really lacking in that respect, you know, we would actually — we would truly appreciate hearing from you, because we want to have that kind of information in the report. But then we want you to make the calculation.

But we've stuck, I mean, that material, for example, on the float in the insurance business, we consider that quite relevant, obviously, because we use up almost a page printing it. It's pretty serious stuff at Berkshire. (Laughter)

But that is relevant. I mean, your interpretation may be different than mine or Charlie's, but those are important numbers.

And we could give you a lot of baloney about satisfied policyholders, you know, in Lincoln, Nebraska. It wouldn't tell you a thing about what the company's worth — and have pictures of them, and happy, you know, receiving the check from the agent and all of that. (Laughter)

We're not going to do that.

61. Buffett on Peter Lynch

WARREN BUFFETT: Zone 1.

AUDIENCE MEMBER: Mike Macy (PH) from Indianapolis.

I have really enjoyed reading your annual letters and your annual report, and I've gone back and read all of the older ones, too. They're terrific.

I have also enjoyed reading the two books by Peter Lynch, and I see a lot of commonalities between the two of you, the way you think, your philosophy, et cetera.

I'd certainly appreciate it if you'd make a few comments on what you think of Peter Lynch, the things he says in his two books, and the advice that he gives to investors. Thank you.

WARREN BUFFETT: Well, I know Peter. I don't know him well, but we've played bridge together in Omaha as a matter of fact.

I like him personally, and obviously he has an outstanding record. And he has written those two books, which have been bestsellers, about his investment philosophy. I don't really have anything — you know, I'm not going to embroider on his.

There's certainly a fair amount of overlap. There's some difference.

Peter, obviously, likes to diversify a lot more than I do. He owns more stocks than the names of companies I can remember. I mean, but that's Peter. (Laughter)

And, you know, I've said in investing, in the past, that there's more than one way to get to heaven. And there isn't a true religion in this, but there's some very useful religions.

And Peter's got one, and I think we've got one that's useful, too. And there is a lot of overlap.

But I would not do as well if I tried to do it the way Peter does it, and he probably wouldn't do as well if he tried to do it exactly the way I'd do it.

I like him personally very much. He's a high-grade guy.

62. We'll only write insurance when prices make sense

WARREN BUFFETT: Zone 2.

AUDIENCE MEMBER: Mr. Buffett, Mr. Munger, my name is Dave Lankes (PH). I'm a senior editor at Business Insurance Magazine.

A two-part question for you. Can you explain a little bit regarding your primary insurance operations? What drove up written premiums by more than 50 percent last year, and if you expect that to continue this year?

And then regarding your earlier comments on the stupid things reinsurers can do en masse, can you explain what potential pitfalls that the new cat facilities in Bermuda will have to avoid that you feel Berkshire Hathaway won't fall into?

WARREN BUFFETT: Well, the first question about our primary insurance figures, you'll find it way in the back someplace. But they're a little distorted because we bought Central States Indemnity, what would it be, late in the year '92. So there's a lot more premium volume in there for Central States in '93 than there was in '92.

Our basic — National Indemnity's basic insurance, which is commercial, auto, and general liability, premium volume was fairly flat, the Homestate operation fairly flat, Cypress up somewhat. But those numbers were not anything like the changes —

So our business last year, pro forma for including Central States Indemnity for all of '92, would not have shown a dramatic change. There really hasn't been much happening in our primary business, except that it's been run, it's done very well, but it is not growing or exploding. And that's true this year as well as last year.

It's a good business. And it could grow in certain kinds of markets very substantially, but it is not growing in this market, and it did not grow last year, although its underwriting was very good.

In the reinsurance business, I think, essentially, the difference in our reinsurance business from many others, you know — it doesn't include them all in a place like Bermuda — is essentially the difference that may exist in our operations and securities versus other people.

We will offer reinsurance at any time in very large quantities at prices we think make sense. But we won't do business if we don't think it makes sense, just like we will buy securities, to the extent of the cash we have available, if they make sense. But we have no interest in being in the stock market per se just to be in it. We want to own securities that make sense to us.

I think for most managements, if the only thing they're in is the reinsurance business, they may like it better when prices make sense, but they will, I think they will be prone to do quite a bit of business when prices don't make sense as well, because there's no alternative, except to give the money back to the owners. And that is not something that most managements, you know, do somersaults over. (Laughter)

So, I think we are in a favored position, essentially being — having the flexibility of capital allocation that lets us take the lack of business with a certain equanimity that most managements probably can't, because of their sole focus on the business.

Rates will get silly, in all likelihood, after a period when nothing much happens, when you've had a couple of years of good experience.

We price to what we think is exposure. We don't price to experience. I mean, the fact that there was no big hurricane last year — I forget the name of the one that was coming in at North Carolina and then veered out essentially — but to us, it has nothing to do with the rates next year whether that hurricane actually came in in a big way or veered out into the Atlantic again. I mean, we are pricing to exposure.

And everyone says that, but the market tends to price and respond to experience, and generally to recent experience. That's why all the retrocessional operations in London, you know, in the spiral, went busted, because they priced, in our view, they priced to experience rather than to exposure.

It's very hard not to do that, to be there year after year with business coming by and investors expecting this of you and not do that.

But we will never knowingly do that. We may get influenced subconsciously in some way to do that, but we will not do that any more than we will accept stock market norms as being the proper way for us to invest money and equities.

Basically, when you lay out money or accept insurance risks, you really have to think for yourself. You cannot let the market think for you.

Charlie?

CHARLIE MUNGER: Yeah, I think Berkshire is basically a very old-fashioned kind of a place. And it tries to exert discipline to stay old-fashioned.

And I don't mean old-fashioned stupid, I mean, you know, the eternal verity, so to speak, basic mathematics, you know, basic horse sense, basic fear, basic discriminations regarding human nature, all very old-fashioned. And if you just do that with a certain amount of discipline, I think it's likely to work out quite well.

63. Praise from Sandy Gottesman

WARREN BUFFETT: Zone 3.

DAVID GOTTESMAN: David Gottesman from New York.

It's no wonder that this meeting draws stockholders from all over the country. And despite the talk about age today, I'm happy to say this meeting gets better every year.

Berkshire stands unique in American business as a company whose name has become synonymous with management excellence.

Unlike many American corporations, we, as stockholders, don't have to worry about reorganizations, large write-offs, massive restructurings, overstated earnings, and overpaid executives with strategic visions.

Instead, year in and year out, we enjoy the benefits of the common sense and brilliance of Charlie and Warren. (APPLAUSE)

WARREN BUFFETT: What did you say your name was? (Laughter)

DAVID GOTTESMAN: I want to add to that, to say nothing of your good humor.

It's easy to take such consistently outstanding results for granted, but we in this room are the direct beneficiaries of their efforts.

By our presence here today, we show our appreciation to them for their exceptional performance. But we can also demonstrate in another way. I would like to suggest we give them a rousing hand of applause for a job well done. Thank you. (APPLAUSE)

WARREN BUFFETT: Thank you. That was Sandy Gottesman. We've worked together for 30-odd years, and he's finally got that down. I appreciate that, Sandy. (Laughter)

64. Brief adjournment

WARREN BUFFETT: With that, we will adjourn. And anyone who wants to stay around, we'll reconvene in 15 minutes, and then we'll be here till about 1:15.

Afternoon Session - 1994 Meeting

1. No comment on Guinness investment

WARREN BUFFETT: Zone 2 now. Well, I don't know where zone 2 is, but we'll — (laughs)

AUDIENCE MEMBER: Do you feel basically the same about your investment in Guinness now as when you made the investment, in terms of the company?

WARREN BUFFETT: Well, I wouldn't like to comment on anything that we own, in terms of how we rate them as desirability or anything. I mean, whether it's Coke or Gillette or anything that — we made decisions at a given time, at a given price, which you can figure out by looking at our purchases.

But we may be buying or selling any of those securities right as we talk. And we simply don't think it's in the interest of Berkshire shareholders as a group to be talking about things that we could be buying or selling.

2. World Book's sales slide: "I wish I knew the answer"

WARREN BUFFETT: OK?

AUDIENCE MEMBER: Hi, David Winters, from Mountain Lakes, New Jersey.

Just wondering, World Book's had a tough time lately, and I'm wondering if there's things you're doing to try to improve that.

And also, The Buffalo News has been fabulous. And I'm kind of wondering what's driving The Buffalo News?

WARREN BUFFETT: Buffalo News is doing what?

AUDIENCE MEMBER: Fabulously.

WARREN BUFFETT: Yeah, it's doing well, right. Well, I would say you got to give credit Stan Lipsey — I'm not sure whether Stan's here right now, but — who's been running the News.

World Book, in terms of unit sales — as we put in the report — have fallen off significantly the last few years. It's actually surprising, in a sense, how well the profits have held up because they've done a good job, a very good job, in that respect.

And as we put in the report, we don't know the answer, precisely. We are, Ralph Schey is — has taken some actions — is taking some actions — that he thinks will improve the operations. Ralph's record as a manager is absolutely at the top of the list. I mean, it — I wrote about it in the 1992 report.

In 1993, Ralph did even better. I mean, it was a — fabulous. I think, probably, may have been 110 or so million pre-tax on 90-some million of average equity capital, or something of the sort. So it's a fabulous record.

But Encyclopedia Britannica, as you probably know, ran at a loss last year. The encyclopedia business has been very — has been poor. Could be due to electronic competition, could be due to recruiting problems for salespeople. Obviously, it can be a combination of many factors.

If we knew the answer, we'd have — you wouldn't be seeing those figures right now. But it is a top item of attention for Ralph. He takes anything that's not performing as well as before very seriously. And we will see what happens.

But I don't have a prediction on it. I wish I knew the answer. I don't see any variables to, in any intelligent way, tell you or — we put in the report the best we could do on that.

The profitability has, like I say, has been pretty good. But obviously, current trends of new sales will catch up with us at some point, unless we boost unit sales.

I don't think our market share, if you look at print encyclopedias, has fallen. But I can't be sure of that, but I think that's probably true. But there are an awful lot of encyclopedias going out there as part of a bundled product with computer sales.

3. Breaking up Berkshire wouldn't help

WARREN BUFFETT: How are we going to do this, is there?

VOICE: We got three now.

WARREN BUFFETT: OK, I'll let you hand the mic to whomever, you —

VOICE: (Inaudible) three.

AUDIENCE MEMBER: Lee again, from Palo Alto. By Omaha standards you are a relatively young man.

And every year, you point out that Berkshire's size now precludes you from making the great, relatively small trades which made your reputation.

How much thought have you given to breaking up Berkshire into smaller entities?

WARREN BUFFETT: How much what?

AUDIENCE MEMBER: How much thought have you given into breaking up Berkshire into smaller entities, which would allow you to make those nice, small, wonderful trades that you made from the beginning?

WARREN BUFFETT: It wouldn't do any good to break into smaller entities, because I'd still own, you know, we'd still have 10 billion-plus of capital to be responsible for, wherever it would be.

So, the — we could distribute it out to the shareholders, and let them make their own decisions, obviously. And any time we thought that we weren't going to get more than a dollar of value per dollar retained, that, obviously, would be the course to follow.

But there's no magic to creating multiple little — I mean, we could call Berkshire Two, Berkshire Three, Berkshire Four, but you still got the problem. There's \$10 billion to invest, and it doesn't really solve anything.

Charlie, do you have any thoughts on that?

CHARLIE MUNGER: No, the — Berkshire is incredibly decentralized, in the — in terms of power and decisions resting in the operating divisions. In terms of the marketable securities, it's incredibly centralized.

And so far, we have not had any big penalty from not being able to do the things that we did when we were young. Eventually we will reach the penalty.

WARREN BUFFETT: Yeah, I think we're — there's no question we could earn higher percentage returns working with \$100,000, though, than \$10 billion. But, yeah — but it hasn't hurt us as much as we thought it would, as size has increased.

But your universe of opportunity shrinks. But it shrinks no matter — I mean, you can set it up in 20 bank accounts or one bank account, but you still — the universe still has to fit the 10 billion, in aggregate.

4. “Absolutely sensational job” by General Dynamics management

WARREN BUFFETT: Now, how are we doing this? Do we have another zone over there? Yeah.

AUDIENCE MEMBER: Michael Bunyaner (PH), New York City.

Two questions. One, last year you discussed in your annual report your investment in General Dynamics. And you also gave your proxy to the company and its management. This year, it appears you have sold the stock.

WARREN BUFFETT: This year, what?

AUDIENCE MEMBER: This year, it appears that you have sold the stock in General Dynamics.

What has changed that you sold 20 percent of your stake? This is question number one, and I have number two.

WARREN BUFFETT: Probably inappropriate to be talking about what we're buying or selling, except to the extent that we make a public — have to make a public announcement, which, on something like General Dynamics, we've got 13G requirements if we change by more than 5 percent.

And we also have — as long as we own more than 10 percent — we have monthly reporting requirements under Form 4.

We think the management of General Dynamics has done an absolutely sensational job.

Obviously, also it isn't the kind of business, basically, that we have a 20-year view on, or something of the sort. So, it's — the shareholders of General Dynamics have been extraordinarily well-served by the management of that company. And we've — we're thankful, because we prospered accordingly.

AUDIENCE MEMBER: But should I take from this comment that you have changed your view about the business itself?

WARREN BUFFETT: Pardon me?

AUDIENCE MEMBER: Should I take from your comment that you have changed your view about the business itself?

WARREN BUFFETT: No, no. I think you take my comments as saying just what I've said. (Laughs)

AUDIENCE MEMBER: OK. (Laughter)

Question number two, could you tell me —

WARREN BUFFETT: I think we want to give people a chance around the room, and then when, in the zone you're in, when a second question comes along, it will be fine. But we want to get as many people in this hour as we can, because this is the hard core here.

5. No encouragement for short-term stockholders

WARREN BUFFETT: Zone 1?

AUDIENCE MEMBER: It appeared to me that in 1993 the variation between the stock price for the high and the low was much greater than years in the past. Would you mind commenting on that?

WARREN BUFFETT: Well, there was more volatility in the price of Berkshire last year. And as I put in the annual report, the stock overperformed the business last year.

Now, over any 10 or 20 or 30-year history, every year the stock is going to perform a little differently, at least, from the business. I mean, it may slightly underperform, or slightly overperform.

We would prefer that those variations be as small as possible. But there was more variability last year than historically's been the case. Although we've had one or two other — we had a few years like that. We —

Our best way to handle that is to give all the information we can to shareholders and prospective shareholders, and follow policies that we think will induce the investment-oriented with long time horizons to join us, and not to encourage other people. But, occasionally — you know, we can't guarantee that result.

One of the things that was interesting to me, I don't know whether it was three months ago or when, but I happened to be talking to the [NYSE] specialist, terrific specialist, Jimmy Maguire. He had to leave, but he was here earlier in the session.

And I think, at the time, the stock was around 16,000 or something like that. And he had some rather significant stop-loss orders on the books at 15-5, or thereabouts, involving some hundreds of shares.

And that to me is a signal that, you know, we have some people that are — in my view — are not really the kind of owners that we would like to attract. Because why somebody wants to put in an order to sell something for 15,500 that they don't want to sell at 16,000 is beyond me, but — (Laughter)

The idea of people using stop-loss orders with Berkshire, obviously — it tells me that we've got some people in that are using it as trading vehicle of some sort, or have some totally non-investment-type calculations in their mind.

I don't think we have very many of them. But obviously, if we have enough people like that, you will have a more volatile stock than if you have a whole bunch of people who look at it as something that they're going to hold for the rest of their life.

And the stock did go down at that time and hit 15,500. And there were — that — I think it was close to 300 shares, which is 4 1/2 million dollars' worth of stock.

And somebody made a decision, apparently, that they — or some small number of people — made a decision that they wanted to sell something at 15,500 that they could have sold for 16,000. The lower it went, the better they liked it, apparently. I mean, the better they liked the sale. (Laughter)

Which, you know, has always struck me as like having a house that you like, and you're living in, and, you know, it's worth \$100,000 and you tell your broker, you know, if anybody ever comes along and offers 90, you want to sell it. I mean, it doesn't — (laughter) — make any sense to me.

But it has — I would say that there's been some small — I think, relatively small — tendency for people to get — relatively few people — but to get more interested in the price of the stock in terms of — and thinking of it in terms of whether it's going to go up or down in the next six months, than might formerly have been the case.

I think we're unusually well-blessed in that respect, in that we've got people who basically want to own it for a very long time.

But to the extent that you get people who were owning it because they think the stock market's going to go up, or something of that sort's going to happen, that is not good news from our standpoint, and it will increase the volatility in it.

We will do nothing to encourage that.

6. Berkshire benefits when the stock market falls

WARREN BUFFETT: Zone 2?

AUDIENCE MEMBER: Yes, Mr. Buffett, Steve Lang (PH) from Toronto.

I was just curious about when you were saying that one of the best things that could happen to shareholders is the — the market goes down and you're able to buy good businesses at foolish prices.

And then a little on, you were saying that we could judge your ability to do what it is that you feel you should be doing by how much cash you have in the account at any given point in time, and —

WARREN BUFFETT: By what?

AUDIENCE MEMBER: By the amount of cash that you have in the account. In other words, I guess, what you feel you're supposed to be doing is investing the cash in good businesses.

So I'm just wondering about that kind of dichotomy. Where does the cash come from if the market does go down, if you've been successful in your first ability? Would that be from the cash flow on the operations of the business from the float?

WARREN BUFFETT: Yeah.

AUDIENCE MEMBER: Is that —?

WARREN BUFFETT: Yeah.

AUDIENCE MEMBER: So really, the success of the company then is, to some degree, the fact that you're able to dollar-cost average into the market on an ongoing basis? Is that right?

WARREN BUFFETT: Well, it isn't that precise. But A, we do generate cash in considerable amounts, so that we will not husband cash, simply because we think the market's going to go down, in order to buy something.

But obviously, as cash comes in, we're always looking for things to do. And the cheaper that the market is generally, the more likely it is that we will find something that we understand and that we like, and that the price will be attractive, and that we will do it.

But it isn't like we can change around the whole portfolio then, because that doesn't gain us anything. I mean, we'd be selling things at lower prices to buy things at lower prices.

But to the extent that we have net cash coming in — which we do, and which we will have — on balance, we're, you know, we're adding to our businesses at more attractive prices than would be the other case.

And it's no prediction on any given company. I mean, whether it's Gillette or Coke, or anything. It might be something we already own, it might be something we don't own. But we welcome the chance to buy more shares.

We're not wishing it on anybody. But if you asked us next month whether Berkshire would be better off if the whole stock market were down 50 percent or where it is now, we would be better off if it was down 50 percent, whether we had any cash on hand now or not, because we would be generating cash to buy things.

7. Salomon's compensation: "Far from ideal"

WARREN BUFFETT: Zone 3?

AUDIENCE MEMBER: Byron Ransdell (PH) from Raleigh, North Carolina. Thanks for your hospitality to this weekend.

WARREN BUFFETT: Well, we thank you for coming, too.

AUDIENCE MEMBER: My question concerns Salomon, Inc., and more specifically, Salomon Brothers. I know that you were on the board of directors, I think, from '87 to the current time. Very much interested in compensation there, and maybe on the compensation committee.

Between 1987 and 1992, Salomon's financial results were quite dismal in a very lumpy way, but overall, quite dismal.

In your opinion, if the compensation had been rational during this time, would Salomon have shown results that would make it a quite decent business?

WARREN BUFFETT: Would Salomon — if the compensation —

CHARLIE MUNGER: If the past compensation —

WARREN BUFFETT: — had been more rational —

CHARLIE MUNGER: — decisions had been more rational, '87 to the current time, would Salomon have done better? Yeah, was that it?

AUDIENCE MEMBER: Yes, sir.

WARREN BUFFETT: Well, I would — yeah, I would say that, if the present people and the present compensation philosophy — which allows for very large payments for very large results — I think the company would have done better, yeah.

It — you're going to see very big numbers paid in Wall Street. That's the nature of it. The trick is to pay them only when you're getting very big results for the owners. I mean, it — there's no way you're going to pay numbers that look like numbers in other industries, and get great results for owners.

But if you pay these big numbers, I think you should be getting very good results for owners.

And there — the old system was not — I mean, it wasn't totally off the mark on that. But it was far from an ideal system, in my view.

8. Unlikely to write put options on Coca-Cola again

WARREN BUFFETT: Zone 1?

AUDIENCE MEMBER: Warren, I have one question.

Last year you were using Coca-Cola puts as a way to increase income, and conversely, if they were exercised, as a way of increasing your position. Do you still use puts in this type on investments you wish to add to?

(BREAK IN RECORDING)

WARREN BUFFETT: — five million shares, as I remember, of Coke sometime in the early fall or thereby — I don't remember exactly — last year. And the puts, I think the premium was around 7 1/2 million dollars, and they were priced around 35.

We have not done that very often, and we're unlikely to do very much of it. For one thing, there are position limits on puts, which don't apply to us, but they apply to the brokers for which we do them. And those position limits were not clear before that. But we could probably write puts on that same amount by doing it through a bunch of different brokers.

It's not something we're really very likely to do. I was happy to do it, and in that particular case, we made 7 1/2 million dollars.

But we're better off, probably — if we like something well enough to write a put on it, we're probably better off buying the security itself, and particularly since we can't do it in the kind of quantities that really would make it meaningful to Berkshire.

There are securities I would not mind writing puts for 10 million shares or something, but I — that probably — it's probably allowable for us to do it. It's not allowed — we'd probably have to do it through multiple brokers to get the job done.

And on balance, I don't think it's as useful a way to spend my time as just looking for securities to buy outright.

Charlie, you have anything?

CHARLIE MUNGER: No.

9. Don't believe reports on what we're buying or selling

WARREN BUFFETT: Zone 2?

AUDIENCE MEMBER: Mr. Buffett, I'm from West Point. And my name is Rogers.

A couple of months ago, there were stories in The World-Herald that Berkshire Hathaway had taken a large position in Philip Morris, and UST. But in your annual report, I don't see anything about that. Can you comment?

WARREN BUFFETT: Yeah, I would say, in the last two years maybe — I'm just approximating — I've probably seen reports in either The Wall Street Journal, or USA Today — maybe picked up by The Associated Press, or in The Herald, but in papers of some significance — I've probably seen stories that we were buying maybe any one of 10 companies in aggregate over that period of time. I would say a significant majority were erroneous.

We don't correct the erroneous ones, because if we don't correct the erroneous ones — if we correct the erroneous ones, and don't say anything about the correct ones, in effect we're identifying the correct ones, too.

So we will never comment on those stories, no matter how ridiculous they are.

And it's interesting because, you know, they keep getting printed. And frankly, from our standpoint, the fact that most of them are inaccurate is probably useful to us. We don't do anything to encourage it, but it — the fact that people are reading that we are buying A, B, C, or X, Y, Z when we aren't — you know, that's — I don't think people should be buying stocks because they're reading in the paper that we're buying something. But if they do, they may get cured of it at some point.

Maybe the newspapers will even get cured of writing the stories when they don't know, you know, what the facts are.

But it's something we live with, and we'll probably continue to live with.

And I would say that based on history, if you read something about us buying or selling something, other than through reports we've filed with the SEC or regulatory bodies, the chances are well over 50 percent — that I can tell you, based on history, is correct — well over 50 percent that it's wrong.

10. Unlikely Berkshire will be a Dow or S&P 500 stock

WARREN BUFFETT: Zone 3?

AUDIENCE MEMBER: Do you expect that Berkshire will become one of the Standard & Poor 500 stocks, or a Dow Jones stock?

WARREN BUFFETT: Well, I think it's unlikely it ever becomes a Dow Jones stock.

I don't know what the criteria are for the S&P 500. But I imagine there's some reason why we don't fit. I don't know whether they have questions about number of shares outstanding or — I've never checked with S&P.

I wouldn't be surprised if we have the largest market capitalization of any company that isn't in the S&P, although I don't know that. But they may have some criteria that preclude Berkshire being part of it.

I've always thought it would be very interesting, for those of you who like to think about such things, that if we were part of the S&P 500, and enough people became indexed so that 60 percent of the market was indexed, and if Charlie and I wouldn't sell, which we wouldn't, it'd be an interesting proposition as to how the index funds would ever get their 60 percent if they tried to replicate the S&P.

It'd be — I don't know whether they have rules even about concentration of ownership. That same line of thinking might have applied to Walmart, or some company.

Because just take the extreme example of a company that had 90 percent of its stock owned by one individual, and 12 percent of the money in the market were indexed, and the 90 percent wouldn't sell, it would bring back the Northern Pacific Corner or something of the sort.

In any event, I don't think that's going to be a problem. And I don't think we are going to end up being in either index, so —

11. Diversify if you don't understand businesses

WARREN BUFFETT: Yeah, zone 1?

AUDIENCE MEMBER: Mr. Buffett, my name is Aaron Morris (PH). I'm from California.

What I wanted to know was how you think about how large a position you're willing to take in a given security, both in your case, where you have new cash coming in that you can invest, and in the case of an investor, where they have a fixed amount of capital, and they're trying to decide what's the most (inaudible) security that they really love?

WARREN BUFFETT: Well, Charlie and I have — probably at our present size, we will never find anything that we get as much money into as we want. Don't you think that's probably true, Charlie? If we really like it?

CHARLIE MUNGER: Yeah, I think that's quite likely.

WARREN BUFFETT: Yeah, so we will probably never hit the limit. We would love to. We'd love to find something we felt that strongly about, and occasionally we do.

But we won't get as much money into it as we would wish, or as if we were running a million dollars of our own money or some number like that, so —

We are willing to put a lot of money into a single security. When I ran the partnership, the limit I got to was about 40 percent in a single stock. I think Charlie, when you ran your partnership, you had more than 40 percent in —

CHARLIE MUNGER: Sure. (Laughter)

WARREN BUFFETT: And we would do the same thing if we were running smaller partnerships, or our own capital were smaller and we were running that ourselves.

Because, no, we're not going to do that unless we think we understand the business very well, and we think the nature of the business, what we're paying for it, the people running it, and all of that lead up to virtually no risk, and —

But you find those things, occasionally. And we would put — assuming it were that much more attractive than the second, and third, and fourth choices — we would put a big percentage of our net worth in it.

We only advise you to do that — well, we probably don't advise you to do it all, maybe — but we would only advise you to do it, if you're doing it based on your conclusions about — your own ideas of value, and something that you really feel you know enough to buy the whole business, if your funds were sufficient, and it was being offered to you. You ought to really understand the business.

But people do that all the time, incidentally, in private businesses, which have got terrible prospects. I mean, they buy dry cleaning establishments, or filling stations, or whatever, and they put very high — franchises of some kind — they put a very high percentage of their net worth into something — a business that's very risky, basically. I mean, it —

People put all their money in a farm, you know. It's a business. It's subject to all kinds of business risk.

So it's not crazy, if you understand the business well, and if the price is sufficiently attractive, to put a very significant percentage of your net worth in. If you don't understand businesses, then you're better off diversifying and fairly widely diversifying.

Zone — go ahead. Sorry

CHARLIE: Berkshire has a substantial shareholder whose father accumulated the original position, and when he died he left a very large estate, practically all of which was in two securities, Berkshire and one other outstanding company.

A bank was co-trustee. And the bank trust officer said you've got to diversify this. And, you know, it was a very large estate.

And the young man who was co-trustee with the bank said, “Well,” he says, “you know, if my father believed the way you do, he might have been a trust officer in a bank instead of — (laughter) — leaving this large estate.” (Applause)

And that young man holds the Berkshire to this day. And I suppose the bank is still giving the same advice. (Laughter)

12. We don't like to “give you our answers” on Coca-Cola

WARREN BUFFETT: Zone 2?

AUDIENCE MEMBER: Mr. Buffett, this is Chuck Peterson (PH) from Omaha.

And I was just wondering if you could comment on the Coca-Cola Company — you haven't really talked about it too much today — in regards to what you foresee over the next five years, the earnings per share growth, and where this growth is, perhaps, going to come from.

WARREN BUFFETT: Was that the question, about the growth of Coke?

CHARLIE MUNGER: Yeah.

WARREN BUFFETT: You really have to come to your own conclusion.

Coca-Cola Company writes — their annual reports are extremely good. I mean, they're very informative. You know, you —

My guess is that, at least, if you read a few of the reports, you'd absolutely know as much about the Coca-Cola Company as I would.

But in the end, you have to make your own decisions about growth potential, profitability potential, and all that.

But the one thing I can assure you is that, probably, if you spend a relatively small amount of time on it, the facts that you will have available to you for making a decision on that question will be just as good, essentially, as the facts you'd get if you'd worked at the Coca-Cola Company for 20 years, or if you were a food and beverage analyst in Wall Street or anything of the sort.

That's the kind of businesses we like to look at, are things that we think we can understand that way. And they're also businesses that, usually, I think you could understand that way.

But we don't like you to give you our answers. I mean, that would not be a good idea.

13. Allianz deal was “close to a wash”

WARREN BUFFETT: Zone 3?

AUDIENCE MEMBER: David — I'm sorry — David Swab (PH) from Austin, Texas.

I have a question pertaining to the convertible bonds that were outstanding for about four years.

Any thoughts on, if you're a teacher, to grade if that was a good deal, bad deal, how the money was employed compared to the cost of getting out of the bonds? Any thoughts?

WARREN BUFFETT: Charlie what? Did you get that?

CHARLIE MUNGER: He wants to know if you think, in retrospect, your deal with Allianz was a good deal for Berkshire.

WARREN BUFFETT: No, I would say that if I knew everything at the time that we did the Allianz deal — which was a convertible shareholder coupon debenture — if I knew everything now — then — that I know now, would we have done it? Probably pretty close. We had relatively few bonds converted when we called — when he called them. And so — that — it really wasn't a negative in that sense.

But if we'd had more — we could have easily had a lot more converted. And that would not have been so good, obviously, if we'd ended up selling a lot of stock at 11,800 or whatever it was.

It's very hard to measure exactly what we did with the 400 million or so that we took in at the time. So, money being fungible, separating that 400 million from other resources to measure the — what happened on the plus side from having the money — is hard to do.

But my guess is, if you could play the whole hand over again, it probably was maybe a tiny minus to have issued them. What do you think, Charlie?

CHARLIE MUNGER: It's certainly close to a wash.

WARREN BUFFETT: Yeah.

CHARLIE MUNGER: Now, you could ask about USAir, and that is one we would have been well to duck. (Laughter)

WARREN BUFFETT: And I might say Charlie had nothing to do with that decision. (Laughter) He didn't even know about it till I did it. And when he knew about it, hmmm. (Laughter)

14. "Size is a disadvantage" in buying and selling

WARREN BUFFETT: Zone 1?

AUDIENCE MEMBER: Mr. Buffett, I'm Joe Sirdevan from Toronto.

With respect to Berkshire's non-permanent, but large — and therefore, illiquid — holdings, what is your strategy for managing market impact on sales, given the intense scrutiny that Berkshire's under by the market?

WARREN BUFFETT: I didn't get that either. You get that?

CHARLIE MUNGER: I'm not hearing that very well.

WARREN BUFFETT: Yeah, I don't know whether you're too close to the mic — we're having a little trouble on that.

CHARLIE MUNGER: Speak a little more slowly.

WARREN BUFFETT: Or maybe the monitor can repeat that and — would you repeat the question?

AUDIENCE MEMBER: Sorry. Just with respect to Berkshire's large non-permanent holdings that are, therefore, illiquid, I'm just wondering what your strategy is for managing market impact when you do decide to sell portions of those holdings, given the intense scrutiny you're under?

WARREN BUFFETT: Yeah, question about the things we might sell, and what's going to happen to the market when we sell them.

That depends. I mean, it can be a very significant impact. It can be a negligible impact.

And it depends on market conditions, it depends on whether we might sell in a couple of large blocks to some institutions, it depends on — it could be, you know, there could be a tender offer or something of the sort we would sell through. So, it's hard to measure.

But it is a disadvantage. Size is a disadvantage, you're absolutely correct in the basic point, both in buying and in selling. And we don't know any way around that.

We allow for it, in terms of what we expect, you know, the kind of possibilities we need to see. And we do — we sell so infrequently, that it's not a crusher of a negative point, but it's a negative we have that you do not.

15. No key man insurance for Buffett and Munger

WARREN BUFFETT: Zone 2?

AUDIENCE MEMBER: My name is Anna (inaudible). I'm from Roanoke, Virginia.

Does Berkshire Hathaway or any of its subsidiaries have key man insurance on you and Mr. Munger?

CHARLIE MUNGER: Does Berkshire have key man insurance on —

WARREN BUFFETT: Oh, no. No. We have no life insurance, to my knowledge, on anyone except the maybe standard — the group life contracts people have. We have no key man insurance.

It really doesn't — it wouldn't be material.

I mean, that if we have a market value of 18 billion or something like that, if it really didn't — if it — a one — if it made a 1 percent difference, it'd be \$180 million.

And basically, the math of intelligently selling insurance is better than the math of intelligently buying insurance. (Laughter and applause)

16. Guinness-VNMH restructuring was “logical”

WARREN BUFFETT: Zone 3?

AUDIENCE MEMBER: Mr. Buffett, I'm Barry Siskind (PH) from Mesa, Arizona. Long-time admirer of yours. Question pertains to Guinness.

I remember reading in a publication I greatly respect, Outstanding Investor Digest by [editor] Henry Emerson in New York, that back in — I think it was '58 or '59, you made an investment in Cuba, decided to never to make an investment outside the United States again at that time.

Have subsequently invested in Guinness. I'm a fellow investor in Guinness. I've invested in Guinness for — and its sister company, Louis Vuitton Moët Hennessy — for over five years. And I'm very happy with those investments, by the way.

There's been a restructuring, as you know, of the Guinness-LVMH relationship, where Guinness no longer owns 24 percent of LVMH. Rather, it owns only its distilling, or I should say, alcoholic beverage-related businesses —

WARREN BUFFETT: The Moët Hennessy part.

AUDIENCE MEMBER: Right, the Moët Hennessy part.

The other parts of LVMH are showing better results these days, namely the Louis Vuitton luggage, as well as the Christian Dior perfume. They've also expanded into the newspaper business this past year, a business that you understand.

Do you intend to look at the possibility, first of all, of participating in those businesses that you no longer own now — with the restructured Guinness-LVMH deal — through some other form?

And the second question relates to the currency risk inherent in the Guinness investment, having bought it at about \$1.80, as you mentioned, pound sterling now down to about \$1.48.

The cost of hedging foreign currency through the FX has diminished through the combination of lower interest rates in the U.K., and higher interest rates, most recently in the U.S., to just about zero.

I take it we're all investors in companies, not speculators in currencies. So, the second part of the question is, do you intend to do anything about the currency risk portion of that investment?

WARREN BUFFETT: Well LVMH, which as you mentioned was 24 percent owned by Guinness — you know, that's one of thousands of securities that we could be a buyer or a seller of. So, I really don't want to comment on LVMH's specific attractiveness, or lack thereof.

And Guinness, I think what Guinness did was quite logical. I mean, their interest in that operation was basically through the distribution advantages that it gave to Guinness's own brands around the world, to be hooked up with Moët Hennessy, and vice versa. So, I think what they did was logical.

You can — the question of the exchange rate and all of that — the exchange rate, in terms of what they got in the spirits business, versus what they gave up in the luggage business, as in Christian Dior and a few things. You can form your own opinion on that.

But I think the logic was sound. But in terms of whether we want to be in LVMH by itself, that's like any other security, which we really can't answer.

17. Berkshire doesn't hedge currencies

WARREN BUFFETT: Second question related to —

CHARLIE MUNGER: Hedging.

WARREN BUFFETT: Hedge. Yeah, the hedging of currency —

CHARLIE MUNGER: Do we hedge?

WARREN BUFFETT: The answer to that is we don't. And Coca-Cola, as I mentioned, gets 80 percent of their earnings from a variety of currencies, the yen and the mark being two very important ones. They're going to be getting a very high percentage five years from now, 10 years from now.

They do certain currency transactions, but it's a practical matter. If you own Coca-Cola, you own a bunch of foreign bonds with coupons on them, denominated in local currencies, that go on forever.

Now, should you try and engage in currency swaps on all those coupons — you don't know what those coupons are yet, because you don't know how much they're going to earn in Japan or Germany, but you do know it's going to go on for decades, and it's — they're going to be very significant sums.

Should you try and engage in a whole bunch of currency swaps to go on out and convert all that stream into dollars or anything?

We basically don't think it's worth it. We don't think our opinion on currencies is any good. We don't think — we think the market probably know — well, we know it knows as much about it — it probably knows more about currencies, but it — we don't know — we do not know more than the market does about currencies.

So there are costs to hedging. And even though interest rate structures may cause the curve to look flat going out forward, so that, in effect, there's no contango on it, there's still the cost — there are costs in it. Now, it's a relatively efficient market, so that they're not huge.

But we see no reason to incur those costs with what we regard as a — totally, a 50-50 proposition. And it really doesn't go out that far anyway. I mean, we could do it for a couple of years.

But if you take that — the way we look at businesses, being the discounted flow of future cash out between now and Judgment Day, we can't really hedge that kind of a risk anyway. We could keep rolling hedges, but there's a cost to it that we don't want to incur.

We don't — we wouldn't worry a whole lot about whether some portion of our earnings, whether it's from Guinness, whether it's from Coke, whether it's from Gillette, are denominated at some mixture of marks, and pounds, and yen, and dollars, or whether they're all in dollars.

We'd slightly prefer if it were all in dollars, but we don't lose sleep over the fact that it may be coming from a mix of currencies like that. We wouldn't like it, in terms of, obviously, some very weak currencies.

18. Insurance intrinsic value far exceeds book value

WARREN BUFFETT: Zone 1?

AUDIENCE MEMBER: Lawrence Grawning (PH), Mill Valley, California.

On page 13 of the annual report, in — talking about the insurance operation, you say that it possesses an intrinsic value that exceeds its book value by a “large amount — larger, in fact, than is the case at any other Berkshire business.”

To refine an earlier question that was asked, could you tell me whether you mean that it is larger in — by a percentage or in absolute dollars, that is —

WARREN BUFFETT: By absolute dollars. And —

AUDIENCE MEMBER: That’s what you’re referring to?

WARREN BUFFETT: Yeah, by absolute — it’s very hard to stick a percentage figure on the insurance business, because we have so much capital in there that —

And then — and we have other businesses. I think that the — we’ve got businesses with a book value of in the tens of millions that are worth in the many hundreds of millions. So, you couldn’t apply that to the insurance company (Inaudible). So, it’s absolute dollars.

But in terms of absolute dollars, we think the excess of intrinsic value over carrying value — at least I do — is substantially greater for the insurance business than any other business we own.

Charlie, do you have any —

CHARLIE MUNGER: No —

WARREN BUFFETT: — thoughts on that?

CHARLIE MUNGER: — that’s exactly right.

19. No concerns on Coca-Cola succession

AUDIENCE MEMBER: Joe Little (PH), Vancouver, Canada.

Does the management succession issue for the top job at Coca-Cola concern you?

WARREN BUFFETT: Management picture, you’d do what with the —?

AUDIENCE MEMBER: The management succession issue over the next several years.

WARREN BUFFETT: Oh, yeah.

AUDIENCE MEMBER: The top job. Does that concern you?

WARREN BUFFETT: At Coca-Cola —

AUDIENCE MEMBER: Yeah.

WARREN BUFFETT: I think any announcement that — from that would come with — from Coca-Cola.

CHARLIE MUNGER: He said do you like it?

AUDIENCE MEMBER: Does it concern you?

CHARLIE MUNGER: Does it concern you?

WARREN BUFFETT: Oh, I'm not concerned at all, no. No, Coca-Cola is very well managed.
(Laughs)

20. Salomon CEO's \$24M bonus target "hellishly hard to hit"

WARREN BUFFETT: Zone 3?

AUDIENCE MEMBER: Chris Stavrou (PH) from New York.

According to the latest Salomon Brothers proxy, if [Chairman and CEO] Deryck [Maughan] earns 30 percent on allocated equity of Salomon Brothers, provided that that's at least 10 percent above the return for competitors, he could earn a bonus of \$24 million.

My question is whether that return number is reduced by a charge for preferred dividends?

WARREN BUFFETT: I, Charlie, do you remember on the comp committee —?

CHARLIE MUNGER: I can't remember the detail on that.

WARREN BUFFETT: I think the equity — I — my — I'm fairly sure, but I'm not positive, that the equity figure would include our preferred, but not non-convertible preferreds.

And it would apply to the earnings applicable to the — to our preferred plus common, but not — but it would be after dividends on non-convertible preferred.

But I, you know, I'm not on the comp committee, and I have not read the description that carefully.

CHARLIE MUNGER: Well, I am, and I can't remember. (Laughter)

But I will tell you, one thing I do remember about that, and that is a target which would be one — would be hellishly hard to hit.

WARREN BUFFETT: It'd be unbelievable. I mean —

CHARLIE MUNGER: That's is, you're talking about Babe Ruth —

WARREN BUFFETT: Squared.

CHARLIE MUNGER: Yeah, doing 150 home runs in a season instead of a — if that happens, you'll be very glad to pay the money. (Laughter)

WARREN BUFFETT: Very. Under either calculation, yeah. It really — but it, you know, I'm glad it's there. (Laughs)

I hope Deryck's paying attention to it.

21. Salomon is a “better company than it was some years back”

WARREN BUFFETT: Zone 1?

AUDIENCE MEMBER: Hi, I'm Chris Davis again, from New York.

I wanted to ask if you — I feel there's such a huge discrepancy between the valuation of some of your holdings versus others, in terms of the market valuation, in terms of price-to-earnings, price-to-book.

In your opinion, do the growth prospects of Salomon Brothers, or the quality — or your anticipation of your ability to clip the coupons at Salomon Brothers — justify such a dramatic discount to the growth prospects of Coca-Cola or Gillette, in terms of our ability as Berkshire shareholders to clip those coupons?

And if you could explain, or perhaps share your thoughts on why the market perception, if it is — justifies that distinction?

WARREN BUFFETT: Yeah, I'm not sure I can answer that question without getting into a discussion of the relative merits of the two companies — or the three companies — you mentioned, at these prices, but —

Salomon and Coca-Cola are obviously very different kinds of businesses, or Salomon and Gillette. And Charlie and I do our best to try to understand the businesses.

Obviously, it's easier to understand the future of a Coca-Cola than it is a Salomon. But that doesn't mean it's a better buy.

And what you see at any given time in our holdings is partly the historical accident, even, of when we bought, and when we had money available, and all that. But it reflected an affirmative decision at that point, obviously.

Our guess would be that the — you know, we would feel reasonably good about anything that we owned, in terms of the price at which we bought it, and the facts at the time we bought it. And the facts change over time.

Salomon, I think, is a better company now than it was some years back. But it's still in a business that's — can be very volatile, and it has a small amount — as does any investment banking firm and as any commercial banking firm — of systemic risk. I mean, you can't get rid of that.

Charlie, you want to?

CHARLIE MUNGER: No, I've got nothing to add.

22. Calculating intrinsic value

WARREN BUFFETT: Zone 2?

AUDIENCE MEMBER: Thank you. Sean Barry, Regina, Canada.

Mr. Buffett, you've indicated that most of us in this room could acquire a lot of the information that you and Charlie acquire through the annual reports. Yet you both also indicated that the GAAP rules, a lot of times, leave a little to be desired.

Could you perhaps give an indication as to how you and Charlie come up with the economic value, or the intrinsic value, of the businesses that you finally decide to invest in? And a little bit about the process that you go through with that? Thank you.

WARREN BUFFETT: Well, the — in the 1992 annual report, we discuss that a fair amount.

But the economic value of any asset, essentially, is the present value, the appropriate interest rate, of all the future streams of cash going in or out of the business.

And there are all kinds of businesses that Charlie and I don't think we have the faintest idea what that future stream will look like. And if we don't have the faintest idea what the future stream is going to look like, we don't have the faintest idea what it's worth, now. Now that —

So, if you think you know what the price of a stock should be today, but you don't think you have any idea what the stream of cash will be over the next 20 years, you've got cognitive dissonance, I guess, is what they call it. (Laughter) The —

So we are looking for things where we feel — fairly high degree of probability — that we can come within a range of looking at those numbers out over a period of time, and then we discount them back.

And we are more concerned with the certainty of those numbers than we are with getting the one that looks absolutely the cheapest, but based upon numbers that we don't have any — we don't have great confidence in.

And that's basically what economic value is all about.

The numbers in any accounting report mean nothing, per se, as to economic value. They are guidelines to tell you something about how to get at economic value.

But they don't tell you anything. It — there are no answers in the financial statements. There are guidelines to enable you to figure out the answer. And to figure out that answer, you have to understand something about business.

You don't have to understand a lot about mathematics. I mean, the math is not complicated. But you do have to understand something about the business.

But that's the same thing you would do if you were going to buy an apartment house, or a farm, or any other small business you might be interested in.

You would try to figure out what you are laying out currently, and what you are likely to get back over time, and how certain you felt about getting it, and how it compared to other alternatives. That's all we do, we just do it with large businesses, basically.

The accounting figures are very helpful to us, in the sense that they generally guide us to what we should be thinking about.

And of course, if we find numbers where it looks like people are taking the most optimistic interpretation of things that they can under GAAP and all of that, we get very worried about people who look like they massage the numbers in any way. And there are plenty of people that do.

23. Growth alone doesn't make a company a good investment

WARREN BUFFETT: Zone 3?

AUDIENCE MEMBER: I'm Howard Bask (PH). I'm from Kansas City.

When you are estimating a growth rate on a company (inaudible), a very predictable company, I imagine you apply a big margin of safety to it. What kind of rate do you generally apply? I mean, high single digits?

WARREN BUFFETT: In the margin of safety, or —

AUDIENCE MEMBER: What kind of growth rate would you, on a predictable company, might you —

WARREN BUFFETT: We are willing to —

AUDIENCE MEMBER: — stab at?

WARREN BUFFETT: — buy companies that aren't going to grow at all.

AUDIENCE MEMBER: OK.

WARREN BUFFETT: It — assuming we get enough for our money when we do it. So, it — we are not looking — we are looking at projecting numbers out, as to what kind of cash we think we'll get back over time.

But you know, would you rather have a savings — if you're going to put a million dollars in a savings account, would you rather have something that paid you 10 percent a year and never changed, or would you rather have something that paid you 2 percent a year and increased at 10 percent a year? Well, you can work out the math to answer those questions.

But you can certainly have a situation where there's absolutely no growth in the business, and it's a much better investment than some company that's going to grow at very substantial rates, particularly if they're going to need capital in order to grow.

There's a huge difference in the business that grows and requires a lot of capital to do so, and the business that grows, and doesn't require capital.

And I would say that, generally, financial analysts do not give adequate weight to the difference in those. In fact, it's amazing how little attention is paid to that. Believe me, if you're investing, you should pay a lot of attention to it.

Charlie?

CHARLIE MUNGER: I agree with that. But it's fairly simple, but it's not so simple it can all be explained in one sentence. (Laughter)

WARREN BUFFETT: Our — some of our best businesses that we own outright don't grow. But they throw off lots of money, which we can use to buy something else. And therefore, our capital is growing, without physical growth being in the business.

And we are much better off being in that kind of situation [than] being in some business that, itself, is growing, but that takes up all the money in order to grow, and doesn't produce at high returns as we go along. A lot of managements don't understand that very well, actually.

24. Capital allocation shouldn't be delegated

WARREN BUFFETT: Zone 1?

AUDIENCE MEMBER: Byron Wien from New York.

You said that you decentralized the operating decisions, but centralized the capital allocation decisions.

What kind of staff do you have in Omaha to help you with the capital allocation decisions and the stock selection decisions you make? Or do you and Charlie do that, pretty much, by yourselves?

WARREN BUFFETT: Yeah, we don't have any staff to help us on it. I mean, basically we tell them to mail all the money to Omaha — (laughter) — and then when we get there, we put our arms around it. (Laughs)

And we allocate all the capital ourselves. I mean, that is our job.

And we don't feel we should delegate, I mean, we wouldn't do it anyway. Our personalities aren't such that we would delegate our — allocating our own money to someone — letting somebody else allocate our own money.

But we feel that's our job. And it's interesting, and we've — I've written about this in the past — that that's an important job for most managements. There's some companies where it's not, but it's a — it usually is a very important job for most managements.

And if you take a CEO that's in a job for 10 years, and he has a business that earns, say, 12 percent on equity, and he's — and he pays out a third, that means he's got 8 percent per year of equity. I mean, when you think of his tenure in office, how much capital he's allocated, it's an enormous factor over time.

And yet, probably relatively few chief executives are either trained for, or are selected on, the basis of their ability to allocate capital. I mean, they get there through other routes.

So, I've said it's like somebody playing the piano all their life, and then getting to Carnegie Hall and they hand him a violin. I mean, it is a different function than most — than the route — than the functions that exist along the routes to the CEO's job at most companies.

And so many CEOs, when they get there, think they can solve it by either having a staff that does it, or by hiring consultants, or whatever it may be.

And in our view, that is — and that's a terrible mistake, because it's — it is, if not the key function of the CEO, it's one of two or three key functions at say 80 or 90 percent of all companies.

And if you can't do it yourself, you're going to make a lot of mistakes. You may make a lot of mistakes even if you do it yourself. But if you —

You know, you wouldn't want anybody in any other position of that importance in the company essentially saying, "I don't know how to do this, so I'm going to have somebody else do it," when it's their key responsibility. But that's the way it works in business.

And Charlie and I take responsibility for all capital allocation decisions, other than just, sort of, routine expenditures at the operating businesses. And we don't get into those at all.

I mean, if our managers are spending three or four million dollars a year on machinery — or if one of them is, I mean — on machinery, equipment, plants, new leases — we have no review process on that. We don't have a staff at headquarters. We don't waste the time to do that.

We think those people know how to allocate the money that relates to the actual operations of their business. We think, in terms of the capital that is generated above that, that that's our job.

Charlie, anything —?

CHARLIE MUNGER: I would say we have practically nobody at headquarters in Omaha. One of the reasons Warren shines up so well is, you know, he's being compared to practically nobody. (Laughter)

WARREN BUFFETT: I might say if — one interesting — when we're having this meeting, for example, I think there's one person there in the office. I mean, the rest of them are down here helping on the meeting. I mean, it —

CHARLIE MUNGER: Here we are, Warren and I are selling candy and encyclopedias, and so forth. The chief financial officer of Berkshire Hathaway is handling the microphones. I mean, this makes Southwest Airlines look like they don't understand —

WARREN BUFFETT: Cost control. (Laughter)

CHARLIE MUNGER: — cost accounting, yeah. It's a very old-fashioned place.

And by the way, speaking of hawking our merchandise, if any of you have safety deposit boxes full of Berkshire Hathaway certificates, and have children or grandchildren who don't have World Book in print in the house, you are making a very serious error.

That is a marvelous thing for — to have in the house with —

WARREN BUFFETT: And the discount only applies —

CHARLIE MUNGER: — full of young people.

WARREN BUFFETT: The discount only applies today — (laughs) — incidentally. I think that's right.

CHARLIE MUNGER: It is. That is, it may not be selling too well because of the current vogue for encyclopedias on computers. And by the way, those encyclopedias that are available are inferior compared to World Book, which is very user-friendly for children, and I like it that way myself. And —

WARREN BUFFETT: We —

CHARLIE MUNGER: That is one product you really ought to buy.

WARREN BUFFETT: We both use it, personally. I mean, I keep a set at the office, and a set at home. And I —

CHARLIE MUNGER: I give away more of that product —

WARREN BUFFETT: — I use it a lot.

CHARLIE MUNGER: — than other product that Berkshire Hathaway makes in any subsidiary. It's a perfectly fabulous human achievement. To edit a thing, to — that user friendly, with that much wisdom encapsulated. It is a — it's a fabulous thing.

25. Keynes: Great "wisdom" about investing

WARREN BUFFETT: Zone 2?

AUDIENCE MEMBER: (Inaudible) from Houston, Texas. From time to time, you have quoted John Maynard Keynes, the British economist.

So, I would assume that you have read the investment writings very extensively. What are two or three investment lessons, in your opinion, one can learn from that economist?

WARREN BUFFETT: Well, I forget which, I think it's chapter eight of "The General Theory," do you remember Charlie? Or is it chapter —

CHARLIE MUNGER: No.

WARREN BUFFETT: There's one chapter in "The General Theory" that relates to markets, and the psychology of markets, and the behavior of market participants and so on, that probably is, aside from Ben Graham's two chapters, eight and 20, in "The Intelligent Investor" — I think you'll find you'll get as much wisdom from reading that as anything written in investments. And you'll know it when you see it in "The General Theory."

It's a chapter that jumps out to you about securities and so on. And I — could be chapter eight, but I may be wrong on that. But I would recommend reading that.

Keynes and Graham, from vastly different starting points, came to the same conclusion at about the same time in the '30s, as to the soundest way to invest over time. They differed some on their ideas on diversification. Keynes believed in diversifying far less than did Graham.

But Keynes started off with the wrong theory, I would say, in the '20s and essentially tried to predict business cycles in markets, and then shifted to fundamental analysis of businesses in the '30s, and did extremely well.

And about the same time, Graham was writing his first material. I think Janet Lowe, in her book on Ben Graham, actually has a little correspondence that took place between Keynes and Ben. So I would advise you to read that.

And there's some letters of his that he — of Keynes' — that he wrote to co-trustees of life insurance societies, and colleges, and so on, that I think you'd find interesting, too.

SYNC TRANSCRIPT TO VIDEO

1994 Letter

BERKSHIRE HATHAWAY INC.

To the Shareholders of Berkshire Hathaway Inc.:

Our gain in net worth during 1994 was \$1.45 billion or 13.9%. Over the last 30 years (that is, since present management took over) our per-share book value has grown from \$19 to \$10,083, or at a rate of 23% compounded annually.

Charlie Munger, Berkshire's Vice Chairman and my partner, and I make few predictions. One we will confidently offer, however, is that the future performance of Berkshire won't come close to matching the performance of the past.

The problem is not that what has worked in the past will cease to work in the future. To the contrary, we believe that our formula - the purchase at sensible prices of businesses that have good underlying economics and are run by honest and able people - is certain to produce reasonable success. We expect, therefore, to keep on doing well.

A fat wallet, however, is the enemy of superior investment results. And Berkshire now has a net worth of \$11.9 billion compared to about \$22 million when Charlie and I began to manage the company. Though there are as many good businesses as ever, it is useless for us to make purchases that are inconsequential in relation to Berkshire's capital. (As Charlie regularly reminds me, "If something is not worth doing at all, it's not worth doing well.") We now consider a security for purchase only if we believe we can deploy at least \$100 million in it. Given that minimum, Berkshire's investment universe has shrunk dramatically.

Nevertheless, we will stick with the approach that got us here and try not to relax our standards. Ted Williams, in The Story of My Life, explains why: "My argument is, to be a good hitter, you've got to get a good ball to hit. It's the first rule in the book. If I have to bite at stuff that is out of my happy zone, I'm not a .344 hitter. I might only be a .250 hitter." Charlie and I agree and will try to wait for opportunities that are well within our own "happy zone."

We will continue to ignore political and economic forecasts, which are an expensive distraction for many investors and businessmen. Thirty years ago, no one could have foreseen the huge expansion of the Vietnam War, wage and price controls, two oil shocks, the resignation

of a president, the dissolution of the Soviet Union, a one-day drop in the Dow of 508 points, or treasury bill yields fluctuating between 2.8% and 17.4%.

But, surprise - none of these blockbuster events made the slightest dent in Ben Graham's investment principles. Nor did they render unsound the negotiated purchases of fine businesses at sensible prices. Imagine the cost to us, then, if we had let a fear of unknowns cause us to defer or alter the deployment of capital. Indeed, we have usually made our best purchases when apprehensions about some macro event were at a peak. Fear is the foe of the faddist, but the friend of the fundamentalist.

A different set of major shocks is sure to occur in the next 30 years. We will neither try to predict these nor to profit from them. If we can identify businesses similar to those we have purchased in the past, external surprises will have little effect on our long-term results.

What we promise you - along with more modest gains - is that during your ownership of Berkshire, you will fare just as Charlie and I do. If you suffer, we will suffer; if we prosper, so will you. And we will not break this bond by introducing compensation arrangements that give us a greater participation in the upside than the downside.

We further promise you that our personal fortunes will remain overwhelmingly concentrated in Berkshire shares: We will not ask you to invest with us and then put our own money elsewhere. In addition, Berkshire dominates both the investment portfolios of most members of our families and of a great many friends who belonged to partnerships that Charlie and I ran in the 1960's. We could not be more motivated to do our best.

Luckily, we have a good base from which to work. Ten years ago, in 1984, Berkshire's insurance companies held securities having a value of \$1.7 billion, or about \$1,500 per Berkshire share. Leaving aside all income and capital gains from those securities, Berkshire's pre-tax earnings that year were only about \$6 million. We had earnings, yes, from our various manufacturing, retailing and service businesses, but they were almost entirely offset by the combination of underwriting losses in our insurance business, corporate overhead and interest expense.

Now we hold securities worth \$18 billion, or over \$15,000 per Berkshire share. If you again exclude all income from these securities, our pre-tax earnings in 1994 were about \$384 million. During the decade, employment has grown from 5,000 to 22,000 (including eleven people at World Headquarters).

We achieved our gains through the efforts of a superb corps of operating managers who get extraordinary results from some ordinary-appearing businesses. Casey Stengel described managing a baseball team as "getting paid for home runs other fellows hit." That's my formula at Berkshire, also.

The businesses in which we have partial interests are equally important to Berkshire's success. A few statistics will illustrate their significance: In 1994, Coca-Cola sold about 280 billion 8-ounce servings and earned a little less than a penny on each. But pennies add up. Through Berkshire's 7.8% ownership of Coke, we have an economic interest in 21 billion of its servings, which produce "soft-drink earnings" for us of nearly \$200 million. Similarly, by way of its Gillette stock, Berkshire has a 7% share of the world's razor and blade market (measured by revenues, not by units), a proportion according us about \$250 million of sales in 1994. And, at Wells Fargo, a \$53 billion bank, our 13% ownership translates into a \$7 billion "Berkshire Bank" that earned about \$100 million during 1994.

It's far better to own a significant portion of the Hope diamond than 100% of a rhinestone, and the companies just mentioned easily qualify as rare gems. Best of all, we aren't limited to simply a few of this breed, but instead possess a growing collection.

Stock prices will continue to fluctuate - sometimes sharply - and the economy will have its ups and down. Over time, however, we believe it highly probable that the sort of businesses we own will continue to increase in value at a satisfactory rate.

Book Value and Intrinsic Value

We regularly report our per-share book value, an easily calculable number, though one of limited use. Just as regularly, we tell you that what counts is intrinsic value, a number that is impossible to pinpoint but essential to estimate.

For example, in 1964, we could state with certitude that Berkshire's per-share book value was \$19.46. However, that figure considerably overstated the stock's intrinsic value since all of the company's resources were tied up in a sub-profitable textile business. Our textile assets had neither going-concern nor liquidation values equal to their carrying values. In 1964, then, anyone inquiring into the soundness of Berkshire's balance sheet might well have deserved the answer once offered up by a Hollywood mogul of dubious reputation: "Don't worry, the liabilities are solid."

Today, Berkshire's situation has reversed: Many of the businesses we control are worth far more than their carrying value. (Those we don't control, such as Coca-Cola or Gillette, are carried at current market values.) We continue to give you book value figures, however, because they serve as a rough, albeit significantly understated, tracking measure for Berkshire's intrinsic value. Last year, in fact, the two measures moved in concert: Book value gained 13.9%, and that was the approximate gain in intrinsic value also.

We define intrinsic value as the discounted value of the cash that can be taken out of a business during its remaining life. Anyone calculating intrinsic value necessarily comes up with a highly subjective figure that will change both as estimates of future cash flows are revised and as interest rates move. Despite its fuzziness, however, intrinsic value is all-important and is the only logical way to evaluate the relative attractiveness of investments and businesses.

To see how historical input (book value) and future output (intrinsic value) can diverge, let's look at another form of investment, a college education. Think of the education's cost as its "book value." If it is to be accurate, the cost should include the earnings that were foregone by the student because he chose college rather than a job.

For this exercise, we will ignore the important non-economic benefits of an education and focus strictly on its economic value. First, we must estimate the earnings that the graduate will receive over his lifetime and subtract from that figure an estimate of what he would have earned had he lacked his education. That gives us an excess earnings figure, which must then be discounted, at an appropriate interest rate, back to graduation day. The dollar result equals the intrinsic economic value of the education.

Some graduates will find that the book value of their education exceeds its intrinsic value, which means that whoever paid for the education didn't get his money's worth. In other cases, the intrinsic value of an education will far exceed its book value, a result that proves capital was wisely deployed. In all cases, what is clear is that book value is meaningless as an indicator of intrinsic value.

Now let's get less academic and look at Scott Fetzer, an example from Berkshire's own experience. This account will not only illustrate how the relationship of book value and intrinsic value can change but also will provide an accounting lesson that I know you have been breathlessly awaiting. Naturally, I've chosen here to talk about an acquisition that has turned out to be a huge winner.

Berkshire purchased Scott Fetzer at the beginning of 1986. At the time, the company was a collection of 22 businesses, and today we have exactly the same line-up - no additions and no disposals. Scott Fetzer's main operations are World Book, Kirby, and Campbell Hausfeld, but many other units are important contributors to earnings as well.

We paid \$315.2 million for Scott Fetzer, which at the time had \$172.6 million of book value. The \$142.6 million premium we handed over indicated our belief that the company's intrinsic value was close to double its book value.

In the table below we trace the book value of Scott Fetzer, as well as its earnings and dividends, since our purchase.

Year	Beginning Book Value (1) (In \$ Millions)	Earnings (2)	Dividends (3)	Ending Book Value (4) (1) + (2) - (3)
1986	\$172.6	\$40.3	\$125.0	\$87.9
1987	87.9	48.6	41.0	95.5
1988	95.5	58.0	35.0	118.6
1989	118.6	58.5	71.5	105.5
1990	105.5	61.3	33.5	133.3
1991	133.3	61.4	74.0	120.7
1992	120.7	70.5	80.0	111.2
1993	111.2	77.5	98.0	90.7
1994	90.7	79.3	76.0	94.0

Because it had excess cash when our deal was made, Scott Fetzer was able to pay Berkshire dividends of \$125 million in 1986, though it earned only \$40.3 million. I should mention that we have not introduced leverage into Scott Fetzer's balance sheet. In fact, the company has gone from very modest debt when we purchased it to virtually no debt at all (except for debt used by its finance subsidiary). Similarly, we have not sold plants and leased them back, nor sold receivables, nor the like. Throughout our years of ownership, Scott Fetzer has operated as a conservatively-financed and liquid enterprise.

As you can see, Scott Fetzer's earnings have increased steadily since we bought it, but book value has not grown commensurately. Consequently, return on equity, which was exceptional at the time of our purchase, has now become truly extraordinary. Just how extraordinary is illustrated by comparing Scott Fetzer's performance to that of the Fortune 500, a group it would qualify for if it were a stand-alone company.

Had Scott Fetzer been on the 1993 500 list - the latest available for inspection - the company's return on equity would have ranked 4th. But that is far from the whole story. The top three companies in return on equity were Insilco, LTV and Gaylord Container, each of which emerged from bankruptcy in 1993 and none of which achieved meaningful earnings that year except for those they realized when they were accorded debt forgiveness in bankruptcy proceedings. Leaving aside such non-operating windfalls, Scott Fetzer's return on equity would have ranked it first on the Fortune 500, well ahead of number two. Indeed, Scott Fetzer's return on equity was double that of the company ranking tenth.

You might expect that Scott Fetzer's success could only be explained by a cyclical peak in earnings, a monopolistic position, or leverage. But no such circumstances apply. Rather, the company's success comes from the managerial expertise of CEO Ralph Schey, of whom I'll tell you more later.

First, however, the promised accounting lesson: When we paid a \$142.6 million premium over book value for Scott Fetzer, that figure had to be recorded on Berkshire's balance sheet. I'll spare you the details of how this worked (these were laid out in an appendix to our 1986 Annual Report) and get to the bottom line: After a premium is initially recorded, it must in almost all cases be written off over time through annual charges that are shown as costs in the acquiring company's earnings statement.

The following table shows, first, the annual charges Berkshire has made to gradually extinguish the Scott Fetzer acquisition premium and, second, the premium that remains on our books. These charges have no effect on cash or the taxes we pay, and are not, in our view, an economic cost (though many accountants would disagree with us). They are merely a way for us to reduce the carrying value of Scott Fetzer on our books so that the figure will eventually match the net worth that Scott Fetzer actually employs in its business.

Year	Beginning Purchase Premium	Purchase-Premium Charge to Berkshire Earnings	Ending Purchase Premium
(In \$ Millions)			
1986	\$142.6	\$11.6	\$131.0
1987	131.0	7.1	123.9
1988	123.9	7.9	115.9
1989	115.9	7.0	108.9
1990	108.9	7.1	101.9
1991	101.9	6.9	95.0
1992	95.0	7.7	87.2
1993	87.2	28.1	59.1
1994	59.1	4.9	54.2

Note that by the end of 1994 the premium was reduced to \$54.2 million. When this figure is added to Scott Fetzer's year-end book value of \$94 million, the total is \$148.2 million, which is the current carrying value of Scott Fetzer on Berkshire's books. That amount is less than half of our carrying value for the company when it was acquired. Yet Scott Fetzer is now earning about twice what it then did. Clearly, the intrinsic value of the business has consistently grown, even though we have just as consistently marked down its carrying value through purchase-premium charges that reduced Berkshire's earnings and net worth.

The difference between Scott Fetzer's intrinsic value and its carrying value on Berkshire's books is now huge. As I mentioned earlier - but am delighted to mention again - credit for this agreeable mismatch goes to Ralph Schey, a focused, smart and high-grade manager.

The reasons for Ralph's success are not complicated. Ben Graham taught me 45 years ago that in investing it is not necessary to do extraordinary things to get extraordinary results. In later life, I have been surprised to find that this statement holds true in business management as well. What a manager must do is handle the basics well and not get diverted. That's precisely Ralph's formula. He establishes the right goals and never forgets what he set out to do. On the personal side, Ralph is a joy to work with. He's forthright about problems and is self-confident without being self-important.

He is also experienced. Though I don't know Ralph's age, I do know that, like many of our managers, he is over 65. At Berkshire, we look to performance, not to the calendar. Charlie and I, at 71 and 64 respectively, now keep George Foreman's picture on our desks. You can make a bet that our scorn for a mandatory retirement age will grow stronger every year.

Intrinsic Value and Capital Allocation

Understanding intrinsic value is as important for managers as it is for investors. When managers are making capital allocation decisions - including decisions to repurchase shares - it's vital that they act in ways that increase per-share intrinsic value and avoid moves that decrease it. This principle may seem obvious but we constantly see it violated. And, when misallocations occur, shareholders are hurt.

For example, in contemplating business mergers and acquisitions, many managers tend to focus on whether the transaction is immediately dilutive or anti-dilutive to earnings per share (or, at financial institutions, to per-share book value). An emphasis of this sort carries great dangers. Going back to our college-education example, imagine that a 25-year-old first-year MBA student is considering merging his future economic interests with those of a 25-year-old day laborer. The MBA student, a non-earner, would find that a "share-for-share" merger of his equity interest in himself with that of the day laborer would enhance his near-term earnings (in a big way!). But what could be sillier for the student than a deal of this kind?

In corporate transactions, it's equally silly for the would-be purchaser to focus on current earnings when the prospective acquiree has either different prospects, different amounts of non-operating assets, or a different capital structure. At Berkshire, we have rejected many merger and purchase opportunities that would have boosted current and near-term earnings but that would have reduced per-share intrinsic value. Our approach, rather, has been to follow Wayne Gretzky's advice: "Go to where the puck is going to be, not to where it is." As a result, our shareholders are now many billions of dollars richer than they would have been if we had used the standard catechism.

The sad fact is that most major acquisitions display an egregious imbalance: They are a bonanza for the shareholders of the acquiree; they increase the income and status of the acquirer's management; and they are a honey pot for the investment bankers and other professionals on both sides. But, alas, they usually reduce the wealth of the acquirer's shareholders, often to a substantial extent. That happens because the acquirer typically gives up

more intrinsic value than it receives. Do that enough, says John Medlin, the retired head of Wachovia Corp., and "you are running a chain letter in reverse."

Over time, the skill with which a company's managers allocate capital has an enormous impact on the enterprise's value. Almost by definition, a really good business generates far more money (at least after its early years) than it can use internally. The company could, of course, distribute the money to shareholders by way of dividends or share repurchases. But often the CEO asks a strategic planning staff, consultants or investment bankers whether an acquisition or two might make sense. That's like asking your interior decorator whether you need a \$50,000 rug.

The acquisition problem is often compounded by a biological bias: Many CEO's attain their positions in part because they possess an abundance of animal spirits and ego. If an executive is heavily endowed with these qualities - which, it should be acknowledged, sometimes have their advantages - they won't disappear when he reaches the top. When such a CEO is encouraged by his advisors to make deals, he responds much as would a teenage boy who is encouraged by his father to have a normal sex life. It's not a push he needs.

Some years back, a CEO friend of mine - in jest, it must be said - unintentionally described the pathology of many big deals. This friend, who ran a property-casualty insurer, was explaining to his directors why he wanted to acquire a certain life insurance company. After droning rather unpersuasively through the economics and strategic rationale for the acquisition, he abruptly abandoned the script. With an impish look, he simply said: "Aw, fellas, all the other kids have one."

At Berkshire, our managers will continue to earn extraordinary returns from what appear to be ordinary businesses. As a first step, these managers will look for ways to deploy their earnings advantageously in their businesses. What's left, they will send to Charlie and me. We then will try to use those funds in ways that build per-share intrinsic value. Our goal will be to acquire either part or all of businesses that we believe we understand, that have good, sustainable underlying economics, and that are run by managers whom we like, admire and trust.

Compensation

At Berkshire, we try to be as logical about compensation as about capital allocation. For example, we compensate Ralph Schey based upon the results of Scott Fetzer rather than those of Berkshire. What could make more sense, since he's responsible for one operation but not the

other? A cash bonus or a stock option tied to the fortunes of Berkshire would provide totally capricious rewards to Ralph. He could, for example, be hitting home runs at Scott Fetzer while Charlie and I rang up mistakes at Berkshire, thereby negating his efforts many times over. Conversely, why should option profits or bonuses be heaped upon Ralph if good things are occurring in other parts of Berkshire but Scott Fetzer is lagging?

In setting compensation, we like to hold out the promise of large carrots, but make sure their delivery is tied directly to results in the area that a manager controls. When capital invested in an operation is significant, we also both charge managers a high rate for incremental capital they employ and credit them at an equally high rate for capital they release.

The product of this money's-not-free approach is definitely visible at Scott Fetzer. If Ralph can employ incremental funds at good returns, it pays him to do so: His bonus increases when earnings on additional capital exceed a meaningful hurdle charge. But our bonus calculation is symmetrical: If incremental investment yields sub-standard returns, the shortfall is costly to Ralph as well as to Berkshire. The consequence of this two-way arrangement is that it pays Ralph - and pays him well - to send to Omaha any cash he can't advantageously use in his business.

It has become fashionable at public companies to describe almost every compensation plan as aligning the interests of management with those of shareholders. In our book, alignment means being a partner in both directions, not just on the upside. Many "alignment" plans flunk this basic test, being artful forms of "heads I win, tails you lose."

A common form of misalignment occurs in the typical stock option arrangement, which does not periodically increase the option price to compensate for the fact that retained earnings are building up the wealth of the company. Indeed, the combination of a ten-year option, a low dividend payout, and compound interest can provide lush gains to a manager who has done no more than tread water in his job. A cynic might even note that when payments to owners are held down, the profit to the option-holding manager increases. I have yet to see this vital point spelled out in a proxy statement asking shareholders to approve an option plan.

I can't resist mentioning that our compensation arrangement with Ralph Schey was worked out in about five minutes, immediately upon our purchase of Scott Fetzer and without the "help" of lawyers or compensation consultants. This arrangement embodies a few very simple ideas -

not the kind of terms favored by consultants who cannot easily send a large bill unless they have established that you have a large problem (and one, of course, that requires an annual review). Our agreement with Ralph has never been changed. It made sense to him and to me in 1986, and it makes sense now. Our compensation arrangements with the managers of all our other units are similarly simple, though the terms of each agreement vary to fit the economic characteristics of the business at issue, the existence in some cases of partial ownership of the unit by managers, etc.

In all instances, we pursue rationality. Arrangements that pay off in capricious ways, unrelated to a manager's personal accomplishments, may well be welcomed by certain managers. Who, after all, refuses a free lottery ticket? But such arrangements are wasteful to the company and cause the manager to lose focus on what should be his real areas of concern. Additionally, irrational behavior at the parent may well encourage imitative behavior at subsidiaries.

At Berkshire, only Charlie and I have the managerial responsibility for the entire business. Therefore, we are the only parties who should logically be compensated on the basis of what the enterprise does as a whole. Even so, that is not a compensation arrangement we desire. We have carefully designed both the company and our jobs so that we do things we enjoy with people we like. Equally important, we are forced to do very few boring or unpleasant tasks. We are the beneficiaries as well of the abundant array of material and psychic perks that flow to the heads of corporations. Under such idyllic conditions, we don't expect shareholders to ante up loads of compensation for which we have no possible need.

Indeed, if we were not paid at all, Charlie and I would be delighted with the cushy jobs we hold. At bottom, we subscribe to Ronald Reagan's creed: "It's probably true that hard work never killed anyone, but I figure why take the chance."

Sources of Reported Earnings

The table on the next page shows the main sources of Berkshire's reported earnings. In this presentation, purchase-premium charges of the type we discussed in our earlier analysis of Scott Fetzer are not assigned to the specific businesses to which they apply, but are instead aggregated and shown separately. This procedure lets you view the earnings of our businesses as they would have been reported had we not purchased them. This form of presentation seems to us to be more useful to investors and managers than one utilizing GAAP, which requires purchase

premiums to be charged off, business-by-business. The total earnings we show in the table are, of course, identical to the GAAP total in our audited financial statements.

Operating Earnings (000s omitted)	Pre-Tax 1994	Earnings 1993	Berkshire 1994	Share 1993
Insurance Group:				
Underwriting	\$129,926	\$30,876	\$80,860	\$20,156

* *Includes Dexter's earnings only from the date it was acquired, November 7, 1993.*

***Excludes interest expense of Finance Businesses.*

A large amount of information about these businesses is given on pages 37-48, where you will also find our segment earnings reported on a GAAP basis. In addition, on pages 53-59, we have rearranged Berkshire's financial data into four segments on a non-GAAP basis, a presentation that corresponds to the way Charlie and I think about the company. Our intent is to

supply you with the financial information that we would wish you to give us if our positions were reversed.

"Look-Through" Earnings

In past reports, we've discussed look-through earnings, which we believe more accurately portray the earnings of Berkshire than does our GAAP result. As we calculate them, look-through earnings consist of: (1) the operating earnings reported in the previous section, plus; (2) the retained operating earnings of major investees that, under GAAP accounting, are not reflected in our profits, less; (3) an allowance for the tax that would be paid by Berkshire if these retained earnings of investees had instead been distributed to us. The "operating earnings" of which we speak here exclude capital gains, special accounting items and major restructuring charges.

If our intrinsic value is to grow at our target rate of 15%, our look-through earnings, over time, must also increase at about that pace. When I first explained this concept a few years back, I told you that meeting this 15% goal would require us to generate look-through earnings of about \$1.8 billion by 2000. Because we've since issued about 3% more shares, that figure has grown to \$1.85 billion.

We are now modestly ahead of schedule in meeting our goal, but to a significant degree that is because our super-cat insurance business has recently delivered earnings far above trend-line expectancy (an outcome I will discuss in the next section). Giving due weight to that abnormality, we still expect to hit our target but that, of course, is no sure thing.

The following table shows how we calculate look-through earnings, though I warn you that the figures are necessarily very rough. (The dividends paid to us by these investees have been included in the operating earnings itemized on page 12, mostly under "Insurance Group: Net Investment Income.")

Berkshire's Major Investees	Berkshire's	Approximate at	Berkshire's	Share of
	Ownership	Yearend	Undistributed	Operating Earnings
	1994	1993	1994	1993
American Express Company	5.5%	5.5%	\$25 (2)	\$25 (2)
Capitla Cities / ABC Inc.	13.0%	13.0%	\$85 (2)	\$83 (2)
The Coca-Cola Company	7.8%	7.2%	116 (2)	94
Federal Home Loan Mortgage Corp.	6.3% (1)	6.8% (1)	47 (2)	41 (2)

Berkshire's share of undistributed earnings of major investees			\$492	\$422
Hypothetical tax on these undistributed investee earnings (4)			(68)	(59)
Reported operating earnings of Berkshire			606	478
Total look-through earnings of Bekrshire			\$1,030	\$841

- (1) Does not include shares allocable to the minority interest at Wesco
- (2) Calculated on average ownership for the year
- (3) Excludes realized capital gains, which have been both recurring and significant
- (4) The tax rate used is 14%, which is the rate Berkshire pays on the dividends it receives

Insurance Operations

As we've explained in past reports, what counts in our insurance business is, first, the amount of "float" we develop and, second, its cost to us. Float is money we hold but don't own. In an insurance operation, float arises because most policies require that premiums be prepaid and, more importantly, because it usually takes time for an insurer to hear about and resolve loss claims.

Typically, the premiums that an insurer takes in do not cover the losses and expenses it must pay. That leaves it running an "underwriting loss" - and that loss is the cost of float.

An insurance business is profitable over time if its cost of float is less than the cost the company would otherwise incur to obtain funds. But the business has a negative value if the cost of its float is higher than market rates for money.

As the numbers in the following table show, Berkshire's insurance business has been an enormous winner. For the table, we have compiled our float - which we generate in exceptional amounts relative to our premium volume - by adding loss reserves, loss adjustment reserves, funds held under reinsurance assumed and unearned premium reserves and then subtracting agents' balances, prepaid acquisition costs, prepaid taxes and deferred charges applicable to assumed reinsurance. Our cost of float is determined by our underwriting loss or profit. In those years when we have had an underwriting profit, such as the last two, our cost of float has been negative, and we have determined our insurance earnings by adding underwriting profit to float income.

(in \$ Millions)	(1) Underwriting Loss	(2) Average Float	Approximate Cost of Funds	Yearend Yield on Long- Term Govt. Bonds
1967	Profit	\$17.3	< 0	5.50%
1968	Profit	19.9	< 0	5.90%
1969	Profit	23.4	< 0	6.79%
1970	\$0.37	32.4	1.14%	6.25%
1971	Profit	52.5	< 0	5.81%
1972	Profit	69.5	< 0	5.82%
1973	Profit	73.3	< 0	7.27%
1974	7.36	79.1	9.30%	8.13%
1975	11.35	87.6	12.96%	8.03%
1976	Profit	102.6	< 0	7.30%
1977	Profit	139.0	< 0	7.97%
1978	Profit	190.4	< 0	8.93%
1979	Profit	227.3	< 0	10.08%
1980	Profit	237.0	< 0	11.94%
1981	Profit	228.4	< 0	13.61%
1982	21.56	220.6	9.77%	10.64%
1983	33.87	231.3	14.64%	11.84%
1984	48.06	253.2	18.98%	11.58%
1985	44.23	390.2	11.34%	9.34%
1986	55.84	797.5	7.00%	7.60%
1987	55.43	1,266.7	4.38%	8.95%

1994	Profit	3,056.6	< 0	7.88%

Charlie and I are delighted that our float grew in 1994 and are even more pleased that it proved to be cost-free. But our message this year echoes the one we delivered in 1993: Though we have a fine insurance business, it is not as good as it currently looks.

The reason we must repeat this caution is that our "super-cat" business (which sells policies that insurance and reinsurance companies buy to protect themselves from the effects of mega-

catastrophes) was again highly profitable. Since truly major catastrophes occur infrequently, our super-cat business can be expected to show large profits in most years but occasionally to record a huge loss. In other words, the attractiveness of our super-cat business will take many years to measure. Certainly 1994 should be regarded as close to a best-case. Our only significant losses arose from the California earthquake in January. I will add that we do not expect to suffer a major loss from the early-1995 Kobe earthquake.

Super-cat policies are small in number, large in size and non-standardized. Therefore, the underwriting of this business requires far more judgment than, say, the underwriting of auto policies, for which a mass of data is available. Here Berkshire has a major advantage: Ajit Jain, our super-cat manager, whose underwriting skills are the finest. His value to us is simply enormous.

In addition, Berkshire has a special advantage in the super-cat business because of our towering financial strength, which helps us in two ways. First, a prudent insurer will want its protection against true mega-catastrophes - such as a \$50 billion windstorm loss on Long Island or an earthquake of similar cost in California - to be absolutely certain. But that same insurer knows that the disaster making it dependent on a large super-cat recovery is also the disaster that could cause many reinsurers to default. There's not much sense in paying premiums for coverage that will evaporate precisely when it is needed. So the certainty that Berkshire will be both solvent and liquid after a catastrophe of unthinkable proportions is a major competitive advantage for us.

The second benefit of our capital strength is that we can write policies for amounts that no one else can even consider. For example, during 1994, a primary insurer wished to buy a short-term policy for \$400 million of California earthquake coverage and we wrote the policy immediately. We know of no one else in the world who would take a \$400 million risk, or anything close to it, for their own account.

Generally, brokers attempt to place coverage for large amounts by spreading the burden over a number of small policies. But, at best, coverage of that sort takes considerable time to arrange. In the meantime, the company desiring reinsurance is left holding a risk it doesn't want and that may seriously threaten its well-being. At Berkshire, on the other hand, we will quote prices for coverage as great as \$500 million on the same day that we are asked to bid. No one else in the industry will do the same.

By writing coverages in large lumps, we obviously expose Berkshire to lumpy financial results. That's totally acceptable to us: Too often, insurers (as well as other businesses) follow sub-optimum strategies in order to "smooth" their reported earnings. By accepting the prospect of volatility, we expect to earn higher long-term returns than we would by pursuing predictability.

Given the risks we accept, Ajit and I constantly focus on our "worst case," knowing, of course, that it is difficult to judge what this is, since you could conceivably have a Long Island hurricane, a California earthquake, and Super Cat X all in the same year. Additionally, insurance losses could be accompanied by non-insurance troubles. For example, were we to have super-cat losses from a large Southern California earthquake, they might well be accompanied by a major drop in the value of our holdings in See's, Wells Fargo and Freddie Mac.

All things considered, we believe our worst-case *insurance* loss from a super-cat is now about \$600 million after-tax, an amount that would slightly exceed Berkshire's annual earnings from other sources. If you are not comfortable with this level of exposure, the time to sell your Berkshire stock is now, not after the inevitable mega-catastrophe.

Our super-cat volume will probably be down in 1995. Prices for garden-variety policies have fallen somewhat, and the torrent of capital that was committed to the reinsurance business a few years ago will be inclined to chase premiums, irrespective of their adequacy. Nevertheless, we have strong relations with an important group of clients who will provide us with a substantial amount of business in 1995.

Berkshire's other insurance operations had excellent results in 1994. Our homestate operation, led by Rod Eldred; our workers' compensation business, headed by Brad Kinstler; our credit card operation, managed by the Kizer family; National Indemnity's traditional auto and general liability business, led by Don Wurster - all of these generated significant underwriting profits accompanied by substantial float.

We can conclude this section as we did last year: All in all, we have a first-class insurance business. Though its results will be highly volatile, this operation possesses an intrinsic value that exceeds its book value by a large amount - larger, in fact, than is the case at any other Berkshire business.

Common Stock Investments

Below we list our common stockholdings having a value of over \$300 million. A small portion of these investments belongs to subsidiaries of which Berkshire owns less than 100%.

Shares	Company	Cost (000's omitted)	Market (000's omitted)
27,759,941	American Express Company	\$723,919	\$818,918
20,000,000	Capital Cities/ABC, Inc.	345,000	1,705,000
100,000,000	The Coca-Cola Company	1,298,888	5,150,000
12,761,200	Federal Home Loan Mortgage Corp. ("Freddie Mac")	270,468	644,441
6,854,500	Gannett Co., Inc.	335,216	365,002
34,250,000	GEICO Corporation.	45,713	1,678,250
24,000,000	The Gillette Company	600,000	1,797,000
19,453,300	PNC Bank Corporation	503,046	410,951
1,727,765	The Washington Post Company	9,731	418,983
6,791,218	Wells Fargo & Company	423,680	984,727

Our investments continue to be few in number and simple in concept: The truly big investment idea can usually be explained in a short paragraph. We like a business with enduring competitive advantages that is run by able and owner-oriented people. When these attributes exist, and when we can make purchases at sensible prices, it is hard to go wrong (a challenge we periodically manage to overcome).

Investors should remember that their scorecard is not computed using Olympic-diving methods: Degree-of-difficulty doesn't count. If you are right about a business whose value is largely dependent on a single key factor that is both easy to understand and enduring, the payoff is the same as if you had correctly analyzed an investment alternative characterized by many constantly shifting and complex variables.

We try to *price*, rather than *time*, purchases. In our view, it is folly to forego buying shares in an outstanding business whose long-term future is predictable, because of short-term worries about an economy or a stock market that we know to be unpredictable. Why scrap an informed decision because of an uninformed guess?

We purchased National Indemnity in 1967, See's in 1972, Buffalo News in 1977, Nebraska Furniture Mart in 1983, and Scott Fetzer in 1986 because those are the years they became available and because we thought the prices they carried were acceptable. In each case, we pondered what the business was likely to do, not what the Dow, the Fed, or the economy might do. If we see this approach as making sense in the purchase of businesses in their entirety, why should we change tack when we are purchasing small pieces of wonderful businesses in the stock market?

Before looking at new investments, we consider adding to old ones. If a business is attractive enough to buy once, it may well pay to repeat the process. We would love to increase our economic interest in See's or Scott Fetzer, but we haven't found a way to add to a 100% holding. In the stock market, however, an investor frequently gets the chance to increase his economic interest in businesses he knows and likes. Last year we went that direction by enlarging our holdings in Coca-Cola and American Express.

Our history with American Express goes way back and, in fact, fits the pattern of my pulling current investment decisions out of past associations. In 1951, for example, GEICO shares comprised 70% of my personal portfolio and GEICO was also the first stock I sold - I was then 20 - as a security salesman (the sale was 100 shares to my Aunt Alice who, bless her, would have bought anything I suggested). Twenty-five years later, Berkshire purchased a major stake in GEICO at the time it was threatened with insolvency. In another instance, that of the Washington Post, about half of my initial investment funds came from delivering the paper in the 1940's. Three decades later Berkshire purchased a large position in the company two years after it went public. As for Coca-Cola, my first business venture - this was in the 1930's - was buying a six-pack of Coke for 25 cents and selling each bottle for 5 cents. It took only fifty years before I finally got it: The real money was in the syrup.

My American Express history includes a couple of episodes: In the mid-1960's, just after the stock was battered by the company's infamous salad-oil scandal, we put about 40% of Buffett Partnership Ltd.'s capital into the stock - the largest investment the partnership had ever made. I should add that this commitment gave us over 5% ownership in Amex at a cost of \$13 million. As I write this, we own just under 10%, which has cost us \$1.36 billion. (Amex earned \$12.5 million in 1964 and \$1.4 billion in 1994.)

My history with Amex's IDS unit, which today contributes about a third of the earnings of the company, goes back even further. I first purchased stock in IDS in 1953 when it was growing rapidly and selling at a price-earnings ratio of only 3. (There was a lot of low-hanging fruit in those days.) I even produced a long report - do I ever write a short one? - on the company that I sold for \$1 through an ad in the Wall Street Journal.

Obviously American Express and IDS (recently renamed American Express Financial Advisors) are far different operations today from what they were then. Nevertheless, I find that a long-term familiarity with a company and its products is often helpful in evaluating it.

Mistake Du Jour

Mistakes occur at the time of decision. We can only make our mistake-du-jour award, however, when the foolishness of the decision become obvious. By this measure, 1994 was a vintage year with keen competition for the gold medal. Here, I would like to tell you that the mistakes I will describe originated with Charlie. But whenever I try to explain things that way, my nose begins to grow.

And the nominees are . . .

Late in 1993 I sold 10 million shares of Cap Cities at \$63; at year-end 1994, the price was \$85.25. (The difference is \$222.5 million for those of you who wish to avoid the pain of calculating the damage yourself.) When we purchased the stock at \$17.25 in 1986, I told you that I had previously sold our Cap Cities holdings at \$4.30 per share during 1978-80, and added that I was at a loss to explain my earlier behavior. Now I've become a repeat offender. Maybe it's time to get a guardian appointed.

Egregious as it is, the Cap Cities decision earns only a silver medal. Top honors go to a mistake I made five years ago that fully ripened in 1994: Our \$358 million purchase of USAir preferred stock, on which the dividend was suspended in September. In the 1990 Annual Report I correctly described this deal as an "unforced error," meaning that I was neither pushed into the investment nor misled by anyone when making it. Rather, this was a case of sloppy analysis, a lapse that may have been caused by the fact that we were buying a senior security or by hubris. Whatever the reason, the mistake was large.

Before this purchase, I simply failed to focus on the problems that would inevitably beset a carrier whose costs were both high and extremely difficult to lower. In earlier years, these life-

threatening costs posed few problems. Airlines were then protected from competition by regulation, and carriers could absorb high costs because they could pass them along by way of fares that were also high.

When deregulation came along, it did not immediately change the picture: The capacity of low-cost carriers was so small that the high-cost lines could, in large part, maintain their existing fare structures. During this period, with the longer-term problems largely invisible but slowly metastasizing, the costs that were non-sustainable became further embedded.

As the seat capacity of the low-cost operators expanded, their fares began to force the old-line, high-cost airlines to cut their own. The day of reckoning for these airlines could be delayed by infusions of capital (such as ours into USAir), but eventually a fundamental rule of economics prevailed: In an unregulated commodity business, a company must lower its costs to competitive levels or face extinction. This principle should have been obvious to your Chairman, but I missed it.

Seth Schofield, CEO of USAir, has worked diligently to correct the company's historical cost problems but, to date, has not managed to do so. In part, this is because he has had to deal with a moving target, the result of certain major carriers having obtained labor concessions and other carriers having benefitted from "fresh-start" costs that came out of bankruptcy proceedings. (As Herb Kelleher, CEO of Southwest Airlines, has said: "Bankruptcy court for airlines has become a health spa.") Additionally, it should be no surprise to anyone that those airline employees who contractually receive above-market salaries will resist any reduction in these as long as their checks continue to clear.

Despite this difficult situation, USAir may yet achieve the cost reductions it needs to maintain its viability long-term. But it is far from sure that will happen.

Accordingly, we wrote our USAir investment down to \$89.5 million, 25 cents on the dollar at yearend 1994. This valuation reflects both a possibility that our preferred will have its value fully or largely restored and an opposite possibility that the stock will eventually become worthless. Whatever the outcome, we will heed a prime rule of investing: You don't have to make it back the way that you lost it.

The accounting effects of our USAir writedown are complicated. Under GAAP accounting, insurance companies are required to carry all stocks on their balance sheets at estimated market value. Therefore, at the end of last year's third quarter, we were carrying our USAir preferred at

\$89.5 million, or 25% of cost. In other words, our net worth was at that time reflecting a value for USAir that was far below our \$358 million cost.

But in the fourth quarter, we concluded that the decline in value was, in accounting terms, "other than temporary," and that judgment required us to send the write-down of \$269 million through our income statement. The amount will have no other fourth-quarter effect. That is, it will not reduce our net worth, because the diminution of value had already been reflected.

Charlie and I will not stand for reelection to USAir's board at the upcoming annual meeting. Should Seth wish to consult with us, however, we will be pleased to be of any help that we can.

Miscellaneous

Two CEO's who have done great things for Berkshire shareholders retired last year: Dan Burke of Capital Cities/ABC and Carl Reichardt of Wells Fargo. Dan and Carl encountered very tough industry conditions in recent years. But their skill as managers allowed the businesses they ran to emerge from these periods with record earnings, added luster, and bright prospects. Additionally, Dan and Carl prepared well for their departure and left their companies in outstanding hands. We owe them our gratitude.

* * * * *

About 95.7% of all eligible shares participated in Berkshire's 1994 shareholder-designated contributions program. Contributions made through the program were \$10.4 million and 3,300 charities were recipients.

Every year a few shareholders miss participating in the program because they either do not have their shares registered in their own names on the prescribed record date or because they fail to get the designation form back to us within the 60-day period allowed for its return. Since we don't make exceptions when requirements aren't met, we urge that both new shareholders and old read the description of our shareholder-designated contributions program that appears on pages 50-51.

To participate in future programs, you must make sure your shares are registered in the name of the actual owner, not in the nominee name of a broker, bank or depository. Shares not so registered on August 31, 1995 will be ineligible for the 1995 program.

We made only one minor acquisition during 1994 - a small retail shoe chain - but our interest in finding good candidates remains as keen as ever. The criteria we employ for purchases or mergers is detailed in the appendix on page 21.

Last spring, we offered to merge with a large, family-controlled business on terms that included a Berkshire convertible preferred stock. Though we failed to reach an agreement, this episode made me realize that we needed to ask our shareholders to authorize preferred shares in case we wanted in the future to move quickly if a similar acquisition opportunity were to appear. Accordingly, our proxy presents a proposal that you authorize a large amount of preferred stock, which will be issuable on terms set by the Board of Directors. You can be sure that Charlie and I will not use these shares without being completely satisfied that we are receiving as much in intrinsic value as we are giving.

* * * * *

Charlie and I hope you can come to the Annual Meeting - at a new site. Last year, we slightly overran the Orpheum Theater's seating capacity of 2,750, and therefore we will assemble at 9:30 a.m. on Monday, May 1, 1995, at the Holiday Convention Centre. The main ballroom at the Centre can handle 3,300, and if need be, we will have audio and video equipment in an adjacent room capable of handling another 1,000 people.

Last year we displayed some of Berkshire's products at the meeting, and as a result sold about 800 pounds of candy, 507 pairs of shoes, and over \$12,000 of World Books and related publications. All these goods will be available again this year. Though we like to think of the meeting as a spiritual experience, we must remember that even the least secular of religions includes the ritual of the collection plate.

Of course, what you really should be purchasing is a video tape of the 1995 Orange Bowl. Your Chairman views this classic nightly, switching to slow motion for the fourth quarter. Our cover color this year is a salute to Nebraska's football coach, Tom Osborne, and his Cornhuskers, the country's top college team. I urge you to wear Husker red to the annual meeting and promise you that at least 50% of your managerial duo will be in appropriate attire.

We recommend that you promptly get hotel reservations for the meeting, as we expect a large crowd. Those of you who like to be downtown (about six miles from the Centre) may wish to

stay at the Radisson Redick Tower, a small (88 rooms) but nice hotel or at the much larger Red Lion Hotel a few blocks away. In the vicinity of the Centre are the Holiday Inn (403 rooms), Homewood Suites (118 rooms) and Hampton Inn (136 rooms). Another recommended spot is the Marriott, whose west Omaha location is about 100 yards from Borsheim's and a ten-minute drive from the Centre. There will be buses at the Marriott that will leave at 8:45 and 9:00 for the meeting and return after it ends.

An attachment to our proxy material explains how you can obtain the card you will need for admission to the meeting. A good-sized parking area is available at the Centre, while those who stay at the Holiday Inn, Homewood Suites and Hampton Inn will be able to walk to the meeting.

As usual, we will have buses to take you to the Nebraska Furniture Mart and Borsheim's after the meeting and to take you from there to hotels or the airport later. I hope you make a special effort to visit the Nebraska Furniture Mart because it has opened the Mega Mart, a true retailing marvel that sells electronics, appliances, computers, CD's, cameras and audio equipment. Sales have been sensational since the opening, and you will be amazed by both the variety of products available and their display on the floor.

The Mega Mart, adjacent to NFM's main store, is on our 64-acre site about two miles north of the Centre. The stores are open from 10 a.m. to 9 p.m. on Fridays, 10 a.m. to 6 p.m. on Saturdays and noon to 6 p.m. on Sundays. When you're there be sure to say hello to Mrs. B, who, at 101, will be hard at work in our Mrs. B's Warehouse. She never misses a day at the store - or, for that matter, an hour.

Borsheim's normally is closed on Sunday but will be open for shareholders and their guests from noon to 6 p.m. on Sunday. This is always a special day, and we will try to have a few surprises. Usually this is the biggest sales day of the year, so for more reasons than one Charlie and I hope to see you there.

On Saturday evening, April 29, there will be a baseball game at Rosenblatt Stadium between the Omaha Royals and the Buffalo Bisons. The Buffalo team is owned by my friends, Mindy and Bob Rich, Jr., and I'm hoping they will attend. If so, I will try to entice Bob into a one-pitch duel on the mound. Bob is a capitalist's Randy Johnson - young, strong and athletic - and not the sort of fellow you want to face early in the season. So I will need plenty of vocal support.

The proxy statement will include information about obtaining tickets to the game. About 1,400 shareholders attended the event last year. Opening the game that night, I had my stuff and

threw a strike that the scoreboard reported at eight miles per hour. What many fans missed was that I shook off the catcher's call for my fast ball and instead delivered my change-up. This year it will be all smoke.

Warren E. Buffett

Chairman of the Board

March 7, 1995

Morning Session - 1995 Meeting

1. Welcome

WARREN BUFFETT: Morning. I'm Warren Buffett, the chairman of Berkshire Hathaway. And on my left is Charlie Munger, the vice chairman and my partner. And we'll try to get him to say a few words at some point in the proceedings. (Laughter)

The format today is going to be just slightly different.

We have one item to — normally, we breeze through the meeting pretty fast, and we'll do that, but we have one item of business on the preferred stock that I could tell caused some confusion with people. So, I'll discuss that a little bit.

And if, before the vote on that, anybody would like to talk about the preferred issue, we'll have any comments or questions at that time. And then we'll breeze through the rest of the meeting, and then we'll open it up. And I'll have one announcement to make then, too.

And then after that, we'll go for, maybe, close to noon. And feel free, earlier, anybody that would like to leave, you're free to, obviously, at any time. Better form to do it while Charlie's talking, as I've mentioned. (Laughter) And you'll have to be quick. (Laughter)

But then we'll have a break a little before noon for a few minutes, while a more orderly retreat can be conducted. And we'll have buses outside to take you back to the hotels or to any of the commercial establishments that Berkshire's involved in.

And then because so many of the — we have people here, at least based on the tickets reserved, from 49 of the 50 states. Only Vermont is absent. We have — but we have Alaska, we have a delegation from every place.

We have people from Australia, Israel, Sweden, France, the U.K., 40-some from Canada. So, a lot of people have come a long way. So, Charlie and I will stick around.

In fact, we'll eat our lunch right up here. And we will — you don't want to watch what we eat. The — but the — well, we'll stick around until perhaps as late as even 3 o'clock, but if the crowd gets below a couple of hundred, then we'll feel we can cut it off.

But we do want to answer everyone's questions. You people are part owners of the company. And any question that relates to your ownership of Berkshire, we want to be able to give you a chance to ask.

And it's tough because of the numbers of people here. I don't know how many are in the other room. But there're about 3,300, I believe, in this room. And we want to get to you — to all of you. So, that will come after the meeting.

Now, we've got a little business to take care of.

2. Election of directors

WARREN BUFFETT: The meeting will come to order. And I'll first introduce the directors of Berkshire, in addition to myself. They're right down here. And if you'll stand up when I give your name.

Susan T. Buffett (Applause).

Howard Buffett (Applause)

These are names we found in the phone book, you can understand — (Laughter)

Malcolm Chace, III (Applause)

And Walter Scott Jr. (Applause)

Also with us today are partners in the firm of Deloitte and Touche, our auditors, Mr. Ron Burgess and Mr. Craig Christiansen (PH). They're available to respond to appropriate questions you might have concerning their firm's audit of the accounts of Berkshire.

Mr. Forrest Krutter is secretary of Berkshire. He will make a written record of the proceedings.

Mr. Robert M. Fitzsimmons has been appointed inspector of elections at this meeting. He will certify to the account of votes cast in the election for directors.

The named proxy holders for this meeting are Walter Scott Jr. and Marc Hamburg. Proxy cards have been returned through last Friday representing 998,258 Berkshire shares to be voted by the proxy holders as indicated on the cards.

That number of shares represents a quorum, and we will therefore directly proceed with the meeting. We will conduct the business of the meeting and then adjourn the formal meeting. After that we'll entertain questions you might have.

First order of business will be a reading of the minutes of the last meeting of shareholders. I recognize Mr. Walter Scott Jr. who will place a motion before the meeting.

WALTER SCOTT JR.: I move that the reading of the minutes of the last meeting of the shareholders be dispensed with.

WARREN BUFFETT: Do I hear a second?

VOICE: I second the motion.

WARREN BUFFETT: Do I hear a second? (Laughter)

VOICE: I second the motion.

WARREN BUFFETT: The motion has been moved and seconded. Are there any comments or questions? We'll vote on the motion by voice vote. All of those in favor say, "Aye."

VOICES: Aye.

WARREN BUFFETT: Opposed? The motion is carried. (Laughter)

Does the secretary have a report of the number of Berkshire shares outstanding entitled to vote and represented at the meeting?

FORREST KRUTTER: Yes, I do. As indicated in the proxy statement that accompanied the notice of this meeting that was sent by first-class mail to all shareholders of record on March 7, 1995, being the record date for this meeting, there were 1,177,750 shares of Berkshire common stock outstanding, with each share entitled to one vote on motions considered at the meeting.

Of that number, 998,258 shares are represented at this meeting by proxies returned through last Friday.

WARREN BUFFETT: Thank you. If a shareholder is present who wishes to withdraw a proxy previously sent in and vote in person on the two items of business provided for in the proxy statement, he or she may do so.

Also, if any shareholder that's present has not turned in a proxy and desires a ballot in order to vote in person on these two items, you may do so. If you wish to do this, please identify yourself to meeting officials in the aisles who will furnish two ballots to you, one for each item.

Would those persons desiring ballots please identify themselves so we may distribute them? Just raise your hand and you'll get one.

The first item of business of this meeting is to elect directors. I now recognize Mr. Walter Scott Jr. to place a motion before the meeting with respect to election of directors.

WALTER SCOTT JR.: I move that Warren E. Buffett, Susan T. Buffett, Howard G. Buffett, Malcolm G. Chase, III, Charles T. Munger and Walter Scott Jr. be elected as directors.

VOICE: I second the motion.

WARREN BUFFETT: It has been moved and seconded that Warren E. Buffett, Susan T. Buffett, Howard G. Buffett, Malcolm G. Chase, III, Charles T. Munger and Walter Scott Jr. be elected as directors. Are there any other nominations? There any discussion? You're doing fine. (Laughter)

The nominations are ready to be acted upon. If there are shareholders voting in person, they should now mark their ballots on the election for directors and allow the ballots to be delivered to the inspector of election. Collect those, please.

Would the proxy holders please also submit to the inspector of elections, a ballot on the election of directors, voting the proxies in accordance with the instructions they've received?

Mr. Fitzsimmons, when you're ready, you may give your report.

ROBERT FITZSIMMONS: My report is ready. The ballot of the proxy holders received through last Friday cast not less than 996,892 votes for each nominee. That number far exceeds a majority of the number of shares outstanding.

The certification required by Delaware law regarding the precise count of the votes, including the votes cast in person at this meeting, will be given to the secretary to be placed with the minutes of this meeting.

WARREN BUFFETT: Thank you, Mr. Fitzsimmons. Warren E. Buffett, Susan T. Buffett, Howard G. Buffett, Malcolm G. Chase, III, Charles T. Munger and Walter Scott Jr. Have been elected as directors.

3. Motion authorizing preferred stock

WARREN BUFFETT: The second item of business at this meeting is to consider the recommendation of the board of directors to amend the company's certificate of incorporation.

The proposed amendment would add a provision to the certificate of incorporation authorizing the board of directors to issue up to one million shares of preferred stock in one or more series, with such preferences, limitations, and relative rights as the board of directors may determine.

Now, we discussed this some in the annual report. But I would say — and we'll find out the exact number — but I think we probably had 11 or 12 — maybe 12,000 or so shares voted against the proposal. And I think we had a couple thousand shares that abstained.

And since there really is no downside to the proposal, that indicated to me that I'd not done a very adequate job of explaining the logic of authorizing the preferred. So, I'd like to discuss that for a minute now.

And I'd also like anybody that would like to ask questions about it, they can do so now. We can talk about it later, too. But if you'd like to do it before the vote, that'd be fine.

The authorization is just that. It's an authorization. It's not a command to issue shares. It's not a directive. It simply gives the directors of the company the ability, in a situation where it makes sense for the company to issue preferred shares, to do so.

Now, when we acquire businesses — and I'll tell you about one when we're through with this in a few minutes — when we acquire businesses, sometimes the seller of the business wants cash. Sometimes they would like common stock.

And it's certainly possible, as one potential seller did last year, that they wanted, in that case, a convertible preferred stock.

Now, from our standpoint, as long as the value of the consideration that we give equates, we really don't care, aside from a question of tax basis we might obtain, but we —

In other economic respects, we don't care what form of consideration we use, because we will equate the value of cash, versus a straight preferred, versus a convertible preferred, versus common stock, whatever it may be.

So, if the worry is that we will do something dumb in issuing the preferred stock, you should — that's a perfectly valid worry. But you should worry just as much we'll do something dumb in terms of using cash or common stock.

I mean, if we're going to do something unintelligent, we can do it with a variety of instruments. (Laughter)

And we will not get more licentious in our behavior or anything simply because we have the preferred stock.

And the preferred stock may offer sellers of a business the chance to do a tax-free exchange with us. And they may not want common stock, because they may have an ownership situation where they don't want to run the risk of common stock ownership. And that's why our preferred is flexible as to terms.

Because we could give those people a straight preferred with a coupon that made it worth par at the time we issued it. And then they would know what their income would be for the next umpteen years. And that may be of paramount interest to them.

We could issue them an adjustable-rate preferred, which as money market conditions change, would also change its coupon. And then they would be sure of a constant principal value for the rest of their lifetimes. And one or both of those factors could be more important to one seller or another.

So that we simply have more forms of currency available to make acquisitions if we have the ability to issue various forms of preferred. Because a preferred stock, if it's properly structured, allows for the possibility of a tax-free transaction with a seller. And that's important to many sellers.

Now, in the end, many sellers will prefer cash, just as in the past. And probably most of the sellers that don't want cash will want common stock. But we will have a preferred stock available.

We're only authorizing a million shares because under Delaware law, there's an annual — I think there's an annual fee. I know there's an initial fee. And I think there's an annual fee that relates to the amount of shares authorized.

So, if we authorized a hundred million shares, we would be paying a larger annual fee, which is something Mr. Munger wouldn't let me do. (Laughter)

So what we will do, if we issue this, we will issue — undoubtedly, we will issue some sub-shares so that the numbers of shares, for taxation purposes, is relatively limited.

But that we will issue sub-shares to make it easier to make change, essentially, in the market.

We may issue — if the occasion demands — we may issue a convertible preferred. But that convertible preferred would not be worth any more, at the time we issue it, than a straight preferred. We would adjust, in terms of the coupon, and the conversion price, and so on.

So we can equate various forms of currency to fit the desires of the seller of the business. And this is simply one more tool to do it. There's no downside, like I say, unless we do something stupid.

And if we do something stupid with this, we would do something stupid with cash or whatever. So it — we probably should've done this some time ago, but we never had a case of a seller wanting that form of currency before.

And so it just — and we always felt we could get it authorized promptly. But there's no reason to lose a couple of months, if a transaction is pending, to call a meeting to get this on the books. So, it's simply one more tool.

And if there are — anybody that has any questions or comments on the preferred, like I say, you can hold them until later, but I'd be glad to have them before we have the vote. Do we have any?

Yeah, there's a question over there. If you'll wait just a second, we'll get a microphone to you.

When you ask questions, now or later, if you'll give your name and where you live, I'd appreciate it.

AUDIENCE MEMBER: Hi, my name is Dr. Lawrence Wasser. I'm from New York.

My question is this. If you want to buy a business and the people in the business want cash, you have to have cash, cash that — you know, this kind of cash.

WARREN BUFFETT: We're familiar with it.

AUDIENCE MEMBER: Yeah. (Laughter and applause)

But it strikes me that the preferred isn't really cash, it's fiat currency. That is, it's currency that we can create.

WARREN BUFFETT: That's true. It's like common stock in that respect. It is the — it is a form — it is an alternate form of currency, and — but it is —

Just in terms of common stock, for example, assuming we had enough authorized, we have an unlimited ability to create currency. Now, if we created the wrong price, it dilutes the value of the old currency. But go ahead on.

AUDIENCE MEMBER: Until we vote in the affirmative, which I'm sure that this group will probably do because of their confidence in you, but until we vote in the affirmative, it doesn't exist.

WARREN BUFFETT: That is correct. That would be true, incidentally, with common stock. If we had no more authorized common stock out than we had issued, we have, I think, a million and a half authorized.

But let's assume that we'd issued all that we had authorized. Until more was authorized by the shareholders, there would — it would not be available to be issued.

AUDIENCE MEMBER: But if more were authorized by the shareholders then isn't it true that the value of the shareholders' holding would be diluted?

WARREN BUFFETT: Only if we receive less in value than we give. That's the key to it.

I mean, if we issue \$200 million worth of preferred and we receive a business that's only worth 150 million, there's no question you're worse off than before. So are we, incidentally. But we're all worse off.

The — and that's true if we give cash that's worth more for a business than the business is worth. If we give 200 million of cash for a business that's worth a 150 million, we are worse off. We may not have issued a share of stock. But we have diluted the value of your stock if we do that.

As long as we get value received, in terms of whether — of cash, common stock, or preferred stock — then you are not diluted in terms of value. It's an important point.

And obviously, a number of companies, as you may have — Charlie and I have commented about in reports and elsewhere — a number of companies, in our opinion, have issued common stock, particularly, which has a value greater than what they receive.

And — when they do that, they are running what I — what John Medlin of the Wachovia called a “chain letter in reverse.” (Laughter)

And that’s cost American shareholders a lot of money. I don’t think it’ll cost them any money at Berkshire. But it’s a perfectly valid worry for shareholders to have.

Because a management can build an empire just by issuing these little pieces of paper, which they feel don’t cost them anything.

I think Charlie had one story about that in the past. You want to comment on that, Charlie? No-names basis, of course. (Laughs)

CHARLIE MUNGER: There was a particular bank where one of the officers wanted stock options, pointed out to the management that they could issue all these shares and it didn’t cost anything.

Now, imagine hiring a manager who thinks that way and paying them money — (laughter) — to behave like Judas in your very midst.

WARREN BUFFETT: We have had conversations with managers — (laughter) — where they tell us how fortunate they feel because the stock is down and they can issue options cheaper.

Now, if they were issuing those to the third parties, you know, I’m not sure whether they’d have exactly the same attitude.

But we have no feeling that we’re getting richer when we issue shares. We have a feeling we’re getting richer when we get at least as much value in a business as the shares are worth that we issue. And we don’t intend to issue them under any other circumstances. But it’s a perfectly valid worry.

AUDIENCE MEMBER: The second part of the question is that, obviously, with preferred issue, you have a situation where the common shareholder is — moves to the back of the line, as it were.

Why should the common shareholder in this room want to step to the back of the line if he’s at the front of the line now?

WARREN BUFFETT: Well, it — but it’s also true if we buy a business for cash, and we — let’s say we borrow the money, the bank that we borrow the money from will come ahead of the common shareholder.

There's no question. Any time you move — you engage in transactions that involve the capital structure, you are changing the potential for each part of the capital structure.

If you issue a lot of common and you've got some debt outstanding, you've generally improved the position of the debt.

And the question really becomes whether you think that the position of the common shareholder is improved by issuing either preferred stock, or perhaps borrowing a lot of money, to make an acquisition.

I mean, a couple of times in the history of Berkshire, we've borrowed money to buy something, to buy a business. And when we do that, we are placing a bank, or an insurance company, or whomever, ahead of the position of the common shareholder. We did that when we issued some debt a few years back.

And there's a question of weighing whether the common shareholders are going to be better off by borrowing money. But borrowing money is not necessarily at all harmful to shareholders — although certainly, if it's carried to excess, it is.

And the preferred is a form of quasi-borrowed money that does rank ahead of the common shareholder. But then, at the same time, we're adding a business which we think is going to benefit the shareholder, if we issue that. So that's the tradeoff.

Yeah.

AUDIENCE MEMBER: My name is Matt Zuckerman (PH). I'm from Miami, Florida.

My question is, it seems to me that there's some requirement for shareholder votes if convertible stock — preferred stock — is issued beyond a certain limit. What are those limits?

WARREN BUFFETT: There are no limits on the conversion term that we might do. But for example, if we were going to issue a convertible preferred — now we have no plans to do it, but it could happen. In fact, it might well happen this year.

The — we would — and the alternative, we'll say, was giving somebody a hundred million dollars in cash for a business. If we were to issue a straight preferred, we would figure out what a hundred million dollars' worth of a straight preferred would sell for, what coupon would be necessary.

And that would depend on call provisions and a few things. But for a triple-A credit like Berkshire, you know, it would be somewhere in the area of 7 percent or thereabouts. And then they would have no participation in the upside of the common.

If they wanted something that was sure to maintain its principal value, then you have to issue an adjustable-rate preferred that will keep its value around par.

That preferred might have an initial coupon of, say, 5 percent or something of the sort, because it has the ability to go up or down based on interest rates. But it would always be worth about par.

If we were to issue a convertible preferred, it might have a conversion price of, just to pick a figure, 28,000 or something of the sort, and a coupon well below the coupon on a straight preferred.

And so, whatever we did, they would equate out in our mind as to the value we were giving.

We're not going to give 120 percent of X if we're only willing to pay a hundred percent of X, just because the form of a deal changes.

But you may well see us issue, at some point — you may see us issue a convertible preferred. You may see us issue a straight preferred. You may see us issue an adjustable-rate preferred. I hope we do something because I'd like, you know —

AUDIENCE MEMBER: Yeah. Based on —

WARREN BUFFETT: If we do it, we'll think we're better off.

AUDIENCE MEMBER: Well, based on your past performance, I'm sure you'll get more value than you give.

WARREN BUFFETT: Well.

AUDIENCE MEMBER: But in any case, it was my understanding that if the amount of shares issued for a conversion of a convertible issue were greater than 20 percent of the total amount of shares outstanding, then it would require a vote of the stockholders, under Delaware law. I may be wrong.

WARREN BUFFETT: I think it's a stock exchange rule, isn't it, Charlie?

CHARLIE MUNGER: Yes.

WARREN BUFFETT: You're right about the rule, but —

CHARLIE MUNGER: It's a New York Stock Exchange rule.

WARREN BUFFETT: It's a New York Stock Exchange rule. That would be \$5 billion-plus of deal. And, you know, we would love to make a \$5 billion deal, but I don't think we're going to do it.

So I would say that the chances of any acquisition being large enough so that it requires a shareholder vote is probably slim.

But it isn't because we wouldn't be interested. (Laughter)

And you know, if we have one, we'll be coming back to you — (laughter) — with the votes already in hand. (Laughter and applause)

Are there any other questions on the preferred? We can talk more about it later, too. I just want to — oh, here we are. Sure.

AUDIENCE MEMBER: Good morning, Mr. Buffett.

WARREN BUFFETT: Morning.

AUDIENCE MEMBER: I'm Raina Di Costiloy (PH) from Chicago. I'm very proud to be here. And I've seen you grow so, that pretty soon we're going to be out in a football field. (Laughter)

I think your explanation was very helpful. Because as I read this, and I'm sure many of the other lay folk, I didn't understand what you —

WARREN BUFFETT: (Inaudible)

RAYNA DI COSTILOY: — what you were doing. And you mentioned the preferred stock. But in the prospectus, it's not clear whether it would be the convertible preferred, the straight preferred. And you cleared that, answering a few other questions, but some of the people felt it would dilute their stock.

WARREN BUFFETT: Yeah. Well, I should've made that clear in the annual report. And I'm glad I've had this chance to do it today.

Anything else on the preferred? OK.

AUDIENCE MEMBER: You don't have to come back to the shareholders for a vote, after these shares are authorized, for the terms of it. And you've discussed this in terms of buying companies.

My question is, you yourself, through Berkshire Hathaway, own the preferred shares of several companies: Salomon, USAir, American Express.

Do those shareholders have to vote on the terms of the preferred shares that you bought for those companies? Or is that left at the board of directors' decision level.

WARREN BUFFETT: Those —

AUDIENCE MEMBER: Could you clarify that point?

WARREN BUFFETT: Go — excuse me, go ahead.

AUDIENCE MEMBER: Could you clarify that point, please?

WARREN BUFFETT: Yeah. We bought a — I think we've probably bought six issues of preferred directly from companies.

And since none of those triggered that New York Stock Exchange rule that we discussed earlier — and they could've if they'd been somewhat larger, but they didn't — none of those deals had to be approved by the shareholders.

I think the only deal we've had with a company that had to be approved by the shareholders was when we bought the Cap Cities/ABC stock. Well, we bought early in 1986. I think it was approved by their shareholders in 1985.

But the only situations where it would've had to have been approved is if it triggered the New York Stock Exchange rule. And our purchases were not that large that they did that.

Any other questions? Yeah, there's one more.

AUDIENCE MEMBER: My name is Dale Vocawitz (PH). I'm from Champagne, Illinois.

A recent issue of Barron's indicated that it may be possible to issue a best of all possible worlds preferred, that being one where the dividend looks like interest to the issuer and is tax-deductible.

And to the purchaser, it would qualify for the dividends received deduction. Do you think that structure might be possible with these shares?

WARREN BUFFETT: Well, we haven't thought about that. I know what you're talking about on that, but I don't think it would be possible.

For one thing, I don't think you probably have a tax-free deal that way. Charlie, do you?

CHARLIE MUNGER: We probably wouldn't try and be that cute. (Laughter)

WARREN BUFFETT: I've got several quips in mind, but I think I'll keep them to myself. (Laughter)

My guess is that that form does not work for a long time. I know what you're talking about on it, but my guess is it doesn't.

Some companies — then we'll get on with this — but some companies care about the consideration they give in a deal, whether it's cash, or preferred, or so on, because they care about the accounting treatment that they get.

They want — they usually want pooling treatment rather than purchase accounting treatment. I won't get into that here. I know it's going to disappoint you, but I won't get into that here. Although I may in the next annual report.

And that is of absolutely no consequence to us. We care not a wit about the accounting treatment that we receive. We feel that we have a shareholder body that's intelligent enough to understand the economic reality of a transaction.

And that by playing various games, in terms of how we try to structure it, and maybe flow part of the purchase price back through the income statement or anything of the sort, which is done — that's not something that we care about at all.

We would rather do whatever makes the most sense for us and for the seller, and then explain to you whatever accounting peculiarities may arise out of the transaction. And that probably differentiates us from most companies. And it probably helps us make a deal, occasionally.

Anything else?

AUDIENCE MEMBER: — really

WARREN BUFFETT: OK, now I can hear you fine.

DALE VOCAWITZ: OK. And I was wondering, will there be any opportunity for shareholders who may find the preferred issue preferable, for any number of reasons, to participate in that?

WARREN BUFFETT: Well, if we issued a preferred and it became actively traded — let's say it was a company with many shareholders instead of a few. Obviously, that would be something that any new or present shareholder could make a decision on whether they preferred that issue than others.

We could, but have no plans of doing it and I don't see it happening, we could offer to exchange preferred for present common.

And it's conceivable a few people would have an interest, but the — most people have self-selected in terms of the kind of security they want to own in terms of owning Berkshire common.

So it's unlikely they would want to switch into a preferred, because they would — we wouldn't have a premium of value, it would just be an alternative security.

We could do that, though. I mean, and it would probably be a tax-free deal.

We have no plans of doing that, but it's something that if we ever thought that enough people might want, we could offer it. But no one would be obliged to take it. It's a good question.

OK? We'll move on.

Is there a motion to adopt the board of directors' recommendation?

WALTER SCOTT JR.: I move the adoption of the amendment to the fourth article of the certificate of corporation as set forth in exhibit A of the company's proxy statement for this meeting.

WARREN BUFFETT: Is there a second?

VOICE: I second the motion.

WARREN BUFFETT: Motion's been made and seconded to adopt the proposed amendment to certificate of incorporation. Any further discussion?

We are ready to act upon the motion. If there are any shareholders voting in person, they should now mark their ballot on the proposed amendment to the certificate of incorporation and allow the ballots to be delivered to the inspector of election.

Collecting a few there. Would the proxy holders please also submit to the inspector of elections a ballot on the proposed amendment voting the proxies in accordance with the instructions they have received?

We'll wait just a second here.

Mr. Fitzsimmons, when you're ready you may give your report.

ROBERT FITZSIMMONS: My report is ready. The ballot of the proxy holders received through last Friday cast lot — not less than 928,889 in favor of the proposed amendment to the certificate of incorporation.

That number far exceeds the majority of the number of all shares outstanding. The certification required by Delaware law regarding the precise count of the votes, including the votes cast in person at this meeting, will be given to the secretary to be placed with the minutes of this meeting.

WARREN BUFFETT: Thank you, Mr. Fitzsimmons. The amendment to the certificate of incorporation as set forth in exhibit A to the proxy statement for this meeting is approved.

After adjournment of the business meeting, I will respond to questions that you may have that relate to the businesses of Berkshire, but do not call for any action at this meeting.

Does anyone have any further business to come before this meeting before we adjourn? If not, I recognize Walter Scott Jr. to place a motion before the meeting.

WALTER SCOTT JR.: I move this meeting be adjourned.

VOICE: I second the motion.

WARREN BUFFETT: Motion to adjourn has been made and seconded. We will vote by voice. Any discussion? If not, all in favor say, "Aye."

AUDIENCE: Aye.

WARREN BUFFETT: All opposed say, "No." The meeting is adjourned. (Laughter)

4. Helzberg's Diamonds acquisition

WARREN BUFFETT: Now, I'd like to tell you about one thing that — since the annual report — that some of you probably read about in the papers, but maybe not all of you have heard about.

Just shortly after the annual report was issued, we completed a transaction with Helzberg's Diamonds, with Barnett Helzberg, who's here today. Barnett, would you stand up, please? All right. There he is. Give him a hand. (Applause)

You may be interested in how it came about, because Barnett attended two of the last three meetings of Berkshire. He had a few shares in an IRA account, and he was here last year.

And shortly after this meeting, I was back in New York City. And I was crossing the street at 58th Street, right near the Plaza Hotel on 5th Avenue. And a woman said, "Mr. Buffett," and I turned around.

And she came up, and she said she'd attended the annual meeting last year — or a few days ago — and said that she enjoyed it. And I said, "That's terrific," and I started to cross again.

And Barnett had been about 30 or 40 feet away. I didn't know him, and he had heard this woman. So, he said the same thing. And I turned around. And we shook hands. First time I'd met him, and he said, "You know," he said, "I might have a business you'd be interested in."

And I get that all the time, so — (Laughter)

So I said, “Well, why don’t you write me?” And a time went by, and I got a letter from Barnett. And he’d been thinking about doing something with the business his father had started in 1950, and based in Kansas City that whole time. And he’d been exploring various avenues.

But probably, in some part because of his background as Berkshire shareholder, he had some specific interest in the company becoming associated with Berkshire. He cared very much about the company having a permanent home.

He cared very much about it having an environment in which it could grow and be run autonomously and be based in Kansas City. And he wanted to receive something in exchange — that he was happy to own for the rest of his life.

And so, we worked out a transaction shortly — just very shortly after the annual report went to press.

And so now Berkshire, as of 12:01, I guess, yesterday morning, the deal closed. There’s this waiting period because of the Hart-Scott-Rodino Act and a few other things.

The transaction closed. And now Berkshire is the owner of Helzberg’s Diamonds, which has roughly 150 stores around, perhaps, 26 or 27 states. I’m not sure the exact number. And mostly in malls, although some others. It’s been enormously successful.

Barnett brought in Jeff Comment, who formerly ran Wanamaker’s about eight years ago, I guess it is.

And the company has both expanded in its traditional format — it’s gone with a new format recently, which has been very successful.

It is — in its position in the jewelry industry, it tends to compete with a Zales or Gordon’s, but it does a far, far better job.

Their sales, per store, on roughly equivalent square footage, will be very close to double what competitors achieve.

It’s got a magnificent morale, and organizational structure. And the people — Barnett was very generous with people in making the sale. He took it out of his own pocket to treat people right because they’d done such a terrific job over the years.

And I think you’ll see Helzberg’s become a very big factor in Berkshire over time. And it just shows you what can come out of these annual meetings. So, the rest of you, you know, do your stuff. (Laughter)

So anyway, that is an acquisition that was made for — largely for common stock. It did not involve preferred, and — because Barnett preferred common.

And — but different people have different needs. And sometimes there's a group of shareholders that can have different priorities. And that's the reason we want to have various currencies.

If we had not been able to use common stock, we would not have made this transaction, because Barnett has been in no hurry to write a large check to the government. And we can help him in that respect with a common stock deal.

So anyway, we're glad to have Helzberg's become part of Berkshire. I wouldn't be surprised if we have another announcement or two in the next year before we have the next meeting. I hope so. But there's no guarantees.

5. Buffetts on the board adds stability

WARREN BUFFETT: Now we're going to turn the meeting open for questions. We'll do it as we've done before. We've got this room divided into six zones. And if you will raise your hand, the monitor in that — in your zone will recognize you. And we'll keep going around.

We will not go to a second person in any zone until we've exhausted all those who have yet to ask their first question. We have — we also have a zone in the overflow room. So, there'll be a total of seven.

And we'll just keep going around, if you'll identify yourself, please. And we'll be delighted to answer your questions. And the more, the better. So, we'll start with zone 1.

AUDIENCE MEMBER: My name is Fred Efell Jr. (PH) from Sacramento, California.

And I wanted to ask if you could elaborate upon the logic of adding two family members to the board of trustees?

WARREN BUFFETT: Well, it's terrific for family harmony, just to start with. (Laughter)

The — as I've talked about in the annual report, the — if I die tonight, you know, my stock goes to my wife, who is a member of the board of directors.

And she will own that stock until her death, when it will go to a foundation. So, there is a desire to have as long a term and permanent ownership structure as can really be done, in terms of planning, and the tax laws, and so on.

I mean, I — we have invited people like Helzberg's to join in with Berkshire into what we think is a particularly advantageous way for them to conduct a business and to know the future that they're joining.

And part of knowing the future that they're joining involves knowing that the ownership is stable. And it will be stable for a very long period of time in Berkshire, probably about as long as you can — anybody can plan for in this world.

After my death, the family would not be involved in the management of the business, but they'd be involved in the ownership of the business.

And you would have a very large concentrated ownership position, going well on into the foundation, that would care very much about having the best management structure in place.

And to, in effect, prepare for that over time, I think it's very advisable that family members who will not be involved in management, but who will have a key ownership role to play, become more and more familiar with the business and the philosophy behind it.

I discussed that some in the — I guess, it was the 1993 annual report, because I think it's important that you understand.

And anybody that wants to sell us a business — if you've built a business since 1915, and you care enormously about it, and you care about the people that you've developed, but you've got something else you want to do in life, it's more than, you know, advertising your car in the paper to sell it.

I mean, it is an important — a very important transaction to you. Not just in terms of how much money you receive, but in terms of who you deliver thousands of people that have joined you — who you deliver them to.

And I think we have a structure that is about as good as you can do. Nothing is forever.

But we have a structure that's about as good as you can do, in terms of people knowing what they're getting into when they make a deal with us and being able to count on the conditions that prevail at the time of the deal, continuing for a long period in the future.

Many people — I had a fellow tell me the other day about a business where he'd been wooed by the acquirer. And, you know, the day after the deal, they came in and fired the top half-dozen people. They had a secret plan all along. Well, I don't think you run into much of that.

But what you do run into is the company that's the acquiring company, itself, either being acquired or some new management coming along, or some new management consultant coming along, and saying, "Well, this doesn't fit our strategic plan anymore, so let's dump this division."

And people that join in with Berkshire can be relatively, I think, comfortable about nothing like that happening.

Charlie, you want to elaborate on —

CHARLIE MUNGER: No. (Laughter)

WARREN BUFFETT: I was hoping Charlie would have a near-life experience this morning. (Laughter)

Keep encouraging him.

6. No comment on Kerkorian's Chrysler bid

WARREN BUFFETT: Zone 2.

AUDIENCE MEMBER: Hello. My name is Jim Lichty (PH) from Des Moines. I'm interested in, like, Chrysler. Can you make a comment on the Chrysler Corporation? (Laughter)

WARREN BUFFETT: No, I don't think I can make a comment on Chrysler. (Laughter)

I think Salomon Brothers, incidentally, has been retained by them. We have nothing to do with it. Charlie and I — I read that in the paper.

And Charlie and I are not familiar with — normally — with investment banking arrangements at Salomon.

But it has been in the paper that Salomon's involved with that. We have no involvement.

Charlie, you're not interested in commenting on the question? No? (Laughter)

Try him on something else.

7. Managers need to know "money costs money"

WARREN BUFFETT: Zone 3.

AUDIENCE MEMBER: I'm Jim Vardaman (PH) from Jackson, Mississippi.

In describing the — your allocation of capital to your wholly-owned subsidiaries, you wrote in the annual report that, quote, you "charge managers a high rate for incremental capital they employ and credit them at an equally high rate for capital they release," end quote.

How do you determine this high rate, and how do they determine how much capital they can release?

WARREN BUFFETT: Well, what we try to do with those — the question's about incentive arrangements we have with managers or other situations, where we either advance capital to a wholly-owned subsidiary or withdraw it — usually, that ties in with the compensation plan.

And we want our managers to understand just how highly we do value capital. And we feel there's nothing that creates a better understanding than to charge them for it.

So, we have different arrangements. Sometimes it's based a little on the history of the company. It may be based a little bit on the industry. It may be based on interest rates at the time that we first draw it up.

We have arrangements depending on the — on those variables and perhaps some others and perhaps just, you know, how we felt the day we drew it up, that range between 14 percent and 20 percent, in terms of capital advanced.

And sometimes we have an arrangement where, if it's a seasonal business where, for a few months of the year, when they have a seasonal requirement, we give it to them very cheap at LIBOR.

But, if they use more capital over — beyond that, we start saying, "Well, that's permanent capital," so we charge them considerably more.

Now, if we buy a business that's using a couple hundred million of capital, and we work out a bonus arrangement, and the manager figures out a way to do the business with less capital, we may credit him at a very high rate — same rate we would use in charging him — in terms of his bonus arrangement.

So, we believe in managers knowing that money costs money. And I would say that, just generally, my experience in business is that most managers, when using their own money, understand that money costs money.

But sometimes managers, when using other people's money, start thinking of it a little bit like free money. And that's a habit we don't want to encourage around Berkshire.

We — by sticking these rates on capital, we are telling the people who run our business how much capital is worth to us.

And I think that's a useful guideline, in terms of the decisions they're making, because we don't make very many decisions about our operating business. We make very, very few. I don't see capital budgets, in most cases, from our hundred percent-owned subsidiaries.

And if I don't see them, no one else sees them. I mean, we have no staff at headquarters looking at this kind of thing.

We give them great responsibility on it. But we do want them to know how we calibrate the use of capital. And so far, I would say, it's really worked quite well.

Our managers don't mind being measured, and they like getting a — I think they enjoy seeing a batting average posted. And a batting average that does not include a cost of capital is a phony batting average.

Charlie?

CHARLIE MUNGER: Well, I certainly agree. (Laughter)

WARREN BUFFETT: And his name isn't even Buffett. I mean — (Laughter)

8. The two reasons for buying insurance

WARREN BUFFETT: Zone 4.

AUDIENCE MEMBER: Hi, my name's Dave Lancasam (PH) with Business Insurance Magazine.

The sum of property-casualty risk management experts are advising commercial insurance buyers to forge five- and 10-year policies with their property-casualty insurers to promote stronger partnerships with their insurers, as well as to maintain the smooth PC market of the past seven, eight years.

Do you believe this idea will take hold for most policyholders? And if so, what would be the implications for policyholders' costs and insurers' underwriting results?

WARREN BUFFETT: The question is about partnerships between, probably, commercial policyholders and their insurers. And there are a lot of ways of doing that by various retrospective plans or adjustable rates of various sorts, and self-insured retentions, and that sort of thing.

As a general matter, there are only two reasons for buying insurance. One is to protect yourself against a loss that you are unable or unwilling to bear yourself. And that is partly a — an objective decision. It's partly subjective.

For example, a manager that's terribly worried that his board of directors may second-guess him if he has an uninsured loss, is going to buy a lot more protection, probably, than the company really needs.

But he knows he's never going to have to go in front of his board of directors and say, "We just had a million-dollar fire loss."

And then the next question the director asks is, “Was it insured?” And then he doesn’t want to answer no.

So, he may do something that is very unintelligent from the company’s standpoint merely to protect his own position.

But the reason for buying insurance is, whether — and this is true of life insurance, it’s true of property-casualty, it’s true of personal insurance, it’s true of commercial insurance — is to protect against losses that you’re unwilling or unable to bear yourself.

Or the second reason, which occasionally comes up, is if you think the insurance company is actually selling you a policy that’s too cheap, so that you really expect, over a period of time, to have a mathematical advantage by buying insurance.

Well, we try to avoid selling the second kind and to concentrate on selling the first kind.

And we think any company we can sell insurance to — and of course, we — much of the insurance we sell is to other insurance companies. I mean, we are a reinsurer, in very large part.

We are selling them insurance against a loss that they are either unable or unwilling to sustain.

And a typical case, you know, might be a company that had a lot of homeowners policies in California. And if those include earthquake coverage, they may not be able to sustain the kind of loss that is possible, even though they want to keep a distribution system in place that merchandises en masse to homeowners in California.

So, we will write a policy. They may take the first 5 million of loss, they may take the first 50 million of loss — depends on their own capabilities — but then they come to us.

And we are really uniquely situated to take care of problems that no else — that the companies can’t bear themselves and that they can’t find anybody else to insure.

But we really don’t want to insure someone for a loss that they can afford themselves, because if we’re doing that it may be because they’re dumb. But it may be because they also have a loss expectancy that’s higher than the premium we’re charging, which is not what we’re trying to do in business.

I think that — I think probably, as compared to 30 years ago, that risk managers at corporations are probably more intelligent about the way they buy their insurance than many years ago. I think it’s become a — I think they’re more sophisticated and they’ve thought it through better.

But there’s a lot of insurance — there’s some — there’s a fair amount of insurance bought that doesn’t make sense. And there’s a fair amount of insurance that isn’t bought that should be bought.

There are certain companies that are exposing themselves in this country to losses which would wipe them out. And they prefer not to buy reinsurance because it's, quote, "expensive." But what they're really doing is betting on something that won't happen very often, happening not at all.

And if you take a huge hurricane on Long Island or you take a major quake in California, there are a number of companies that are not — that have not positioned themselves to withstand those losses.

And if you're a 63-year-old CEO and you figure, "I'm going to retire in a couple of years," you know, the odds are pretty good that it won't happen on your watch.

But the — it will happen on somebody's watch. And we try to sell reinsurance to those people. And usually, we do. But sometimes we don't.

Charlie?

CHARLIE MUNGER: Nothing to add. (Laughter)

9. "We can sustain shocks ... that others can't"

WARREN BUFFETT: OK. Zone 5.

He's saving himself. He'll be dynamite when he gets going. (Laughter)

AUDIENCE MEMBER: My name is Hugh Stephenson (PH). I'm a shareholder from Atlanta, Georgia. My question involves the company's catastrophe lines of insurance.

It seems that there's a relative ease of entry into that business through Bermuda-based companies and others. And given the importance of that business to the overall company, I'm curious how the ease of entry into the business affects its long-term competitive position and its rates of return?

WARREN BUFFETT: Well, you're very right, there is an ease of entry into the catastrophe business. And, you know, it's sort of attractive for — it's particularly attractive for promoters.

Because if you start an insurance company to write earthquake insurance in California and you raise a few hundred million dollars, you'll either have essentially have no losses or, if you write enough of it, you'll go broke. And most years, you'll have no losses.

So, if your intention is to sell your stock publicly in a year or two, that — the odds are very good that you will have a beautiful record for a couple of years. And you can sell.

And, you know, maybe one time out of ten, you'll go broke. And nine times out of ten, you'll sell to somebody else who will eventually go broke.

And it — there is — there's real ease of entry. The only thing that may restrict that is that if the buyer is sophisticated enough to question the viability of that company under really extreme conditions, which is the only conditions that count when you're buying catastrophe insurance, that may restrict it.

The second thing is, of course, none of the people that have started up can offer anywhere near the amount of coverage that Berkshire has. Berkshire is really one of a kind in terms of its capital strength in the business.

I'm — I don't think any money in Bermuda that I can remember — I don't think Ajit's out there. But I don't think anybody has a billion of net worth. And you know, we have — at present, we probably have close to 13 billion of net worth and considerably more of value.

So we can sustain shocks, and we will sustain shocks, I should add, that others can't. And we try to get paid appropriately for that.

But when we say we can take a billion-dollar loss, we can take a billion-dollar loss. And we will have a billion-dollar loss at some point.

And anyone buying it knows we can take it, or something greater. And they should know that very few other — very few of our competitors can. So, there's competition.

We do an unusual proportion of our business with the eight or ten largest insurance — reinsurance companies and insurance companies in the world. So, we really have established with the people who understand the real risks of the business.

They come to Berkshire and — a lot more often than they stop in Bermuda, because they know that we'll pay. And they've been around long enough to know that, in the end, that's what really counts with an insurance company.

If the rates — if there were enough capacity at really ridiculous rates, I mean, in the end, we wouldn't be writing that business at that time. But I don't think that will happen. It certainly hasn't happened so far. And if it happens, you know, so be it. We'll all play golf until the loss occurs.

Charlie? (Laughter)

CHARLIE MUNGER: Nothing to add.

10. Graham's principles for high-tech stocks?

WARREN BUFFETT: Zone 6? Or did we do — yeah.

AUDIENCE MEMBER: Chairmen, most company Berkshire invest at this time are not high in — are not in high-technology sector. What we have seen in the last few years, that there seems to be a significant growth, both in sales and earnings of the high-technology area.

And also, what invest — what U.S. shareholder believe that the times are changing from a brand name to high-technology.

My question is, can someone apply your investment principle, business philosophy, and your discipline in life to build a portfolio of, say, five or six high-technology company? Let's call it Berkshire Hathaway Technology Fund? (Laughter)

WARREN BUFFETT: Well, I think it would sell. (Laughter)

The question about — Charlie and I won't be able to do it. We — Charlie probably understands high-tech. But you can see how hard it is to get any information out of him. So — (laughter) — he hasn't told me yet.

We try not to get into things we — that we don't understand. And if we're going to lose your money, we want to be able to come before you, you know, next year and tell you we lost your money because we thought this and it turned out to be that.

We don't want to say, you know, somebody wrote us a report saying if, you know, "This is what's going to happen," in some field that we don't understand and that, therefore, we lost your money by following someone else's advice. So, we won't do it ourselves.

At — I think that the principles — I think Ben Graham's principles — are perfectly valid when applied to high-tech companies. It's that we don't know how to do it, but that doesn't mean somebody else doesn't know how to do it.

My guess is that if Bill Gates were thinking about some company in an arena that he understood and that I didn't understand, he would apply much the same way of thinking about the investment decision that I would. He would just understand the business.

I might think I understand Coca-Cola or Gillette. And he may have a — he may have the ability to understand a lot of other businesses that seems as clear to him as Coke or Gillette would seem to me.

I think once he identified those, he would apply pretty much the same yardsticks in deciding how to act.

I think he would act — I think he would have a margin of safety principle that might be a little different because there's essentially more risk in a high-tech company. But he would still have

the margin of safety principle on a — sort of adjusted for the mathematical risk of loss in his mind.

He would have — he would look at it as a business, not as a stock.

You know, he would not buy it on borrowed money. I mean, it — a bunch of principles would be carried through.

But our circle of things we understand is really unlikely to enlarge, maybe a tiny bit here or there. But if the capital doesn't get too large, the circle's OK.

And — but we will not — if we have trouble finding things within our circle, we will not enlarge the circle. You know, we'll wait. That's our approach.

11. USAir: “You don't have to make it back the way you lost it”

WARREN BUFFETT: Now, how are we set up for Zone 7? Can we do it out — yeah, here we are.

AUDIENCE MEMBER: Are you there? Hi, I'm Susie Taylor (PH) from Lincoln, Nebraska.

By way of explaining — we wrote down the value of USAir, reflecting our investment's current market value.

You had a good explanation in your report as to why the economics of the business are unattractive. And I presume, given the choice, we wouldn't do it over again.

WARREN BUFFETT: I think that's a fair assumption. (Laughter)

I should mention, anybody wanted to ask about USAir, we put them in the other room, just so you'll know why. (Laughter)

AUDIENCE MEMBER: And then the second part is better.

WARREN BUFFETT: But I'm watching you. I can see you on the monitor. (Laughs)

AUDIENCE MEMBER: And quoting from your profound statement, “You don't have to make it back the way you lost it.”

WARREN BUFFETT: Right.

AUDIENCE MEMBER: Wouldn't it be a good idea to put that 89 million in something you are really behind as opposed to USAir?

WARREN BUFFETT: Well, that's a very good question. Because it is true that a very important principle in investing is you don't have to make it back the way you lost it. And in fact, it's usually a mistake to make — try and make it back the way that you lost it.

And we have — when we write our — an investment down, as we did with USAir at 89 million, we probably think it's worth something more than that. But we tend to want to be on the conservative side. But it's worth a whole lot less than we paid.

And the nature of that preferred, as well as other private issues we've bought, usually makes it quite difficult to sell. That's one of the things we know going in.

When we bought preferred, some people thought that we were getting unusually favorable terms. I haven't heard from them lately on USAir, but — (Laughter)

But one of the considerations in that is that, if you buy a hundred shares of a preferred that's being offered through a securities firm, from the same issuer, you can sell it tomorrow. And we are restricted, in some ways legally, and in other ways simply by the way that markets work, from disposing of holdings like that.

And we know that there's an extra cost involved to us if we should try to sell, or it may be impossible.

And that's not of great importance with us because we don't buy things to sell, but it's of some importance.

And we are not in the same position owning our Series A preferred of USAir as we would be if we bought a thousand shares or 5,000 shares of the Series B preferred, I believe it is, that trades on the New York Stock Exchange. That would be very saleable.

And our preferred could well even be saleable at a price modestly above what we carry it for, but it would require — it would not be very easy to do.

It might — if it were do — if we went about to do it, we could probably — assuming we could do it at all — we could probably get a little more money for it.

But it would not be easy to do, partly because of legal restrictions. Charlie and I are on the board. That complicates things.

We always know something that, just by being on the board, that the public doesn't know. So, that complicates things.

And in the end, we usually find that dealing with anything where we've got fiduciary obligations is, maybe, not practical at all. And if it is, it's probably more trouble than it's worth.

Charlie?

CHARLIE MUNGER: Well, it's certainly been an interesting experience, the USAir experience.
(Laughter)

WARREN BUFFETT: Is that it, Charlie? OK. No, he —

CHARLIE MUNGER: I'd like to repeat that business about not having to get it back the way you lost it. You know, that's the reason so many people are ruined by gambling.

They get behind and then they feel they have to get it back the way they lost it. It's a deep part of the human nature.

And it's very smart just to lick it by will, and little phrases like that are very useful.

WARREN BUFFETT: Yeah, one of the important things in stocks is that the stock does not know that you own it. You know, you have all these feelings about it. You know, and — (laughter) — you remember what you paid, you know? (Laughter)

You remember who told you about it. All these little things, you know?

And it — you know, it doesn't give a damn, you know? (Laughter)

It just sits there. And it — you know, a stock at 50, somebody's paid a hundred, they feel terrible. Somebody else paid 10, they feel wonderful. All these feelings, and it has no impact whatsoever.

And so, it's — as Charlie says, gambling is the classic example. Someone builds a business over years. You know, that, they know how to do.

And then they go out some place and get into a mathematically disadvantageous game. Start losing it and they think they've got to make it back, not only the way they lost it, but that night. And — (laughter) it's a great mistake.

12. Beware of complicated fads and "high priests"

WARREN BUFFETT: Zone 1.

AUDIENCE MEMBER: My name is Donald Stone. I'm from Riverside, Connecticut. I'm — this is my second shareholders meeting, ever, at age 61. So, I'm really very privileged to be here.

My first was Coca-Cola a week and a half ago. And there were only 200 people there. I'm trying to figure this out. (Laughter)

I think the rule is that the number of people present is in direct proportion to the price of the shares.

WARREN BUFFETT: Well, in that case, we won't split. (Laughter)

AUDIENCE MEMBER: OK.

Prefatory comment to my question: the November 24th, 1994 issue of Fortune Magazine had an article, a featured article, entitled "America's Greatest Wealth Builders," dealing with the concepts of market value added and economic value added.

It was with great glee that I noticed that Coca-Cola was number two on that list, second only to General Electric, and that Coca-Cola had done twice as well as Pepsi-Cola, number nine on the list, with one-third as much capitalization.

My question is this: whether the concept of market value added and economic value added, as such, or any of its variants, is a concept that's applicable and useful to Berkshire Hathaway as a whole, or in analyzing its line of business segments?

I'd really like to hear from Charlie Munger on this first. (Laughter) Because I've heard —

WARREN BUFFETT: So would I. (Laughter)

AUDIENCE MEMBER: I've heard —

WARREN BUFFETT: Charlie?

AUDIENCE MEMBER: I've heard that he's thought a lot about this particular subject.

WARREN BUFFETT: Right.

CHARLIE MUNGER: If Warren is using economic value added exactly the way they're now teaching it in the business schools, he hasn't told me.

Obviously, the concept has some merit in it. But the exact formal methods, I don't believe we use.

Warren, are you using this stuff secretly?

WARREN BUFFETT: No, we — (laughter) — in a sense, they're trying to get at the same thing we do. Or we're trying to get at the same thing they do. But I think it's — A, I think it has some flaws in it.

Although I think it generally comes out with the right answers, it sort of forces itself to come out with the right answers.

But I really don't think you need that sort of thing. I mean, I do not think it's that complicated to figure out, you know, where it makes sense to put money. You can make mistakes doing it. But in terms of the mental manipulations you go through, I don't think it's a very complicated subject.

And I don't think that — I think that the people marketing one or another fad in management tend to make them a little more complicated than needed so that you have to call in the high priest.

And, you know, it — if all that really counts is the Ten Commandments, you know, it's very tough on religious counselors and everything. (Laughs)

It doesn't take — it just doesn't make it complicated enough.

And I think there's some of that in — quite a bit of that — in management consulting and in the books that you see and all of that, that come out.

CHARLIE MUNGER: It's way less silly than the capital assets pricing model. So that, at least academia's improving. (Laughter)

WARREN BUFFETT: Really, yeah. The capital asset pricing model, which is — I don't know how much it's used now. Certainly — you know, they had these great waves of popularity. You get that in management. You get it in investing. I mean, real estate, you know, may have been popular, or international.

I — you can read Pensions & Investment magazine, which is a pretty good magazine. But you can just see these fads sort of going through. And then they have seminars on them and everything. And, you know, the investment bankers create product to satisfy the demand.

And there're these fads in management — I mean, obviously, listening to your customer and things like that, I mean, that is — nothing makes more sense. But it's hard to write a 300-page book that just says, "Listen to your customer." (Laughter)

And, you know, that's one of the things I liked about Graham's book. I mean, you know, he wrote — everything he wrote sort of made sense. He didn't sort of get into all the frills and try and make it more complicated than it really, truly is.

You know, I really didn't need to read the November issue — 1994 issue of Fortune — to know that Coca-Cola had added a lot of value. (Laughter)

We added about 4 billion-some of value to Berkshire. That's good enough for me. (Laughter)

13. Derivatives: “Potential for mistakes and mischief”

WARREN BUFFETT: Zone 2.

AUDIENCE MEMBER: My name is Maurus Spence (PH) from Omaha, Nebraska. I have a two-part question on derivatives.

Does Berkshire Hathaway currently, or had they in the past, engaged in strategies involving derivatives?

If so, do you as CEO, fully understand these financial instruments? (Laughter)

WARREN BUFFETT: Whoever suggested that crazy notion? (Laughter)

AUDIENCE MEMBER: Finally, would Charlie care — you or Charlie — care to comment on the use of these by other financial institutions?

WARREN BUFFETT: The question about derivatives — the reason I inject that remark — in a Fortune article that all of you should read if you haven't, I suggested that the use of derivatives would be dramatically reduced if the CEO had to say in the report whether he understood them or not, and — (Laughter)

The answer to your question, though, is we have two types, I guess it would be, of derivative transactions, of very modest size. But that doesn't mean we wouldn't — if the conditions were right, we either wouldn't have them on a much greater scale now, or we wouldn't have done it in the past.

We have two types of transactions, and I do understand them. And there are times when there are things that we would want to do — not often — but there would be times when they could be best accomplished by a transaction involving a derivative security. And we wouldn't hesitate to do so.

We would obviously care very much about the counterparty, because that transaction is just a little piece of paper between two people. And it's going to cause one of the two to have to do something painful at the end of the period, usually, which is to write a check to the other person.

And therefore, you want to be sure that that person will be both willing and able to write the check. And so, we're probably more concerned about counterparty risk than most people might be.

Last year and the year before, I think I said that derivatives often combine borrowed money with ignorance, and that that is a rather dangerous combination. And I think that we've seen some of that in the last year.

When you can engage in, sort of, non-physical transactions that involve hundreds of millions, or billions, or tens of billions of dollars, as long as you can get some party on the other side to accept your signature, that really has — that has the potential for a lot of mistakes and mischief.

And if you've looked at the formulas involved in some, particularly I guess, interest rate-type derivative instruments, it is really hard to conceive of how any business purpose could be solved by the creation of those instruments.

I mean, they essentially had a huge, really, gambling element to them.

And I use that in the terms of engaging in a risk that doesn't even need to be created, as opposed to speculative aspects. They involved a creation of risk, not the transfer of risk, you know, not the moderation of risk, but the creation of risk on a huge scale.

And it may be fortunate that in the last year, half a dozen or so cases of people that have gotten into trouble on them have come out because it — that may tend to moderate the troubles of the future.

The potential is huge. I mean, you can do things in the derivative markets —

Well, I've used this example before, but in borrowing money on securities, the Federal Reserve of the U.S. Government decided many decades ago that society had an interest in limiting the degree to which people could use borrowed money in buying securities.

They had the example of the 1920s, with what was 10 percent margin. That was regarded as contributing to the Great Crash.

So, the government, through the Fed, established margin requirements and said, "I don't care if you're John D. Rockefeller," you know, "You're going to have to put up 50 percent of the cost of buying your General Motors stock," or whatever it may be.

And they said that maybe Mr. Rockefeller doesn't need that, but society needs that. They don't — we don't want a bunch of people on thin margins gambling, you know, essentially, in shares, where the ripple effects can cause all kinds of problems for society.

And that's still a law. But it means nothing anymore because various derivative instruments have made 10 percent margins of the 1920s, you know, look like what a small-town banker in Nebraska would regard as conservative, compared to what goes on.

So, it's been an interesting history. You know, like I say, perhaps the experiences of the last year — they've got everybody focused on derivatives. Nobody knows exactly what to do about them.

Berkshire Hathaway will — if we think something makes sense and Charlie and I understand it — we may find ways to use them to what we think will be our advantage.

Charlie, you want to add anything on that?

CHARLIE MUNGER: Well, I disapprove even more than you do, which is hard.

If I were running the world, we wouldn't have options exchanges. The derivative transactions would be about 5 percent of what they are. And the complexity of the contracts would go way down. The clearing systems would be tougher.

I think the world has gone a little bonkers. And I'm very happy that I'm not so located in life that I have to be an apologist for it.

You know, a lot of these people, I feel sorry for them. You know, they had great banks. And they have to go before people, sometimes even including their children and friends, and argue that these things are wonderful.

14. Salomon's murky future

WARREN BUFFETT: Zone 3?

AUDIENCE MEMBER: Good morning. I'm John Nugier (PH) from Kingsburg, California. And my question relates to Salomon.

And where — I'm just asking if you could take us out the next two or three years in your vision. It started out as a good investment. You got a good return on it, or your interest.

And it's clearly had some problems. And we have gotten in deeper and deeper as those problems have continued. And it doesn't look like it's superbright.

So, it — you must understand where it's going. But could you just give us where you see it going in the next two or three years?

WARREN BUFFETT: Well, no, I think it's very difficult to forecast where Salomon or, really, almost any major investment bank, slash, trading house will do over actually the next two or three months, let alone the next two or three years.

The nature of that business is obviously far more volatile than the blade and razor business. Now the — and the tough part is assessing over a longer period of time whether — because of volatility, it's much harder to assess whether — what the average returns might be from a business.

And the answer is, Charlie and I, probably, if we were to try and write the forecast for the next two or three years, we would not have a high — a feeling that we had a high probability of being able to predict what that company, or other companies in that industry either, would earn three years out or would probably have in the way of average earnings.

Our own commitment is to a \$700 million preferred issue, which has five redemption dates starting in October 31st of this year and then every year thereafter.

On those dates, we can either take cash or stock. And that's an advantage, obviously, to have an option. Any time you have an option in this world, it's to an advantage — it's to your advantage.

It may be a very small advantage, but it's — giving options is generally a mistake, and accepting options is usually a good idea, if it doesn't cost you anything.

And we will — the other thing about options is you don't make a decision on them until you have to make a decision. But — so, we, in addition to that \$700 million of preferred, which in our view is a hundred percent money-good — I mean, we'd like to own more of that.

But we also have about 6 million-odd shares of common, which we paid perhaps \$48 a share for, or something in that area. In any event, considerably more than the present market of 35 or '6. So, we have a loss of probably 80 or \$90 million, or some number like that, at market in the common.

The preferred has actually treated us fine. We've received \$63 million a year.

Incidentally, by owning the amount of common we own, this probably isn't generally known, but — or recognized — if you own 20 percent of the voting power of a company, you have a somewhat different dividends-received credit. You have somewhat different tax treatment than if you own less than 20 percent.

So, until we own that common, we paid somewhat more tax on our preferred dividend than we now pay. It's not a huge item, but it's not immaterial, either.

Charlie?

CHARLIE MUNGER: Well, I certainly agree, it's hard to forecast what's going to happen in the big investment banking, dash — slash, trading houses.

I would like to say that Berkshire Hathaway was a large customer of Salomon long before we bought the preferred, and that we've had marvelous service over the years.

I think Salomon's going to be around for a long time, rendering very good service to various clients.

WARREN BUFFETT: We sold —

CHARLIE MUNGER: Satisfied clients.

WARREN BUFFETT: We sold our first debt issue of Berkshire, I think, in 1973, through Salomon. So, we've had an investing banking relationship for 21 or 22 years there. And actually, we'd done business with them before that in various other ways. So, it's a long-term relationship.

But there's no question about Salomon being around. The question — and that's why our preferred is absolutely money-good.

But the question is what the average return on capital will be. And we knew that was difficult to predict when we went in. And we found out it's even more difficult to predict than we thought.

15. Honoring mutual fund pioneer Phil Carret

WARREN BUFFETT: Zone 4?

AUDIENCE MEMBER: Thank you for the opportunity. Dick Jensen (PH) from Omaha, a fellow Nebraska University supporter.

A rather convoluted question: very interested in your recent purchase and your future intention of American Express. And as I understand the company, I know it's a rather involved and complicated and rather expansive company, insofar as it has its interest in many areas.

I know one of which, of course, is the credit card. But there's also the major part of the organization of IDS and others that I don't even know about.

And I wondered, what your hopes are for that investment.

And I also, just recently, as perhaps you have, became curious to know if you are personally acquainted with Mr. Phil Carret, I believe, his name is. And how about the purchase of his firm in your future? Thank you.

WARREN BUFFETT: Dick, I think Phil Carret is here today. Phil?

CHARLIE MUNGER: He's right back there.

WARREN BUFFETT: Phil, would you stand up? There he is. (Applause)

Give him a hand.

Phil is 98. I first met him in 1952, 43 years ago. He attends every eclipse around the world. And you can run into him in some very strange places.

Wrote his first book on securities, I believe, in 1924. I — am I right on that, Phil? Yeah.

And wrote an autobiography here, recently.

Probably the greatest long-term investment record in this country's history. And — but I think — I, you know, my impression is that Phil sold part, or a good bit, of Pioneer some years ago, which he managed for decades, many decades.

In fact, I first learned about Phil when I was leafing through Moody's Banks and Financial Manual 40-odd years ago, and I saw this company with this great record and with some securities that looked terribly interesting.

So, we got in touch. And he was out in Omaha and we got acquainted. It — so, anybody that can get Phil to talk to them, listen carefully. I advise that.

16. Cards are key to future of American Express

WARREN BUFFETT: The question about American Express: we own just under 10 percent of American Express. And obviously, even though you mentioned they're in a number of businesses, the — by far, the key, the most important factor in American Express's future for a good many years to come — a great many years to come — will be the credit card.

And that is a business that has become, and will forever, probably, become ever more competitive. I mean, I followed it since — I think I met Ralph Schneider at the Diners' Club in the late 1950s.

And American Express entered into the credit card business out of fear. I mean, they were worried about what the credit card was going to do to their traveler's check business. Traveler's check business had been originated back in 1890-something, I believe.

And that was, in turn, building off of the old express business where, I think, it was Henry Wells and William Fargo, they would chain themselves to the express boxes as they delivered them through the — to the West.

And they decided that maybe issuing traveler's checks would a little easier — (laughter) — than carrying all this stuff around.

So, that — the traveler's check was the — evolved out of the express business.

And the credit card business with American Express arose out of fear of what — particularly Diners' Club at the time. They were all terrified of Diners' Club, which got this — got the jump on everybody.

And they became enormously successful with it. And the American Express card, as you know, had a terribly strong position in what they called the “travel and entertainment” part of the card business.

And of course, the banks entered in on a big scale. And Visa’s been enormously successful.

So, the card has a strong franchise in certain areas, like the corporate card. Although people like First Bank System are very aggressive in going after them there.

The card — but the card has a significant franchise, but it does not have the breadth of franchise that it had many years ago.

For a while, it was “the” card. And now it’s “the” card in certain areas, but nothing like as broad an area as before.

It has certain, very important, advantages and economic strengths and it has some weaknesses. And you have to suss those, in deciding where it’ll be in the year 2000 or 2005.

And we think that the management of American Express thinks well about the question of how to — how you keep the card special in certain situations. And they’ve reacted to the merchant backlash for higher discount fees, I think, in an intelligent way.

So, we’ll see how it all plays out. But the key — IDS, which has now been renamed, but is a very big part of American Express — it accounts for close to a third of their earnings — but the real key will be how the card does over time.

Charlie?

CHARLIE MUNGER: Nothing to add.

17. “Corruption won” in stock option accounting rule

WARREN BUFFETT: Zone 5?

AUDIENCE MEMBER: Hi, my name is Philip King (PH) from San Francisco.

And my question has to do with how the FASB has caved in on the stock option proposal.

And the people opposed to the proposal argue that it would hurt capital formation for companies and that the cost of stock options is already reflected in shares outstanding, in fully diluted calculations.

And I was curious, what is your feelings about what’s happened?

WARREN BUFFETT: Well, as those of you have followed this issue — FASB did cave, and they were — they hated it. I mean, they knew they were right. Matter of fact, most of the, what are now, I guess, the big six auditing firms, many years ago, sided with the position.

But in my opinion, the auditing firms caved to their clients, in that respect.

In terms of capital formation, I would argue that the most intelligent form of capital formation follows from the most accurate form of accounting.

I mean, it — if all the companies with — whose names began with A through M didn't have to count depreciation and all the ones with N through Z did, or something, you know, that might help in capital formation for companies that were — had names with A thru M. And incidentally, they probably all change their names.

But I don't think that bad accounting is an aid to capital formation. In fact, I think probably over time, it distorts capital formation.

Because if we were to pay all of the shareholders with — I mean, all of the people who worked for Berkshire Hathaway — in stock, and therefore record no wage expense, you know, we might be able to sucker in a bunch of people who thought the earnings were real.

But that would not be a great step forward for capital formation, in my view.

I really think that — you know, I've talked privately to a number of managers about this. And they understand it. But they, you know, they prefer the present situation. And they used a lot of muscle in Washington many years ago.

And I think I have this authenticated now. This fellow — mathematics professor — sent me some material after I'd written this. I try to get a little proof after the fact when I can.

I believe it was in the Indiana legislature, where a legislator introduced a bill to change the value of pi, the mathematical symbol pi, to three. Because he said that it was too difficult for the schoolchildren to work with this — (laughter) — complicated 3.14159.

And he was right. I mean, it was difficult. And I — and Congress, in connection with the stock option question, received all kinds of pressure to, in turn, pressure FASB and the SEC to not count stock option costs as part of compensation.

I've never met anybody that wanted to be compensated that felt that, if he received his present salary plus an option, he was not getting compensated more than if he just received a salary. So, he thought it was compensation.

And I will tell you that if we'd been issuing options over a period of time at Berkshire for things unrelated to the performance of the entire business, that we would've had a cost, perhaps measuring in the billions of dollars, whether it was recorded or not.

So, it goes back to Bishop Berkeley's question of whether a tree that falls in the forest and doesn't make a sound, you know, when — et cetera.

But it — I think it is — I really think that it makes you a bit of a cynic about American business when you see the extent to which a group has pressured — even to the extent of talking about financial — withdrawing financial support from the Financial Accounting Standards Board — the degree to which they've pressured people to make sure the value of pi stays at three instead of 3.14, simply because it was their own ox that was being gored a bit.

In any event, it's — it looks like it's all over now for some time. In fact, now they're pressuring them to even weaken further the standards that have been set. So, self-interest is alive and well in corporate America.

Charlie?

CHARLIE MUNGER: Yeah, I think dishonor won. And I think that — I think it is quite important for a civilization to have sound engineering and good accounting.

And it is a very regrettable episode, leading politicians — leading venture capitalists.

I think to some extent, it's an indictment of the educational system, that this thing could be so widely looked at, and so wrongly.

WARREN BUFFETT: It's bad enough people want to cheat on their accounting. And they do cheat on their accounting. But to want it to be endorsed as the system —

CHARLIE MUNGER: Yeah.

WARREN BUFFETT: — is really kind of disgusting.

CHARLIE MUNGER: Yeah, corruption won.

WARREN BUFFETT: Well, put us down on undecided on that and we'll move on to zone 6.
(Laughter)

18. Why there's no video of Berkshire meetings

AUDIENCE MEMBER: Good morning, Mr. Buffett, Mr. Munger, Mike Lee-Chin from Hamilton, Ontario.

Could you consider availing a videotape of this meeting to us, the shareholders?

CHARLIE MUNGER: I didn't quite get that.

AUDIENCE MEMBER: Would you consider availing this videotape of the shareholder — this particular shareholder meeting to us, the shareholders?

CHARLIE MUNGER: Distributing a videotape?

WARREN BUFFETT: A transcript or a videotape?

AUDIENCE MEMBER: Yes.

WARREN BUFFETT: Yeah, we've had that suggested a number of times. It's a good suggestion, and we've considered it.

The thing we're worried about, in connection with that, is discouraging attendance.

I mean, it — (laughter) — we'd hate to have two people here asking questions and then send it out to tens of thousands. So — (laughter) — in the end —

CHARLIE MUNGER: Particularly if it might make sales go down at the jewelry store.

WARREN BUFFETT: Yeah. (Laughter and applause)

Since we were just attacking hypocrisy in American business, Charlie felt like he should add that to my comments. (Laughter)

But we — it's a close call on that because we would like everybody —

Of course, we try to cover a great many subjects in the annual report. But we like the idea of the meeting — answering a lot of shareholders questions.

We don't want to discourage attendance. And it's fun to have everybody come in and ask questions.

And the chances are, if we had far fewer people, we would have, you know, far more — far fewer — good questions. So that the quality of the meeting is enhanced, I think, by having a lot of people come.

But you've come a long way, so I can understand why you might be interested in a transcript. (Laughs)

I apprentice that. Thank you.

AUDIENCE MEMBER: — or no. Is that a yes or a no?

WARREN BUFFETT: It's — (Laughter)

CHARLIE MUNGER: It was a no.

WARREN BUFFETT: It's a no.

AUDIENCE MEMBER: OK. (Applause)

WARREN BUFFETT: Most everything we say is a no. But we have various ways of getting there. (Laughter)

19. Berkshire meetings boost Borsheims' sales

WARREN BUFFETT: OK. Zone 7 from the other room, I can see you.

AUDIENCE MEMBER: Good morning, Mr. Buffett and Mr. Munger.

I was wondering if you could tell us what the sales at Borsheims were yesterday and how it compared to a year ago?

WARREN BUFFETT: Well, I can tell you how it compared to a year ago. They were 15 percent above a year ago. And a year ago it was 40-odd percent above the year before. And I forget how much that was before.

So, we keep setting records. But we haven't announced any numbers. But it's a pretty good size number. You're a sporty crowd.

AUDIENCE MEMBER: Thank you. (Laughter)

20. An "idiot" could successfully run Berkshire

WARREN BUFFETT: Zone 1?

AUDIENCE MEMBER: Good morning. My name is Patrick Terhune from Fort Lauderdale, Florida.

And first of all, I see, per your request, there are a lot of people who wore red in honor of the Cornhuskers. (Applause)

Of course, my team was the — or is the Miami Hurricanes. And I've got my green and orange on under my clothes. So — but if we were to lose, I'm glad we lost to Nebraska and Tom Osborne.

I've got a request for Warren and Charlie, and that is, recognizing that the value, both intrinsic and extrinsic, of Berkshire Hathaway, is the result of your combined skills in acquiring growth

companies and with your prudent and expert investing of the company's capital for growth, I'd like to know if you have a plan — a succession plan — to be executed in the event, God forbid, something happens to one or both of you, which would remove your input to the strategic decisions.

I sincerely hope you're in the process of developing individuals to carry forward your collective visions and to manage the company's resources as effectively and as profitably as is being done now.

WARREN BUFFETT: Well, I appreciate that question. And the answer is, obviously, we do care enormously about that because both Charlie and I — in addition to a lot of other reasons, but in — we both have a very significant percentage of our net worth in Berkshire.

And neither one of us has figured out how to sell it all exactly, you know, 15 minutes before we get hit by a truck. So, we will not have the jump on the rest of you.

And therefore, our continuing interest will go — financially — will go well, well beyond our deaths.

And it will — in terms of foundations or something like that, it will go to organizations that we care very much about having maximum resources available to.

So, we do have some plans. We don't name names or anything of the sort.

It's not quite as tough as you might think because we have a collection of fabulous businesses. Some of them owned totally, some of them owned in part.

And I don't think razor blade sales or Coca-Cola sales are going to fall off dramatically the day Charlie or I die. It — we've got some great businesses. And then same is true of the wholly-owned businesses.

So the question is more that of allocating capital in the future. And you know, that's a problem for Charlie and me right now, simply because of the size with — it's not easy to find things to do that make sense with lots of money.

And sometimes a year will go by and we don't find anything. And other times a year goes by, and we think we found something, but it turns out we were wrong.

So, it's not easy. But we think we will have some very smart people working on that.

And we don't think it will be the end of the world if they don't find anything the first year, because the businesses will run very well.

We have a big advantage in that, as contrasted to virtually almost every other company, we, now and in the future, are willing — eager — to buy parts of wonderful businesses or all of them.

I mean, most managements have a — most investors are limited to buying parts of businesses. And most managers, psychologically, are geared to owning all of something that they can run themselves.

We — you know, it's like, I think Woody Allen said some years ago, the advantage of being bisexual is it doubles your chances of a date on Saturday night. (Laughter)

And we can go either direction, in that respect. (Laughter)

And our successors will also. So very — Charlie, you want to add anything?

CHARLIE MUNGER: I think few business operations have ever been constructed to require so little continuing intelligence in corporate headquarters. (Laughter)

An idiot who was willing just to sit here would have a very good record long after the present incumbents were dead.

WARREN BUFFETT: I think that's true.

CHARLIE MUNGER: Yeah. I think it would be a little better if Warren would keep alive, in terms of allocating the new capital. I don't think we'll easily replace Warren.

But, you know, we don't have to keep getting rich at the same rate we have in the past. (Laughter)

WARREN BUFFETT: That's a tie vote. (Laughter)

21. Decisions so obvious that exact numbers aren't needed

WARREN BUFFETT: Zone 2?

AUDIENCE MEMBER: Hi, this —

WARREN BUFFETT: (Inaudible)

AUDIENCE MEMBER: — Keith Briar from San Francisco.

I have a question. When you're valuing the companies and you discount back the future earnings that you talk about, how many years out do you generally go? And if you don't go out a general number of years, how do you arrive at that time period?

WARREN BUFFETT: Well, that's a very good question. And it's — I mean, it's the heart of investing or buying businesses, which we regard as the same thing, but —

And it is the framework in which we operate. I mean, we are trying to look at businesses in terms of what kind of cash can they produce, if we're buying all of them, or will they produce, if we're buying part of them. And there's a difference. And then at what discount rate do we bring it back.

And I think your question was how far out do we look, and all that.

Despite the fact that we can define that in a very kind of simple and direct equation, you know, we are — we've never actually sat down and written out a set of numbers to relate that equation.

We do it in our heads, in a way, obviously. I mean, that's what it's all about.

But there is no piece of paper. And we never — there never was a piece of paper that shows what our calculation on Helzberg's or See's Candy or The Buffalo News was, in that respect.

So, it would be attaching a little more scientific quality to our analysis than there really is, if I gave you some gobbledygook about, "Well, we do it for 18 years and stick a terminal value on and do all of this."

We are sitting in the office thinking about that question with each business or each investment. And we have discount rates, in a general way, in mind.

But we really like the decision to be obvious enough to us that it doesn't require making a detailed calculation.

And it's the framework. But it's not applied in the sense that we actually fill in all the variables.

Is that a fair way of stating it, Charlie?

CHARLIE MUNGER: Yeah. Berkshire is being run the way Thomas Hunt Morgan, the great Nobel laureate, ran the biology department at Caltech.

He banned the Friden calculator, which was the computer of that era. And people said, "How can you do this? Every place else in Caltech, we have Friden calculators going everywhere."

And he said, "Well, we're picking up these great nuggets of gold just by organized common sense, and resources are short, and we're not going to resort to any damn placer mining as long as we can pick up these major aggregations of gold."

That's the way Berkshire works. And I hope the placer mining era will never come.

Somebody once subpoenaed our staffing papers on some acquisition. And of course, not only did we not have any staffing papers, we didn't have any staff. (Laughter and applause)

22. "Something will happen" and we want to be ready

WARREN BUFFETT: Zone 3?

AUDIENCE MEMBER: I'm Tom Morrow (PH) from Laguna Beach, California. And the question I have to ask pertains to the issuance of the new stock.

And again, as Charles mentioned, is there some potential gold mine out there that you have specifically in mind with the — some large acquisition that you have specifically in mind at this time, without revealing any strategic secrets?

WARREN BUFFETT: Yeah. There are things we would like to do. Whether we ever get a chance to do them or not is another question. But you know, I will be surprised if, in the next five years, we haven't used some preferred stock one time or another.

As I mentioned in the report, we had one last year that if we'd done it, it would've involved the issuance of maybe a billion dollars' worth of — no, more than that, I'm sorry — a couple billion dollars' worth of preferred.

That one isn't going to happen, in my view. I mean, it — there's one chance in a hundred it'll — it could happen or something of the sort — but, probably, it isn't going to happen.

On the other hand, we want to be prepared for it. Something will happen. That's always been our experience.

You know, we have sat through some dry spells. And this is true in both the stock market and the acquisition business.

You know, I closed up the partnership in 1969 because there was nothing that made sense to do. And I'm glad I did because that situation prevailed in '71 and '2.

But in 1973 and '4, you know, there were all kinds of things to do.

And that will happen from time to time. People will behave, particularly in markets, just as foolishly in the future as they have in the past. It'll come at unexpected times. But we will get a chance to do something.

Now, that's more of a cash-type purchase, obviously, in the market. But we will get a chance to use the preferred.

And we will try to think about big things. We may not find them. But Charlie and I, the larger something is, the more interested we are.

23. Big assets make float more flexible

WARREN BUFFETT: Zone 4.

AUDIENCE MEMBER: Jim Moss (PH) from Los Angeles.

I was reading through your annual report. And to me, an eye-popping number in there was the amount of float in 1994, at a cost of less than zero — I think it was \$3 billion.

And I was wondering if there are any restrictions on your investment of that money, or can that go into your marketable equity securities?

WARREN BUFFETT: The question relates to — we have that long table we put in — we introduced about four years ago or so in the annual report, that shows the amount of float and the cost of float.

And that's a very important table. It — in terms of our operating businesses, that's probably the most important piece of information in the report.

And that float is, as you noted, well over \$3 billion now — last year, because of various favorable factors, including the fact that our super-cat business was favorable, but also, because our other insurance businesses did very well — amazingly well.

The cost of that float, which is money that we're holding that eventually — does not belong to us, but will go to somebody else. The cost of that float was less than zero, and that is a very valuable asset.

And the question is, how much flexibility we have in investing that, which I think was the core of your question.

The answer is we have a lot of flexibility. We are not disadvantaged by that money being in float, as opposed to equity, really, in any significant way.

Now, if we had a very limited amount of equity and a very large amount of float, we would impose a lot of restrictions on ourselves as to how we would do it, because we would want to be very sure that we were in a position to distribute that float, in effect, to policyholders, or claimants, or whatever it may be at the time that was appropriate.

But we have so much net worth that, in effect, that float is just about as useful to us as equity money. And that means quite useful. It's a big asset of Berkshire's.

24. Not feeling threatened by Beardstown Ladies

WARREN BUFFETT: Let's see, we've got zone 5.

AUDIENCE MEMBER: Susan Scott (PH) from Madison, Wisconsin.

On a more serious note, are you beginning to feel threatened by the success of the Beardstown Ladies? (Laughter)

WARREN BUFFETT: Which lady?

CHARLIE MUNGER: I —

WARREN BUFFETT: Which lady was that? I —

CHARLIE MUNGER: I didn't get it.

WARREN BUFFETT: I got everything except what lady that was.

AUDIENCE MEMBER: The Beardstown Ladies, the investment group?

WARREN BUFFETT: Oh, that group. Yeah, the best-seller. Yeah. I have not read that book. I hate to admit that to an audience of shareholders, that I —

This is a book that's — I think it's probably number, I don't know, seven or eight or something like that on the Times best-seller list, and been up there for a couple of months now.

It's a group — an investment group — that, apparently, is sharing with the world their secrets of success.

I'm always suspicious of people when they're sharing with the world any great ideas on investments. But we are not threatened at the moment, no. (Laughter)

25. Economics of the moat and the castle

WARREN BUFFETT: Zone 6.

WARREN BUFFETT: Mike Assail (PH) from New York City.

In the mistake du jour section of the annual report, you mentioned a fundamental rule of economics that you missed. I'd like to know the two or three most important fundamental rules of economics you habitually get right.

In other words, what are the fundamental rules of economics you used to make money for Berkshire?

And I'm not talking about Ben Graham's principles here, but rather, rules of economics which may be found in an economics textbook. Thank you.

WARREN BUFFETT: We — Yeah, we try to — I mean, we try to follow Ben's principles, in terms of the attitude we bring toward both investing and in buying businesses.

But the most important thing you can — you know, what we're trying to do is we're trying to find a business with a wide and long-lasting moat around it, surround — protecting a terrific economic castle with an honest lord in charge of the castle.

And in essence, that's what business is all about. I mean, you want to be the lord of the castle, yourself. In which case, you don't worry about that last factor.

But what you're trying to — what we're trying to find is a business that, for one reason or another — it can be because it's the low-cost producer in some area, it can be because it has a natural franchise because of surface capabilities, it could be because of its position in the consumers' mind, it can be because of a technological advantage, or any kind of reason at all, that it has this moat around it.

And then our — then what we have to decide is — all moats are subject to attack in a capitalistic system, so everybody is going to try and — if you've got a big castle in there, people are going to be trying to figure out how to get to it.

And what we have to decide — and most moats aren't worth a damn in, you know, in capitalism. I mean, that's the nature of it. And it's a constructive thing that that's the case.

But we are trying to figure out what is keeping — why is that castle still standing? And what's going to keep it standing or cause it not to be standing five, 10, 20 years from now. What are the key factors? And how permanent are they? How much do they depend on the genius of the lord in the castle?

And then if we feel good about the moat, then we try to figure out whether, you know, the lord is going to try to take it all for himself, whether he's likely to do something stupid with the proceeds, et cetera. But that's the way we look at businesses.

Charlie, you want to add anything?

CHARLIE MUNGER: Well, I think he wants it translated into the ordinary terms of economics. The honest lord is low agency cost. That's the word in economics.

And the microeconomic business advantages are, by and large, advantages of scale — scale of market dominance, which can be a retailer that just has huge advantages in terms of buying cheaper and enjoying higher sales per square foot.

So you're — by and large, you're talking economies of scale. You can have scale of intelligence. In other words, you can have a lord with enough extra intelligence that he has a big advantage. So you're — by and large, you're talking scale advantages and low agency costs.

WARREN BUFFETT: Yeah, to some extent, Charlie and I try and distinguish between businesses where you have to have been smart once and businesses where you have to stay smart.

And, I mean, retailing is a good case of a business where you have to stay smart.

But you can — you are under attack all of the time. People are in your store. If you're doing something successful, they're in your store the next day trying to figure out what it is about your success that they can transplant and maybe add a little something on in their own situation. So, you cannot coast in retailing.

There are other businesses where you only have to be smart once, at least for a very long time. There was once a southern publisher who was doing very well with his newspaper. And someone asked him the secret of his success. And he said monopoly and nepotism. (Laughter)

And I mean, he wasn't so dumb. I mean, he didn't have any illusions about himself.

And if you had a big network of television affiliates station 30 years ago, there's still a major difference between good management and bad management. I mean, a major difference.

But you could be a terrible manager and make a fortune, basically. Because the one decision to own the network TV affiliate overcame almost any deficiency that existed from that point forward.

And that would not be true if you were the first one to come up with some concept in retailing or something of the sort. I mean, you would have to be out there defending it every day.

Ideally, you know, is you want terrific management at a terrific business. And that's what we look for.

But as we pointed out in the past, if you have to choose between the two, get a terrific business.

Charlie, any more?

CHARLIE MUNGER: No.

26. Compliments for Helzbergs of Kansas City

WARREN BUFFETT: Let's see, zone 7, I believe is next?

VOICE: No questions from zone 7.

WARREN BUFFETT: OK. How about zone 1?

AUDIENCE MEMBER: Paul Miller (PH) from Kansas City.

First, I'd like to comment on your purchase of Kansas City-based Helzberg Jewelers. You commented about Barnett Helzberg and his — what he's done, retailing-wise.

For those of us in Kansas City, you've also picked up Barnett and Shirley Helzberg, who are the first family in philanthropy in Kansas City.

And for the shareholders in this room, the Helzbergs are wonderful people. And to have them added to this group of companies says miles about Warren Buffett and that they pick companies based upon their management and their people.

So, kudos to Berkshire Hathaway for picking up the Helzbergs, and thanks to the Helzbergs for everything they've done to Kansas City. Now, my — (Applause)

WARREN BUFFETT: Appreciate that. (Applause)

27. Putting a value on the subsidiaries

AUDIENCE MEMBER: My question relates to value. We can look in the annual report, and we can all see the purchase of a Washington Post, for instance, for \$10 million that has a value today of 420 million.

But discerning the value of the other consortium of non-publicly traded businesses, the Nebraska Furniture Marts, the Borsheims, et cetera — the value of their purchase price over the years versus their value today, how can we understand that value and how is it reflected in the annual reports?

WARREN BUFFETT: Yeah, well we try to — that's a good question. We try to give you the information that we would want in answering that question, in the annual report.

Part of it, we do in those pages where we say it's not according to GAAP accounting. But there's a lot of useful information in there.

We're not — we don't stick a number on each company. But we try to give you enough information about the capital employ, the margins, and all of that sort of thing on the bigger businesses that you can make estimates that are probably just about as good as ours.

WARREN BUFFETT: Charlie and I would not need more information than is in the report to come up with a pretty good idea of what the controlled businesses are worth. And there's no

information we're holding back that we think would be of any real importance in evaluating those businesses.

But you're right, it's a lot easier with marketable securities than it is — at least in terms of current numbers — than it is with the wholly-owned businesses.

The wholly-owned businesses, generally speaking, some of them are worth a whole lot more than we've — than they're carried on the books for. And we feel pretty good about, essentially, all of them.

But they're — they've turned out remarkably well, I would say that, over the years. And my guess is that they keep working pretty well.

We have managers in a number of those businesses here. I'm not going to introduce them all because we have so many that it would take a considerable period of time.

But you named The Washington Post. In the front row there, close to the front row, we have Don Keough, would you step up, of Coca-Cola? (Applause)

And we have Kay Graham for the Post. (Applause)

And Tom Murphy from Cap Cities. (Applause)

CHARLIE MUNGER: Is Paul Hazen here, too?

WARREN BUFFETT: And I'm going to try and do — well, there's a whole bunch more. I don't want to get — but I — but those three were sitting together and I was struck by the fact that if — those three combined, we have about 6 1/2 billion of profit in, so far. (Laughs)

So, I would say that that's a — (Applause) —

Those are three businesses that have been fantastic. And like — I emphasize "so far" because we'd like to be able to name a bigger number in the future.

But we have a group of managers, both at the controlled companies and at the partly-owned companies, that have just created incredible value for Berkshire.

I mean, Charlie and I sit around and read the paper every day and a lot of magazines and things, watch OJ Simpson or whatever it may be. (Laughter)

And these people are out there creating a ton of value for us. So, we're not going to change it. That —

28. Salomon Brothers culture clash

WARREN BUFFETT: Now, let's see. I think, zone — is it zone 2 now? Or is it — yeah.

AUDIENCE MEMBER: Hello. I'm Tim Palmer (PH) from Dillon, Colorado. I have a question for you regarding Salomon.

In the past week, there's been an article in The New York Times, The Wall Street Journal, and I believe it's Businessweek, that were rather unflattering, as far as what's going on with the management and your selection. There seems to be a — somewhat of a cultural clash there.

I don't know that to be a fact. But I wondered, number one, how you keep yourself open to bad news before it's news.

And what is going on in Salomon there, the compensation plan, et cetera? How do you think that, culturally, is going to work out?

WARREN BUFFETT: Charlie and I are always — we're more interested in bad news, always, than good news. We figure good news takes care of itself. And one — we only give a couple of instructions to people when they go to work for us.

And one of them is to think like an owner. And the second one is to just tell us the bad news immediately, because good news takes care of itself. And we can take bad news, but we don't like bad news late.

So, I would say, in connection with Salomon, that there is, and has been, some culture clash. And there probably almost always would be a culture clash in a business where there is that amount of tension.

Whether it be the entertainment business, or the investment banking business, or the sports business, there's going to be a certain amount of tension when — between compensation to the people that work there and compensation to the owners.

And I think there's been some — that strain has existed at Salomon from the day I was first there and far before that. I mean, I — that was no surprise. It's understandable.

You're seeing a tension, actually, in the airline business between the people that work there and capital. And it's produced terrible results in the airline business. And the people that work there have been able to — and I'm not talking about USAir specifically, although that's a case. But it goes beyond that.

They have had contracts, which were, as I pointed out in the report, were executed in an earlier age, which, essentially, will not allow — in many cases — capital to receive any compensation. And that produces a lot of tension.

You don't have contracts like that in the investment banking business or Wall Street, generally. But you have that same sort of tension.

And changing a culture around, A, takes time and, B, probably takes some change in people. I mean, I don't think that's a great surprise if you expect to do it.

I have — I don't think you can find two better people than Bob Denham and Deryck Maughan. They're smart, they're high-grade, they're willing to work very hard. And there will be people that buy into the arrangements they want to have. And there are people that won't.

Not all of the people that have left, by a long shot, are leaving of their own volition, but most of them are. But some aren't. I mean, there — Salomon lost a lot of money last year. And many of the people that have left were not responsible for some of those losses, but some of the people were.

So, that is not something where you announce names in the paper. But some people are leaving because they can make more money elsewhere. And some people are, maybe, leaving because we think we can make more money without them. (Laughter)

Charlie?

CHARLIE MUNGER: Yeah, I don't think the tensions that have been commented on within Salomon are all that unusual. I think they pretty well exist everywhere on Wall Street. And even in the banks, which have tried to imitate Wall Street. I just think it comes with the territory.

WARREN BUFFETT: I don't know what percentage of the Goldman Sachs partners left this year, but they had tensions that were produced, obviously, when they had a bad year. And they're going to have a bad year from time to time. Everyone's going to have a bad year.

But it — the partners — the general partners — of Goldman Sachs, in the year ended November 30th, 1994, did not do well. They may have not done anything at all. And they'd made some very big money in prior years. And they'll probably make some very big money in subsequent years.

But in the year when they didn't make any money, it was a lot of turnover. And maybe some of that turnover, also, was not all at the volition of the general partners that you read about leaving. I don't know the facts in that case.

But there's a certain amount of tension that exists in Wall Street under any circumstances. And when you aren't making money, there's a lot of tension.

29. Best edition of Ben Graham's "Security Analysis"

WARREN BUFFETT: Zone 3?

AUDIENCE MEMBER: Yeah. My name is Michael Johnson. I'm a native to Omaha, and however, my family and I are Americans living abroad in Dhahran, Saudi Arabia.

My question is related to intrinsic value and Ben Graham's "Security Analysis."

I read a book earlier this year by Janet Lowe, who said that you were more toward the first or second editions of "Security Analysis" and not so much toward the fourth.

Yet, the fourth edition seemed to move more toward growth and value being kind of joined at the hip, like you've said in your last few annual reports.

And so, if I'm a person who's always studying security analysis like I do — I think I spend more time with that — do you think I need to get those first editions? Or is the fourth edition kind of more of what you've moved toward, with your comments such as value and growth are joined at the hip?

WARREN BUFFETT: Janet Lowe is here, incidentally, today. She wrote a very good book on Ben Graham. I recommend that any of you that haven't read it, go out and buy a copy.

The — I still prefer the — I think the second edition is cheaper to buy than the first edition, by some margin. And I think it's basically the same book. So, I — that's the one I would recommend. I — it isn't because of differences on value and growth.

I just think that the reasoning is better and more consistent throughout the second edition, which is really the last one that Ben was the hundred percent — along with Dave Dodd helping him in various ways — was responsible for writing.

So, I think that the book has gotten away, to quite an extent, from both Graham's thinking and from his way of expressing himself. So I really — but I have no quarrel with anybody that wants to read later editions at all.

I do think, probably, the second edition, if you're a real student of security analysis and you read and understand that, you'll — you should do all right.

In terms of — a lot of the mistakes that were made, in terms of junk bonds and accounting and all of that sort of thing, were covered in 1934 in that first edition, and subsequently in 1940 in the second edition. There's a lot of meat in there.

Later on, you know — I must admit, I didn't read the last edition as carefully as the earlier ones. But it struck me, it was — it — what was said was not as important and it wasn't said as well. And it was more expensive. (Laughter)

Charlie, you have any thoughts on that?

CHARLIE MUNGER: No.

30. Why Berkshire doesn't sell businesses

WARREN BUFFETT: Zone 4?

AUDIENCE MEMBER: Yes, Jeff Peskin (PH) from New York City.

And I was — I have a question on the annual report where you say that, obviously, going forward, due to the size of Berkshire, the returns going forward probably won't match the returns of the past.

And then you go on to state that one thing that may hinder that is the fact that you don't really like to sell companies that you own.

And I would just like to know what the reasoning is in that, if you've got a company or investment that you don't think is going to do as well as where you can put the money going forward. What really the reasoning is for holding on and not redeploying the money elsewhere?

WARREN BUFFETT: Yeah. I'll just correct you just slightly. A, I didn't say we'd probably do worse than the past. I said we will do worse than the past. I mean, there's no way we can match percentage numbers of the past.

That, you know, we would — in a period that would not take that long, we would — assuming we paid out nothing — we would gobble up the whole GDP, which is something we may think about, occasionally, but — (laughter) — we don't really expect to accomplish. The —

But — and the second point, that relates to size. That does not relate to our unwillingness to sell businesses, because that unwillingness has existed for decades. But the size has not existed for decades.

The size is — you know, doubling 12 billion or so is harder than doubling 1 billion-2, which was harder than doubling 120 million. I mean, there's no question about that.

So, eventually — well, already it will be a drag on performance. It doesn't mean that the performance will be terrible, but it does mean that 23 percent is an historical figure. It has no predictive value.

The unwillingness to sell businesses, like I say, goes back a long way. That is not what — that —

If that hurts performance, it's peanuts. That's simply a fact — a function of the attitude Charlie and I have, is that if we want to live our lives, we find it a rarity when we find people in the business that we want to associate with. When we do find that, we enjoy it.

We don't see any reason to make an extra half a percent a year or 1 percent a year — don't try us on higher numbers. But the — (laughter) — we don't see a reason to go around ending friendships we have with people, or contact, or relationships. It just doesn't make any sense to us. It —

We don't want to get committed to that sort of activity. We know we wouldn't do it if we were a private company.

Now, in Berkshire, we feel we've enunciated that position. We want to get that across to everybody who might join with us because we don't want them to expect us to do it.

We want them to expect us to work hard to get a decent result, and to make sure that the shareholders get the same result we get, and all of that sort of thing.

But we don't want to enter into any implicit contract with our fellow shareholders that will cause us to have to behave in a way that we really don't want to behave.

If that's the price of making more money, it's a price we don't want to pay.

There's other things we forgo also, but that is the one that people might disagree with us on. So, we want to be very sure that everybody understands that, going in. That's part of what you buy here.

And it may — I don't think it'll hurt performance that much anyway. But to the extent that it does, it's a limitation you get with us.

Charlie? (Applause)

CHARLIE MUNGER: I don't think there's any way to measure it, exactly. But my guess is that, if you could appraise something you might call the character of the people that are running the operating businesses in Berkshire, many of whom helped create the businesses in the first place, and are leading citizens in their community, like the Helzbergs —

I don't think there's any other corporation in America that has done as well as we have, if you measure the human quality of the people who are in it.

Now, you can say we've collected high-grade people because we sure as hell couldn't create them. But one way or another, this is a remarkable system. And why would we tinker with it?

WARREN BUFFETT: If you want to — (applause) — attract high-grade people, you probably ought to try and behave pretty well yourself.

I mean it's just — besides, it wouldn't be any fun doing the other. I mean, it — I was in that position, a little bit, when I ran the partnership back in the '60s.

And I really — you know, people were coming into partnership with me. And my job was to turn out the best return that we could. And I found that if I got into a business, that presented certain alternatives that I didn't like. So, Berkshire's much more satisfactory in that respect.

31. Focus on Graham's three principles

WARREN BUFFETT: Zone 5?

AUDIENCE MEMBER: John Rankin (PH), Fort Collins, Colorado. Thanks for having us.

In the book, "Warren Buffett Way," the author describes the capital growth model that you've used to evaluate intrinsic value in common stock purchases.

My question is, do you also still use the formula Ben Graham described in "The Intelligent Investor," that uses evaluating anticipated growth, but also book value?

It seems to me that fair value is always a bit higher when using Mr. Graham's formula than the stream of cash discounted back to present value that is in "Warren Buffett Way" and also that you've alluded to in annual reports.

WARREN BUFFETT: Yeah, we've tried to put in the annual report pretty much how we approach securities. And book value is not a consideration — virtually, not a consideration at all.

And the best businesses, by definition, are going to be businesses that earn very high returns on capital employed over time. So, by nature, if we want to own good businesses, we're going to own things that have relatively little capital employed compared to our purchase price.

That would not have been Ben Graham's approach. But Ben Graham was — Ben was not working with very large sums of money. And he would not have argued with this approach, he just would've said his was easier. And it is easier, perhaps, when you're working with small amounts of money.

My friend Walter Schloss has hewed much more toward the kind of securities that Ben would've selected. But he's worked with smaller amounts of money. He has an absolutely sensational record. And it's not surprising to me at all. I mean, when Walter left Graham-Newman, I would've expected him to do well.

But I don't look at the primary message, from our standpoint, of Graham, really, as being in that — in anything to do with formulas. In other words, there's three important aspects to it.

You know, one is your attitude toward the stock market. That's covered in chapter eight of "The Intelligent Investor." I mean, if you've got that attitude toward the market, you start ahead of 99 percent of all people who are operating in the market. So, you have an enormous advantage.

Second principle is the margin of safety, which again, gives you an enormous edge, and actually has applicability far beyond just the investment world.

And then the third is just looking at stocks as businesses, which gives you an entirely different view than most people that are in the market.

And with those three sort of philosophical benchmarks, the exact — the evaluation technique you use is not really that important. Because you're not going to go way off the track, whether you use Walter's approach — Walter Schloss's — or mine, or whatever.

Phil Carret has a slightly different approach. But it's got those three cornerstones to it, I will guarantee. And believe me, he's done very well.

Charlie?

32. Don't believe projections

CHARLIE MUNGER: Yeah. To the extent that the method of estimating future cash flow requires projections, I would say that projections, while they're logically required by the circumstances, on average, do more harm than good in America.

Most of them are put together by people who have an interest in a particular outcome. And the subconscious bias that goes into the process, and its apparent precision, make it — makes it some — well, it's fatuous, or dishonorable, or foolish, or what have you.

Mark Twain used to say a mine is a hole in the ground owned by a liar. And a projection prepared in America by anybody with a commission, or an executive trying to justify a particular course of action, will frequently be a lie.

It's not a deliberate lie, in most cases. The man has gotten to believe it himself. And that's the worst kind.

So, I don't think we should — projections are to be handled with great care, particular when somebody has an interest in misleading you.

WARREN BUFFETT: Charlie and I, I think it's fair to say, we've never looked at a projection in connection with either a security we've bought or a business we've bought. We've had them offered to us in great quantities.

Now, the fact that we voluntarily turn them away when people try to thrust them upon us — I mean, it — the very fact that they are prepared so meticulously by the people who are selling the businesses, or by the executives who are presenting to their boards and all of that sort of thing, you know, I mean, either we're wrong or they're wrong.

It's a ritual that managers go through to justify doing what they wanted to do in the first place, in about nine cases out of ten.

I have never, you know, I have never met an executive who wanted to buy something that said, "Well, I had to turn it down because the projections didn't work." I mean, it's just — it's never happened.

And there will always be somebody that will come up with the projections that will satisfy the guy who's signing his paycheck or will sign the deal that provides the commissions.

And they will pass those along to whomever else they need, the bankers or the board, to approve it.

It is total nonsense. I was recently involved in some — in a situation where projections were a part of the presentation. And I asked that the record of the people who made the projections, their past projections also be presented at the same time. (Laughter)

It was a very rude act. (Laughter)

CHARLIE MUNGER: It was regarded as apostasy.

WARREN BUFFETT: It — but believe me, it proved the point. I mean, it was a joke, I mean. So, we'll leave it at that.

33. First question when looking at an investment

WARREN BUFFETT: We're going to have another — one more question, maybe. And then we'll take a break.

And Charlie and I will be eating up here. The ones who want to stick around can stick around. And the ones who are in the other room, undoubtedly there will be seats in here to fill.

So, we'll sort of regroup in 10 or 15 minutes. And then we'll go on as long as that group lasts.

So, let's take one more from zone 6. And then we'll take a break.

AUDIENCE MEMBER: Hello, my name is Peter Bevelin from Sweden.

What is the absolutely first question you ask yourself when you look at a potential investment? And do you and Mr. Munger ask yourself the same first question?

WARREN BUFFETT: Yeah. Well, I think — I don't ask myself whether Charlie's going to like it because — (laughter) — that will be a tough one.

No, the first question is, can I understand it? And unless it's going to be in a business that I think I can understand, there's no sense looking at it.

There's no sense kidding myself into thinking that I'm going to understand some software company, or some biotech company, or something of the sort. What the hell am I going to know about it? I mean, you know, I can — so that's the first threshold question.

And then the second question is, you know, does it look like it has good economics? Has it earned high returns on capital? You know, does it strike me as something that's likely to do that? And then I sort of go from there.

How about you, Charlie?

CHARLIE MUNGER: Yeah. We tend to judge by the past record. By and large, if the thing has a lousy past record and a bright future, we're going to miss the opportunity. (Laughter and applause)

Afternoon Session - 1995 Meeting

1. Banks are in our circle of competence

WARREN BUFFETT: OK, we're ready to start here with a question from zone 1, if you'll take your seats, please. We've got to —

AUDIENCE MEMBER: Mr. Buffett, I'm Brian Murphy (PH) from Clearwater, Florida.

I'd like to ask you a question concerning your present thinking behind your acquisitions of banks, such as PNC and SunTrust, particularly in light of the fact that banks were selling so cheaply in 1990 and now many have tripled in price.

And it would appear from recent publications and the financial literature that you've become much more interested in banks at these higher prices, relative to the 1990 valuations. Could you comment on your thinking there?

WARREN BUFFETT: Yeah, we really have no different — there's no difference in the criteria we apply to banks than to other businesses. And a couple of publications have, maybe, made a little more of that than is warranted, because I doubt if there's more than a couple percentage points difference in —

And we don't think of it that way, incidentally. And we do not have a lot of sector — we don't have any sector allocation theories whatsoever.

So, we simply apply the same criteria when looking at banks that we would at any other business that —

There — incidentally, there — sometimes, you should know, that there's — I would say that maybe half, or maybe even a little more, of the reports about our activities are — in the press are erroneous. Now, some are accurate, too.

And then, of course, some are way out of date. I mean, we get confidential treatment on our — on the filings we make with the SEC as to our holdings, so they're published well over a year after we've filed them.

And therefore, there have been a couple of stories in the last month or two as to something we've bought. And of course, if you read the story carefully, we bought it a year and a half ago, maybe. And we may have sold it, we may have bought more, all kinds of things.

So that, I'd be careful about press reports, generally.

We've — we actually — we bought a bank for Berkshire in 1969, the Illinois National Bank and Trust of Rockford. We've had an interest in the banking business.

We feel it's something that we can — that falls within our circle of competence to evaluate. That doesn't mean we'll be right every time, but it — we don't think it's beyond us to understand the banking business. And so, it's — we look at businesses in that area.

Charlie?

CHARLIE MUNGER: Nothing to add.

2. Buffett always plans to write a book “six months from now”

WARREN BUFFETT: OK. And do we have zone 2?

AUDIENCE MEMBER: Larry Myers from Omaha.

Warren, two quick questions, the first one very brief. Do you have any timetable regarding when you will write your own book about your career and philosophy?

WARREN BUFFETT: Yes, my timetable's always been six months from now. (Laughter)

The answer on that is I've thought about doing it a few times, and I think about it. It always seems to me there's way more interesting things yet to happen than have happened so far, and I don't want to — I know I won't write a second one, so I keep postponing it. That's my rationale on it, anyway.

3. Coca-Cola “doing exactly the right thing” with its cash

AUDIENCE MEMBER: Thank you. Second question concerns dividends. Last Friday night, by coincidence, on Louis Rukeyser’s weekly television show, the special guest was Philip Carret.

And Mr. Carret made the statement that his favorite American stock is Berkshire Hathaway. And one of the major reasons he stated was that, “Berkshire has never paid a dividend, as we all know,” and consequently, you had superior utilization of the extra cash.

Now, if you extend that reasoning, could it also be a beneficial policy if Coca-Cola and Gillette stopped paying dividends and utilized the cash in other ways?

WARREN BUFFETT: Well, it depends what they could use the — how they would use — utilize the cash, what they could use it for. Those are more focused enterprises than Berkshire, at least in terms of products.

And they — I think — I commend managements that have a wonderful business for utilizing cash in those wonderful businesses, or in businesses that they understand and that will also have wonderful economics, and for getting the rest of the money back to the shareholders.

So, Coca-Cola, in my book, is doing exactly the right thing with its cash when it both — when, A, it uses all the cash that it can, effectively, in the business to expand in new markets and all of that sort of thing.

But then beyond that, it pays a dividend which distributes cash to shareholders, and then it repurchases shares in a big way, which returns cash on a selective basis to shareholders, but in a way that benefits all of them.

So, we — you will benefit from us not paying dividends just as long as we can use the — every dollar we retain — to produce more than a dollar of value, and of market value over time.

Whether we can continue doing that, you know, how long we can continue doing that, I can’t promise you, but that is the — that’s the yardstick by which the decision is made.

And that is the yardstick, I think, by which Coca-Cola’s making the decision, too. And I think that they deserve great credit for exercising the discipline to quit when they — using cash — when they’ve run out of the opportunities to use it well, and then to use it — then to further deploy it advantageously by repurchasing shares.

I think one of the things I admire about my friend, Bill Gates, he’s got 4 1/2 billion of cash in Microsoft, and very few managements can stand having 4 1/2 billion of cash and not doing something unintelligent with it.

So far, it's made sense for us to retain everything we earn, and I think it'll make sense for a while longer, but it may not make sense indefinitely.

Charlie?

CHARLIE MUNGER: I hope it lasts a long time. (Laughter)

4. Why is Wall Street compensation so high?

WARREN BUFFETT: Zone 3?

AUDIENCE MEMBER: My name is Dan O'Neil from Santa Fe, New Mexico.

And I would ask — like to ask you a more specific question about Salomon Brothers, which is, why do we pay our employees there so much?

WARREN BUFFETT: Why what?

AUDIENCE MEMBER: Why do we pay our employees there so much money? The conventional theory seems to be that there's just a different pay scale on Wall Street than the rest of the world.

And it's based on the idea that traders are smarter than — that some traders are smarter than others, and, in some supernatural way, are able to receive signals that the future is sending back to the present. And how do we know that that isn't just an urban legend like alligators in the New York City sewers?

Another theory would be that the large amount of shareholders' capital allows the traders to capture inefficiencies that are in the market in the same way that the house does in Las Vegas.

I mean, if we owned a casino, it wouldn't make any difference if we hired Albert Einstein or Forrest Gump to run the blackjack table, and we would pay them the same. And I wonder which theory you think is closer to the truth.

WARREN BUFFETT: Well, you put it well. (Laughter and applause)

In the end, of course, you end up paying at a, what you think, at least, is a market rate. And to some extent, the market tests you out by whether people leave because they can get a higher rate.

But the limiting factor on that should be that you pay them a market rate as long as you are getting a market rate on capital. But it's harder to measure the market rate on capital in a short period than it is to measure the market rate on compensation.

So, the — a good many of the people that have left — but far from all — have left because they felt that they would obtain — presumably — because they would obtain greater compensation elsewhere.

The market was working in that way, just as it works in entertainment that way and it works in the athletic field that way.

And whether it — when it works that way, it leaves a return for capital that's adequate, is an open question. I mean, I haven't looked at the figures on all the baseball teams, but I've seen some of them. And certainly, in some of the smaller markets, I mean, the books were not phony.

I mean, it is very hard to pay market rates for ballplayers in Kansas City and still make money running a ball team, where you've got a smaller television market and all of that of the big cities.

So, in the end you're going to have to pay market rates to retain people, but part of that will also depend upon the period over which they measure their — what they are going to be paid.

I mean, if you want to look at Goldman Sachs last year, they were paid nothing. Does that mean that everybody will leave because they can get paid something someplace else? No, because 80 percent of the partners, or 90 percent of the partners, have a longer time horizon than that. And they have an anticipated earnings figure in mind when comparing it with what they're being offered elsewhere.

If you have a situation where market rates, you know, exceed the earning capacity of the business, then at some point, capital will flow away from the business.

In the airline industry, which I use as an example, the market rate — most — well, the — in terms of the bigger airlines, people are not being paid market rates, they're being paid contractual rates. Well, you can't blame anybody for that.

If you have a contract that entitles you to X and the current market is a half of X, you're going to hang onto that contract very aggressively. And like I say, you don't blame anybody for that, it's just if you end up in that condition, though, you've got a real problem.

And if you have the same problem that you have if the market is higher than — or a similar problem — the one you have if the market is higher than one that you can sustain in your own business.

My guess is that there — that, in effect, Salomon has put in a more Goldman Sachs-like system because, essentially, it created, to a degree, a partnership within it. That —

To have that work, A, over time, the partners have to earn good money or it won't work, but, B, you have to have people that have a partnership mentality in it. And if you change from one culture to another, you are not going to get a hundred percent acceptance of any new system.

Charlie?

CHARLIE MUNGER: Yes, it was kind of a bad break to put in a new compensation system and then have a very bad year. In the very nature of things, people are going to blame the compensation system subconsciously.

And then, two, I think that Wall Street generally has more envy-jealousy effects than are typically present elsewhere.

5. Buffett on the “real” advantage of being rich

I have a friend whose grandmother used to say that she couldn't understand why people got into envy-jealousy, because it was the only one of the sins that you could never possibly have any fun at. And — (Laughter)

But generally speaking, on Wall Street I think a lot of people have had the wrong kind of grandmothers. (Laughter and applause)

WARREN BUFFETT: Yeah, I've commented from time to time that — what's his name? Robin Leach has it all wrong on “Lifestyles of the Rich and Famous,” because he's presenting all these wonderful things that will happen to you if you get rich.

But they really aren't that all that wonderful, these fancy houses and boats and all that. The real advantage of being rich, as I explain to people, is that it enables you to hate so effectively.

That if you're terribly rich, you know, and — but your brother or whomever, cousin or somebody, is getting a little more attention in the world or something of the sort, you can hate in a very major way.

You can hire accountants and lawyers to cause him all kinds of trouble. If you're poor, you just snub him at Thanksgiving and don't show up or something of the sort. (Laughter)

But I've noticed that these rich people, particularly when they inherit great amounts of money, sooner or later they start — frequently — they get very antagonistic toward siblings, or cousins, or whatever it may be.

And they really can — they can hate in a way that — or get envious in a way that the rest of us really can't really aspire to. So, that's the benefit that hasn't appeared on Robin Leach lately, but I —

But you see that — you see a little of that in the athletic field and the entertainment field, and perhaps even on Wall Street, that making a million dollars a year looks great until this guy that sits next to you that can't possibly be as smart as you is making a million-two. And then the whole world, it turns into a very unfair place. (Laughter)

6. “It’s never a policy of ours to hold a lot of cash”

WARREN BUFFETT: Zone 4?

AUDIENCE MEMBER: Good afternoon. My question is simply about the cash and cash equivalents that are shown on the balance sheet this year versus last year.

In my thinking, cash equivalents is always something good to have around in case of a big market drop, being able to make opportunistic buys, as I know you've referred to “Mr. Market” getting manic-depressive at times.

Is there something that is less than obvious here that I'm not seeing? Or is the position not there now, should that happen in the marketplace?

WARREN BUFFETT: Cash at Berkshire is a residual. I mean, we would like to have no cash at all times. We also don't want to owe a lot of money at any time.

But we — if we have cash around, it's simply because we haven't found anything we like to do, and we hope — always hope — to deploy it as soon as possible.

We never are thinking about whether the market's going to go down or something of the sort, or whether we might buy something even cheaper. If we like something, we'll buy it.

And when you see cash on our balance sheet of any size, that's an acknowledgement by Charlie and me that we have not found anything, in size anyway, attractive at that point. It's never a policy of ours to hold a lot of cash.

7. Newspaper business is “exceptionally good,” but not as good

WARREN BUFFETT: Zone 5?

AUDIENCE MEMBER: David Winters, Mountain Lakes, New Jersey. I'll stand up.

David Winters, Mountain Lakes, New Jersey.

Years ago, you said you loved the newspaper business and then, over time, I guess, it — said it declined a bit in how much you loved it. And I'm kind of wondering how you feel about it now, and if you can prognosticate a little bit for us at all?

WARREN BUFFETT: Well, I used to love it in two respects. I loved the economics and I loved the activity, both. The activity — the love of the activity has not diminished.

The economics are still exceptionally good compared to virtually any business in the world. They aren't quite as good as they were 15 years ago.

So, they have — I wrote about that a couple of years ago, whereas what was — seemed almost the most bulletproof of franchises is still an exceptionally good business, but it isn't quite as bulletproof as might've been the case 10 or 20 years ago.

I still think it's about as interesting a business as there is in the world I'm in. But if you're talking pure economics, the — I can't think of many other businesses that, if I just owned one asset over my life, that I would rather own than a newspaper in a single-newspaper town.

But I wouldn't have quite the feeling of absolute certainty that I had — that I would've had 10 or 15 years ago.

Charlie?

CHARLIE MUNGER: Yeah, I think it's obvious, I — the newspaper proprietors are getting a touch of paranoia for the first time.

I mean, they worry about the electronic revolution, they worry about the fact that young people, you know, don't read. It's not as much fun going to newspaper conventions as it used to be.

WARREN BUFFETT: They're still making exceptional money. I mean, that's the interesting thing.

CHARLIE MUNGER: Ah, but they — I've heard you say a dozen times, "People don't seem to care what floor they're at, just whether the elevator is going up or down."

WARREN BUFFETT: That's right, that is true. (Laughter)

People feel better when they're on the second floor of an elevator that's just come from one than they do when they're on the 99th floor coming down from a hundred, there's no question about that.

They have this projection. And of course, it's particularly the case where they've been in a business where the money — the profits — were automatic, because they start thinking about, you know, questions of whether they really have the ability to make a lot of money, absent this favored position.

And that's not something they've had to dwell on before. So, it can make them uncomfortable.

They're all screaming about newsprint prices. We'd probably scream about them a little bit, too.

I mean, if you compare being in the newsprint business over time to being in the newspaper business, I mean, it's a joke.

And newsprint prices, if you — you can graph them from any point, you know, 15 or 20 years ago, or 10 years ago, and the price of the newspaper, the price of advertising has gone up more.

I mean, it is interesting to hear them yelling foul, because they have moved a lot in the last 12 months and they'll move some more in the next six months. But believe me, it's better to be in the newspaper business than the newsprint business.

8. Buffett's semi-hostile takeover of Berkshire

WARREN BUFFETT: Zone 6?

AUDIENCE MEMBER: Mr. Buffett, my name is Liz Pruce (PH), I'm from New York City.

I was wondering, on your acquisition criteria — I know part of that is that Berkshire Hathaway won't participate in unfriendly takeovers. I wondered how that philosophy may or may not apply to your role as a member of the board of several other companies.

WARREN BUFFETT: That's an interesting question. And I haven't been on the board of any company where the CEO has brought to the board the question of a hostile takeover.

Can you think of anything I'm forgetting? No, and — but there's no rule that that can't happen.

So, I don't know exactly what I would do if that came along. That's a very good question.

I used to be — I used to have a whole different attitude on that. I mean, in effect — we actually — if you go back 40 years, we bought, in effect, control of companies.

Well, in the case of Berkshire, Malcolm Chace, the chairman, was all in favor of us buying our stock in Berkshire. But Seabury Stanton, the president, would not have been in favor of it, and Seabury was the — was managing the business.

So, it wasn't hostile, but Seabury would not have been in favor of it. It would — but Malcolm would've been.

So, I don't know what the situation would be today if somebody walked in Gillette or Cap Cities, or someplace like that.

I don't think it's going to happen, but I have not — I don't have any policy on it at this point.

What do you think we'd do, Charlie?

CHARLIE MUNGER: I don't think our behavior is totally predictable. (Laughter and applause)

WARREN BUFFETT: And he's right. (Laughter)

9. Comparing investing styles of Ben Graham and Phil Fisher

WARREN BUFFETT: Zone 1?

AUDIENCE MEMBER: Yes, Neil McMahon (PH), New York City, also a Sequoia shareholder.

Ben Graham investing encouraged turnover. Looking at Berkshire's holdings, concentration and long-term, are you still a 15 percent Phil Fisher and 85 percent Graham?

WARREN BUFFETT: I don't know what the percentage would be. I'm a hundred percent Ben Graham in those three points I mentioned earlier, and those really count.

I am very — I was very influenced by Phil Fisher when I first read his two books, back around 1960 or thereabouts. And I think that they're terrific books, and I think Phil is a terrific guy.

So, I think I probably gave that percentage to — I think I first used it in Forbes one time when Jim Michaels wrote me. And I think I, you know, it was one of those things. I just named a number.

But I think I'd rather think of myself as being a sort of a hundred percent Ben Graham and a hundred percent Phil Fisher in the points where they don't — and they really don't — contradict each other. It's just that they had a vastly different emphasis.

Ben would not have disagreed with the proposition that if you can find a business with a high rate of return on capital that can keep using more capital on that — that that's the best business in the world. And of course, he made most of his money out of GEICO, which was precisely that sort of business.

So, he recognized it, it's just that he felt that the other system of buying things that were statistically very cheap, and buying a large number of them, was an easier policy to apply, and one that was a little more teachable.

He would've felt that Phil Fisher's approach was less teachable than his, but his had a more limited value because it was not workable with really large sums of money.

At Graham-Newman Corp — Graham-Newman Corp was a closed-end fund — oh, it was technically an open-end fund, but it had \$6 million of net worth. And Newman and Graham, the partnership that was affiliated with it, had 6 million. So, you had a total pool of 12 million.

Well, you could go around buying little machine tool companies — stocks in machine tool companies, whatever it might be, all statistically cheap. And that was a very good group operation.

And he had — you have — if you own a lousy business, you have to sell it at some point. I mean, if you own a group of lousy businesses, you better hope some of them get taken over or something happens. You need turnover.

If you own a wonderful business, you know, you don't want turnover, basically.

Charlie?

CHARLIE MUNGER: What was interesting to me about the Phil Fisher businesses is that a very great many of them didn't last as wonderful businesses.

One of his businesses was Title Insurance and Trust Company, which dominated the state of California.

It had the biggest title plant, which was maintained by hand, and it had great fiscal solvency, and integrity, and so forth. It just dominated a lucrative field.

And along came the computer, and now you could create, for a few million dollars, a title plant and keep it up without an army of clerks.

And pretty soon, we had 20 different title companies, and they would go to great, big customers like big lenders and big real estate brokers, and pay them outlandish commissions by the standards of yore, and bid away huge blocks of business.

And in due course, in the State of California, the aggregate earnings of all the title insurance companies combined went below zero — starting with a virtual monopoly.

WARREN BUFFETT: From what looked like a monopoly.

CHARLIE MUNGER: So, very few companies are so safe that you can just look ahead 20 years. And technology is sometimes your friend and it's sometimes your bitter enemy.

If Title Insurance and Trust Company had been smart, they would've looked on that computer, which they saw as a cost reducer, as one of the worst curses that ever came to man.

WARREN BUFFETT: You can — it probably takes more business experience and insights, to some degree, to apply Phil Fisher's approach than it does Graham's approach. If you —

The only problem is, you may be shut out of doing anything for a long time with Ben's approach, and you may have a lot of difficulty in doing it with big money.

But if you strictly applied, for example, his working capital test to securities, you know, it will work. It just may not work on a very big scale, and there may be periods when you're not doing much.

Ben really was more of a teacher than a — I mean, he had no urge to make a lot of money. It did not interest him. So he was — he really wanted something that he thought was teachable as a cornerstone of his philosophy and approach.

And he felt you could read his books sitting out here in Omaha and apply — buying things that were statistically cheap, and you didn't have to have any special insights about business or consumer behavior, or anything of the sort.

And I don't think there's any question about that being true, but I also don't think you can manage lots of money in accord with it.

10. Munger's sales of Berkshire shares

WARREN BUFFETT: Zone 2?

AUDIENCE MEMBER: Hi, Rob Pitts, shareholder from New York City.

This is a question for Mr. Munger. I've noticed, in the insider sales activity sheets, that you've been a rather consistent seller of your Berkshire stock over the last few months.

Wondered if you would comment on why you're doing this, especially in light of the prospective tax change in capital gains, where it might be reduced, which would obviously be beneficial to you and beneficial to Berkshire by reducing its deferred tax liability?

CHARLIE MUNGER: I've given away a fair amount of Berkshire in the last couple of years and I've also sold some. I gave away the Berkshire because I thought it was the right way to behave, and I sold some because I had uses for the money. (Laughter and applause)

WARREN BUFFETT: He doesn't know anything I don't know. I (Inaudible) it's selling, I'd checked that, but — (Laughter)

11. When a company's accounting is confusing, stay away

WARREN BUFFETT: Zone 3?

Charlie has a very high percentage of his net worth in Berkshire, as do I.

Go ahead. I'm sorry, go ahead. I don't think it's working, quite —

AUDIENCE MEMBER: Hello?

WARREN BUFFETT: OK.

AUDIENCE MEMBER: Hi, Gorem Pulich (PH) from New York City.

I have a two-part question, first part very short. I think a lot of people have difficulty valuing businesses because of some convoluted accounting schemes that are out there.

Do you have any suggestions, in terms of books, or something you can read, where you can sort of make sense of some of the accounting stories that are going around?

WARREN BUFFETT: Well, that's a good question. Abe Briloff used to write for Barron's quite frequently on various accounting machinations, and Barron's has continued that somewhat.

But you're right that there are people out there who will try to paint pictures with accounting that are something far from the economic reality. And sometimes, the rules of accounting themselves lead to that.

I would say that when the accounting confuses you, I would just tend to forget about it as a company. I mean, it's probably — it may well be intentional, and in any event, you don't want to go near it.

I — we have never had any great investment results from companies whose accounting we regarded as suspect. I can't think of a one. Can you, Charlie?

CHARLIE MUNGER: No.

WARREN BUFFETT: It's a very bad sign.

CHARLIE MUNGER: I made a short sale once that worked out well — (laughter) — in a case like that.

WARREN BUFFETT: It really — accounting can be a — accounting can offer you a lot of insight into the character of management.

And I would say there's a lot — you know, there's a — you run into a fair amount of bad accounting. I used to call it creative accounting. And you'd probably run into a lot more, if it was allowed.

But some companies have been able to push their auditors pretty far, and I would be very skeptical of anything that looks suspicious to you.

I think there have been — there've been a couple of things written, but I can't think of where they've appeared, where people talk about the questions of, you know, what —

Obviously, if some prepaid expense, deferred asset accounts start building up suspiciously high, and inventories look out of line, you know, with sales and, particularly, the trend of them and all that, you want to look twice at companies like that.

Life insurance, you know, frequently, you know, we see weak accounting in. You can — when you don't have a product where revenues and expenses are being matched up on something close to cash in the short-term, you have the opportunity for people playing games with numbers.

And some people have learned how to do that very well, and they've sometimes created long-lasting stock manipulation or promotion schemes that have enriched themselves, or they've enriched the managers or the creators of it, at the expense of the public, over time.

If you ever get suspicious about accounting, just go onto the next company.

12. Lloyd's of London has slipped in recent years

WARREN BUFFETT: Zone 4?

AUDIENCE MEMBER: Yes. Miss Wasserman (PH) from Chicago.

In order to understand the reinsurance business a little better, can you explain your relationship with Lloyd's of London in the marketplace, how you — which is probably the leader in the field?

How often do you compete directly, or if you've ever done reinsurance business for them, since they've had losses in recent years, and how you see the industry changing as their economics changes?

WARREN BUFFETT: Well, Lloyd's, which is not an insurance company, as you know, but a — well, originally it was a place — it was a coffee house, but people think what — it's a place where a large number of syndicates operate and congregate in a given physical location. And it's had a history for larger, more exotic risks over time.

Lloyd's has lost its relative position to a fairly significant degree in the last 10 or so years, partly because — well, in significant part, because of bad results, which had the other effects of causing capital to withdraw and people who backed the syndicates to become unhappy.

So, Lloyd's is still an important competitive factor in the reinsurance business and in certain specialized kinds of primary insurance. It's a very — you know, it's very important factor.

But it's not the factor it was 10 or 15 years ago. And I'm not sure how Berkshire's capital compares with the capital of all those syndicates at Lloyd's, but it's certainly changed in its relative importance in the last five or 10 years.

And the ability of Lloyd's to attract capital with the problems they had has been diminished, although they're working on that problem.

But we regard Lloyd's as a competitor just like we would regard any one of a number of reinsurance companies as competitor.

But we also do business with a number of syndicates at Lloyd's, and we'll probably do a lot of business over the next 10 years with various syndicates.

Charlie?

CHARLIE MUNGER: Yeah, Lloyd's is a very interesting institution because it had this reputation for integrity, what they paid off in — what, the San Francisco fire, and so on, and so on.

But I would argue that 10 or 15 years ago, a lot of slop and folly got into Lloyd's, in certain syndicates particularly.

And too many commissions coming off the top as the same risks circulated around the system. Too much fine tailoring and three-hour lunches with fine wines. And it wasn't right, and they got in a lot of trouble.

WARREN BUFFETT: Actually, in the history of Berkshire, the most significant insurance problem we ever had was in connection with Lloyd's almost — or certain syndicates of Lloyds — almost 20 years ago.

And as Charlie said, they had this terrific reputation — behavioral reputation — over centuries. And I think that they coasted for a while on that. And we had a behavioral problem with — in one situation. And it was very expensive to us. So, we may have gotten an early lesson in what was coming.

There are a lot of different syndicates at Lloyd's, and there are different people running them, and they have had different standards of behavior, to some extent. And people who assumed that, because they were dealing with Lloyd's, that they would have no problems of any kind have found out otherwise.

But they will continue to be a major force in insurance, and they will get by their present troubles, and they'll probably come out of it better structured than they went in.

13. We'll keep a dollar if we can make more than a dollar of value

WARREN BUFFETT: Was that zone 5 that we did there?

AUDIENCE MEMBER: Christopher Jones (PH) from Scottsdale, Arizona. I had a couple of questions for you.

You've mentioned several times today about the difficulty and the frustration that you both have in trying to find capable companies to acquire, or acquire parts of, in the United States.

And I realize that, of course, when we own Coca-Cola and Gillette we are a part of the global environment.

But it's surprising to me that there haven't been any global franchises or global managements that have been interesting to either of you that — and I realize, in the past we've owned some pieces of some.

So, I was — questioned, because of the size of Berkshire now, might we see something more of a global flavor to the portfolio?

And second question, you've also addressed the intelligent use of cash as something that you look for in management.

Many management teams now are buying back their own shares because they can't find anything cheaper or better in the marketplace.

Does your current philosophy of not buying back your own shares suggest that maybe you think Berkshire's overpriced at these prices?

WARREN BUFFETT: Well, we have never bought back shares. I — we actually bought a few back in the '60s — but we basically have never bought back shares, although there were plenty of times when we thought it would be quite attractive to do it.

But we've also felt that if we could create more than a dollar of market value by — and maybe well over a dollar of market value — by retaining a dollar, that on balance that that would work out better over time.

As long as we can find ways to use the cash, which, overall, we feel will turn dollar bills into something larger than dollar bills, we will — we'll keep retaining the money.

And we won't measure that on whether we can find anything this week or this month, but we'll certainly measure it based on whether we can find anything in a couple of years, always.

We've had dry spells. Actually, right now, there's a little more going on than usual. But we've had dry spells a lot of times over a 20-odd year period. And you know, as I said, I wound up the partnership during one dry spell.

So that — it will be measured — it's measured partly on what's going on now, and it's measured partly on the expectancy.

And I don't think, whether our stock was selling at X or three-quarters of X right now, would make a lot of difference. But it would make a difference if we thought we couldn't find things to do with the money externally.

14. "Not too likely" we'll buy a business outside the U.S.

WARREN BUFFETT: The question about nondomestic operations, as you mentioned, we've got almost \$8 billion in Coca-Cola and Gillette combined, and Coke has 80 percent-plus of their earnings from non-U.S. sources, and Gillette has maybe two-thirds or thereabout.

So, you can argue that almost 40 percent of the net worth of Berkshire — 35 to 40 percent — is operating outside the United States, just in those two investments alone.

In terms of buying a business outright, we don't preclude buying a non-U.S. domicile business. But it's not too likely that it'll happen.

We'd like to do it, particularly if it were large and if we understood it. But are we as likely to get a fix on a Helzberg's of Europe as we would a Helzberg's in the United States? You know, I doubt it.

I just don't know whether we would develop as much confidence in understanding the scene in which they operated, and understanding the management, and all that. But we might.

It would have to be a pretty simple business, and it would have to be a business where we thought we really understood the moat for a long time.

And it would have to be a business where we could establish a rapport with the management, despite coming from somewhat different backgrounds. It's not impossible, but I would say it's, you know, it's less than likely.

Charlie?

CHARLIE MUNGER: I've got nothing to add.

15. Buffett: my growing fame isn't a distraction

WARREN BUFFETT: Zone 6?

AUDIENCE MEMBER: Hi there. My name is Lee Debroff (PH) from Morgantown, West Virginia.

Ever since the Salomon debacle, it appears that you have attracted more and more media attention.

In this regard, there have been numerous displays that would appear to be distractions from the actual business of investing. To wit, we have watched as you attended Bill Gates' wedding in Hawaii, and bought a personal computer, and now wear striking designer ties. (Laughter)

And yesterday —

WARREN BUFFETT: Bill would've invited me to the wedding even if I hadn't have been at Salomon. (Laughs)

AUDIENCE MEMBER: Yesterday, we got those pennants during the rainout.

A very serious question, now that you've become this media darling, how can you assure us that you're still keeping your eyes concentrated on the proverbial ball? (Laughter)

WARREN BUFFETT: Well, I do get more mail than I used to, so we've developed a little more of a system on that. But I just — I do what I like to do.

Just take speeches, I probably get asked to make, maybe, 20 times as many speeches as I would've been asked to make 10 years ago, but I make the same number. You know, I've got the — I've got my own selection process for what I do on that.

And it's the same way, you know, I'm invited to, you know, I don't know how many dinner tributes, et cetera. And you know, they basically — I don't change the way I — what I do, because I don't want to change the way —

If I wanted something else — if, while I was building Berkshire, that was being done to end up in some other spot, I'd have been there by now. And it just doesn't change anything.

It does change the volume of mail, but I've got that so that that is not a big distraction.

Pardon me?

WARREN BUFFETT: Oh, I'll remain in Omaha. Yeah, there's no question about that. I mean, I — if I hadn't wanted to be in Omaha, I would have figured out ways to change, and it would have been very easy to change decades ago.

I think it's — we've got a lot of people here who aren't from Omaha, but that's their problem. I mean — (Laughter)

CHARLIE MUNGER: I have been watching Warren for a long time, and people who are concerned that he will change have a huge appetite for needless worry. (Laughter)

WARREN BUFFETT: The odds that I will change are about as good as the odds that Charlie will change. (Laughter)

The mail thing is a, you know, you wish you didn't — that there was an easier way to handle it.

But you essentially can't answer all the letters you get, it's that's simple. And that's about the — once you get past that and get a form letter that takes care of it, that takes care of it.

16. Decline in GEICO's return on equity

WARREN BUFFETT: Zone 1?

AUDIENCE MEMBER: Yes. I'm Samuel Park (PH) from Tulsa, Oklahoma.

My question is regarding GEICO. I noticed that, for the last five years, their return on equity has come down every year. Is this something that signifies change of a business, or just temporary things?

WARREN BUFFETT: Question is about GEICO's return on equity?

AUDIENCE MEMBER: Yes.

WARREN BUFFETT: Yes. Well, it's true, it has come down to some extent. The — GEICO's growth is, more or less, a function of, basically — I mean there's a natural rate of growth there.

And the growth in capital has been greater than the growth rate in premium volume and in invested assets, so that achieving the same success on underwriting and achieving the same success on investments will produce a lower return on capital unless they buy in stock, which they have done fairly significantly. But that's limited by availability, too, but —

It's a very good business. But it's not a business where, if you double the capital, you can double the earnings easily.

Charlie?

CHARLIE MUNGER: I have nothing to add.

17. No comment on Guinness investment

WARREN BUFFETT: Zone 2?

AUDIENCE MEMBER: My name's Mark Hake (PH) from Scottsdale.

And I think your question — my question — about foreign equity investment was pretty much answered by the other gentleman.

But I noticed that you had made an investment in Guinness in the past. And can you comment on that? Do you — is it still owned? And if not, why not?

WARREN BUFFETT: We don't comment on purchases and sales of securities or ownership, unless either we're legally required to, or they hit this threshold level where we report annually.

And we move the threshold level up as our assets move up. We don't move it up as a percentage of assets. So that we used, as a cutoff this year, 300 million, I believe, of market value as to where we reported.

Now, if we'd owned the same amount of Guinness — which I'm not saying that we did — but if we owned the same amount of Guinness on December 31st, 1994, it would not have hit that threshold as we had on December 31st, '93. It would not have hit that threshold.

And we really don't want to get in the business where we are talking at all about what we're buying or selling. We get a lot of speculation on that, but it's of no use to Berkshire to be talking about purchases or sales.

If we were acquiring a piece of land downtown and we bought a quarter of what we intended to buy, for example, we would not feel we were benefitted by a front-page story in the paper saying that we were acquiring land.

And it — we are not in the business of giving investment advice, basically. We'll talk about our principles.

So, the only conclusion you can come to about Guinness, or anything else that does not show up on our list at year-end, is that we did not own \$300 million's worth at market value at that time.

18. Buffett's Berkshire shirt isn't available

WARREN BUFFETT: Zone 3?

AUDIENCE MEMBER: Yes, Mr. Buffett. My name is Don Bresca (PH), I'm from Boston, Massachusetts.

Recently I've noticed you wearing an IZOD shirt with Berkshire Hathaway in the middle — there was a fist grasping cash. Is that the new insignia?

And the second question is, is that shirt available to stockholders? (Laughter)

WARREN BUFFETT: The shirt is not available. That shirt was a gift from someone, and the shirt is not available to stockholders. But you can draw your own conclusions, the meaning of it. (Laughs)

19. No matchmaking for Mrs. B and Phil Carret

WARREN BUFFETT: Zone 4?

AUDIENCE MEMBER: Yes. I'm Lyle McIntosh from Missouri Valley, Iowa, about 25 miles up the road.

And Warren, recognizing this is corn country, and I farm, and there's several other farmer shareholders, this meeting hits right in the middle of corn planting.

Could you move it back about three weeks? (Laughter)

And also, I noticed [mutual fund pioneer] Phil Carret was on "Wall Street Week" Friday night. I'm sorry I don't know his marital status, but if he is available have you thought about introducing him to Mrs. B. [Nebraska Furniture Mart founder Rose Blumkin]? (Laughter)

WARREN BUFFETT: Well, Mrs. B., incidentally, was out working yesterday. I went out and dropped by to see her about 4 o'clock, and she was doing fine.

She will be 102 late this year, and my guess is she will be working on her 102nd birthday as well. But I'll let Phil and Mrs. B. handle their own affairs, in that respect. (Laughter)

CHARLIE MUNGER: He's probably a little too young for her. (Laughter)

20. "We're open to buying anything"

WARREN BUFFETT: Zone 5?

AUDIENCE MEMBER: Well, I'm Ken Donovan (PH), a Cincinnati investor.

You've addressed the subject of your feelings about buying entire foreign corporations.

I wonder if you'd say something about, or is Berkshire looking for opportunities to buy, we'll call them near-franchise companies, that might be based overseas — buying a stock interest or a part interest? And also, how do you feel about fixed-debt investments of overseas companies?

WARREN BUFFETT: Debt investments, was that?

AUDIENCE MEMBER: Yes. Well, the first part was buying a stock investment rather than a whole company.

WARREN BUFFETT: Right.

AUDIENCE MEMBER: And the second part was debt investments.

WARREN BUFFETT: Yeah. Well, we're open to buying anything. When you say, are we looking at them, I've never been quite sure how we look at things anyway. I mean, they just seem to sort of pop up from reading or something of the sort.

But we're — it's less likely we end up doing it, for some of the reasons I've given earlier. But we have bought stock in companies that — aside from Guinness, that are domiciled outside of the United States. And we would have — we could conceivably buy debt instruments.

We don't buy a lot of debt instruments anyway, so it'd be very unlikely.

But we will do anything we think makes sense at Berkshire, that's compatible with the way we want to operate. And certainly, we don't care where — the domicile is not that important.

Charlie?

21. Helzberg has unusually good sales for jewelry retailer

WARREN BUFFETT: OK, zone 5, is it?

AUDIENCE MEMBER: Scott Spilcovich (PH), New York City.

My question is regarding the Helzberg acquisition. Can you comment on things such as the acquisition price, your sales and profit expectations, and how much debt was on the books at the time of the acquisition?

WARREN BUFFETT: This is in reference to which acquisition?

AUDIENCE MEMBER: Helzberg.

CHARLIE MUNGER: Helzberg.

WARREN BUFFETT: Well, we have not put out the figures on Helzberg's, and we won't be.

But we evaluate — the sales have been published at about 280 million for the year that ended in February, and there'll be considerably more in the current year.

But we have not put out the figures. I can tell you that, obviously, that we think that, in terms of the amount we are laying out in terms of shares and/or cash — we think, over time, that it's going to be a very decent acquisition.

It's the same line of reasoning we've applied in other businesses. Retailing, as I mentioned earlier, is the kind of business where you have to stay smart over time, and we have a terrific manager, a fellow named Jeff Comment, who's going to be running it.

And his record is extremely good, and I would bet the record would stay good.

It earns good returns on invested capital or we wouldn't be buying into it. We always look for good returns on capital.

And a lot of companies in the jewelry business do not get good returns on capital. I mean, it's not an industry that — where most of the participants are prosperous.

It takes unusual sales per square foot compared to competitors to succeed in that, and we have one operation that does that in spades at Borsheims, and then a different type of operation that does it at Helzberg's.

The typical jewelry store operation is not a very good business, but we think we've got two good operations.

Charlie?

CHARLIE MUNGER: Yeah, we frequently find that owners of entire businesses have schizophrenia. They want to sell their business for a little more than it's worth, taking stock, so they don't have to pay taxes.

And they want the stock to be the kind of — to be in a kind of business that will make just one dumb acquisition — theirs, and thereafter will guard the stock like gold, making no more dumb acquisitions. (Laughter)

Needless to say, the world is not that easy. And I think over time, we've made acquisitions that were fair on both sides, and averaged out, they've worked well for Berkshire.

And I think a company that behaves that way is giving the best long-term value to the private owner who wants to sell. You do not want to sell your business for stock to a firm that likes issuing stock.

22. Insurance float important in estimating intrinsic value

WARREN BUFFETT: Zone 6?

VOICE: That was six.

WARREN BUFFETT: Where do we have the mic? Oh, there. I don't think it's on.

AUDIENCE MEMBER: Can you hear me now?

WARREN BUFFETT: Yeah, sure.

AUDIENCE MEMBER: Jack Glanding (PH) from Knoxville, Tennessee.

I have a question which may not be appropriate for the officers of Berkshire to answer, but I think I'll ask it anyway.

You focused on intrinsic value in your annual report, and you suggested that by reviewing the grey pages in the back that one could come up with a — possibly come up — with a value of intrinsic value for Berkshire.

I've made an effort to do this, and I think I come up with a price-to-earnings ratio somewhere around 21, which seems to be a little overvalued.

I'd like to ask you, Mr. Buffett, if you would care to divulge what you believe is the intrinsic value of Berkshire?

And if you're not willing to do that, do you consider the price of Berkshire at this level to be fair?

WARREN BUFFETT: I — every year I get asked that, in one form or another, and I always say that I don't want to spoil the fun for those of you who are working out the intrinsic value for yourself.

You have all the numbers that we have that are key to it.

And I would say that there are some important factors besides P/E. I mentioned earlier that I thought that the page where we describe float, for example, is probably as important a page as there is in the report.

And then the question is, you know, what do you do with the capital as you allocate it over time? And obviously, that makes a difference in intrinsic value, too.

But I would say in a general way that I — and this has been true virtually all of the time that — I think — I would say that the intrinsic value of Berkshire in relation to its — actually, I'll put it the other way.

The price of Berkshire in relation to its intrinsic value, I think, probably offers as much value as, or more, than the majority of stocks that I see. But I don't want to go any further than that.

Charlie?

CHARLIE MUNGER: I've got nothing to add.

The — your story about the fun of working it out, though, there's a famous English headmaster who used to say to each graduating class, he said, "Five percent of you are going to become criminals, and I know just who you are.

"But I'm not going to tell you, because I don't want to deprive your lives of a sense of excitement." (Mild laughter)

WARREN BUFFETT: We'll explain that later on. (Scattered laughter and applause)

There is a lot more to — there's more to intrinsic value, as we've discussed earlier, than just adding up what you think you can sell the pieces for at any given time, because it is a prospective figure. It is future cash discounted back to the present. And capital allocation is a good part of that.

What you expect the float to do, for example, over time, would not — that would lead to a large swing in possible numbers relative to value.

I mean, if — when we bought National Indemnity in 1967, when it had whatever it had, 15 or 20 million in float, we didn't see it then.

But if we could have foreseen the eventual development of float over time, it might have turned out that the intrinsic value of National Indemnity was many multiples of what most people might have thought at the time, and probably what we thought at the time.

23. Hagstrom book had "some effect" on Berkshire's stock price

WARREN BUFFETT: Zone 1.

AUDIENCE MEMBER: Richard Ducheck (PH) from Melbourne, Florida.

I have a two-prong question, first on the stock. As we all know, the first month this year we ramped up about 25 percent and then we pulled back, I guess, about 20.

Just wondering your thoughts on that, if specifically you attribute that to the books perhaps, or institutional buying or, you know, what explanation you might have for that. And second —

WARREN BUFFETT: I would say — I'll answer that first. I would say [Robert] Hagstrom's book ["The Warren Buffett Way"] undoubtedly had some effect on that. It's impossible to measure, but that book sold a lot of copies. And my guess is that that had some effect.

AUDIENCE MEMBER: OK. More so than institutional buying? Because I've heard rumors like Fidelity and whatever were buying —
